## EDITOR'S PREFACE

At its inception the series of volumes that were to be included under the title "The Fauna of British India" was limited to seven, which were to deal with the Vertebrata only. On the recommendation of the then Government of India the Secretary of State for India sanctioned the preparation of these volumes in 1883; but the first volume to be published, that on the Mammalia by W. T. Blanford, F. R. S., did not appear till 1888.

The geographical limits of the fauna to be studied were defined in the preface to this first volume as comprising " the dependencies of India, with the addition of Ceylon, which, though British, is not under the Indian Government. Within the limits thus defincd are comprised all India proper and the Himalayas, the Punjab. Sind, Baluchistan, all the Kashmir territories, with Gilgit, Ladak, etc., Nepal, Sikkim, Butan, and other Cis-Himalayan States, Assam, the countries between Assam and Burma, such as the Khasi and Naga hills, and Manipur, the whole of Burma, with Karennee, and, of course, Tenasserim and the Mergui Archipelago, and lastly the Andaman and Nicobar Islands. Afghanistan, Kashgaria, Tibet, Yunnan, Siam, and the Malay Peninsula south of Tenasserim are excluded '".

When the volumes dealing with the Vertebrata were completed the series was extended to include the Lepidoptera and thereafter the Insecta in general. A few years later it was realised that the series was in danger of becoming overloaded with works on the insects to the almost complete exclusion of all the other groups of animals, the only exception being the Arachnida, which were reported on by the late R. I. Pocock, F.R.S., in 1900. In 1908 the first of a series of volumes on the Mollusca was published and this was followed at intervals by three other volumes on this group. In 1909 the sanction of the Sec-
retary of State for India was granted for the preparation of volumes on the Freshwater Sponges, Hydroids and Polyzoa by the late Dr. Annandalé, and on Leeches by Mr. Harding and Prof. J. Percy Moore. In the same year it was decided to extend the series so as to include the marine launa of the Indian coasts, and sanction was accorded for the preparation of two volumes on the Brachyura by the late Lieut.-Col. Alcock, F.R.S.; but Alcock's retirement from India and pressure of work in other spheres prevented the preparation of these volumes. In 1922 the Sccretary of State for India was asked to sanction the preparation of a volume on the Madreporarian Corals, but he decided for financial reasons to postpone for a time consideration of any further volumes in the 'Fauna' series.

When the consideration of further volumes was again taken up the marine fauna was not lost sight of and sanction was granted by the Secretary of State for India for the preparation of several volumes on groups of the marine fauna, and with the steady growfh ot our knowledge of the deep-sea fauna of Indian seas it was decided that this should be included, thus widening very considerably the scope of such volumes. The volumes on the marine fauna, that have up to the present time been sanctioned, are:-

Sponges .. by M. Burton.
Echinoidea .. by Th. Mortensen. ${ }^{1}$
Polychaeta $\quad . \quad$ by P. Fauvel.
Cirripedia $\quad . \quad$ by C. A. Nilsson-Cantell.
Copepoda Calanoida .. by R. B. Seymour Sewell.
Brachyura, Oxyrhyncha .. by B. N. Chopra.
and Pelecypoda .. by Baini Prashad.
The preparation of a 2nd Edition of the volumes on Fishes was also entrusted to Dr. S. L. Hora.

With the extension of the series to include the deepwater fauna it has become necessary to define the boundaries of the ocean within which the fauna may be con-

[^0]sidered to belong to Indian waters and the following limits have been accepted :-

On the west the area shall be bounded by the meridian of lat. $60^{\circ} \mathrm{E}$. as far north as Ras-al-Had, and thus includes the Gulf of Oman and the Persian Gulf.

On the south by the latitude $1^{\circ} \mathrm{S}$. so as to include the whole of the Maldive Archipelago.

On the east by the coast of Burma, by a line drawn from Victoria Point to the northern tip of Sumatra and by the west coast of Sumatra as far south as Lat. $1^{\circ} \mathrm{S}$.

The area thus enclosed is shown in the accompanying map, which also indicates the various sub-marine ridges and basins that lie wholly or in part within the boundaries of the Indian region. It is, of course, well known that this area is populated by an Indo-Pacific fauna and hence a certain amount of latitude must be granted to Authors who wish, for one reason or another, to include in their account of the Indian fauna certain species that up to the present time have not been captured within these waters but whose presence there may confidently be expected, and this is all the more necessary
since the land region has now been extended beyond the original scope to include Malaya, where this is possible.

As a consequence of the recent change in the Government of India and the division of this region into two new Dominions of India and Pakistan it has become necessary to change the title of the series. In future the series will be known as "The Fauna of India", and the Government of India have decided that the area to be covered shall include India, Pakistan, Ceylon, Burma and, if possible, Malaya. It has also been decided that henceforth the volumes of the series shall be printed in India. The present volume thus becomes the first of a new series.

Acknowledgment and the thanks of both Author and Editor of this volume are due to a number of Scientific Societies and other bodies for permission to reproduce illustrations that have previously been included in the Journals and Memoirs published by them. First and foremost among these is Dr. Chopard and the "Federation Francaise des Sociétés de Sciences Naturelles ", to whom we are indebted for permission to reproduce a large number of figures from Dr. Fauvel's Monographs on the " Polychètes errantes" and " Polychètes sédentaires" in the " Fauna de France ": Other scientific bodies, to whom our thanks are due, are the Trustees of the British Muscum (Natural History), the Royal Society of London, the Linnean Society of London, the Zoological Society of London, the Muséum d'Histoire Naturelle de Paris and the Société Zoologique de France, and to Messrs. Taylor and Francis, the Publishers of the "Annals and Magazine of Natural History". Finally, our thanks are tendered to the Director of the Zoological Survey of India for permission to reproduce many figures that have been published in the "Records" and "Memoirs of the Indian Museum ".

## POLYCHAETA

## INTRODUCTION

Previous to the year 1861 very little was known concerning the Polychaetous Annelids of India.
L. K. Schmarda, in the course of a journey round the world (1853-1857), spent several months collecting in Ceylon and in his Report "Neue wirbellose Thicre" (1859-61)* he described about a score of Polychaeta from that island. Unfortunately Schmarda's descriptions are generally too vague and too scanty to allow of an accurate identification.

In Grube's short paper on the Ceylon Annelids (1874) only six species are described. In W. Michaelsen's "Polychaeten von Ceylon" (1892) fifteen species were recorded.
liy far the most important work on the subject is A . Willey's " Report on the Polychaeta collected by Prof. Herdman at Ceylon" (1905) in which a large number of old and new species are described. It was followed by Southern's " Polychaeta of the Chilka Lake" (1921); Augener's "Ceylon Polychacten" (1926) and "the Littoral Fauna of Krusadai Island, in the Gulf of Manaar; " " Chaetopoda ", Part I, by Gravely (1927); Part II by Fauvel (1930).

But all these papers are relative to Ceylon and its vicinity and the coasts of the Madras Presidency. As for the other parts of India, with the exception of S. S. Bindra's "Fauna of Karachi" (1927), only casual mention, here and there, of a few species are scattered in papers not specially dealing with India. But later the collections of the Zoological Survey of India and of the Indian Museum, Calcutta, have afforded us much more extensive knowledge concerning the Polychacta, not only from the coasts of India but also from the neighbouring Seas. Three hundred species were recorded in Fauvel's Report (1932).

[^1]The range of the area dealt with in the present work extends from Long. $60^{\circ} \mathrm{E}$, as far as Cape Ras-al-Hadd, on the western side; the whole of the Persian Gulf and the Baluchistan Coast forming the northern boundary; to the east, the region includes the Malacca Strait, as far as Singapore, whilst the Southern boundary is Lat. $1^{\circ} \mathrm{S}$, so as to include the whole of the Maldive Archipelago.

On the Persian Gulf, the Arabian Sea, the Gulf of Oman, the Bay of Bengal, the Maldive and Mergui Archipelagoes information as regards the Polychaeta is very plentiful but is scattered in a large number of Reports of various expeditions.

Thus we have been able to record 450 species from the given area. Nevertheless, this rather high number hardly represents more than about one-half of the probable total number of the Polychaeta, for, owing to the well known ubiquity of these worms, nearly every species of the Indian Ocean and of the warm parts of the Pacific is likely to be found in the area of the Indian Fauna, as delimited above.

Having had the good fortune to be able to study three hundred species of the Indian Museum, one hundred and nine of the Madras Government Museum, and the material of several expeditions to the Red Sea, Persian Gulf, Indo-China, New Caledonia, Australia and Gambier Islands, nearly all of the 450 species here described have been in my hands, the few exceptions being some rare ones, the description of which I have taken from the original authors.

The Polychaete Fauna of India does not materially differ from that of the Gulf of Siam, Malay Archipelago, China Sea, Philippines, Great Barrier Reef, Australia, New-Caledonia, and a great part of the Pacific. It must also be borne in mind that many Polychaetes are really cosmopolitan. Out of the 450 species here recorded 108, nearly one-fourth, are also European species.

## ANNELIDA POLYCHETA

The Polychaeta and the Oligochaeta are two important divisions of the Chaetopoda, annulated worms endowed with locomotive bristles or setac. But the bristles of the Oligochaeta are few and directly set on the bodywalls, which are destitute of parapodia or feet. Other appendages are also wanting. On the other hand, the bristles of the Polychaeta are usually very numerous and borne on clearly marked parapodia, lateral expansions, or feet, of the teguments. The body generally carries various appendages such as tentacles, palps, cirri, branchiae, etc. Moreover, the Polychaeta are very generally marine animals with separate sexes, whilst the Oligochaeta live in fresh water or damp earth and are hermaphrodite.

## MORPHOLOGY

Fig. 1.
The body is generally clongated, with numerous segments. It consists of a Prostomium or anterior cepha-

lic lobe, a Metastomium including all the following segments, and a Pygidium, the last segment.

A few anterior segments, more or less modified, may be fused with the prostomium to form a kind of head with various appendages such as antennae or tentacles, palps and tentacular cirri.

In the Errantia, the segments of the metastomium are often very numerous and nearly all alike, as in the Nereidae, Syllidae, Eunicidae, etc., whilst in the Sedentaria the body, sometimes shorter, is often clearly divided into distinct regions such as thorax, abdomen, and tail.

The prostomium, a cephalic lobe, the anterior part of the so-called head, is sometimes reduced to a merc cone, blunt or sharp, and destitute of any appendages, as in Lumbriconereis. It is a long annulated cone, with four small tentacles at the tip, in Glycera; square or scute-like in Nephthys; more or less complicated with several appendices in Nereids, Aphroditidae and Eunicidae; or reduced to a mere ridge in Sabellids and Scrpulids.

The prostomium generally carries one, two or more pairs of eyes, mere eye-spots, single or compound, or sometimes highly differentiated organs such as the big, red eyes of the Alciopids, with a cornea, a lens and a retina.

## Appendages (Fig. 2).

The appendages of the Polychaeta are various processes of the teguments which may be classed into two groups. The first are merely epidermic solid projections, as the styles and stylodes. The others are hollow and are formed by an evagination of the body wall.

When the antennae, palps and cirri are borne on a hollow base, this last is termed 'phore'. Such an antenna is then divided into a solid distal part, or ceratostyle, and a basilar hollow part or ceratophore; a palp is divided into a palpostyle and a palpophore a cirrus into a cirrostyle and a cirrophore.

Amongst the cephalic appendages are: (1) the palps, innervated by a large nerve issuing from the anterior part of the brain. They may be simple, elongated, prehensile (Spionidae) or short, simple, or articulate (Syllidae, Nereidae) ; (2) the antennae or tentacles, innervated from the middle brain; (3) the tentacular cirri, borne on
the metastomium (buccal segment), or on the segments fused with the prostomium to form the head.

The Parapodia, or feet, are more or less complicated lateral processes of the body-wall. These organs, with the

bristles they carry, provide the most important features for the identification of the species. Typically, each segment carries one pair of parapodia divided into two rami, a dorsal one, or notopodium, and a ventral or neuropodium. When both rami are borne on a common base the biramous foot is said to be monostichous; when both rami are quite distinct and more or less apart, as in most Sedentaria, it is termed distichous. (Fig. 3). For instance, in a biramous parapodium of Nereis there are; (1) two setigerous lobes (or chaetigerous sacks) carrying the setae and supported by a stout, enclosed, bodkin-like bristle or aciculum; (2) parapodial lobes, lips or fillets; (3) a dorsal and a ventral cirrus. Branchiae, or gills, simple or branched may be inserted upon the dorsal ramus or between the two rami.

The parapodia are biramous when both rami are nearly equally developed; subbiramous with a dorsal cir-

Fig. 3.-Parapodia: a, subbiramous, of Podarke pallida Claparéde; $b$, of Eunice; c-d, biramous, elytiogetous and carrigerous of an Aphroditid; e, biramous of Nereis; f, biramous of Nephthys; $g$, sesquiramous of Staurocephalus; $h$, uniramous of Phyllodoce; $i$, distichous of Amphicteis, dorsal ramus and ventral pinnule; $k$, of an Aricia; $l$, distichous of Arenicola (a.c. aciculum; br, gills; cd. dorsal cirrus; cv, ventral cirrus el, elytron; pi, pinnule; to, uncinigerous torus).
rus but the dorsal setae-sack and setae more or less reduced; sesquiramous when the dorsal lobe is reduced to a few bristles or acicula; uniramous when the dorsal ramus is practically wanting, being reduced to the dorsal cirrus.

In the Sedentaria the neuropodia, or ventral rami, are often reduced to mere transverse ridges, or uncinigerous tori, destitute of a cirrus and carrying short hooks or uncini.

Setae (or chaetae) are chitinous bristles which are very important for the classification and are of very varied shapes and disposition. They may be divided into two groups: (1) the setae s. str., or bristles, and (2) the uncini, avicular or acicular hooks.

The setae are simple, jointed, or compound. They may be long, slender, filiform, hair-shaped, capillary, smooth or spinulose, curved, flat, limbate, or winged on one or both sides, with frills or transverse rows of spines, geniculate, trumpet-shaped, exceptionally forked at the tip, etc. (Fig. 4). When they are short, stout, bodkin-

shaped, or flattened, paddle- or oar-shaped, they are called paleae. The articulated, or many-jointed setae of the Chloraemidae and SIGALIONINAE are a connecting link with the compound setae with a basal part, or stalk, and a terminal piece elongate, needle-like, or short, sickleshaped. When both sides of the articulation are the same length it is termed homogomph, and heterogomph when they are unequal.

The ventral uncini of the Maldanidae and Capitellidae are sigmoid hooks with a rostrum, a guard, and a manubrium. The uncini of the Sedentaria are often short denticulate plates, such as the avicular hooks of the Sabellidae and Terebellidae, with a broad basal manubrium and a beak-like hook, crested with denticles
on the vertex. They are set on the tori in one or two parallel rows. (Fig. 5).

Proboscis. Many Errantia are provided with an eversible proboscis armed with strong horny jaws, or beset with papillae, or with chitinous denticles, or paragnaths.

The intestine is generally straight, rarely coiled, sometimes with glands or diverticula.

Body cavity. In the Errantia the body-cavity, or coelom, is generally divided by numerous intersegmental septa, or diaphragms. In the Sedentaria these septa are few and generally restricted to the anterior part of the thorax.

Muscles. The muscles are smooth, set in circular layers and stout longitudinal fascicles. Oblique muscles run from the sides to the middle of the ventral side.

Nephridia, or excretory organs, are disposed in pairs on succeeding segments with lateral pores opening on the sides near the feet. In the Sedentaria, they are generally reduced to a few thoracic pairs. The anterior ones,
in front of the diaphragm, are purely excretory organs, whilst the others are also used as genital ducts.

The vascular system is generally closed and well developed, sometimes very complicated and offering many variations. The dorsal vessel is contractile, but special organs of propulsion, or hearts, may also exist.

The blood is red, or emerald green in Sabellidae, Serpulidae, Chloraemidae, but is often uncoloured. The respiratory pigments, haemoglobin or chlorocruorin, are in solution in the plasma, only very exceptionally in corpuscles.

Respiration is effected by means of branchiac or gills, of which there are two kinds: (1) genuine branchiae, with vascular loops, and (2) lymphatic gills destitute of vesscls and filled with coelomic fluid. The gills exhibit very numerous and varied types. They may consist of simple filaments, straight or coiled, forked or pectinate, set on the dorsal rami of many feet, or branched or bushy and restricted to the anterior segments, disposed as a terminal funnel of many filaments on the head of Sabellids and Serpulids, etc.

Sense organs. The sense organs are the eyes, the nuchal organs, the lateral organs and the statocysts or otocysts. The eyes are not always restricted to the prostomium. The branchial filaments of the Sabellids often bear dorsal or subterminal eyes. The Ophelidide have lateral eye-spots disposed on a number of segments and the pygidium of little Sabellids may carry several eye-spots. We have already mentioned the large eyes of the Alciopidae. The lateral organs are small ciliated cups, or knobs, present on a number of segments in the Capitellidae, Opheliidae, Aricidae, etc.

Otocysts, or statocysts, exist only in very few species (Arenicolidae, Ariciddae, Terebellidae and Sabellidae).

Colour. Many species are adorned with bright colours and variegated patterns. Unhappily, these colours do not keep well in the preservatives, formol or alcohol. They are due to the red, or emerald green, blood and to solid or dissolved pigments of the epidermis, such as Haemoglobin, Chlorocruorin, Haemerythrin, Tetronerythrin, Melanin, Uranidin and various Lipochromes. These pigments, with the exception of Melanin and a few others, are either dissolved or altered by the preservative fluids.
F. 4

On the other hand, the splendid iridescence of the bristles of Aphrodita and Chloraemidae, as well as of the body-wall of Eunicids and others, displaying all the changing hues of the rain-bow, are permanent for they are caused by diffraction of the light either by the numcrous very fine striac of the setae or the very thin lamellae of the cuticle and these structures are not affected by the spirit.

Phosphorescence is not restricted to the Syllids and other small pelagic species which abound in the plankton; it is also a property of many Annelids crecping on the rocks and algae, and even of tubicolous species. For instance, the luminescence of Chaetopterus, living on the bottom inside a thick parchment-like tube, is the most beautiful of all.

## REPRODUCTION

The sexes of the Polychaeta are usually separate and even sexual dimorphism may occasionally occur. Nevertheless, a few species are hermaphrodite, especially amongst Sabellidae and Serpulidae. The ova and spermatonoa are discharged into the sea. The iertilised eggs give rise to a floating Trochophore larva, and then to post-larval stages dropping to the bottom or swimming for a long period.

Asexual reproduction, Blastogamic or Schizogamic, is frequent amongst Syllids and a few other Polychaeta.

Epitoky. A number of Polychaeta, especially amongst Syllidae, Nereidae and in a few Eunicidae, undergo a peculiar metamorphosis at the epoch of reproduction, acquiring new long swimming bristles, and developing large foliaceous lobes on the feet, whilst the eyes grow larger. For instance, in Nereis, the eyes become larger, a few of the anterior dorsal cirri grow thicker at the end, but the anterior segments are not otherwise materially altered; the middle and posterior segments, however, become flattened and crowded together, the enlarged feet develop broad foliaceous lamellae, and shed their bristles which are replaced by new oar-shaped swimming setae. When maturity is perfect and the metamorphosis complete, these Heteronereis stages rise in swarms to the surface of the sea, shed their sperm and ova, and then die. In the case of the "Palolo" (Eunice viridis), an Eunicid of the Pacific, the posterior part of the worm, a little modified and filled with genital products, breaks off from the ante-
rior part, which remains in the coral reefs, and rises in swarms to the surface where it is taken up for food by the natives. Singularly enough the rise of the "Palolo" is connected with lunar phases. It is very probably the only instance of an edible Polychaete.

## Autotomy and Regeneration.

Autotomy is wide-spread amongst Polychaeta. The POLYNOINAE easily shed their elytra, the Spionidae their palps, the Ampharetidae and Terebellidae their gills or their tentacular cirri. Many Eunicidae, Capitellidae and others are so brittle that it is but too often difficult to obtain a whole specimen.

This propensity to autotomy is counterbalanced by a great facility of regeneration and may be turned into a mode of ascxual multiplication as in Phyllochaetopterus and Dodecaceria. It is not uncommon to find a more or less long fragment of the mid-body of an Eunicid having regenerated both a head and a tail. In Procerastea and Dodecaceria a fragment composed of two segments, or even a single segment, may thus regenerate a whole worm.

## HABITS

As already stated the Polychacta are marine animals; nevertheless a few species can live in brackish water and even, though infrequently, in fresh water. In the brackish water of the Chilka Lake, the Salt Lakes near Calcutta, the Gangetic Delta, and the Taleh Sap, for instance, a few genuine marine species occur with several others more closely adapted to water of low salinity, such as two small Nephthys, Dendronereides heteropoda, two Capitellidae, and two small Serpulidae, Ficopomatus macrodon and Mercierella enigmatica. But species living in fresh water, or water of so low a salinity as to be drinkable, are of much rarer occurrence. Such are however several Lycastis and a few other Nereidae, several Sabellidae of the Baikal Lake, Mercierella enigmatica of world-wide distribution in estuaries and rivers, and another little Serpulid, Marifugia cavatica, found living in the deep caves of the Karst Region.

The Polychaetes are plentiful on the shore between tide-marks, on coral reefs, and in the shallow littoral waters as far as 200 fathoms, but beyond this, as the depth increases, the number of species rapidly decreases and they
become very scarce in the deep-sea dredgings. But, singularly enough, in the decp-sea fauna many shallowwater species are found associated with rare genuine abyssal forms. For instance, Amphicteis gunneri, often collected between tide-marks, has been dredged by the Prince of Monaco in 1885 metres, and in 2750 fms by the "Challenger", and the common shore Serpulids, Hydioides norvegica and Pomatoceros triqueter, at 4808 m .

Polychaeta are hence very little affected by depth and pressure.

Genuine pelagic species, usually transparent, and numerous larval and post-larval forms are part of the plankton.

For the most part, the others live on the bottom, boring in the sand or mud, fixed on stones or shells, creeping amongst algae, or burrowing in the crevices of rocks and corals, or amongst stones and shells incrusted with calcarcous algae, Sponges, Ascidians and Polyzoa. Some are commensal or ectoparasitic on Hydroids and Echinoderms.

Several of the so-called Errantia live nevertheless inside tubes, whilst true Sedentaria are sometimes tubeless or vagabond. The limivorous species swallow mud or muddy sand, like the earthworms. The Sabellids and Serpulids, which cannot leave their tubes, feed by means of their branchial tufts, the radii or barbules of which collect the plankton and the small particles of food floating in the water and their cilia carry them to the mouth. Certain Errantia, the proboscis of which is armed with stout horny jaws, such as the Aphroditidae, Nereidae and Eunicidae are prowling and hunt living prey.

## GEOGRAPHICAL DISTRIBUTION

Most of the species of Polychaeta have a very wide distribution and many are quite cosmopolitan, so that they cannot be grouped into Zoological Provinces. For instance, amongst the 450 species, here recorded from the Indian area, 108, nearly a fourth, are common on the western shores of Europe.

A comparison of the genuine pelagic Annelids of the plankton of Indo-China shows a nearly complete identity with those of the Atlantic.

Many of the Arctic circumpolar Annelids, with the exception of a few peculiar species, are also tound inothe
temperate Atlantic and Pacific Oceans. In the tropical area, whilst many disappear in the littoral zone, a number of them is still to be found in the deep-sea dredgings, and some of these northern species reappear on the temperate or cold shores of the south-hemisphere.

Antarctic species reach to the south parts of America, Australia and Africa.

Most of the intertropical species are also the same all round the world.

In the Fauna of Japan both arctic and tropical forms ane found. This is easily explained. Two streams run along the coasts of Japan: a cold one, the Oja-Siwo, runs down from the glacial Arctic Ocean along the coasts of Kamchatka, Manchuria, Korea and the North-West coast of Japan, bringing with its cold waters the northern species of Polychaeta, whilst the Kuro-Siwo brings to the Eastern coasts the warm waters of the tropical Pacific with part of their fauna.

In short, the distribution of the Polychaeta is mainly regulated by the temperature. In the great depths of the Oceans the temperature is both very low and very uniform all over the world and the Annelidan fauna is also very uniform and contains moreover a number of arctic species which find there the same cold temperature. For the same reason, in the intertropical area the shore and shallow-water species, especially those of the coral reefs, finding the same conditions in the three oceans, are nearly all identical.

The Polychaeta are indeed very sensitive to the temperature and an abrupt rise or fall of a few degrees sometimes kills them outright.

## COLLECTING

Pelagic Annelids are easily procured by the towing of a plankton net. Night fishing with artificial light will thus procure a lot of Syllids, epitokous Nereids and many rare small species and larvae. Shore collecting will yield the most varied and abundant crops.

The necessary implements are a stout spade, a crowbar, a chisel and a canvas bucket, or a fisherman's basket with several glass jars and a number of glass tubes.

Care must be taken to separate large predatory species such as Nereids, Eunicids and Aphroditians. These large and ravenous species, whilst being carried home, are
better kept in damp sand or amongst algae than in water bottles.

Many species burrowing in sand or mud are caught by turning it over with the spade. Each clod must be carefully broken into small parts with the fingers, avoiding any injury to small and delicate species. The sand may also be washed through a sieve in little pools of water.

Many Annelids are to be found creeping on stones or algae or in tubes incrusting them. Loose stones should be carefully turned over and examined, and should then be replaced in their previous position to avoid the decay of the fauna fixed on the upper surface. The crow-bar is used to rip open the crevices of rocks and corals in which a very rich and varied fauna is usually found.

In dredging and trawling, when the dredge or trawl comes on board, and the contents are scattered on deck, it is easy to pick up the large specimens. To search the rubbish for small species, shells and stones coated with Serpulids, Polyzoa, Algae, etc., should be put into broad. shallow, glass vessels, or, better still, into white china wash-hand basins, with sea water. When the water becomes putrid the small boring species and others ensconced in tubes or crevices come out and reach the edges of the vessel where they can easily be picked up.

## PRESERVATION

The best preserving medium for Polychaeta is $70-$ $75 \%$ alcohol. Formalin is very bad, quite detrimental to good preservation for the specimens rapidly become soft, sticky and nearly useless. Nevertheless, in an emergency, and for large species, it may be used for a short time previous to spirit ( $5 \%$ of the commercial solution of formalin). On the other hand, when specimens have been first hardened in strong spirit they may next be kept in formalin with less inconvenience.

For histological purposes, Bouin, Brasil or Zenker fluids are amongst the best.

Delicate and brittle species must be naroctised previously to fixing in spirit. This is easily done by adding very gradually, small quantities of alcohol (up to $5 \%$ or $10 \%$ ) to the sea water. Other anaesthetics such as cocaine, chloral, etc., may also be used for the same purpose. 'I's avoid too great a contraction of large species they may first be put into very weak spirit $(30-40 \%)$ and. be
kept well stretched with pincers; or bamboo or horn spatulae, and as soon as they cease to react they should be immesed in $70-90 \%$ alcohol. To ensure a good preservation the volume of alcohol must be greater than the specimen's and it must be renewed after a few days.

Preserved specimens should be kept separate in glass tubes, the smaller ones, in small tubes with a cotton-wool stopper, are packed together in larger vessels filled with $70-75 \%$ alcohol. The paper, or parchment, labels must be put inside the tubes with inscriptions, in pencil or permanent Indian-Ink, carefully noting the date and locality, the colour of the living animal and other particulars.

## IDENTIFICATION

To identify a specimen it is necessary carefully to note the divisions of the body, if any, the form of the prostomium, the eyes, the tentacles, tentacular cirri, gills, and the proboscis with its jaws and denticles, when there is one. Next in importance are the parapodia or feet with their bristles of high specific value. But as the structure of the feet and the form of the setae often vary materially in the antcrior, middle and posterior parts of the body it is always necessary to examine a number of them. This is easily done by tcaring. or cutting, with sharp pincers, or scissors, a whole series of feet, say nine for a Nereis, and disposing them in three rows on a slide, three anteior, three median and three posterior ones, the relative numbers of the segments they belong to being carcfully noted on the label.

If a permanent preparation be wanted, rapidly drain the alcohol from the slide and before the parapodia get dried drop on them a small quantity of melted gelatinglycerin, put on a cover-slip and warm slightly, if necessary: the preparation will then keep for years.

Mounting in Canada balsam is not recommended, the setae-unless previously coloured-becoming too transparent and the fine structures indiscernible.

## CLASSIFICATION

## Annelida Polychaeta.

Annulated worms with numerous specially differentiateg chitinous bristles carried on parapodia, or feet,
lateral processes of the segment's body-wall. Various appendages present, antennae, palps, cirri, gills. Marine animals, very exceptionally living in fresh water. Sexes usually separate.

## I. ERRANTIA.

Body usually vermiform, very long, segments numerous, nearly all alike, the first near the mouth excepted. Generally with cephalic appendages, antennae, palps. tentacular cirri; feet uniramous or biramous, with both rami hardly different; acicula present; frequently gills above the feet.

## II. SEDENTARIA.

Body divided into distinct regions. Head small, hardly distinct or greatly modificd. Feet generally simple, the ventral rami are often tori, or pinnules, with hooks or uncini; gills usually limited to a part of the body. Usually tubicolous.

According to Benham, the families may be grouped as follows:

## A. PHANEROCEPHALA

(Head distinct)
Sub-Order I. Nereidiformia (Errantia auct. and Ariciidae).
Antennae and palps. Peristomium with special cirri. Eversible proboscis often with jaws.

Families: Syllidae, Hesionidae, Aphroditidae, Phyllodocidae, Tomopteridae, Nereidae, Nephthydidae, Amphinomidae, Eunicidae, Glyceridae, Spharrodoridae, Typhloscolecidae and Ariciidae.

Sub-Order II. Spioniformia.
Prostomium reduced to a mere knob, neither tentacles nor palps. Eversible proboscis without jaws. The peristomium usually carries a pair of long tentacular cirri and extends forwards at the two sides of the prostomium.

Families: Spionidae, Chaetopteridae, Magelonidae and Ammocharidae.

Sub-Order 11I. Terebelliformia.
Prostomium destitute of appendages. The achaetous peristomium may carry cirri and tentacles. Proboscis not eversible, unarmed.

Families: Cirratulidae, Terfbellidaf, Ampharetidae and Amphictenidae.

Sub-Order IV. Capitelliformia.
No prostomial processes. Peristomium without appendages. Proboscis unarmed. An accessory gut. No blood vessels. Lateral sense-organs.

Family: Capitellidae.
Sub-Order V. Scoleciformia.
Antennac and palps wanting. Pcristomium without appendages. Proboscis unarmed. Blood vessels present.

Families: Ophelidae, Maldanidae, Arenicolidae, Scalibregmidae, Chioraemidae and Sternaspididae.

## B. CRYPTOCEPHALA

(Head indistinct)
Sub-Order I. Sabelliformia.
Prostomium entirely hidden by the forward extension of the peristomium. Palps greatly developed, branched and acting as respiratory organs. Tube membranous or calcareous.

Families: Sabellidae, Eriographidae, Amphicor inidae and Serpulidae.

## Sub-Order II. Hermelliformia.

Peristomium enormously developed and forming a bilobed hood capable of closing over the mouth

Family: Hermellidae.

| 11. Dorsal cirri short or of moderate length, not moniliform; pharynx armed with a single pair of strong toothed jaws; tentacles two; parapodia almost always biramous | Nerfidaf, p. 163. |
| Dorsal cirri long and more o: less distinctly monilifonm: pharynx cylindrical, armed with at most a small pair o! jaws (Magalia), usually oms with stylets or unammed; tenta cles two or three; parapodia sesquiramous or biramous | Hestovidar, p. ${ }^{\text {10\% }}$ |
| 12. Palps small: prostomium conical slender, annulate, terminateal by four small tentacles arrang ed in the forn of a cross; pharynx large. covered with papillac, armed with at least four teeth; parapodia biramous (Hemipodus excepted) | Glycrridar, p. 281. |
| Palps absent; prostomium more or less normal | 13 |
| 13. Parapodia biramous, with not mal cirri and a sickle-shajed gill between the rami; tentacles four; pharynx with soft papillae; all setae simple | Nfithiydidae. p. 223. |
| Parapodia with foliaceous cirii, without sickle-shaped gill. generally uniramous | 14 |
| 14. General appearance (including the single pair of eyes) normal; tentacles four or five .. | Phyllodocidae, p. 114. |
| Prostomium flanked by a pair of large globular eyes; tentacles four; tissues transparent; pelagic worms | copidat, p. 132 |

## Sedentaria

1. Body clearly divided into regions Body not clearly divided into regions .. ..
2. Segments numerous, without anal gills, without broad ventral shield

3
Body short, swollen; segments
few; filiform anal branchiae.
A large ventral shield border-
ed with stiff setae
ed
3. Palps elongated, tentacle-like 4
Without tentacle-like palps .. 7
4. Two large tentacular palps on the prostomium

5
One or more pairs of palps inserted on the anterior seg. ments. Branchiae simple, filiform, inserted above the feet. Capillary setae and acicular setae. Prostomium conical, without processes

Cirratulidaf, p. 329.
5. Two palps and two bundles of subulate branchiae retractile into a buccal funnel. The protracted setae of the first feet forming a cephatic cage. Body thickly covered with papillae

Chloraemidaf, p. 34.
Two long canaliculate palps, not retractile into the mouth. Without cephalic cage .. 6
6. Palps without suckers. Parapodial lamellae erect, dorsal branchiae cirriform. Hooded hooked setae

Spionidar, p. 311.
Palps with sucker-like papillae. Without branchiae, Prostomium oval, broad and flattened (spoon-shaped) ..
Anterior dorsal and ventral cirrı flask-shaped or frilled. Threadlike lateral branchiae. Numerous kinds of setae ..
7. One median tentacle. Dorsal cirri. Dorsal foliaceous branchiae. Capillary setae and hooded setae
Prostomium with, or without two short tentacles; both parapodial rami more or less conspicuous. Capillary setae and forked setae. No hooks .. Scalibregmidar, p. 954.

## Paraonidar.

Prostomium blunt, without appendages or with a crown of laciniated lobes. Without branchiae. Ventral tori with many tows of very small uncini. Sandy tube
Prostomium with a keel, or a rimmed cephalic plate, with out process. An anal plate or an anal funnel with curr. Without branchiae. Dorsal setae capillary. Ventral ton with elongated sigmord hooks
8. A terminal branchial tuft with numesots filaments beaing secondary processes. Prostomitm indistinct. Lincmi sentral in the thonacic regoon, dorsal in the abdominal region. Tube membranaceous or calcarcous

17
Without tetminal branchial tuft 9
9. Modificed setac (paleae) forming an operculum cloning the lube.
Without opercular setae . 10
10. Prostomium conical or blunt, without pucess. Branchiae on many scgments13

Prostomium more or less distinct. One pair of tentaclelike palps or numerous tentacular filaments 11
11. Prostomium with or without two small tentacles. Two long canaliculated palps. 2.3 strikingly dissimilar regions, the anteitol short, with uniramous feet beating peculiar setac in the fouth setigerous segment. Posterior notopodia crect. Incini comb-like
Without tentacles. A cephalic veil and numerous tentacular filaments. Ventral tori with pectinate uncini ..
12. Tentacular cirri retractile into

the mouth. Prostomium dis. tinct. 3.4 pairs of subulate branchiae inserted on the first segments
Tentacular cirri not retractile into the mouth. Prostomium indistinct. Branchiae arbore-
- scent, or rarely subulate, one,

> two or three pairs in number, inserted on the first segments; they are sometimes wanting

13. With uncinigerous tori ..... 15
Without uncinigerous tori ..... 14
14. Serrated capillary setae and aci- cular hooks. Feet and bran- chiae conspicuous and erected on the back of the abdominal region

Only capillary setae. Feet without lobes. Branchiae lateral and ligulate. Prostomium sharp, conical

Orhelidae, p. 357.
15. Prostomium blunt. Anterior region abranchiate; middle region with dorsal arborescent branchiae not retractile; often an achaetous and abranchiate caudal region

Arenicolidae, p. 375.
Prostomium conical. Anterior region abranchiate; posterior region with branchiae simple, rudimentary or wanting; or sometimes multifid and then retractile into lateral pouches. In the abdominal region dorsal and ventral tori with sigmord hooded hooks

Capitellidae, p. 362.
16. An operculum of one anterior row of large golden setae (paleae). Posterior region (scapha) very small, leaf-like and with hooks at the base. Two pairs of anterior foliated branchiae. A free tube of sand-grains, slightly conical, open at both ends

Amphictenidae, p. 402.
Two large opercular stalks bearing a crown of paleae. Branchiae dorsal and numerous. A narrow smooth achaetous and abranchiate caudal region. Fixed tubes of sand grains often clustered in big reeflike masses .. .. Sabellaridae, p. 393.
17. Without operculum. No thora- Tube mem.
cic membrane. branaceoviar mucouse mem. branaceous or mucous ..
Usually with an operculum. A thoracic membrane. Tube calcareous .. .. Serpulidar, p. 452.

\section*{POLYCHAETA ERRANTIA}

Family APHRODITIDAE Savigny.
Body short, ovate, or long and vermiform. Prostomium rounded or bilobed. One, or three, tentacles, 2 palps, 2 pairs of tentacular cirri with setae. Proboscis cylindrical bordered with soft papillae and with 4 chitinous jaws. (HERMIONINAE excepted). Dorsally rounded, flattened pairs of elytra alternating, more or less regularly, with dorsal cirri. Feet biramous. Dorsal setae simple, ventral setac simple or compound.

Remarks. The chicf character of the family is the presence of elytra which are flattened discoidal organs borne on the dorsal surface of the feet, usually imbricated, often fringed and covered with papillae.

> Key to Subfamilies.
1. F.lytrigesous and cirrigerous segments altennating more or less regularly .. .. In the anterior part of the body, elytrigerous segments alternating: in the posterior part all the segments bear elytra. Compound setae. Body long and cylindrical

Subfamily
SIGAI.ION/ VAE, p. 60
2. In the anterior part of the body, a cirrigerous segment between two elytrigerous; in the posterior part, all the cirrigerous segments are inserted between two elytrigerous. Without compound setae
Only one cirrigernus segment between two elytrigerous. Body verniform. Without compound setac

Subfamily
ACOFTINAE, p. 70.
3. Eyes pedunculate (rarely sessile). A single tentacle. Facial tubercle very conspicuous

Subfamily HERMIONINAE, p. 28.
Eyes sessile. 3 tentacles. Facial Subfamily tubercle wanting or obsolete .. POLYNOINAE, p. 31.

\section*{Subfamily HERMIONINAE Grube.}

Body oval, depressed, a pair of eyes, a median tentacle under which is a papillose facial tubercle. No lateral tentacles. Proboscis devoid of horny teeth. Elytra 15 pairs.

Key to the genera.

Dorsal bristles flattened, serrated Pontogenia Claparide, p. 29.
4. Dorsal bristles acicular. A thick
dorsal felt .. .. Aphrodita Linn., p. 24.
Dorsal bristles sabre-like; no dorsal felt present

\section*{Genus APHRODITA Linnaeus.}

Eyes sessile. Elytra hidden under a thick, close felt. Ventral bristles acicular, disposed in 3 tiers. Dorsal sctae of two kinds, (1) stout, smooth, piercing the felt, (2) very long and slender, iridescent.

Key to the species of Aphrodita.
1. Dorsal bristles long, golden, curving backwards, thatch-like .. australis Baird, p. 26.
Dorsal bristles, short, erect, dark coloured .. .. 2
2. Dorsal bristles with a slender end. Ventral bristles very hairy .. .. talpa Quatrefages, p. 26.
Dorsal bristles straight, blunt. Ventral bristles smooth in the adult \(\quad . . \quad\).. aculeata Linn., p. 24.
1 Aphrodita aculeata Linnaeus (Fig. 6, \(a-g\) ).
Aphrodita aculeata, McIntosh, 1900, p. 247: Fauvel, 1923, p. 33. fig. 10. Aphrodita japonica, Marenzeller, 1879, p. 3, pl. I, fig. 2: Izuka, 1912, p. 74, pl. IX, fig. 1-3.
Dorsal setae short, erect, blackish, protruding very little over the dorsal felt. Slender lateral setae beautifully iridescent. Ventral setae smooth, without lateral hook.

Length: 100-200 mm.
Occurrence: Santapalli, Madras Presidency.
Distribution: Japan, Indian Ocean, Mediterranean Sea, Atlantic Ocean, North Sea and English Channel.

Aphrodita haswelli, Johnston, 1908, p. 241, pl. LIX, fig. 1-8: Aphroditella malayana, Horst, 1917, p. 48, pl. XI, fig. 1-3.
Large dorsal setae, golden, long, curving backwards over the back, with a slender end. Ventral setae smonth. Dorsal felt rough and thick. Lateral slender setae faintly irridescent.

Length: up to 100 mm . by 50 mm .
Occurrence: Laccadive Sea, 637 fms ; West of Comorin, 670 fms.

Distribution: Japan, Australia, Indian Ocean.
3. Aphrodita talpa Quatrefages (Fig. 8, \(a-l\) ).

Aphrodita talpa, Quatrefages, 1865, 1, p. 196, pl. III, fig. 24 (non Ehlers, nec Benham, Fauvel 1917, Augener): Fauvel, 1925, p. 140, fig. 4.
? Aphrodita castanea, Moore, 1910, p. 380, pl. XXIII, fig. 85-97.
? Aphrodita longipalpa, Essenberg, 1917, p. 403, pl. XXI, fig. 114.

Fig. 8.-Aphrodita talpa Quatrefages: \(a, b\), ventral hairy bristles from mid-body \(\times 109\); \(c, d\), bipinnate and hastate bristles from 2nd foot \(\times 109 ; e, f, g\), superior and inferior ventral bristles of a posterior foot \(\times 109 ; h, i, k\), upper median and lower bristles from a hind foot \(\times 109\); \(l\), dorsal capillary coated with mud \(\times 47\).

Dorsal bristles with a slender end. Lateral capillary setae lustreless, or very faintly iridescent, more or less densely coated with cylinders of mud. Ventral setae hairy, without any hook or spur.

Length: \(15-30 \mathrm{~mm}\). by \(13-25 \mathrm{~mm}\).
Occurrence: Andaman Islands, Bay of Bengal, Orissa Coast, Malabar Coast, Laccadive Sea, Gulf of Oman.

Distribution: Pacific Ocean, China, New Zealand, South Australia, Indian Ocean.

\section*{Genus APHROGENIA Kinberg.}

Sabre-like dorsal bristles. Ventral setae bifurcated. Without dorsal felt.
4. Aphrogenia alba Kinberg (Fig. 9, \(a-h\) ).

Aphrogenia alba, Kinberg. 1857, p. 6, pl. II, fig. 6: Fauvel, 1932, p. 9.
Aphrogenia villosa, Horst. 1917, p. 63, pl. XIV, fig. 10-12: Augener, 1926, p. 439.

Fig. 9.-Aphrogenia alba Kinherg: a, big dorsal bristle coated with parasitic Algae \(\times 47 ; b\), dorsal knobbed seta \(\times 47 ; c\), end of same \(\times 117\); \(d\), sabre-like dorsal bristle \(\times 47\); e, \(f, g\) three ventral furcate setae; \(h\). bipinnate seta from the first setigerous segment \(\times 230\). Lepidonotus melanogrammus Haswell \(a^{\prime}\), foot \(\times 8 ; b^{\prime}\), posterior ventral seta \(\times 62 ; c\), anterior bidentate seta \(\times 62\); \(d^{\prime}, e^{\prime}\), bristle front and side view, \(\times 117\).

Elytra 18 pairs, uniformly white, with a faint motherof pearl gloss and with scattered minute papillae. Dorsal cirri long, with a clavate tip. Dorsal bristles stout and curved. Ventral setae with two unequal limbs, sometimes villose with a parasitic growth. Elytra uniformly white or pearly, sometimes with a faint pattern.

Occurrence: Port Blair, Andamans; Ceylon.
Distribution: Malay Archipelago, Indian Ocean, West Indies.

\section*{Genus HERMIONE Blainville.}

Harpoon-shaped dorsal bristles. Ventral setac bifurcated and toothed, but not fringed. Dorsal telt absent.
5. Hermione hystrix (Savigny) (Fig. 10).

Hermione hystrix, Fauvel. 1923, p. 35, fig. 11 (Synonymy); 1932, p. 10.

Hermione malleata, Grube, 1878, p. 17: Willey, 1905, p. 245, pl. I, fig. 3-4; Potts, 1909, p. 329; Horst, 1917, p. 52. pl. XII, fig. 11 -13 .

Fig. 10.-Hermione hystrix (Savigny): a, dorsal view, natural sice; \(b\), elytron \(\times 4 ; c, d\), elytrigerous and cirrigerous feet; \(e\), head; \(f\), dorsal sabre-like bristle; \(g\), \(h\), harpoon-shaped bristles; \(i, k\), ventral bristles.
Body oval, flattened. Median tentacle very variable in length. Elytra smooth. Dorsal bristles erect, diverging, spear-like, with lateral recurved fangs at the tip which is often enclosed in a sheath. Ventral setae bifurcated
with a short limb and a longer one curved, smooth (or toothed in the anterior and posterior feet).

Length: \(50-60 \mathrm{~mm}\).
Colour: pale biown.
Occurrence: Nankauri, Nicobar Islands; Ceylon.
Distribution: Philippine hlands, Malay Archipelago, Indian Ocean, Red sea, Mlediterranean, Atlantic.

\section*{Genus LAETMATONICE Kinberg.}

Harpoon-shaped dorsal bristles. Ventral setae bifurcated, with a fringe of hairs at the distal end. A dorsal felt, sometimes very little developed.
6. Laetmatonice producta Crube, var. benthaliana McIntosh. (Fig. 11, f-g).
Laetmatonice producta, McIntosh, 1885, p. 45, pl. VIII, fig. 4-5, pl. 1V, fig. 12: Moore, 1903, p. 420: Izuka, 1912, p. 89, pl. IX, fig. 7-10; Fauvel. 1932, p. 10.
Elytra 15-18 pairs, delicate, finely granular with radiating lines. No dorsal felt (?). Dorsal spines very large, with \(3-4\) fangs on each side. Slender bristles from the inner dorsal tuft overlapping the elytra. Veneral setae with a spur and a long fringe of hairs. Ventral cirri small, filiform, inserted about the middle of the foot, which is long and slender.

Occurrence: Ccylon.
Distribution: Japan, Indian Ocean.

\section*{Genus PONTOGENIA Claparède.}

Dorsal bristles (paleac) golden yellow, slightly bent, arranged like a fan. Ventral setae few, bifid. A dorsal felt usually present.

Key to the species of Pontogenia.
\begin{tabular}{lll} 
1. No dorsal felt & .. & .. \\
A dorsal felt & .. & indica Grube, p. \(\mathbf{3 0 .}\). 29.
\end{tabular}

\section*{7 Pontogenia indica Grube.}

Pontogenia indica, Grube, 1878, p. 19, pl. I, fig. 4; Willey, 1905. p. 246, pl. 1, fig. 5.

Elytra 18 pairs. 43-45 segments. Back covered by the bent dorsal setae (paleac). A dorsal felt. Palps beset with longitudinal rows of delicate recurved papillae. A granulated facial tubercle. Two pairs of eyes on ommatophores. Palcac rather narrow, denticulated on each side. Ventral setae short, stout, bidentate.

Length: \(20 \mathrm{~mm} .-26 \mathrm{~mm}\).
Occurrence: Ceylon; Singapore.
Distribution: Philippine Islands, Indian Ocean.
8. Pontogenia nuda Horst. (Fig. 11, \(a\) and \(b\) ).

Pontogenia nuda, Horst, 1917, p. 62, pl. XIV, fig. 5-7.

Fig. 11.-Pontogenia nuda Horst: \(a\), ventral bristle \(\times 80 ; b\), dorsal bristle \(\times 30\). Lepidonotus dictyolepis Haswell: \(c\), upper ventral seta \(\times 240\); \(d\), lower ventral seta \(\times 240\); \(e\), dorsal
bristle \(\times 290\) (after Augener). Laetmatonice producta Grube: \(f\), dorsal harpoon seta,
\(g\), ventral bristle, enlarged.
No dorsal felt. Long skin papillae. 15 pairs of elytra. Paleae rather broad, faintly curved, showing two rows of cusps, lying at some distance from one another and cup-shaped. A dorsal fascicle of capillary setae. Teeth of the bifurcated apex of the ventral setae obtuse and short.

Occurrence: Andaman Islands; Off Cape Negrais, Burma, 40 fms.

Remarks: \(P\). nuda differs from the European \(P\). chrysocoma in the absence of a dorsal felt and with its paleae more boldly serrated. They may be only varieties.

Subfamily POLYNOINAE Grube. (Fig. 12).
Body short, or rarely elongate. Elytra 12-18 pairs, inserted on segments, \(2,4,5,7,9, \ldots \ldots . . .23,26 ; 29\), etc.

Fig. 12.-POLYNOINAE. Prostomium: a, type Lepidonotus;
b, type Harmothoë; c, type Halosydna; d, fringed and tuberculate elytron; \(e\), smooth elytron; \(f\), front view of the proboscis with papillae and four jaws.
For explanation of \(a t, c t, e l\), and \(p p\). see fig. 2, p. 5.
Prostomium bilobed, with 4 sessile eyes, 3 tentacles, 2 long palps. Proboscis with a row of terminal papillae and 4 horny jaws. Feet biramous. Setae all simple. 2 anal cirri.

Key to the genera.

7. Elytra with longitudinal dark stripes. Dorsal setae few or absent
Hyperhalosydna Augencr. p. 52.
Elytra soft, translucent. Dorsal setae stout
8. Fifteen pairs of elytra
More than fifteen pairs of elytra
9. Elytra covering the whole body
Elytra leaving the posterior segments of the body uncovered
10. Ventral setae bidentate
Ventral 12
11. Setac transparent as crystal, with spinous pouches
Setae without spinous pouches
12. Dorsal setae capillary
Dorsal setae stouter than the ventral setae
13. Eyes absent. Dorsal and ventral setae similar, flattened, vitreous
Eyes conspicuous, dorsal and ventral setae unlike
14. Tentacles and cirri long, and club-like. Very conspicuous ventral lamellae
Tentacles and cirri tapering. Dorsal tubercles conspicuous

\section*{Genus IPHIONE Kinberg}

Body short, oval. 13 pairs of elytra. Only two tentacles which are inserted laterally; facial tubercle present. Dorsal setae more slender than the ventral, which are unidentate.
9. Iphione muricata Savigny (Fig. 13, a-e).

Iphione muricata, Seidler, 1922, p. 75 (Synonymy); Willey, 1905, p. 246, pl. I, fig. 6; Gravely, 1927, p. 4, pl. IX, fig. 1; Pruvot, 1930, p. 3, fig. 1.
Iphione spinosa, Michaelsen, 1892, p. 5.
Body oval, flattened, entirely covered by the overlapping elytra. Prostomium square, with a deep anterior median notch; 4 eyes, 2 tentacles with a large basal part and a filiform tip. A facial tubercle. 13 pairs of elytra, uniform, deeply notched, their surface divided up into polygonal areas and these again into numerous secondary areoles. The posterior margin bears large spinous tubercles. Dorsal setae extremely fine, in dense clusters. Ventral sctae stout, with a smooth curved tip.

Fig. 13.-Iphione murirata Savigny: a, dorsal view, slightly enlarged; \(b\), head; \(c\), lateral papillae of the elytion; \(d\), elytron's surface divided into areas; \(e\). dorsal and \(f\). ventral seta (after Giavier). Lepidonotus cartnulatus Grube: h. g. dorsal and vential bristles, enlarged; 1, dition's papillac (after (.rube). L. jacksoni Kinbery: \(k\), carinulate elytron's papillae; \(l, m\), echmulate and stellate papillae (after Willey).
L. Cistatus Gube: \(n\), donsal view (after

Grube). I.. jukesi Baird: \(o\), \(p\), two hinds of dorsal setae; \(q\). ventral seta; \(r\), elytron's papillac rafter Pruvot).
L. hedleyi Benham: s, elytron's papillac; \(t\). dorsal. \(u\), vental setae (after Pruvot).
Length: \(10-20 \mathrm{~mm}\), by \(6-10\).
Colour: in life, pale fawn with deep blue border. Brown in spirit.

Occurrence: Mergui; Andaman Islands; Ceylon; Maldive Archipelago.

Distribution: Pacific and Indian oceans, the coasts of India, Red Sea.

\section*{Genus LEPIDONOTUS Leach.}

Body short. Prostomium bilobed. 4 eyes. Paired tentacles short, terminally inserted. Twelve pairs of elytra. Dorsal setae spinous, more slender and shorter than the ventral, which are unidentate or bidentate, with a spipous enlargement at the base of the tip.
F. 7

Key to the species of Lepidonotus.

7. Elytra divided into polygonal areas with star-like papillae .. dictyolepis Haswell, p. 35. Elytra without polygonal areas tenuisetosus (Gıavieı), p. 36.
10. Lepidonotus carinulatus Grube (Fig. 13, g-i).

Lepidonotus carinulatus, Grube, 1878, p. 26, pl. III, fig. 2; \({ }^{\text {Hotst }}\) 1917, p. 69, pl. XV, fig. 10: Fauvel. 1919, p. 330; 1932. p. 13; Seidler, 1924, p. 72 (Synonym): Augener, 1922, p. 8.
Elytra round, next oval and elliptic, fringed, covered with flat or carinulate tubercles. Dorsal setae slender, spinulose; ventral setae stout, bidentate.

Length: \(\quad 15-30 \mathrm{~mm}\). On coral reefs and shells.
Occurrence: Ceylon, Tuticorin, Pamban, Shingle Island, Kilakarai.

Distribution: Japan, Philippine Islands, Indian Ocean, Persian Gulf, Red Sea, Madagascar.
11. Lepidonotus jacksoni Kinberg. (Fig. 13, k-m).

Lepidonotus jacksoni, Kinberg, 18.57, p. 11, pl. 1II, fig. 11; pl. VIII, fig. 48: Augener, 1922a, p. 11; 1927, p. 99: Seidler, 1924. p. 74.

Lepidonotus carinulatus (non Grube), Willey, 1905, p. 248, pl. I, fig. 7-11.
Lepidonotus willeyi, Benham, 1915, pl. XXXVIII, figs. 8-15.
Elytra fringed, with flat, carinulate and large spheroidal echinate papillae, dorsal setae slender; ventral setac bidentate. Elytra more conspicuously echinate or stellate than in \(L\). carinulatus, but in both species there is a large range of variation in the number and size of the spinous tubercles. Both are also closely allied to L. squamatus of Europe.

Occurrence: Port Blair Harbour, Andaman Islands: Ganjam Coast; Ceylon.

Distribution: Pacific Ocean, New Zcaland, Australia, Indian Ocean.
12. Lepidonotus cristatus Grube. (Fig. 13, n.)

Lepidonotus cristatus, Grube, 1878, p. 27, pl. II, fig. 3: Gravier, 1901, p. 270, pl. VII, figs. 104-110: Fauvel, 1919, p. 329, 1932, p. 15: Gravely, 1927, p. 3, pl. I, fig. 2.

Lepidonotus oculatus Baird, Seidler, 1924, p. 43, figs. 3-8.
Elytra soft, large, entirely covering the back: they are rounded or slightly emarginate, without fringe, covered with small stellate tubercles and bearing a large tumid, more or less bilobed crest. Dossal setae stout, crenulated; ventral setae with a short smooth apex and a few rows of small spines.

Occurrence: Andaman Islands; Gulf of Mannar, Ceylon.

Distribution: Philippine Islands, Amboina, West Australia, Indian Ocean, Mauritius, Zanzibar, Red Sca.
13. Lepidonotus hedleyi Benham. (Fig. 13, s. \(t\) and \(u\) ).
L.epidonotus hedleyi, Benham, 1915, p. 181, pl. XXXVIII, figs. 1-7: Seidler, 1924, p. 77: Pruvot, 1930, p. 7, pl. I. figs. (i-10.

Elytra oval, without fringe, smooth in appcarance, pale grey, translucent, thin, slightly overlapping, sparsely covered with uniformly arranged low conical tubercies, which have an oval base. Dorsal setae pale, all alike, with incomplete spiral frills. Ventral setae with a subapical tooth and from 9 to 15 pectinate frills. Tentacles smooth. Dorsal cirri stout with a slight subterminal swelling. (Benham)

Length: 20 mm .
Colour: Dorsal cirri brown, with a dark band below the enlarged tip.

Occurrence: Manora shore, Karachi.
Distribution: New Caledonia, South Australia, Indian Ocean.

\section*{14. Lepidonotus dictyolepis Haswell.}

Lepidonotus dictyolepis, Haswell, 1883, p. 287, pl. IX, figs. 7, 8. Seidler, 1924, p. 25: Augener, 1927a, p. 94, fig. 3.

Elytra oval, overlapping, entirely covering the back, and with a thick fringe and cylindrical papillac along
the margins; the surface is divided into polygonal areas, which may bear in their middle a round papilla with star-like diverging ridges and a central pore. Dorsal setae slender and spinulose. Ventral setae stout, with a short unidentate apex and a few spines.

Colour: A black triangular spot pointing forwards on the elytra.

Occurrence: Shingle Island, Gulf of Mannar.
Distribution: India, South Australia.
15. Lepidonotus tenuisetosus (Gravier). (Fig. 14, \(c-f\) )

Lepidonotus tenuisetosus, Fauvel, 1919, p. 330; 1930, p. 8; Seidler, 1924, p. 25.
Euphione tenuisetosa, Gravier, 1901, p. 122, pl. VIII, figs. 123125: Fauvel, 1911, p. 368.

Fig. 14.-Hermenia acantholepis (Grube): \(a\), elytron, enlarged; \(b\), ventral, trifurcate seta. Lepidonotus tenuisetosus; \(c, d\), elytron's papillae; \(e, f\), dorsal and ventral setae (after Gravier).
Elytra oval, slightly reniform, with a small fringe: covered with a few large and a number of smaller rounded
papillae, and also very small calicinate papillae on the outer edge. Dorsal setae slender, nearly capillary and spinulose. Ventral setae with a rather long smooth tip and a few fringes. Closely allicd to L. squamatus, differs only in having more slender dorsal setae, smaller tubercles on the elytra and more closely placed eyes.

Length: 15-30 mm.
Occurrence: Jack and Una Islands, Mergui Archipelago; Port Canning; off Puri, Orissa; Madras.

Distribution: Indian Ocean, Persian Gulf, Red Sea, Madagascar.
16. Lepidonotus melanogrammus Haswell. (Fig. 9, \(a^{\prime}-e^{\prime}\) ).
I.cpidonotus melanogrammus. Haswell, 1883, p. 284, pl. VIII, hig. 13: Fauvel, 1917. p. 176, pl. IV, figs. 18-19: Sedder, 1924, p. 84.

Elytra rounded, then oval, overlapping but leaving the middle of the back uncovered. They are smooth, without papillae or fringe, and are divided into polygonal areas. Dorsal ramus reduced to a small conical tubercle, with an aciculum., Ventral setae stout, bidentate, or unidentate in the postetior feet. Dorsal cirri short, with a large cirrophore. Dorsal setae rare or wanting.

Colour: Elytra dark, with two round spots. Dark spots on the ventral surface.

Occurrence: Port Blair, Andaman Islands.
Distribution: Andaman Islands, South Australia.
Sub-genus THORMORA Baird.
Two kinds of dorsal setac.

\section*{17. Lepidonotus (Thormora) jukesi (Baird). (Fig. 13, \(o-r\).}

Thormora jukesi, Baird, 1865, p. 199.
Lepidonotus (Thormora), jukesi, Scidler, 1924, p. 88: Fauvel, 1930, p. 508: Pruvot, 1930, p. 9, pl. I, figs. \(11-15\).
Lepidonotus trissochaetus, Grube, 1878, p. 25, pl. II, fig. 4: Fauvel, 1919, p. 392 (Synonymy).
Two kinds of dorsal setae: (1) short, curved, spinulose, (2) long, straight, smooth, slightly hastate. Ventral setae unidentate, with a few rows of spines. Elytra tough, rounded, overlapping, but leaving the middle of the back bare. They are destitute of any fringe and bear a few cylindrical, more or less starry, tubercles and smaller rounded ones.

Occurrence: Mergui Archipelago, 3 fms; Andaman Islands.

Distribution: New-Caledonia, Australia, Malay Archipelago, Indian Ocean, Red Sea.

Incertae sedis.
18. Lepidonotus fusicirrus (Schmarda).

Lepidonotus fusicirrus, Seidler, 1924, p. 85.
Polynoë fusicirra, Schmarda, 1861, p. 152, pl. XXXVI, fig. 311.
Back convex. Elytra 12 pairs, round, red, with brown and dark spots. Tentacles and cirri smooth, fusiform, brown. Dorsal setae long, capillary, sharp, with a tooth. Ventral setae, broad, with \(2-3\) spines under the unidentate tip.

Occurrence: Ceylon.
The description is too incomplete for an accurate identification.

\section*{Genus HERMENIA Grube.}

Body short. Prostomium bilobed. 4 cyes. Tentacles short, inserted terminally. Twelve pairs of elytra, small, not overlapping. Dorsal division of the foot rudimentary. Ventral setae trifurcate.
19. Hermenia acantholepis (Grube). (Fig. 14, a, b).

Hermenia acantholepis, Seidler, 1924, p. 94: Pruvot, 1930, p. 11, pl. I, fig. 27-33.
Lepidonotus acantholepis, Grube, 1878, p. 24, pl. 11, fig. 1: Fauvel, 1922, p. 990, fig. 1; 1932, p. 16.

Segments rough and warty. Elytra, with the exception of the first \(2-3\) pairs, very small, rounded, covered and bordered with large, brown ovoid tubercles and a few cylindrical papillae. Only a few dorsal setae, small, slender, serrated. Ventral setae with two large conical teeth at the base of their large, faintly bent, tip.

Although nearly related to the genus Lepidonotus the general appearance of the animal is very striking.

Length: 30 mm by 10 mm .
Colour: uniformly milky with chestnut elytra.
Occurrence: Ceylon.
Distribution: Pacific Ocean, Samoa, New Caledonia, Australia, Annam, Philippine Islands, Malay Archipelago, Indian Occan, Ceylon, Madagascar.

\section*{Genus EUNOE Malmgren.}

Prostomium bilobed, with trontai peaks. Lateral tentacles inserted ventrally. Fifteen pairs of elytra, covering the whole body. Dorsal setae stout, with transverse rows of minute spines. Ventral setae unidentate.
20. Eunoé pallida (Ehlers). (Fig. 17, c-g).

Eunoë pallida, Fauvel, 1931, p. 7, pl. 1, figs. 1-5.
Gattyana pallida, Ehlers, 1908, p. 49, pl. I, figs. 1-9.
Harmothoë̈ pallida, Horst, 1917, p. 91.
:Harmothoè holothuricola, Izuka, 1912, p. 55, pl. V1, figs. 2-7.
Prostomium bilobed, with two small, short, pointed peaks. Median tentacle with a large, short ceratophore. lateral tentacles filiform, shorter. 4 small pale-coloured eycs. Elytra 15 pairs, overlapping, large, soft, smooth, unfringed. Dorsal cirri with papillae. Dorsal tubercles present. Both divisions of the fect elongated, pointed. Dorsal setac stout, curved and serrated on the convex side. Ventual setae with a long, faintly spinulose, enlarged part and a smooth unidentate tip. The upper ventral setae are long, slender, straight, nearly capillary.

Parasitic on Echinoderms.
Length: about 30 mm , by 9 mm .
Colour: in spirit brownish.
Remaiks: lt has sometimes been described with 16 pairs of elytra (Ehlers and Izuka).
Occurrence: Andaman Sea; Travancore; Perstan Gulf.

Distribution: Japan (?), Malay Archipelago, Indian Ocean, Persian Gulf.

\section*{Genus GATTYANA McIntosh.}

Prostomium with frontal peaks. Lateral tentacles inserted ventrally. Fifteen pairs of elytra covering the whole body. Dorsal setae numerous, spinulose, capillary. Ventral setae stout, unidentate.
21. Gattyana deludens Fauvel. (Fig. 15, 16).

Gattyana deludens, Fauvel, 1932, p. 18, figs. 1, 2.
Body elongate oval, nearly uniform in breadth, much flattened; 36-38 setigerous segments. Prostomium bilobed, frontal peaks blunt, 4 small black eyes. Elongate median tentacle, borne on a large ceratophore. Lateral tentacles filiform, much shorter, ciliated, inserted beneath
the base of the median tentacle. A nuchal fold. Paips tapering. Tentacular cirri and tentacles with clavate

Fig. 15.-Gattyana deludens Fauvel: a, anterior end, dorsal view, the head is supposed to be seen through the elytra which are really opaque, \(\times 7 ; b\), elytron, ascolate patterns not figured \(\times 7\); \(c\), areolate part of the elytron on the smooth border, near the side \(\times 48\); \(d\). areolate part of the elytion near the fimbriate border \(\times 48\); \(e\), polygonal areas with raised cuticle and stomatiform spots \(\times 110\); \(f\), ventral cirrus \(\times 110 ; \mathrm{g}\), cirrigerous
foot \(\times 22\).
papillac. Dorsal cirri little exceeding the setae. Ventral cirri short. Cirrigerous feet provided with a long gilllike dorsal process. 15 pairs of elytra, yellow, tough, crossing and overlapping, covering the whole body. The first pairs orbicular, next reniform; fringed on the outer edge, upper surface smooth, divided into conspicuous polygonal areas, without any spines or papillae and without any secondary areoles in the meshes. I)orsal ramus small, conical, with an enclosed aciculum and a number of white setae, long, slender, hair-like, with transverse rows of delicate spines and a finely tapering, undulating tip. The superior dorsal setae are shorter, stouter, bent and denticulate. Ventral ramus larger, conical, with an enclosed aciculum and yellowish setae, larger, with a longer spinulose part slightly enlarged and a smooth unidentate tip. 2 long papillated anal cirri.

Length: \(12-19 \mathrm{~mm}\). by \(5-7 \mathrm{~mm}\).

Colour: in spirit: elytra yellow, dorsal setae pale and ventral setae pale yellow.

Fig. 16.-Gattyana deludens Fauvel: \(a\), dorsal bristle \(\times 120 ; b\), upper dorsal bristle; \(c, d\), tip of upper ventral seta, side and front view \(\times 380\) : \(e\), inferior ventral bristle \(\times 380 \mathrm{f}\). inferior ventral bristle \(\times 150 ; \mathrm{g}\), median ventral bristle \(\times 150\); \(h\), upper ventral bristle \(\times 150\).

Remarks: This species has externally the appearance of an Iphione, Iphionella cimex, but it is really a Gattyana. Harmothoë iphionclloides Johnson (1901), which is also a Gattyana, is a closely allied species.

Occurrence: Annam; Poulo Condore, Mergui Archipelago; Gangetic Delta, Ghandipore; Balassore, Orissa; Pondicherry, Madras.

\section*{Genus LAGISCA Malmgren.}

Head as in Harmothoë, with lateral tentacles inserted ventrally. Fifteen pairs of elytra, leaving the posterior segments of the body uncovered. Dorsal setae stout, ventral setae bidentate.
22. Lagisca flaccida Potts. (Fig. 18, a-c).

Lagisca flaccida, Potts, 1909, p. 339, pl. XVII, fig. 11. pl. XXI. - figs. 49-50; Horst, 1917, p. 94.
F. 8

Body much flattened, breadth fairly uniform, tapering slightly just before the posterior end. Head hexagonal, with small distinct eyes and two tiny lateral peaks. Median tentacles long: lateral tentacles shorter, sparsely ciliate. A slight nuchal fold behind the head. Elytra soft, gelatinous, with the margins entire; the inner half covered with tiny tubercles. Dorsal setae with acute tip and a rather long smooth portion between it and the spiniferous area. Ventral setae long, with rather short spiniferous area and a short, rather blunt, spine under the incurved apex.

Length: 20 mm , by 6 mm .
Colour: in spirit: elytra white.
Occurrence: Ccylon.
Distribution: Malay Archipelago; Indian Occan, Ceylon, Zanzibar.

\section*{Genus HARMOTHOË Kinberg.}

Prostomium bilobed, often with lateral peaks. \({ }^{4}\) eyes. Lateral tentacles inserted ventrally. Fifteen pairs of scales, covering the whole dorsum. Dorsal setae stouter than the ventral, which are bidentate.

Key to the species of Harmothoë.

4. Elytra densely covered with sharp spines
\[
\text { indica (Kinberg), p. } 47 .
\]

Elytra with conical tubercles .. 5
\(\begin{array}{rrrr}\text { 5. Elytra divided crosswise } & \text { into } 2 & & \\ \text { pale and } 2 \text { dark areas } & \ldots & \text { boholensis (Grube), p. } 47 .\end{array}\)
Elytra with conical tubercles and a posterior row of large papillae

6. Ventral lamellae conspicuous .. ampullifera (Grube), p. 43. Without ventral lamellae .. imbricata (Linn.), p. 42.

\footnotetext{
23. Harmothoë imbricata (Linn.) (Fig. 19).

Harmothoe imbricata, Fauvel, 1923. p. 55, fig. 18, f-1: Gravely, 1927, p. 4, pl. IX, fig. 4.
}

Prostomium bilobed, with frontal peaks. 4 eyes, the anterior pair partly under the frontal peaks. Lateral

Fig. 17.-Harmothoë minuta (Potts): a, b, ventral and dorsal setae. Eunoë pallida (Ehlers): c, foot \(\times 30\); \(d\), inferior; \(e\), median and \(f\), superior ventral setae \(\times 140\); \(g\), dorsal seta \(\times 140\).
tentacles very short and slender. Tentacles and cirri papillated. 15 pairs of elytra, oval-reniform, sparsely fringed, with small conical tubercles and, often, a row of large globular papillae on the posterior border. Dorsal setae stout, slightly curved, serrated, with a smooth apex. Ventral setae spinulous, curved, the apex of which is smooth, bidentate with the secundary tooth curved outwards.

Length: \(30-40 \mathrm{~mm}\); by 10 mm .
Colour: very variable, rather dark, sometimes pale with brown streaks.

Occurrence: Krusadai Island.
Distribution: North Pacific, Japan, Petchili; Indian Ocean; Mediterranean Sea: Atlantic Ocean; Arctic Seas.
24. Harmothoë ampullifera (Grube). (Fig. 18, d).

Harmothoë ampullifera, Fauvel, 1911, p. 368; 1932, p. 22. Polynoë ampullifera, Grube, 1878, p. 35. pl. III, fig. 5.

Lepidonotus ampulliferus, Gravier, 1901, p. 214, pl. VII, figs. 111-113.
Paralepidonotus ampulliferus, Horst, 1917, p. 76.
Prostomium without frontal peaks, tentacles and cirri papillated. Lateral tentacles inserted somewhat

Fig. 18.-Lagisca flaccida (Potts): \(a\), posterior elytron; \(b\), dorsal seta from the 6 th segment \(\times 940 ; c\), ventral seta of the 22nd segment \(\times 340\) (after Potts).

Harmothoë ampullifera (Grube);
d, elytron (after Gravier).
ventrally. Elytra fringed, with small papillae and large vesicles in concentric rows. Dorsal setae arching, verticillate spinulose. Ventral setae bidentate. Long nephiidial papillae and conspicuous ventral lamellae. Closcly related to H. imbricata.

Length: \(\quad 20-30 \mathrm{~mm}\).
Occurrence: Singapore, Camorta Island, Rameswaram and Pamban coral reefs.

Distribution: Philippine Islands; Annam; India; Persian Gulf; Red Sea.
25. Harmothö̈ dictyophora (Grube). (Fig. 20, a-b, m.)

Harmothoe dictyophora, Willey, 1905, p. 251, pl. I, figs. 14-16;
Fauvel, 1911, p. 370; 1932, p. 22; Gravely, 1927. !. 4.
Polynoë dictyophora, Grube, 1878, p. 44, pl. XV. fig. 9. •

Tentacles and cirri papillated. 15 pairs of elytra covering the back. They are divided into polygonal areas carrying chitinous spines, simple or biturcated, and filiform papillae. Dorsal setac numerous, verticillate, spinulose. Ventral setae conspicuously bidentate. Very closely allied to \(H\). areolata of Europe.

Length: \(20-25 \mathrm{~mm}\).
Occurrence: Ganjam Coast, Madras Presidency; Kilakarai, from coral recis.

Distribution: Australia; Malay Archipelago; Annam; Bay of Bengal; Ceylon: Red Sea; Persian Gulf; Madagascar.
26. Harmothoe minuta (Potts). (Fig. 17a-b).

Polynoë (?) minuta, Potts, 1919, p. 337, pl. XIX, fig. 12, pl. XX, fig. 31, pl. XXI, figs. 42, 43.
Lagisca minuta, Horst, 1917, p. 97.

Fig. 19. - Harmothoë imbricata Linn.: \(f\), ventral seta \(\times 100\); \(g\), dorsal seta \(\times 100 ; h\), head, enlarged; \(i\), elytron; \(j . k\). elytron's papillae; \(l\), foot.
[a-e refer to Eunoë nodosa not from India.]
Prostomium bilobed, with acute frontal peaks. 4 very small eyes. Lateral tentacles very minute and slender. 15 pairs of elytra, almost circular, translucent, with entire margin, smooth surface with delicate veins and occasional tiny chitinous tubercles. Dorsal setae broad,
slightly curved with a rather blunt apex and serrations near the tip. Ventral setae numerous, with apex rather faintly serrated. Ventral setae numerous, with apex rather faintly serrated near the tip, not bearing recognisable spines; upper setae with a very long serrated region, a short incurved tip and projecting tooth just under it.

Commensal on Crinoids.
Length: 5 mm by 1.5 mm .
Colour: Dark red or black.
Occurrence: Port Blair, Andaman Islands.
Distribution: Andaman Sea; Maldive Archipelago; Red Sea; Suez.
27. Harmothoë arabica Monro. (Fig. 20, c-g).

Harmothoë arabica, Monro, 1937, p. 257, fig. 5.

Fig. 20.-Harmothoë dictyophora (Grube): a, elytron; \(b\), clytron's marginal papillae, much enlarged; \(m\), medio-dorsal seta.
\(\boldsymbol{H}\). arabica Monro; c, head; \(\dot{d}\), foot; e, dorsal bristle;
\(f\), middle ventral seta; \(g\), lower ventral seta (after Monro). H. indica Kinberg: \(h, i\), ventral setae; \(k\), dorsal seta (after Kinberg). H. boholensis (Grube); \(l\), elytron, enlarged.

Prostomium bilobed, with acute frontal peaks. 4 small eyes, the anterior pair on the sides of the head.

Median tentacle very short, piriform. Lateral tentacles stout. Subulate palps slightly longer. Tentacles and tentacular cirri papillated. 15 (?) pairs of elytra, round, smooth, with two patches of brown pigment. Dorsal bristles slender, slightly curved and quite smooth. Upper ventral bristles long, slender, unidentate and smooth: middle oncs slender, spinous, faintly bidentate; lower ones shorter, faintly denticulated, with tip either simple or faintly notched. Differs from most Harmothoë in having dorsal and upper ventral setae smooth.

Length: 7 mm . by 1 mm . 36 setigerous segments, ripe female.

Occurrence: Maldive area.
28. Harmothoë indica (Kinberg). (Fig. 20, h-k).

Harmothue indica, Augethr, 1922, p. 6, fig. 2; 1926, p. 442.
Lepidonotus indicus, Kinberg. 1857-1910, p. 15, pl. IV, fig. 19.
Lagisca indica, Potts, 1910, p. 338.
Prostomium without frontal peaks. Tentacles and cirri slender, papillated. Lateral tentacles inserted somewhat ventrally. A distinct nuchal fold. Elytra oval, entirely covering the back, overlapping considerably, firm. with granular appearance, with a broad crescentic mark of black pigment, covered densely with short, sharp spines and intermediately placed cilia and with short cilia on posterior and outer borders. Dorsal setac long, straight, anteriorly pointed, with numerous rows of spines. Ventral sctae slender, with acute incurved tip, with a long slender spine situated just under it.

Length: 20 mm . by 7 mm .
Occurrence: Ceylon.
Distribution: East Indies, Banka Strait: Ceylon; Chagos Archipelago, Salomon Island; Amirante Islands, 280 fms .
29. Harmothoë boholensis (Grube). (Fig. 20 l )

Harmothoë boholensis, Fauvel. 1911, p. 369; 1919, p. 332.
Polynoë boholensis. Grube, 1878, p. 41, pl. 1II, fig. 4.
Paralepidonotus boholensis, Horst, 1917, p. 77, pl. XVIII, figs. 1-2.

Prostomium bilobed, with frontal peaks. 4 small eyes, the anterior pair slightly lateral. Median tentacle longer than the lateral which are shorter than the palps. Tentacles papillated, dark brown, faintly enlarged under the filiform tip. 15 pairs of elytra, first rounded, then
oval and next reniform, fringed, with conical or blunt tubercles and divided crosswise into two pale and two dark areas. Dorsal setae numerous, stout, verticillate, spinulose. Ventral setae bidentate. Nephridial papillac and ventral lamellae variably conspicuous.

Length: \(30-35 \mathrm{~mm}\). by 11 mm .
Colour: the dark maltese cross of the elytra is prc served in spirit.

Occurrence: Persian Gulf.
Distribution: Philippine Islands; Annam; Malay Archipelago; Persian Gulf; Red Sea; Madagascar.

\section*{Incertae sedis}
30. Harmothoë sinagawensis (non lzuka), Fauvel, 1932, p. 23, Fig. 3, pl. I, Fig. 1-2. (Fig 21, a, b).

Under this doubtful name I have described a broken Polynoid, incomplete posteriorly. The elytra that remain

Fig. 21.-? Harmothoë sinagawensis Fauvel, non Izuka: a, elytron, \(\times 40\). \(b\), elytrigerousfoot, \(\times 40\) (from

Fauvel, 1932).
are white with a transverse black streak, soft, destitute of fringe or tubercles. Tentacles and cirri papillated. The lateral tentacles, short, nearly piriform, are subterminally inserted, somewhat as in Halosydna. The feet are long and tapering, with a dense cluster of very slender long capillary dorsal setae. The upper ventral setae are long, straight and spinous, the inferior ones have a short enlarged part with only few spines and a long smooth unidentate tip. Owing to the absence of the posterior part, the genus remains doubtful. I have since had the opportunity to observe H. sinagawensis specimens from Japan, which is a different species, with two kinds of dorsal setae and 16 pairs of elytra.

Occurrence: Rameswaram Island, Madras Presidency.

Genus SCALISETOSUS McIntosh.
Body long, very brittle. Prostomium without frontal peaks. 4 eyes, three tentacles, the lateral ones inserted ventrally. Fifteen pairs of elytra: thin, delicate, pellucid, not covering the whole body. Setae having the transparency of crystal. Dorsal setae, faintly curved, with some blunt spines on the convex border. Ventral setae hooked, bidentate with rows of semilunar cusps.

Key to the species of Scalisetosus.
Ventral setae bidentate .. pellucidus Ehlers, p. 49.
Ventral setae unidentate .. longicirrus Schmarda. p. 50.
31. Scalisetosus pellucidus Fhlers. (Fig. 23, \(a-f\) ).

Scalisetosus pellucidus, Fauvel, 1929, p. 74, fig. 27 (Synonymy); 1932, p. 24.

Scalisetosus spec., Horst, 1917, p. 10, pl. XXI, figs. 8-10.
Body of moderate length. Elytra and cirri very easily detached. The anterior pair of eyes larger and wide apart. Tentacles and cirri with filiform tip and clavate papillae. Elytra round or oval, very transparent and delicate, with small cylindrical or clavate papillae; not fringed. Dorsal setae shorter than the ventral ones, curved, with several cusps on the convex side, and tip faintly bifid. Ventral setac with a short enlargement, a semilunar cusp, or spinous pouch, and a bidentate tip. On Echinoderms.

Length: 12-30 mm.
P. 9

Colour: Body translucent, yellowish, with a chequared brown pattern on the back. Elytra dotted with white, yellow, pink or purple.

Fig. 22.-Scalisetosus longicirrus (Schmarda): a. dorsal seta \(\times 363\); \(b\), inferior ventral seta \(\times 563 ; c\), suferior ventral seta \(\times 363\) (afte) Marenzeller). Gastrolepidia clavigera Schmarda: d, head and first segment \(\times 9\); e, dorsal seta \(\times 148 ; f\), median ventral seta \(\times 148\); Allmaniella ptycholepis (Grube): g, elytron \(\times 20\);
\(h\), elytron's papillae, much enlarged (after Grube).
Hyperhalosydna striata (Kinberg): i, elytron \(\times 8\)
(after Grube); \(k\), ventral seta. Admetella longipedata McIntosh: \(l\), 28 th foot \(\times 6\); \(m\), flattened seta \(\times 78\); \(n\), ventral seta \(\times 390\) (aftei Ehlers).

Occurrence: Port Blair, Andaman Islands; Kilakara, S. India; Maldive Archipelago.

Distribution: Annam; Malay Archipelago; Bay of Bengal; Arabian Sea; Mediterranean Sea; Atlantic Ocean. 32. Scalisetosus longicirrus (Schmarda). (Fig. 22, a-cc).

Scalisetosus longicirrus, Marenzeller, 1902, p. 574, pl. III, fig. 10.
Polynoé longicirra, Schmarda, 1861, p. 152, pl. XXXVI, fig. 309.
Polynoë crinoidicola, Potts, 1910, p. 357, pl. 18, fig. 10, pl. 21,
figs. 39-41.
? Halosydna ceylonica, Willey, 1905, p. 250, pl. I, figs. 12-13.
Body long, extremely fragile. Prostomium composed
of two distinct halves. 2 pairs of eyes, the anterior pair lateral. Lateral tentacles inserted ventrally, slender and short. Elytra circular, smooth save for very minute tubercles, red or colourless in spirit (black when alive), covering the back, easily detachcd. Dorsal cirri long. Dorsal setae sabre-like, broad, slightly curved, with 2-3 serrations on the convex side under the acute tip. Ventral setae with a semi-lunar cusp, apex incurved, with a small tooth; ventralmost setae stouter, with sharp incurved unidentate apex. All setae with the transparency of crystal. Commensal on Astropecten and Crinoids.

Length: 13 mm .
Remarks: Though Willey attributes 24 pairs of elytra to his species, his description and figures fit very well with Scalisetosus longicirrus. As the elytra were all wanting on his specimen he may have made an error regarding the number of elytra bearing segments.
Occurrence: Ceylon; Maldive Archipelago.
Distribution: Japan; Indian Occan.
Genus GASTROLEPIDIA Schmarda.
More than 21 pairs of elytra, the arrangement of the posterior pairs irregularly alternating with the cirri. Tentacles and cirri club-like, with a filiform tip. The sternum of the segments is prowided with a foliaceous appendage on each side.
33. Gastrolepidia clavigera Schmarda. (Fig. 22, \(d-f\) ).

Gastrolepidia clavigera, Schmarda, 1861, p. 159, pl. XXXVII, fig. 315: Willey, 1905, p. 258: Potts, 1909, p. 341: Horst, 1917, p. 84, pl. XVI, fig. 5: Scidler, 1924, p. 142, figs. 19, 20: Fausel, 1919, p. 335, 1932, p. 25; 1942, p. 25: Pruvot, 1930, p. 13, pl. I, figs. 16-19.
Gastrolepidia amblyphyllus, Grube, 1878, pl. III, fig. 7.
Prostomium without frontal peaks. Lateral tentacles inserted ventrally. Tentacles and dorsal cirri long and much enlarged distally, with a small filiform tip. Elytra soft, without fringe or tubercles, semi-transparent, covering the whole back. Dorsal setae few, stout, slightly curved and spinulose. Ventral setae with unidentate tip. Ventral lamellae very large and conspicuous. Ectoparasitic on Holothurians.

Length: 25-50 mm.
Colour. Elytra all black or mottled dark brown and white.

Occurrence: Andaman and Nicobar Islands; Ceylon; Rameswaram Island; Maldive Archipelago.

Fig. 23.-Scalisetosus pellucidus Ehlers: a, head, enlarged (after Claparède), \(b\), foot \(\times 20 ; c\), elytron \(\times 12 ; d\), clytron's papillae \(\times 109 ; e\), ventral seta \(\times 310\); \(f\), dorsal seta \(\times 310\) (after McIntosh); g. \(h, i, S c\). assimilis.

Distribution: Pacific Ocean, New Caledonia, New Zealand; Indian Ocean, Bay of Bengal, Ceylon, Madagascar, Zanzibar.

\section*{Genus HYPERHALOSYDNA Augener.}

About 50 segments. More than 18 pairs of elytra. Lateral tentacles inserted terminally. Dorsal setae few or absent. Ventral setae bidentate. Without ventral lamellae.
34. Hyperhalosydna striata (Kinberg). (Fig. 22, i-k).

Hyperhalosydna striata, Seidler, 1924, p. 136 (Synonymy): Fauvel, 1932, p. 26.
Halosydna fulvovittata, Horst, 1917, p. 80.
Polynoë fulvovittata, Grube, 1878, p. 33, pl. III, fig. 1.
Polynoë platycirrus, McIntosh, 1885, p. 111, pl. III, fig. 4.
Lepidonotus striatus, Kinberg, 1857, p. 14, pl. IV, fig. 18.
Halosydna striata, Monro, 1924, p. 41, fig. 4.

Lateral tentacles as in Lepidonotus. Elytra 21-22 pairs, oval, with longitudinal dark stripes and 1-2 keels near posterior edge. Dorsal division of the foot reduced to a small process with only a few short, curved, serrated setae, often wanting. Ventral sctae all alike and bidentate.

Colour: Four or five longitudinal brown stripes on the elytra.

Occurrence: Andaman Islands.
Distribution: Japan; Australia; Malay Archipelago; Indian Ocean.

\section*{Genus ALLMANIELLA McIntosh.}

Prostomium bilobed, with four large eyes. Lateral tentacles terminal. Fiftern (or more) pairs of elytra. Dorsal setae stouter than the ventral, which are bidentate.
35. Almaniella ptycholepis (Grube). (Fig. 22, g-h).

Almanirlla ptycholepis, Horst, 1917, p. 79, pl. XXII, figs. 6-9; Seidler, 1923, p. 151: Fauvel. 1932, p. 26.
Polynoé ptycholepis, Grube, 1878, p. 39, pl. II, fig. 6.
Head broader than long, divided into two rounded lobes with four large black eyes. Median tentacle long and slender, inserted on a ceratophore between the two lobes. Lateral tentacles filifonm, shorter than the median and inserted on the frontal border. Palps twice as long as the lateral tentacles. Elytra \(15-17\) pairs, large, soft, translucent, smooth and without fringe. Parapodia with a long pointed ventral lobe. Dorsal lobe with a few setae, stout, curved, blunt, smooth, or very finely serrated. Upper ventral setac slender, nearly smooth, unidentate; median and lower setac enlarged, bidentate, nearly smooth or very finely serrated. Dorsal cirri long and slightly enlarged under the tip. Dorsal tubercles present. The shape of the head is very characteristic.

Colour: Back striped brown and white, head brown.

Occurrence: Andaman and Nicobar Islands, Nankauri Harbour.

Distribution: Philippine Islands; Malay Archipelago; Bay of Bengal.

\section*{Genus ADMETELLA McIntosh.}

Body elongated, with 75 segments. \(\mathbf{3 0}\) pairs of elytra. Head with the lateral corners elongated, triangular. Eyes absent (?). Both lobes of the parapodia with
an elongated distal extremity. Bristles long, vitreous (Horst).
36. Admetella longipedata McIntosh. (Fig. 22, \(l-n\) ).

Admetella longipedata, McIntosh, 1885, p. 124, pl. XIV, fig. 5, pl. XX, fig. 6, pl. XIIA, fig. 17: Augener, 1906, p. 123: Ehlers, 1908, p. 40, pl. II, figs. 10, 11, pl. III, figs. 1-5: Horst, 1917, p. 101: Seidler, 1923, p. 153: Fauvel, 1932, p. 27.

Prostomium with two rounded lobes and two thin triangular processes. Lateral tentacles inserted under the prostomial lobes. Eyes absent. Elytra 24-30. Paraporia very long, ending in a slender tip. Dorsal and ventral setae long, delicate, translucent, flattened out in their distal part, finely serrated along both edges and ending in a smooth elongated tip. Nephridial papillae very conspicuous.

Length: \(50-60 \mathrm{~mm}\) by 28 mm .
Colourless in spirit.
Occurrence: Andaman Sea, 279-569 fms.
Distribution: Andaman Sea, Pater Noster Island; Indian Ocean, Somali Coast; West Indies.

\section*{Genus DRIESCHIA Michaelsen.}

Body short with about 28 setigerous segments. Head and tentacles as in the genus Lepidonotus; lateral ten tacles inserted terminally. Elytra thirteen pairs, on the segments \(2,4,5,7 \ldots \ldots .21,23\) and 26. Parapodia sesquiramous. Dorsal ramus reduced to an aciculum and a small achaetous lobe. Ventral ramus with an aciculum and setae of two kinds. Setae of the first kind very slender, long, capilliform; other setae stouter, enlarged, and ornamented beneath the pointed tips.
37. Drieschia pelagica Michaelsen. (Fig. 24).

Drieschia pelagica, Michaelsen, 1892, p. 6, figs. 15-18: Seidier, 1923, p. 173: Fauvel, 1932, p. 28; 1939, p. 260.
Nectochaeta caroli, (non Fauvel), Monro, 1997, p. 261.
Prostomium divided into two long rounded lobes, with four small eyes, the anterior pair lateral. The three tentacles are slender, with short ceratophores; the median is twice as long as the lateral ones; they are inserted terminally, somewhat resembling those of Halosydna. The palps are curved and thick. The two pairs of tentacular cirri are equal and elongated. Elytra small, rounded, soft, translucent, with a few yellow grains, but without a fringe. Dorsal cirri very variable in length but with en-
ormous cirrophores. Feet long, ending in two unequal triangular lips. Ventral cirrus filiform, shorter than the

Fig. 24.-Drieschia pelagica Michaelsen; var. caroli: a, anterior region \(\times 5 ; b\), foot \(\times 16 ; c, d, e, f\), ventral setae, upper one \(\times 109\); middle ones, front and side view \(\times 187\).
foot. Dorsal setae absent. A dorsal aciculum and a small rudimentary knob. Ventral setae very long and slender accompanied by 2-4 much shorter and stouter setae with a short enlargement under the tip and a few rows of spines.

Length: \(5-10 \mathrm{~mm}\) by \(2-5 \mathrm{~mm}\).
Colourless, translucent, pelagic.
Remarks: Nectochaeta caroli Fauvel is but an Atlantic variety of Drieschia pelagica with still larger cirrophores and more conspicuous dorsal knob.
Occurrence: Gulf of Oman; Ceylon: Bay of Bengal. Distribution: Indo-China; Indian Ocean.

Genus NECTOCHAETA Marenzeller.
Body short, 15-35 setigerous segments. Head and tentacles as in Lepidonotus. Elytra 5-15 pairs on the segments 2, 4, 5, 7,....23, 26, 29, 32. Parapodia subbiramous or sesquiramous. Dorsal setae few, short. Ventral setae long, spinous. unidentate or bidentate. Pelagic and. bathypelagic.
38. Nectochaeta grimaldii Marenzeller. (Fig. 25).

Nectochaeta grimaldii, Fauvel, 1923. p. 90, fig. 34, a-i: Monro. 1937, p. 261.

Fig. 25-Nectochaeta grimaldii Marenzeller: a, auterior region \(\times 8\); \(b\), foot \(\times 23\); \(c\), elytron \(\times 23\); \(d\), tentacular seta \(\times 233\); \(e\), aciculum and dorsal seta \(\times 233 ; f, g, h, i\), medium, inferior and upper ventral setae \(\times 109,233,109\).

Prostomium bilobed. 4 small black eyes. Tentacles, tentacular cirri and palps very long and slender. Dorsal cirri much longer than the feet. Dorsal ramus reduced to an aciculum and a small knob with 1 or 2 very short dentate setae. Ventral ramus long, with an anterior cirriform and posterior conical lips and dorsal and ventral rows of globular papillae. Upper ventral setae slender, spinous, capillary; the inferior ones enlarged, bidentate. Translucent, planktonic.

Length: \(3-15 \mathrm{~mm}\) by \(1-4 \mathrm{~mm}\).
Remarks: Very likely a young stage of Lepidasthenia.
Occurrence: Central Arabian Sea.
Distribution: Arabian Sea; Mediterranean Sea; Atlantic Ocean.

\section*{Genus LEPIDASTHENIA Malmgren.}

Body elongated, worm-like, segments numerous. Lateral tentacles inserted terminally, as in Lepidonotus. Elytra-bearing segments up to the end of the body. Elytra
minute leaving the greater part of the back naked. Dorsal ramus reduced to an aciculum and occasionally a few setae. Ventral setac bidentate.

Key to the specics of Lepidasthenia.
Elytra rather large. Upper ventral setae slender .. maculata Potts, p. 58.
Elytra very small. Ventral setac all alike equally stout .. microlepis Potts, p. 57.
39. Lepidasthenia microlepis Potts. (Fig. 26, \(e-f\) ).
L.cpidasthenia microlepis, Pots, 1910, p. 343, pl. XIX, fig. 17, pl. XIX, fig. 52: Fauvel, 1930, p. 510.
Ventral setae large, yellow, all about the same size, the upper ones unidentate, the lower ones bidentatc, at least in a variable number of segments. Dorsal setae

Fig. 26.-Hololepidella commensalis, Willey: \(a, b, c\), dorsal, upper and inferior ventral setae; \(d\), head and proboscis (after Willey). Lepidasthonia microlepas Poth: e. head and anterior segments; f, ventral seta of the 15 th segment \(\times 340\) (after Potts).
absent. Elytra very small, hardly as broad as the elytrophore, with the exception of the first pair. They are marked by edging of brown or chocolate pigment. Dorsum yellowish or, sometimes, with dark segments alternating with paler ones, somewhat as in L. elegans. Dorsal cirri stumpy.
F. 10

Length: \(28-30 \mathrm{~mm}\) by 5 mm .
Occurrence: Andaman Islands, on coral stones, Hulule, Male Atoll, Maldive Archipelago.

Distribution: New Caledonia; Malay Archipelago; Andaman Islands; Maldive Archipelago; Durban.
40. Lepidasthenia maculata Potts. (Fig 27, \(h-k\) ).

Lepidasthenia maculata, Potts, 1909, p. 344. pl. XX. fig. 33; pl. XXI, fig. 51: Fauvel, 1914b, p. 71; 1923a, p. 38, fig. 33, l-k; 1932, p. 29.
Upper setae of the ventral bundle more slender than the rest. Elytra relatively large, soft, destitute of fringe

Fig. 27.-Lepidasthenia elegans, Grube: \(a\), head; \(b\), dorsal view, nat. size; \(c\), elytron \(\times 20 ; d\), foot \(\times 20\); \(e\), stout ventral bristle \(\times 194 ; f, g\), median and upper ventral setae \(\times 187\) (Red Sea).
L. maculata Potts: \(h\), foot \(\times 23\); \(i, k\), median and upper ventral setae \(\times 187\).
and papillae, 31 pairs. Dorsal setae absent. The dorsum is provided with black pigment flecks.
var. striata Fauvel.
Fauvel, 1932, p. 29.
Tentacles slender, slightly unequal, a little enlarged under the tip. Nuchal fold conspicuous. Anterior pair of eyes large, the posterior pair smaller. The first dorsal
cirri are longer than the following ones. The rather large elytra leave about a third of the back naked and are rounded, soft, delicate, translucent, smooth, without either fringe or tubercles. Feet elongated, with two vertical, parallel, nearly equal, fillets. Dorsal cirri with big and short cirrophore, and cirrostyles slightly enlarged distaliy. In the median and posterior feet, the dorsal cirri are shorter, conical or fusiform. The dorsal ramus is reduced to a small knob with an enclosed aciculum. There are no giant setae in the ventral bundle. Two or three of the upper setae are more slender, with a long spiniferous area. The others are shorter and stouter, with transverse rows of spines and a bidentate apex.

Length: 25-36 mm.
Colour: In the anterior part of the body a white segment is followed by three marked with seven dark stripes; further on a colourless segment is followed by two with five suipes. Each elytra bears a large dark spor.

Occurrence: Mergui, enclosed in tubes of I'hyllochaetopterus.

Distribution: of typical form Zanzibar; Morocco, Azores.

\section*{Genus HOLOLEPIDELLA Willey.}

Antennae arising at a lower level than the unpaired tentacle; segments and elytra numerous. Posterior elytra irregularly inserted. Parapodia biramous.
41. Hololepidella commensalis Willey. (Figs. 26, \(a-d\) ).

Hololepidella commensalis, Willey, 1905, p. 251, pl. 1, figs. 1720: Fauvel, 1992, p. 30.

Body elongated, fifty segments or morc. Prostomium bilobed, with short frontal peaks. Anterior eyes lateral, posterior eyes dorsal. Median tentacle slender, inserted on a short and broad ceratophore. Lateral tentacles small, piriform, inserted ventrally as in Harmothoë. Nuchal fold not conspicuous. Dorsal cirri smooth, long, tapering; ventral cirri short. Elytra large, rounded, pale, delicate, translucent, overlapping and covering the back; they are destitute of either fringe or tubercles. There are at least \(25-26\) pairs, the last very irregularly alternating with the cirri. Dorsal tubercles conspicuous on the cirrigerous fect. Dorsal setae few, curved, smooth or partly serrate, much shorter than the ventral setae.

Superior ventral setae slender, serrated, unidentate; inferior short; median with a faint subterminal spur and normal fringes of spines.

Length: 8 mm . by 5 mm .
Colour: The back is brown and on the ventral side there are four longitudinal rows of brown spots. Elytra colourless.

\section*{Occurrence: Mergui: Ceylon.}

Subfamily SIG.ALIONINAE Grube.
Body long and narrow, segments numerous. 4 sessile cyes. One or three tentacles. Two palps. Proboscis with a row of terminal papillae and four horny jaws. Elytra numerous, inserted on alternate segments: 2, 4, 5, 7, ctr., and on each segment from the 23rd-29th up to the end of the body. Cirriform dorsal gills. Feet biramous. Dorsal setae simple, ventral setae simple or compound. Two anal cirri.

Key to the genera
1. Gills absent. Only one tentacle Pholoe Johnston. Cirriform gills. 2.3 tentacles .. 2
2. Only two lateral tentacles .. Sigalion Audouin \& M.-Edwalds.

Sthenelats idunae Sars, Saint Joseph, 1888, p. 187, pl. VIII, fig. 55.

Sthenelais orientalis Potts, 1910, p. 348, pl. 21, fig. 62.
Scales mostly reniform, crossing and overlapping over the back, with numerous minute papillac and a fringe on the outer border. Ventral ramus of the feet with 2-3 simple bipectinate setae. Compound setae with a short sickle-shaped appendix and a smooth shaft, others with a pluri-articulate appendix and, on the anterior feet, a few compound setae with a spinulose shaft. Three cup-shaped ctenidia above the dorsal division of the foot. Ventral division with stylodes and three bracts and a papillose ciliated frill. Ventral cirrus subulate.

Length: \(100-200 \mathrm{~mm}\).
Colour: Very variable, grey, yellow, brown, red.
Occurrence: Ceylon, Galle; Cape Comorin; Krusadai; Amiranti.

Distribution: Indian Ocean: Mediterrancan Sca; Atlantic Ocean.
43. Sthenelais zeylanica Willey. (Fig. 29, a).

Sthenelais zeylanica, Willcy, 1905, p. 258, pl. II, fig. 48: Fauvel, 1927b, p. 416; 1932, p. 32.
Differs from Sth. boa in its ventral cirrus with two long tapering stylodes giving it a trifurcate appearance, in the absence of the parapodial frilled collars and in the compound bristles with fewer joints and shorter sickleshaped tips. Simple bipectinate setae in the upper part of the ventral ramus are not always entirely absent, sometimes one may be found on a few posterior feet.

Length: \(100-200 \mathrm{~mm}\). by 5 mm .
Colour: Elytra dotted with small red-brown specks.
Occurrence: Trincomalee; Kilakarai.
Distribution: India.
44. Sthenelais variabilis Potts. (Fig. 29, b-d).

Sthenelais variabilis Potts, 1910, p. 349, pl. XIX, figs. 22-23, pl. XXI, fig. 68.
" Head with two pairs of eyes, both anteriorly placed, foremost and smaller quite lateral. Palps very long and slender, contrasting with shorter structures in Sth. orientalis ( \(=\) Sth. boa). Head closely surrounded by succeeding segments, the first three having revolved almost at right angles. Elytra close, overlapping, uniform in skape,
except the first which is oval, and of a thin translucent nature. Only in one specimen from the Maldives (Hululu, Male, 25 fms ) were any markings picserved on their surface; in this example a spot of white pigment over the elytrophore, and further inward a brown crescent surrounding a white spot. Male specimens, first elytron beset with a large, thick anterior margin. In succeeding elytra, margin ciliate, but degree of ciliation differing greatly in various forms. In some, cilia on greater part of border, and even developed on surlace (var. lirsuta); in others, outer border only ciliate, and tulecrcles confined to small area of surface (var. glabra). Ventral setae in

Fig. 29.-Sthenelai, seylanica Willey: a, foot after Walley). St. fariabilis Potts, var. glabra: \(b\), postetior elytron, \(c, d\), spinous ventral setac of the 15 th segment \(\times 140\). Sth. calcarea Potts, \(c\) clytion (after Potts).
following succession: (1) Spinose simple setac: (2) slender type of compound setae, with long jointed appendix and spinose shaft: (3) stronger setae with smooth shaft and short appendix; (4) slender setae with smooth shaft and long jointed appendix. In first few segments all setae elongated, with long jointed appendices and setae of type (2) absent." (Potts)

Length: 28-87 mm. by \(3.5-4 \mathrm{~mm}\).
Occurrence: var. hirsuta: Hululu, Male Atoll, Mal. dives. var. glabra: idem.

Distribution: Maldive Archipelago; Zanzibar.
45. Sthenelais calcarea Potts. (Fig. 29, e).

Sthenelais calcarea, Potts, 1910, p. 349, pl. XIX, fig. 24.
"Head provided with two pairs of eyes, both very small, anterior placed underneath on anterior border. Ctenidia at sides of tentacle small. Elytra, save for the first which is oval, reniform, provided with cilia, which are moderately long on the outer border, very short on the posterior edge, alternation of shorter and longer taking place in a curiously irregular way. The surface covered with small equal tubercles, flat topped, with chitinous rims thickened on one side. In anterior region of elytron calcareous concretions cover surface; grains of all sizes occurring in connection with tubercles already mentioned, their curious granular nature indicating that they are true concretions. First elytron alone not possessing grains, though the tubercles more thickly placed there than in any other of the series. Parapodia rather resembling those in Sth. variabilis in character. Upper division of ventral setae comprising spinose individuals both simple and compound." (Potts)

Length: more than 57 mm . by 3.5 mm .
Remarks: The encrusting particles are not foreign, but appear to be formed in situ.
Occurrence: Goidu, Goifurfehendu Atoll, Maldive Archipelago.

\section*{Genus EUTHALENESSA Darboux.}

Median tentacle inserted between the prostomial lobes without ceratophore or ctenidia. Lateral tentacles inserted on the frontal margin. A dorsal cirrus on the third setigerous segment. A branchial process on every foot from the fourth setigerous segment. Elytra overlapping but leaving the middle of the back uncovered; they are fringed with multifid papillac. Dorsal setae spinous, simple. Ventral setae compound, falcigerous.
46. Euthalenessa djiboutiensis (Gravier). (Fig. 30, a, b).

Thalenessa djiboutiensis, Gravier, 1901, p. 231, pl. VII, figs. 114 117.

Euthalenessa djiboutiensis, Fauvel, 1918, p. 331; 1919, p. 345; 1922, p. 492; 1932, p. 32.
Three small conical tentacles all alike. Anterior pair of eyes large, postcrior pair small. Dorsal cirrus on the third setigerous segment, with a large ceratophore and
a small tapering ceratostyle. Elytra reniform, with long digitiform multifid papillae on the outer margin. Three ctenidia on the dorsal division of the feet; numerous digitiform stylodes on the anterior feet, and foliaceous parapodial bracts on the others. A dorsal tuft of

Fig. 30-Euthalenewa djiboutiensis (Gravict): a, clytron; b, elytron's papillae, enlarged fafter Gravier). Fiusigalion stylolepis (Willey):
\(r\). head, \(d\), elytron's marginal fimbriac; \(c\), compoumd seta of the Guth segment (after Willey).
slender simple setae. Ventral setae compound, with a bidentate end-piece, simple or multi-articulate.

Length: About 150 mm . by \(7-8 \mathrm{~mm}\).
Colour: In life pale yellow, marked with pigment spots. In spirit, elytra with rusty spots.

Occurnence: Ceylon; off Puri, Orissa, Madras Coast; Mergui; Pedro Shoal.

Distribution: Australia; Mergui; India: Perssan Gulf; \({ }^{-R e d}\) Sea.
F. 11

\section*{Incertae sedis.}

Thalenessa digitata McIntosh, is an Euthalenessa, very close to E. djiboutiensis (Gravier), but the descriptions of Willey and Potts are too scanty to enable one to ascribe the specimens from Ceylon and the Maldives either to E. digitata or to \(E\). djiboutiensis.

\section*{Genus EUSIGALION Augener.}

Prostomium subtrapezoidal, with three subequal tentacles, a pair inserted near the anterior matgin and a median tentacle posterior to, or beturen the cyes. Four minute eyes dispersed in a rectangle on the dorsal side of the prostomium. Elytra pedunculate, like those in Sigalion, with plumose fimbriae. Cirriform branchiae under the elytra: they are wanting on the intervening segments.
47. Eusigalion stylolepis (Willey). (Fig. 30, c-e \().\)
Thalenessa stylolepis, Willey, 1905, p. 261, pl. 1II. figs. 43-56.

Prostomium large, flattened, shield-shaped, with thee notches, two on the frontal border from which the paired antennae arise; one on the occipital border foom which the tentaculum impar arises. Two eyes, two pairs of tentacular cirri with setae and two long smooth filiform palps. Elytra pedunculate. Cirriform branchiae under the elytra; absent on intervening segments which have only a small tubercle. No dorsal cirri. The elytra ca:ry 12-13 plumose fimbriae on the outer border and a small ctenidium on the inner side of each elytrophore. Two dorsal ctenidia on each foot. Dorsal setac long, simple, fringed. Ventral superior bundle of simple whoricd setae. All the remaining ventral setac compound falcigerous with very long, many jointed, tapering bidentate appendices. In the posterior feet, two stout setae with short sickle.

Length: 35 mm . by 3 mm .
Occurrence: Modragam Paar, Ceylon, out of coral block.

\section*{Genus PSAMMOLYCE Kinberg.}

Body narrow and long, segments very numerous. Median tentacle inserted on the anterior margin of the prostomium, without ctenidia. Lateral tentacles fused with the first foot. A dorsal cirrus on the third setiger-
ous segment. A branchial cirriform process on every foot. Elytra and back with adhesive papillae, densely coated with sand grains. Dorsal setae simple, slender. Ventral setac compound, falcigerous.

Key to the species of Psammolyce.
1. Elytra without any large club-
like lobe .. .. fijiensis McIntosh, p. 67.
Elytra with club-like lobes .. 2
2. Flytia with two club-like lobes zeylanica Willey, p. 68.

Elytra with one club-like lobe .. antipoda Schmarda, p. 67.
48. Psammolyce fijiensis McIntosh.

Psammolyce hjensis. McIntosh, 1885, p. 148, pl. XXI, fig. 6, pl. XXII. fig. 4, pl XXIV, fig. 6, pl. XIIIA, fig. 28: Fauvel, 1932, p. 33.

First pair of clyua very large, prow-shaped, the others clongate oval, with anterior margin concave and slightly bilobed, but without any large club-like process, and anterior border beset with long adhesive papillae. Dorsal cirus of the third setigerous segment small and conical and tentacular cirri not swollen at the tip. A transpanent collar above the foot. Dorsal setae plentiful, long, slender and serrated. Ventral setae large, straight, all compound, differing very iittle from one another, with shaft more on less spinous, a terminal piece more or less clongate and always conspicuously bidentate. Ventral cirrus flliform. Ventral papillae filiform, velvety. Deeply incrusted with sand grains.

Occurrence: Magui Archipelago; 40 fms.
Distributoon: Fiji Islands; Mergui Archipelago.
49. Psammolyce antipoda (Schmarda). (Fig. 31, \(a-h\) ).

Pelogenia anttpoda, Schmarda, 1861, p. 160, pl. XXXVII, figs. 320--3:2.
Psammolyce antıpoda, Fhless. 1904, p. 19: Augener, 1913, p. 96; Fauvel, 1917. p. 186, pl. IN, figs. 12-13.
Psammolyre rigida. Giube, 1878, p. 55 (pro parte): Willey, 1905, p. 256, pl. 11, figs. 44-47.

Elytra more or less rounded with anterior margin straight, or slightly concave, and a single club-like process, and posterior burder beset with long adhesive papillae. Dorsal cirrus of the third setigerous segment rather long and bi-articulate and tentacular cirri not swollen at the tip. A semi-circular collar above the foot. Dorsal
sctac slender, serrated. Ventral setae large, yellow, all compound, differing from one another; the upper ones with a spinose shaft, the upper and median with a shont unidentate or bidentate terminal piece; the inferior ones with a long slender one. Ventral cirrus slightly enlarged below the tip. Filiform and rounded ventral papillac mixed.

Fig. 31.-Psammolyce antipoda (Schmarda): a, compound venthal sta of the 2nd segment \(\times 150 ; b, c\), dorsal bristle from middle of body, front and side view \(\times 150\); \(d\), superior ventral compound seta \(\times 80\); \(e, f, g\), two median ventral sctae from the same foot, one unidentate, the other bidentate \(\times 80 ; h\), elytron \(\times 15\).

Ps. zeylanica Willey, i, elytron (after Willey).
Length: 95 mm . by 9 mm .
Occurrence: Ceylon, 10 miles off West Cheval laar.
Distribution: Australia; New Zealand; Philippine Islands; Ceylon.
50. Psammolyce zeylanica Willey. (Fig. 31, i).

Psammolyce zeylanica, Willey, 1905, p. 255, pl. I, II. 11ps. 37 4.3. Psammolyce rigida, Grube, 1868, p. 631, pl. VII. fig. I (pro parte).

Dlyta triangular, wiih a suaight anterior margin and two large club-like piocesses and a posterior booder beset with long adhesive papillac. Dorsal cirrus of the third segment with terminal portion monc slender and shorter than its peduncle; tentacular cini shorter and not swollen. Donsal setac capillary, finely plumose. Ventral compound setae with sub-clongate appendices, then a central group of stout setae with short appendices and an inferior group of slender sctac with clongate appendices. Acuminate ..nd globulan papillae are mixed on the vental surface, which is hairy.

Occureme: Ceylon.
1mいihmion: Red Saa (シ) C Ceslon.
Remales: This species is very likely a variety of I's. antiperia (Schmada). Inder the name of l's. mgida Grube has described two different toms of Psammolyce.

\section*{Genus LEANIRA Kinberg.}

Body narrow and long, werments very numerous. Median tentacle with a ceratophore and ctenidia. Lateral temtacles fused with the first foot. No dorsal cirrus on the third setigerous segment. A branchial cirriform process on every foot, from the fourth backwards. Elytra smooth or fiinged. Dorsal setae simple, slender, serrated. Ventral setac compound, spinigerous, and, sometimes, a faw simple bristles.

L.eanita sibugae, Horst, 1917, p. 115, pl. XXIV. figy. 1-3.

Sthenolepis paponica, Izuka, 1912, p. 88, pl. X, figs. 3-7; Willey, 1905, p. 259, pl. II, fig. 49.

Prostomium with four black cyes and antennal ctenidia. On the third setigerous segment a small conical tubercle, but no true cirrus. Elytra smooth, unfringed, overlapping, leaving the mid-dorsum exposed. Dorsal setae numerous, long, slender and transversely fringed. Ventral setae compound, spinigerous, with a long, sharp pectinatecanaliculate terminal piece, and, occasionally, one or a few superior simple bristles provided with whorls of spikes.

Length: \(30-50 \mathrm{~mm}\). by 2 mm .

Occurrence: Mergui; Andaman Islands; Bay of Bengal; Ceylon; Arabian Sea; Gulf of Oman.

A deep sea inhabitant, sometimes in shallow waters (Galle, in 7 fms .).

Distribution: Japan; Annam; Malay Seas; Indian Ocean.

\section*{Subfamily ACOETINAE Grube.}

Body elongate. Prostomium bilobed, with two large ommatophores (stalked eyes), or four sessile cyes. Three tentacles, the medium sometimes reduced to a small tubercle. Two long palps. Proboscis with papillae on the margin; median dorsal and ventral ones are tentaculiform. Elytra on segments 2, 4, 5, 7, 9 and on every alternate succeeding segment. Feet biramous. Bristles simple. A spinning gland in the dorsal division of the feet.

Key to the genera.
1. With two tentacles .. Eupolyodontes Buchanan, With three tentacles .. 2
2. Eyes sessile .. .. Eupanthalis McIntosh, p. 75.

Two eyes borne on ommatophores 3
3. With branchiae. True bipenna-to-penicillate setat absent .. Polyodontes Renier, p. 70.
No branchiae. Bipennato-penicillate setae present .. Panthalis Kinberg, p. 74.

\section*{Genus POLYODONTES Renier.}

Segments very numerous. Two large ommatophores (eye-stalks) and two small posterior sessile cyes. A median tentacle. Lateral tentacles inserted beneath the ommatophores. Two long palps. Four horny jaws. Proboscis bilobed. Two pairs of tentacular cirri with basal setae. Spinning glands in the feet. Branchial tubercles present on the feet. First foot little or not at all modified. Elytra leaving the back uncovered. Feet biramous; dorsal ramus small, with capillary setae. Ventral ramus large, thick, with three kinds of setae: (1) serrulate, (2) aristate, (3) serrulate subspiral; genuine bipennato-penicillate setae absent.

Key to the species of Polyodontes.
Without dorsal tubercles. No penicillate setac. First foot shoit .. ..

short, filiform. Tentacles and cini smooth. Probostis flattened dorso-ventrally, each lip provided with a long median cirriform papilla and \(8-10\) short ones. Bases of the fangs denticulate. Facial tubercle absent. First elytra large, rounded, smooth, without fringe; the others with posterior margin olten folded, pocket-like. Anterior elytra overlapping in front. Branchial tubercles on the feet, but no dorsal processes. Spinning glands from the 8th foot backwards, and a flattened dorsal ramus with a few spinulose capillary setac; posteriorly the ramus is reduced to a short conical lobe. Ventral ramus lange. thick, with two vertical lips enclosing: (1) a bundle of slender setae enlarged above, the shaft finely serrated, (2) a vertical row of large, yellow, atistate setae, blunt, or bearing a long hairy process, and a bundle of sermiatesubspiral setae. A felt tube.

Length: Up to 1 metre by \(20-25 \mathrm{~mm}\).
Colour: In life. body yellowish with transverse bomn or purple strcaks. Elytra pale brown or edged with dark violet and more or less pale dots.

Remarks: Sometimes caught on fish hooks.
Occurvence: Andaman Sca, 53 fms ; Mergui.
Distribution: Australia (?) ; Indian Ocean; Red Sea (?) ; Meditcrancan; Atlantic Ocean.

Ommatophores large, with black subspherical eyes on the extremity of clavate peduncles. Two small eycspots on each side of the prostomium. Tentacles and palps with pigment spots. First pair of elytra large, crossing and overlapping in front, flat, smooth, without fringe or pouch: others with a narrow posterior pouch. First foot slightly modified, elongated and pointing forwards. Bladder-like branchial tubercles on a number of feet. A dorsal geniculate, or sub-cylindrical, process above the base of the dorsal cirrus. Spinning glands from the 8th foot backwards. Dorsal ramus flattencd, with a few cap,illary setac. Ventral ramus large, thick, with
four kinds of setac: (1) a bundle of slender setac enlarged above the shaft and scrrulate, (2) pseudo-penicillate setac, (3) a vertical row of large yellow aristate setae, and (1) a bundle of serrulate-subspiral setac.

Length: Breadth, about 6 mm . (incomplete specimens).

Occurrence: Andaman Islands; Burma, off Tenasserim, and Arakan Coast; Ccylon; Gulf of Oman, 230 fms.

Distribution: Philippine Islands; Malav Archipelago; Indian Ocean; Ceylon; Madagascar; Jamaica.
F. 1 ?

\section*{Genus PANTHALIS Kinberg.}

Body elongated. Two large ommatophores (eycstalks). A median tentacle. I.ateral tentacles inserted beneath the ommatophores. Two long palps. Four horny jaws. Proboscis bilobed. Two pairs of tentaculat cirri. Spinning glands in the feet. Branchial tubercles absent. First foot modified. Elytra flat, or with a posterior pouch. Feet biramous; dorsal ramus small, with capillary setae; ventral ramus with setae of several types: (1) serrulate; (2) bipennato-penicillate, (3) aristate, (4) serrulate-subspiral. A felt-like tube.
54. Panthalis oerstedi Kinberg. (Fig. 34, \(a-h\) ).

Panthalis oerstedi Kinberg, 1857, p. 25, pl. VI, fig. 34: Watson. 1895, p. 169, pls. IX-X: Fauvel, 1914b, p. 78; 1932, p. 39; 1923, p. 98, fig. 38, \(a-h\).

Fig. 34.-Panthalis oerstedi Kinberg: a, head, enlarged (after McInto,h),
\(b\), first foot (after Pruvot and Racovitza); \(c\), foot \(\times 5\); \(d\), inferiot ventral seta (serrulate-subspiral) \(\times 109, \epsilon\), supetior ventral penicillate seta \(\times 109\); \(f\), aristate seta \(\times 80 ; g\), inferior ventral seta \(\times 109 ; h\), elytron \(\times 4\). Eupanthalis kin bergi McIntosh : \(i\), head, enlarged; \(k\), jaw; \(l, m\). middle and posterior feet \(\times 5 ; n\), penicillat:seta \(\times 109 ; 0\), aristate seta \(\times 109 ; p\), inferior ventral sigmoid seta \(\times 109 ; q\), upper and lower proboscis' papillac, cnlarged. (This species is very like E. edriophthalma Potts, if not conspecific).

Panthalis marcnzelleri, Pruvot and Racovitza, 1895, p. 442, pl. XIX, fig. 105; pl. XX. figs. 106-110.
Panthalis jogasimae, lzuka, 1912, p. 68, pl. I, fig. 6; pl. VIII, figs. 1-6: Monro, 1928, p. 568.

Size comparatively small. About 80 segments. Two lage oval, or cylindrical, colourless ommatophores. Tentacles subulate. Two long tapering palps. Tentacles and cint smooth. Proboscis with the median papilla clongated. Bases of the langs denticulate. Facial tubercle absent. Fiist clytia large, rounded, smooth, without tringe, overlapping in hont; the others with posterior margin folded pocket-like. Branchial tubercles and dorsal processes absent. Finst foot modified, elongated, pointing forwards, with a heart-shaped foliaccous ventral ramus. Spinning glands from the 8 th foot backwards. Dorsal ramus flattened, achactous; ventral ramus compressed. Ventral setac of three kinds: (1) bipennatopenicillate, (2) a vertical row of aristate bristles, and
(3) a bundle of serrulate-subspiral setae. In the anterior segments, preceding the spinning glands, setae similar to the lower ones take the place of the brush-shaped setae. A felt-like tube secreted by the spinning glands and coated with mud is always present.

Length: \(40-100 \mathrm{~mm}\). by \(8-10 \mathrm{~mm}\).
Colour in life: Back pearly-white anteriorly, flesh coloured posteriorly. Elytra uncoloured, translucent.

Remarks: From deep dredgings on muddy or sandy hottom: 34-810 fms.

Occurrence: Off Burma: Andaman Islands; Bay of Bengal; Laccadive Sea;; Arabian Sea.

Distribution: Pacific Ocean, Japan; Indian Ocean; Mediterranean Sca; Atlantic Ocean.

\section*{Genus EUPANTHALIS McIntosh.}

Body narrow, size moderate. Four sessile eyes, no ommatophores. \(\Lambda\) median tentacle. Lateral tentacles inserted at the end of the prostomial lobes. Two palps. Proboscis bilobed. Median dorsal and ventral papillae somewhat larger and lobed. Two pairs of tentacular cirri. Spinning glands in the fect. Branchial tubercles absent. Elytra flat. Fect biramous. Dorsal ramus achaetous (first feet excepted) : ventral ramus thick, with three kinds of setac: (1) serrulate; (2) aristate: (3) serrulatesubspiral. A felt-like tube.
55. Eupanthalis edriophthalma (Potts). (Fig. 33, h,i).

Panthalis edriophthalna, Potts, 1910. p. 345, pl. NIN, fig. 19; pl. XXI, figs. 56-57: Fanvel, 1932. p. 41.
Panthalis nigiomaculata (non Grube). Willey, 1905, p. 255, pl. I. figs. 28-32.

Head spherical, divided by a median longitudinal line. Eyes, two pairs, sessile, anterior pair rather iarger, both distinct, pigment masses situated on lateral border. Median tentacle slender, filiform. Lateral tentacles filiform, longer than the median. Palps stout, rather long, ending abruptly in acute tip. Flytra translucent. The anterior ones larger and overlapping forwards, whilst the others overlap backwards and show a slight poiterior flap. Ventral setae of tour kinds: (1) slender giblous setac with close-set spines placed irregulaly: (2) similar setae with spines arranged in whorls, occurring after the eleventh segment; (3) aristate setate with long appendix; (4) slender gibbous setae diflering slinhtly from (1).

Length: 26 mm . by 3 mm .
Elytra colourless.
Occurrence: Burma, off Akyab; Ceylon, North of Negombo, 9 fms.

Distribution: Indian Ocean, Ceylon, Akyab.

\section*{Family PISIONIDAE Levinsen.}

Prostomium without tentacles, tused with the buccal segment, the two pairs of cirri of which are directed forwards. Proboscis with four jaws. Feet uniramous. Dorsal and ventral cirri globular. Two anal cirri. Simple setae and compound falciform setae.

\section*{Genus PISIONE Grubc.}

Body vermiform, segments numerous. Prostomium reduced, with eyes. Buccal segment with a pair of stout denticulate acicula, dorsal and ventral unequal cirri directed forwards: the dorsal ones looking like tentacles and the ventral ones, stouter and longer, mimicking palps. Dorsal and ventral cirri globular. Feet long, with two lohes and two spines. Upper setac simple, lower ones compound. falriform.
56. Pisione oerstedi Grubs. (Fig. 85)

Pisione oerstedi, Grubs, 1857, p. 175: Levinsen, 1886, p. 292: Ehlers, 1900, p. 257; 1901b, p. 61, pl. VI, figs. 1-9: Augener, 1926, p. 445: Fauvel, 1939, p. 267, fig. 2.
Pisione contracta, Ehlers, 1901, p. 64, pl. VI, figs. 10-18.
Prostomium traperiform, with four small eyes. Proboscis crowned with short papillae, armed with two dorsal and two ventral hooks (as in Polynoë). Dorsal tentaclelike cirri of the buccal segment short and slender, with a basal globular papilla. ventral cirri much longer, mimocking paps. I wo large acicular spines, swollen in the middle and expanded at the tip, which is bevelled and

Fig. 35.-Pisione oersted Grubs: a, anterior end \(\times 14\); \(b\), 23 rd foot \(\times 31\) (after Ehlers); \(c\), ventral bristle \(\times 390\); \(d\), swimming epitocons bristle \(\times 390\); e. \(38-43\) rd segments of the male, with Renita papillae, \(\times 39\).
denticulate. Next segment, the first setigerous, with a long ventral cirrus directed forwards and a small globular dorsal one. The dorsal cirrus of the second setigerous segment is long and slender, the ventral one globular. Dorsal and ventral cirri globular on all the following segments. Feet uniramous, with a median aciculum and a smaller superior one. A single large simple seta and

3-4 inferior ones, which are stout, compound, with a short falcate, unidentate, terminal piece. Mature females with a fascicle of 3-4 very slender transparent compound epitocous setae with paddle-shaped terminal piece, which are inserted between the upper and lower setac. No genital papillae apparent. Males. with genital simple papillar and, when mature, multifid papillae and special organon a number of segments, irregularly distributed.

Length: \(20-40 \mathrm{~mm} . \mathrm{by}_{2} \mathrm{~mm}\).
Colourless in spirit.
Occurrence: Ceylon.
Distribution: Pacific Ocean, Callas, Valparaiso, IndoChina; Indian Ocean, Ceylon.

\section*{Family CHRYSOPETALIDAE Ehlers.}

Body short, elongated, with few or numerous segments, bearing on their dorsal side a fan or a transverse row of paleae. Prostomium with four eyes and three tentacles. Two or four pairs of tentacular cirri. Fect biramous, with dorsal cirri on every segment. Ventral setac compound.

\section*{Genus CHRYSOPETALUM Ehlers.}

Body short, segments comparatively few. Prostomium oval, tentacles inserted on the prostomium. Two stout palps. First two segments partly fused, cach carrying one pair of tentacular cirri. Next, dursal ramus short, carrying only a fan of paleae which cover the greater part of the back. Stout dorsal cirri. Compound setae only on the ventral ramus.
57. Chrysopetalum ehlersi Gravier. (Fig. 36, a-d).

Chrysopetalum ehlersi, Gravier, 1901, p. 260, pl. X, figs. 150-151: Fauvel, 1939, p. 266; Gravely, 1927, p. 5.

Body short, very brittle. Median tentacle short, lateral tentacles pyriform. Four large eyes. \(\Lambda\) nuchal fold. First two setigerous segments with only dorsal paleae and no ventral setae. Dorsal cirri with a long ceratophore. Paleae slightly concave, broad, slightly enlarged under the pointed tip, with a row of teeth on each side. Ventral setae compound spinigerous, with a long striated shaft and a more or less long, slender, unidentate appendix.

Length: 6-15 mm. by 1 mm .
Colour: Yellowish, with golden palcae.
Occurrence: Kıusadai Island, Pamban.
Distribution: Pacific Ocean, Indo-China; Indian Occan, Gulf of Mannar, Red Sea.

\section*{Genus BHAWANIA Schmarda.}

Body elongated, vermiform, very hittle, with numerous segments. Head very small, hidden. Paleae arranged

Fig. 36.- Chrvopetalum chlıi Gravieı: a, head. vential side, ci:laged; \(b\), foot \(\times 64 ; c\), bristle \(\times 191\); \(d\), palea \(\times 320\). Bhawania cryptocephala (iavien: \(e\), foot. enlaged \(>64\); \(f\), dowal cums \(\times 255 ; \mathrm{g}\), palea \(\times 95 ; h\), lowet seta \(\times 390 ; i\), upper seta \(\times 320\) (after Gavier).
in transverse rows: they are denticulated only along one side. Ventral setae compound, of three kinds.
58. Bhawania cryptocephala Gravier. (Fig. 36, \(c-i\) ).

Bhaurania ciyptocephala. (iravict, 1901, p. . 63 , pl. X, figs. 152-156: Pots, 1909, p. 328: Horst, 1917, p. 197: Fauvel, 1919, p. 347; 1932. p. 43; 1939, p. 266: Pruvot, 1930, p. 20.
? Bhawania myriolepis, Schmarda, 1861, p. 164, pl. XXXVII, figs. 323-325.

Body yellow, twisted, very brittle, entirely covered by the palcae. Head very small, hidden by the protruding anterior feet and the paleae, which are imbricated, arranged in dense transverse rows: they are yellow or brown oval-elongate, striated transversely and longitud-
inally, serrated on one side and show prominent ridges with a beaded edge. Dorsal cirri digitiform, partly retractile. Ventral ramus bearing: (1) upper sctae with long spinigerous terminal piece, (2) heterogomph falcigerous and (3) slender setae with an elongated smooth filiform appendix. Ventral cirrus short. The general appearance is like that of a Sigalionid.

Length: \(80-100 \mathrm{~mm}\). by 5 mm .
Occurrence: Burma coast, among sponges; Nicobar Islands, Nankauri Harbour, Camorta Island; Ceylon: Maldive Archipelago.

Distribution: Pacific Ocean, New Caledonia, Philippine Islands, Indo-China: Indian Ocean; Red Sea.

\section*{Family AMPHINOMIDAE Savigny.}

Body elongated, square, or short, oval, depressed. Prostomium deeply set into the anterior segments. Threc: tentacles. Two palpal pads with subulate palpontytes (resembling a second pair of lateral tentacles). A caruncle. Parapodia biramous, with branchiae; one or two dorsal cirri on each side, a ventral cirrus (exceptionally uniramous with compound hooks). Sctac simple, straight or furcate. Proboscis unarmed.

Key to genera

\]

Amphinome pallasii, Quatretages, 1865, p. 344: Fausel, 1914b,
p. 85 (Bibliography); 1923, p. 128, fig. 46. a-g.

Pleione letraedra, Milne-Edwards, 1849. pl. VII, fig. 1.
Body square in section. Prostomium small, rounded, with two eyes. Caruncle smooth or slightly plaited. Median tentacle short, inserted on the anterior margin of the caruncle. Lateral tentacles short, subulate. Paips conical. Bushy gills from the 2nd or 3rd setigerous segment. Dorsal cirrus inserted under the branchial cluster. Dorsal setae of two kinds: (1) long. slender, mote or less serrated at the tip; (2) stouter bristles with lateral fangs (glochidiate setae, harpoon-shaped). Ventral setae few, 5-7 uncinate. Acicula with a terminal knob. ()n floating wrecks, amongst the Lepas.

Length: \(200-400 \mathrm{~mm}\). by \(20-30 \mathrm{~mm}\).
Colour: Body bluish-grey, cirri and gills red (rusty yellow in spirit).

Occurrence: Andaman Sea. 112 fms.; Nankauri Hatbour, on a drifting log; Puri, Orissa.

Distribution: Pacific, Indian, and Atlantic Oceans, in their warm parts.

Remarks: A. rostrata and A. pallasii are synonymous. A careful comparison of specimens from Indian and Atlantic Oceans has failed to reveal any specific differences.

\section*{Genus EURYTHOE Kinberg.}

Body elongate, square in section. Prostomium large, rounded, with four eyes. Three subulate tentacles, two large pad-like palpophores with subulate tentacle-like palpostyles. Caruncle consisting of a sinuous crest with vertical folds along its lateral sides: Branchiae ramified, mostly bifid, generally short and thick. Dorsal setae usually longer, of three kinds: (1) bifid, the shorter arm being a spur; (2) harpoon-shaped; (3) sword-shaped. Acicula lanceolate. Anus dorsal, extending over several segments or terminal.

Key to the species of Eurythoë.

Amphinome eucopochaeta. Schmatda, 1861. p. 153, pI. XXXV', fig. 293.

Branchiac commencing on the second segment. Four very conpictous eyes. Caruncle temminating on third on fourth segment, lateral lobe more or less hidden in

Fig. 38.-Euythoe matthaii Binda: a. head and first segment \(\times 16\) (after Bindra). E. complanata (Pallas); \(b\). head and antetior segments ; \(r\). foot : \(d\) dossal view of amal iegion (after Cravier) : \(k\).
ventral bristle; I. donsal bristle \(\times 389\); \(m\), harpooned bristle \(\times 333\). E. parvecarunculata Horst; \(e\), anterior region;
\(f\). aciculum (after Horst); \(g\), ventral bristle; \(h-i\), dorsal bristles.
grooves under the smooth lobe. About five buccal segments. Dorsal setae very variable in length, of three kinds: (1) long calcareous setac, with an elongate slen-
der tip, more or less serrated, and a small spur at the base;
(2) large straight, harpooned, glochidiate setae, with lateral rows of easily deciduous teeth, and (3) stout, straight, smooth sctac. Two kinds of ventral setae: (1) stout furcate setac with unequal arms, the larger one smooth, or slightly serrated on young specimens, and (2) a few sub-furcate setae with one of the arms thin and greatly elongated. Acucula shout, spear-headed.

Length: \(50-200 \mathrm{~mm}\). by \(10-15 \mathrm{~mm}\).
Colour: Gills red, setae alabaster-white.
Occurrence: Mergui, Andaman Islands, India, Ceylon, Maldive Archipelago, Arabian Sea.

Distribution: On coral reefs of the whole tropical area of Pacific, Indian and Atlantic Occans.

Remarks: The setae, in lite, are very brittle, and consequently vary much in length, according to the enviromment. As they are calcarcous, they ate often damaged in spirit, formol and other reagents, becoming soft, woolly and losing thein lateral teeth. Moreover, many specimens, having undergone tegencrations which ate very heguent in this veries. present marked modifications in the poportions and appearances of the head, the number of hurcal and anal segments, the shape of the body. of the anal funncl, and the length of the tentacles. Contraction, due to the fixatives, also alters the appearance of the caruncle to a large extent. Such is the explanation of its having been described under so many names. (See: Fauvel, 1943a, p. 5).

\section*{61. Eurythoé matthaii Bindra. (Fig. 38, a).}

Eurythö̈ matthaii, Bindra, 1927, p. 12. pl. 11, figs. 4 ;
Body rectangular in cross section. Branchiae begin ning on the first segment. Buccal segments four. Carumcle oval, extending over the first two segments. Anus terminal. Median tentacle shorter than the paired tentacles. Eyes hidden by the anterior margin of the caruncle; anterior ones larger than the posterion. Harpoonshaped setae well developed, reaching the length of the bifid setae.

Length: \(65-110 \mathrm{~mm}\). by \(5-8 \mathrm{~mm}\).
Occurrence: Karachi.
Distribution: India.

\section*{62. Eurythoë parvecarunculata Ilorst. (Fig. 38, e-i)}

Eurylhoë parvecarunculata, Horst, 1912, p. 37, pl. X, ligs. 1-i. Augencr, 1916, p. 90. pl. II. fig. 3, pl. III, figs. 37-38: Fauvel. 1923 , p. 9; 192i, p. 525. fig. 1; 1932, p. 46.
: Amflhinome duboutıensis. Giavier, 1901, p. 245, figs. 249-253. H. IN, figs. 197-1:9.
? Amphinome maldict mis. Pots, 1909, p. 263, pl. XLV. figs. 14-15. pl. XLVI. ligs. 12--17.
Eurythoe heteroticha, Poti, 1909. p. 369. pl. XLV, figs. 16-17, pl. XLVI, figs. 18-19.

Buanchiat ommencins on the thind segment. Rounded comalic lobe winh a lang heat shape palpal part and four eye: upon de poniolion borden it bears a long unpained antenna: the two anterios antennat are much storter. 'The subulate palpo-sisles of the palps are sommebat bontor than the lateral antemnae. The caruncle is a small wal pocess only extending over the first regment. The stomgh mamitorl hamohiae are most developed in the anterion part of the body, decreasing posthionly. 'The as a tha here an elomoted oval tip. Dorsal setae of two hinds: (1) slender elongated, bifurcated, with a long limh smooth of coansely demticulated along it, internal boddes, and a shont limb often reduced to a more spar, and (2) bhont. stout, harpoon-shaped bristles. Venlal setae funcate, with the longer limb bent backward, and poovided with a lew faint donticulations. They are anocidted with at lew shome elongate setate with a spurlike shori linh and a lomy limb smooth, or faintly denticulate.
lenglh: \(\quad 30-2 \div 0 \mathrm{~mm}\). by \(3-14 \mathrm{~mm}\).
Occurbence: Port Blair, Andamans; Chilka Lake.
Distrombon: Malay Archipelago, Bay of Bengal, India, Atlantic Ocean, Cameroon, Guiana, ? Red Sea, Maldives.

Remarks If dmphinome diboutiensis Gravier and A. maldi,ems:s Pots. which really belong to the genus Eurythö̈, be aho conspecific with \(E\). parrecanunculata Horst, Gravien's name should have priority.

\section*{Gcnus PSEUDEURYTHOË Fauvel.}

Body elongated, square in cross-section of the anterior part. Prostomium rounded. Two pairs of eyes. Caruncle reduced to a small knob, deeply set into the first seg. mene. Three tentacles. Palps cushion-like, with subu-
late palpostyles. Feet biramous, with dorsal and ventral divisions far apart. Dorsal setac of two kinds: (1) har-poon-shaped: (2) capillary. Ventral setae: (1) short, bifurcate; (2) capillary, with or without a short basal spur. Each foot bearing a dorsal and a ventral cirrus. Gill-tufts limited to the anterior part of the body.

Remarks: This genus is a connecting link between Eurythoë and Paramphinome.

Key to species of Pseudeurythoë.

3. Head broader than long, not heart-shaped .. .. ambigua Monro, p. 90.
Head heart-haped posteriorly .. paucibranchiata Fauvel, p. 86.
63. Pseudeurythoë paucibranchiata Fauvel. (Figs. 39, a. \(b ; 40, a-e)\).

Pseudeurythö̈ paucibranchiata, Fauvel, 1932, p. 48, fig. 8. pl. I, figs. 3-4.

Body more or less moniliform posteriorly. Prostomium globular, slightly bilobed anteriorly, raised posteriorly into a heart-shaped lobe. Lateral tentacles articulate. Median tentacle inserted at the back of the heart-shaped lobe which bears two small, inconspicuous cyes on its anterior border. Caruncle reduced to a very small lobe, set into the first setigerous segment. Palps cushion-like, with articulate palpostyles. Branchiac from the 3rd setigerous segment to the 25 th, in clusters of filaments. Dorsal setae: (1) long capillary without spur: (2) short slender capillary; (3) stout, harpoon-shaped. Ventral setae: (1) upper trifurcate, serrated, with long spur; (2) very long smooth capillary, without spur; (3) furcate, with long limb serrated.

Length: 25 mm . by 2 mm .
Occurrence: Ain Musa, Gulf of Suez.

Fig. 39.-Pseudeurythoe pancibranchinta Fauvel: a, head, \(\times 18\); \(b\) branchiferous foot \(\times 40\) (from Fauvel, 1932).

Fig. 40.-Pseudeurythoë paucibranchiata Fauvel: \(a\), ventral serrated capillary bristle \(\times 520 ; b\), upper ventral furcate bristle \(\times 520 ; c\), inferior vetnral torked bristle \(\times 520\); \(d\), harpoon shaped bristle \(\times 380\); \(e\), posterior dorsal serrate bistle \(\times 520\)

64. Pseudeurythoé microcephala Fauvel. (Figs. 41, ad; 42, \(a-e\) ).
Pseudeurythoë microcephala, Fauvel, 1932, p. 49. fig. 9. pl. I, figs. 5-8.

Body moniliform posteriorly. Head very small, entirely retracted into the first segment. Prostomimm longer than broad, rounded anterioily, enlarged and quadrangular posteriorly. Caruncle square, very sman, deeply

Fig. 41.-Pseudeurythoë microcephala Fauvel: \(a\), head \(\times 20 ; b\), foot from the middle of the body, male \(\times 40\); \(c\), branchiferous foot, male, \(\times 40\); \(d\), foot from the middle part of the body, female, \(\times 40\).
hidden under the protruding border of the next segment. Two pairs of reddish eyes. Median tentacle filiform, inserted far back between the posterior eyes. Latcral tentacles subulate, faintly articulated. Palpostyles about the same length. No hooks on the first sctigerous segments. Branchiae from the 3rd setigerous segment to the 25th; they are bushy. Dorsal setae: (1) long, slender, smooth, capillary, without spur; (2) harpoon-shaped.

Ventral setae: (1) long, scrrated, capillary, without spur; (2) furcate with longer limb boldly serrated.

Fig. 42.-Pseudeurythoë mocrocephala lauvel: \(a\), smooth dorsal bristle \(\times 380\); b, schated capillary ventral bistle \(\times 530\); \(c\), \(d\), funcate vental brishev \(i 330\); \(i\), harpoon-shaped bristle i 380 .

Differs from \(P\). paucibranchiata Fauvel chiefly by:
(1) head very small: (2) prostomium sunk; (3) absence of basal spur on long setae of both rami.

Length: 30 mm . by 2 mm .
Occurrence: From reef-flat between Hululu and Heratera, Addu Atoll, Maldive Archipelago.
65. Pseudeurythoë acarunculata Monro. (Fig. 43, \(d-m\) ).

Pseudeurythoë acaıunculata, Monro, 1937, p. 249, fig. 2.
Body slender and vermiform. Head deeply retracted into the first segments, more or less rectangular in outline and divided into two regions by a transverse groove. The hinder part of the prostomium is slightly broader than long and cut off squarely behind. No trace of a caruncle is visible. A kind of nuchal pit present. Two pairs of eyes. - The median tentacle on a level with the posterior F. 14
pair, the lateral tentacles just before the anterior pair. Palpostyles lateral. No hooks on the first setigerous segment. Branchiae from the 4th setigerous segment to about the 50th: they are bushy. A long dorsal cirrus. Dorsal setae: (1) very fine, smooth, capillary bristles; (2) harpoon-shaped. Ventral setae: (1) very long capilary bristles, with a smooth spur; (2) short, stout, furcate bristles with the longer limb serrated (no long ventral capillary without spur).

Length: 30 mm . by 1 mm .
Occurrence: Maldive Archipelago.
66. Pseudeurythoë ambig̣ua Monro. (Fig. 43, i-m).

Pseudeurythoë ambigua, Monro, 1937, p. 251, fig. 3.
Shape slender and vermiform, tapering rather sharply in front and gradually behind. Head rounded in front,

Fig. 43.-Benthoscolex coecus Horst: a, dorsal view of anterior seg. ments \(\times 16\); \(b\), short ventral bristle \(\times 191 ; c\), elongated ventral bristle \(\times 191\) (after Horst). Pseudeutythö̈ acarunculn!a Monro: \(d\), anterior end from above; \(e, f\), dorsal bristles
\(g\), short ventral bristle; \(h\), fine ventral bristle.
Ps. ambigua Monro: \(i\), anterior end, from above, eyes not shown; \(k\), dorsal bristle; \(\boldsymbol{l}, \boldsymbol{m}\), ventral bristles (after Monro).
divided into two regions by a transverse groove running a little way behind the lateral tentacles, and more or less rectangular; broader than iong behind: the hinder part is not heart-shaped as in Ps. paucibranchiata Fauvel. - The
caruncle is a rounded pad lying in the first chaetiger. Two pairs of minute, inconspicuous eyes. Branchiae from the 3rd setigerous segment to the 43rd, large and conspicuous. Dorsal cirr long. Dorsal setac: (1) long, smooth capillary; (2) harpoon-shaped. Ventral setae: (1) upper bifurcate, with long spur; (2) very long capillary; (3) stout short furcate, with longer limb serrated. (Bristles as in Ps. paucibranchiata.)

Length: up to 47 mm . by 2 mm .
Occurrence: Maldive Archipelago.
Distribution: Gulf of Panama; Maldive Archipelago.

\section*{Genus PARAMPHINOME Sars.}

Body moderately elongate, vermiform; seginents few. Prostomium rounded, no eyes. Caruncle small. 'Three tentacles. Palps cushion-like, with subulate palpostyles. Feet biramous, with dorsal and ventral divisions far apart. Dorsal setae of two kinds: (1) harpoon-shaped and (2) capillary. Ventral setae also of two kinds: (1) short, bifurcate; and (2) long, capillary, with, or without, basal spur. Acicula hastate. Two strong curved hooks on each side of the first setigerous segment. Gills only on anterior segments. Anus terminal.

\section*{67. Paramphinome indica Fauvel. (Figs. 44, \(a-h ; 45 a-f\) ).}

Paramphinome indica, Fauvel, 1932, p. 51, text-fig. 10, pl. I, figs. 9-16.

Body cylindrical, slightly flattened anteriorly. Prostomium cyeless, globular, rounded anteriorly, very slightly bilobed backwards, with a very small oval or triangular caruncle set into the first segment. Two filiform lateral tentacles; median tentacle long, raised, inserted at the back. Palpostyles tentacle-like. On the first setigerous segment a long dorsal cirrus and a slightly shorter ventral one, and, in front of the setae, two strong, curved, transparent hooks. No ventral cirrus on the second setigerous segment: on the third and the following ones both a dorsal and a ventral cirrus. Branchiae 10-13 pairs, from the 4th setigerous to the 13 th-16th; they are very large, entirely covering the body and feet, divided into many branches bearing lateral filaments, simple or bifurcate. Both rami wide apart. In the posterior abranchiate region, of \(10-13\) segments, a short blunt dorsal process, with a long cirrus and a tuft of capillary setae, a larger ventral
ramus with two fillets, an anterior conical, and a posterior rounded, a little shorter; a ventral cirrus and very long setae. Dorsal setae of two kinds: (1) large, straight, har-poon-shaped bristles, (2) long and slender capillary. Ventral setae also of two types: (1) short, with tip of the shaft bifurcate, one of the limbs large, curved, serrated,

Fig. 44.-Paramphinome indica Fauvel: \(a\), dorsal view \(\times 3\); \(b\), anterior end, dorsal view \(\times 7\); \(c\), head, ventral view \(\times 7\); \(d\), probuscis cxtruded \(\times 7\); \(e\), proboscis cxtruded, side view \(\times 7\); \(f\), third setigerous foot \(\times 25\); \(g\), second setigerous foot \(\times 25 ; h\), hooks from ist setigerous foot \(\times 185\).
the other much smaller, slender and smooth, and longer and slender serrate setae, with a small basal spur. Acicula hastate. Anus terminal.

Length: \(15-20 \mathrm{~mm}\). by \(4-5 \mathrm{~mm}\).
Colourless in spirit.
Occurrence: Arabian Sea, 530 fms.; Cape Comorin 881-891 fms. Green mud.

\section*{Genus BENTHOSCOLEX Horst.}

Body oblong oval, agrecing in general appearance with that of Chloeia. Caruncle short, with three parallel longitudinal ridges. Eyes absent. Branchiae commencing on the 6th segment, strongly developed on the posterior segments. Furcate bristles. An unpaired anal cirrus (Horst).
(68. Benthoscolex caecus Horst. (Fig. 43, a-c).
benthoscolex caecus, Honst, 1912, p. 38, pl. X, fig. 11-16.
Body tapering in front and behind. Prostomium small, heart-shaped, with a short caruncle consisting of

Fig. 45.-Paramphinome indica Fausel: a, large dorsal smooth bristle \(\times 150 ; b\), harpoon-shaped bristle from hind foot \(\times 380 ; c\), furcate ventral bristle from 3rd setigerous segment \(\times \mathbf{3 8 0}\); d, furcate ventral bristle \(\times 380\); e, acicular bristle \(\times 380\); \(f\), slender furcate capillary seta \(\times \mathbf{3 8 0}\).
three longitudinal ridges, that do not extend beyond the first segment. No eyes present. A median tentacle in front. Lateral tentacles nearly as long as the median one, set on each side of the median dorsal line. Cushion-like palpophores with tentacle-like palpostyles. An unpaired
anal papilla, faintly emarginated and a subterminal dorsal anus. Well developed branchiac from the 6th segment, in dense clusters of numerous filaments; on the last \(5-6\) segments they are more numerous, crossing over the back and forming large bushy terminal clusters. Dorsal cirri about the length of the setae, ventral cirri shorter, with the exception of the last \(3-4\) ones which are filiform and very long. Dorsal and ventral bundles of bristles stiff and alabaster-white. Ventral ramus with only bifurcated setae as follows: (1) with a long limb, plain, or with \(1-3\) denticulations, and a short limb, like a spine, and much more slender setae with a long limb, coarsely denticulated, and a short limb like a spur. Dorsal setae alike, but fewer and shorter and mixed with harpoon-shaped ones.

Length: \(34-37 \mathrm{~mm}\). by 10 mm .
Occurrence: Ceylon; Laccadive Sea.
Distribution: Flores Sea; Ceylon; Laccadive Sea.
Genus CHLOEIA Savigny.
Body oval, caruncle composed of a plaited crest, arising from a horizontal plate, folded along its margin. Pinnate branchiae. All bristles more or less bifurcated; the ventral ones smooth, those of the dorsal fascicle, in some anterior segments, smooth, in those of the postcrior body-region, serrated along the outer border. Two anal cirri sausage- or finger-shaped. Anus in the last segment. Only one pair of dorsal cirri on each segment.

Chloeia violacea, Horst, 1912, p. 22, pl. VI, fig. 8, pl. VIII, figs. 8 -11: Monro, 1937, p. 253.

Body pale yellow or greyish brown. In each segment, a violet or orange spot shaped like an inverted T , the transverse arm of which lies just in front of the hinder intersegmental groove. Dorsal cirri purple, and also a

Fig. 46.-Dorsal patterns of Chloeia species: a, Ch: flava (Pallass) \(\times 4\); b, var. pulchella \(\times 10\); c, Ch. amphora Horst \(\times 5\); d, Ch. fusca McIntosh \(\times 8\); e, Ch. violacea Horst \(\times 8\); \(f\), Ch. parra Band \(\times 6 ; \mathrm{g}, \mathrm{Ch}\). conspicua \(\times 4\) (after Horst); \(h\), Ch. rosea Potts, two middle segments (after Potts); i, Ch. flaza (Pallas) head and caruncle, enlaged.
violet-stripe runs over the middle of the caruncle which extends upon the 4th segment. First branchia on the 4th segment.

Length: \(9-20 \mathrm{~mm}\). by \(2-5 \mathrm{~mm}\).
Occurrence: Gulf of Oman.
Distribution: Malay Archipelago; Gulf of Oman.
70. Chloeia flava Pallas. (Fig. 46, d).

Chloeia flava, McIntosh, 1885, p. 8, pl. III, figs. 1-3: Horst, 1912,
p. 18, pl. XII, fig. 2: Fauvel, 1932, p. 55.

Chlocia capillata, Milne-Edwards, 1849, pl. IX.
Chloeia incerta, Quatrefages, 1865, p. 388.
Chloeia ceylonica, Grube, 1874, p. 325.
Chloeia tumida, Baird, 1870, p. 232, pl. IV, fig. 7, a-d.
Median dorsal purple spots varying in shape from a narrow ellipse to a circle. Setae varying from alnost pure white to a bright yellow or pale green. Tentacles and dorsal cirri more or less violet or deep purple. Branchiac unpigmented or brown. Caruncle extends posteriorly to the commencement of the 4th segment and ends with a free tapering extremity.

Length: \(100-120 \mathrm{~mm}\). by 4 mm .
Occurrence: Singapore; Andaman Islands; Bay ot Bengal, Ceylon, Mandapam, Palk Strait. At Port Blair caught on a fishing line, on hooks baited with meat. Feeds on small crabs, etc.

Distribution: Japan, Pacific and Indian Oceans.
71. Chlocia parva Baird. (Fig. 46, f).

Chloeia paria, Baird, 1870, p. 233, pl. IV, fig. 8, \(a-b\) : Horst, 1912, p. 19, pl. VII, fig. 4, pl. VIII, fig. 1-3: Fauvel, 1932, p. 56.

Chloeia merguiensis, Beddard, 1887, p. 258, pl. XXI, figs. 2, 8, 9.

Body tapering posteriorly. Along the centre of the back, on each segment, there is a dark mark in shape somewhat like the Roman T, or rather the Greek Y. The caruncle extends to the anterior part of the 6th segment and its crest is surmounted with a black wavy line.

Length: 20-70 mm.
Occurrence: Penang; Andaman Islands; Sandheads, Mouth of Hughli River; Chandipur, Balasore, Orissa; Vizagapatam; Ceylon.

Distribution: Pacific Ocean, New Guinea, Java; Indian Ocean, Sumatra, Mergui, Andaman Islands, West Coast of India, Gulf of Oman.
72. Chlocia amphora Horst. (Fig. 46, c).

Chloeia amphora, Horst, 1912, p. 21, pl. VII, fig. 6, pl. VIII, Gigs. 6-7: Fauvel, 1932, p. 56.

Each segment shows in the middle a violet spot, somewhat resembling a roman Amphora, surrounded by a white band. The dorsal cirri are dark-violet, the ventral ones colourless. The caruncle bears about 20 lateral folds and extends to the anterior border of the 4th segment (Horst).

Length: \(16-26 \mathrm{~mm}\). by 7 mm ., without the bristles. 26 segments.

Occurrence: Port Blair, Andaman Islands; Nankauri Harbour, Octavia Bay, Nicobar Islands.

Distribution: Malay Archipelago; Andaman and Nicobar Islands.
73. Chloeia fusca McIntosh. (Fig. 46, d).

Chloeia fusca, McIntosh, 1885, p. 14, pl. 11, figs. 1-2: Potts, 1909, p. 356, pl. XLV, figs. 1-2: Horst, 1912, p. 22, pl. VII, fig. 7: Monro, 1924, p. 72: Fauvel, 1932, p. 56.
Chloeia longisetosa, Potts, 1909, p. 357, pl. XLV, fig. 5.
Back uniformly dusky brown, or purple-violet, or pale ground colour with a couple of longitudinal purple stripes near the dorsal middle line. Beneath each dorsal bundle of bristles is a purple ring shading off into orange; the dorsal cirri are dark-purple.

Remarks: Chloeia longisetosa is the epitocous state of Ch. fusca.

Length: \(10-20 \mathrm{~mm}\). by 4 mm .
Occurrence: Nankauri Harbour, Octavia Bay; Cape Comorin 556 fms.; Maldive Archipelago.

Distribution: Australia, China, Bay of Bengal, Amirante Islands.
74. Chlocia rosea Potts. (Fig. 46, h).

Chlocia rosea, Potts, 1909, p. 357, pl. XLV, fig. 3.
Body fusiform in shape, of a uniform reddish pink, even the setac being of the same colour. The branchiae are exceptionally well-developed and overlap the middle line. "It is very noticeable how closely this species adheres to the C. fusca type. The only differences from the original species are but trifling, viz., coloration, structure and arrangement of gills and the absence of a single type of seta" (Potts). It is probably a young form, or a colour variety of C. fusca.

Length: 11 mm . by 3 mm ., 20 segments.
F. 15

Occurrence: Burma; Bay of Bengal; Arabian Sea; Persian Gulf.

Distribution: Bay of Bengal; Arabian Sea; Persian Gulf; Amirante Islands.

\section*{Genus NOTOPYGOS Grube.}

Body oval. Caruncle composed of a plaited crest arising from a horizontal plate, folded along its margin. Branchiae ramified, not pinnate. An accessory dorsal cirrus at the proximal side of each branchia. All bristles bifurcated, smooth or denticulated. Two anal club-shaped cirri. Anus dorsal, subterminal.

Key to the species of Notopygos.
1. A triangular brownish area on the back \(\quad . . \quad\).. labiatus McIntosh, p. 99.
A chequered pattern on the back
2. Caruncle rounded posteriorly, with 30 marginal folds on each side Crest of the caruncle separated from the wings by a smooth. linear, pigmented area on each side, obscured under the lax folds of the wing \(\quad .\). hispidus Potts, p. 100.
Smooth pigmented lateral area of the caruncle always to be seen variabilis Potts, p. 100.
75. Notopygos gigas Horst. (Fig. 47, a-c).

Notopygos gigas, Horst, 1912, p. 26, pl. IX, figs. 1-3: Augener, 1926, p. 439.
Body large, oblong oval, 33-36 segments. Pale buff, in the middle of the dorsum brown or violet, irregularly interrupted by a great number of white lines crossing each other in various directions: a dark band orcurs around the base of each notopodium, and the main stem of the branchiae is also dusky coloured. Caruncle extending to the anterior part of the 6th segment, rounded posteriorly and with 30 marginal folds on each side. Anterior pair of eyes longer than the posterior one. Anus on the anterior of 25 th segment, usually at the apex of a conical papilla. Bristles long and vitreous, both dorsal and ventral bifurcate, smooth, with a yellow tip on the first three segments only, denticulated. Setae with rather divergent fork.

Length: 45-75 mm.

\section*{Occurrence: Ceylon, Galle, Trincomali. \\ Distribution: Malaya Archipelago; India.}
76. Notopygos labiatus McIntosh.

Notopygos labiatus, McIntosh, 1885, p. 19; pl. II, fig. 6, pl. IV, fig. 2, pl. Ha, figs. 5, 6: Fauvel, 1932, p. 57.

Body large. On the dorsum a triangular brownish area indicates the junction of each segment. Caruncle extending to the 5th body segment. Four large eyes.

Fig. 47.-Notopygos gigas Horst: \(a\), dorsal bristle \(\times 230\); \(b\), ventral bristle \(\times 80 ; c\), dorsal bristle of first segment \(\times 230\) (after Horst).
\(N\). hispidus Potts: \(d\), two middle segments; \(e\), head and caruncle; \(f\), dorsal seta from 6 th segment (unidentate) \(\times 250 ; \mathrm{g}\). dorsal seta from 3rd segment (triserrate) \(\times 250\). N. variabilis Potts: \(h\), head and caruncle (after Potts).

Bristles very long, stiff and erect. On the first setigerous segments only, dorsal and ventral setae serrated: next, ventral setae with 2-3 serrations. Dorsal setae smooth. Anus dorsal, on the 20th-21st segment.

Length: \(\quad 20-40 \mathrm{~mm}\). by \(5-10 \mathrm{~mm}\)., setae included. The long straight, stiff, alabaster bristles give it a spincus caterpillar appearance.

Occurrence: Andaman Islands and Laccadive Sea.
Distribution: Pacific Ocean, Hawaiian Islands, Philippine Islands; Indian Ocean, Andaman Islands and Laccadive Sea.
77. Notopygos hispidus Potts. (Fig. 47, d-g).

Notopygos hispidus, Potts, 1909, p. 359, pl. XLV, figs. 6, 7, pl.
XLVI, figs. 3-5 : Fauvel, 1917, p. 192; 1919. p. 350 ; 1922, p. 493; 1932, p. 58.
? Notopygos labiatus, Benham, 1915, p. 205.
Body elongate. On the dorsum an irregular chequered purple pattern. Caruncle extending to the 5th setigerous segment. The crest is separated from the wings by a smooth linear pigmented area on each side. The lax folds of the wings and crest often come into contact and obscure the area: this is characteristic of the specics. Four black, large eyes, sometimes almost contiguous. Donsal setae not serrated; ventral setae serrated in the first few segments alone. Anus dorsal on the 21st segment.

Length: 24 mm . by 10 mm ., setae included.
Occurrence: Nankauri Harbour, Nicobar Islands, amongst coral.

Distribution: Australia; Philippine Islands; Indian Ocean, Red Sea.
78. Notopygos variabilis Potts. (Fig. 47, h).

Notopygos variabilis, Potts, 1909, p. 360, pl. XLV, fig. 9: Fauvel, 1931, p. 9; 1932, p. 58.

Body fusiform. Dorsum sometimes ornamented with a pattern of orange spots; most specimens almost without pigment. The folded regions of the caruncle are separated on each side by a smooth pigmented area which is always to be seen. Four large eyes. Dorsal setae nonserrated, ventral setae serrated in the first few segments only, or, sometimes, a few in the ventral bundles of the middle segments with a couple of well marked serrations underneath the hooked apex of the longer limb. Anus dorsal, position varying from the 22nd to the 25th seg. ment. Extensive variations.

Length: 30 mm . by 12 mm ., setae included.

Occurrence: Andaman Islands.
Distribution: Nankauri Harbour, Nicobar Islands; Andaman Islands; Maldive Archipelago.

\section*{Genus EUPHROSYNE Savigny.}

Body short, with few segments. Prostomium elongated and bending over the tip of the snout, partly ventral. Two pairs of eyes, one dorsal, the other ventral. Caruncle with three longitudinal, parallel lobes. A median tentacle and two small lateral ones. Two dorsal cirri on each side. A transverse sow of several branchial tufts on each segment. Two anal cirri. Bifurcate setae.

Key to species of Euphrosyne.
Tips of branchial divisions taper-
ing .. .. myrtosa Savigny, p. 101.
Tips of branchial divisions ex-
panded .. .. foliosa Milne-Edwards, p. 102.
79. Euphrosyne myrtosa Savigny. (Fig. 48, k-n).

Euphrosyne myrtosa, Savigny, 1820, p. 64, pl. II, fig. 2: Gravier, 1901, p. 254, pl. X. figs. 147-149: Augener, 1916, p. 95: Fauvel. 1923a, p. 139, fig. 49, \(k-n\); 1930a, p. 11, fig. 1; 1932, p. 59.
Euphrosyne ceylonica, Michaelsen, 1892, p. 2, pl. 1, fig. 1-4.
Body oval, 36-43 segments. Median tentacles blunt, with a broad base. Lateral tentacles very small. 6-8 branchial tufts in each transverse row, with terminal divisions blunt or tapering, not enlarged. Transverse rows of dorsal furcate setae of two kinds: (1) with unequal smooth limbs, and (2) serrated "ringent" bristles. Ventral setae with straight, smooth unequal limbs.

Length: \(10-20 \mathrm{~mm}\). by 5 mm .
Colour: In life bright pink or red.
Occurrence: Ceylon, Pamban, Krusadai Island, Sandy Point, among rocks.

Distribution: Pacific Ocean, Malay Archipelago; Indian Ocean, Red Sea; South Atlantic Ocean; Adriatic Sea.
80. Euphrosyne foliosa Audouin and Milne-Edwards (Fig. 48, \(a-h\) ).
Euphrosyne foliosa, Fauvel, 1919, p. 350, fig. 1; 1923a, p. 136, fig. 49, \(a-g\); 1932, p. 59.
Euphrosyne laureata, Horst, 1912, p. 11, pl. VI, fig. 10: Pruvot, 1930, p. 25, fig. 2.
Body oval, 30-36 segments. Median tentacle thick, cylindrical. Lateral tentacles very slender and shorter. 7-9 branchial tufts in each transverse row, with terminal divisions more or less expanded and hastate. Transverse

Fig. 48.-Euphrosyne foliosa Audouin \& M.-Edwards: a, dorsal view, enlarged; \(b\), head; \(c\), anterior part, ventral side; \(d\), foot; \(e, f\), tips of the gills; \(g\), ringent bristle \(\times 233 ; h\), ventral bristle \(\times 117 \&\) E. myrtosa Savigny: \(k\), falcigerous bristle; \(l\), furcate bristle; \(m\), ringent bristle; \(n\), gills' tips (after Gravier); i, E. intermedia Saint-Joseph epitocous stage of E. foliosa.

rows of furcate dorsal setae of two kinds: (1) with unequal smooth limbs, and (2) serrated "ringent" bristles. Ventral setae with smooth, unequal limbs.

Length: \(10-30 \mathrm{~mm}\). by 10 mm .
Colour: In life orange red, cinnabar or red-brick.
Occurrence: Nicobar Islands, Nankauri Harbour, Camorta Island, coral reef; Ceylon, Pamban.

Distribution: Malay Archipelago; Indian Ocean, Bay of Bengal, Persian Gulf, Red Sca; Atlantic Ocean, Mediterranean Sea.

\section*{Family HESIONIDAE Grube.}

Head with two pairs of eyes, two or three tentacles, and generally two biarticulate palps. Proboscis cylindrical, protrusible, armed or unarmed. Anterior segments (1-4) distinct, or more or less fused; each carrying two pairs of tentacular cirri. Other segments bearing uni- or bi-ramous parapodia, the dorsal ramus being often reduced to dorsal cirrus and acicula. Dorsal bristles, when present, simple. Ventral setae generally compound.

Key to the genera.
1. Two tentacles. Palps absent ..
Three tentacles. Palps present ..
The Savigny, p. 103.
2. Two pairs of
\(\begin{aligned} & \text { setae simple }\end{aligned}\)
tentacular cirri,
\(\ldots\) Ancistrosyllis McIntosh, p. 110.

More than two pairs of tentacular cirri .. .. 3
3. Six pairs of tentacular cini.

Feet biramous. Proboscis unarmed \(\quad . . \quad\).. Podarke Ehlers, p. 108.
Eight pairs of tentacular cirri. Body short, cylindrical . 4
4. Dorsal setae present .. Leocrates Kinberg, p. 105.

Dorsal setae absent .. Leocratides Ehlers, p. 107.

\section*{Genus HESIONE Savigny.}

Body short, cylindrical. Prostomium bilobed. Four eyes. Two very small tentacles. Palps absent. Proboscis unarmed. Eight pairs of tentacular cirri (4 pairs on each side). Parapodia uniramous. Dorsal cirri long, articulate. Setac compound, sickle shaped.

Key to the species of Hesione.
1. Dorsum generally spotted or chequered with brown rounded or elongate dots
pantherina Risso, p. 104.
On each dorsal segment a tran-
sverse row of brown broad
spots .. .. genetta Grube, p. 105.
Body pale yellow, numerous
narrow longitudinal brown
stripes segmentally broken. .. intertexta Grube, p. 105.
81. Hesione pantherina Risso. (Fig. 49) .

Hesione pantherina, Fauvel, 1923a, p. 233, fig. 87, (Synonymy); 1932, p. 60.
Hesione ehlersi, Gravier, 1900, p. 175, pl. IX, figs. 14-15.
Hesione splendida, Augener, 1918, p. 187; Pruvot, 1930, p. 27.
Hesione ceylonica Grube, Willey, 1905, p. 266.
Hesione eugeniae, Kinberg, 1857, p. 57, pl. XXIII, fig. 8.
Body very slightly tapering posteriorly. Segments few (about 16 setigerous), distinct only on the sides. Proboscis smooth, with a larger circular opening and a dorsal conical fleshy papilla near the base. Dorsal cirri long,

Fig. 49.-Hesione pantherina Risso: \(a\), natural size; \(b\), head and proboscis \(\times 8 ; c, d\), two feet from one specimen, enlarged; \(e, f\), compound setae with short and long end-piece \(\times 311 ; \mathrm{g}\), tip of a bristle \(\times 350\).
with many short articles, borne on a large cirrophore. Ventral ramus large, cylindrical, hollow, with black spines and ending in two small retractile conical lobes. Ventral setae heterogomph, with a long sickle-shaped terminal piece, bidentate at the apex, with a sub-apical spine very variable in length.

Length: \(\quad 30-60 \mathrm{~mm}\). by \(5-8 \mathrm{~mm}\).
Colour: Very variable, generally spotted or chequered, with brown rounded or elongate dots, often obsolete, or wanting in spirit.

Occurrence: Banka Strait; Nankauri Harbour, Nicobar Islands; Andaman Islands; Chilka Lake, Orissa Coast; Krusadai Island; Rameswaram Island; Ceylon; Arabian Sea.

Distribution: Pacific, Indian and Atlantic Oceans.
82. Hesione genetta Grube.

Hesione genetta, Grube, 1878, p. 102: Willey, 1905, p. 267: Fauvel, 1919, p. 370; 1923, p. 15; 1943, p. 9.
On each dorsal segment a transverse row of about 67 broad brown spots, the median one larger than the others. Very possibly this is a mere colour variety of \(H\). pantherina (Risso).

Occurrence: Ceylon, Chilwa Paar.
Distribution: Pacific Ocean, California, Samoa, Gambier Islands, Philippine Islands; Indian Ocean, Ceylon, Madagascar.
83. Hesione intertexta Grube.

Hesione intertexta, Grube, 1878, p. 102, pl. VI, fig. 5: Monro, 1926, p. 311; 1937, p. 270: Pruvot, 1930, p. 29.
Body pale yellow, dorsum with numerous, segmentally broken, narrow longitudinal stripes and a pair of brown spots on each intersegmental line.

Very likely a mere colour variety of the widespread H. pantherina (Risso).

Length: 40 mm . by 5 mm .
Occurrence: Gulf of Mannar; South Arabian Sea.
Distribution: New Caledonia; Philippine Islands; Australia; Indian Ocean.

\section*{Genus LEOCRATES Kinberg.}

Body short, cylindrical, segments few. Prostomium bilobed. Four eyes. Three tentacles. Two biarticulate palps. Proboscis with a chitinous jaw in the mid-dorsal and mid-ventral lines. Eight pairs of tentacular cirri. Parapodia biramous. Dorsal ramus small. Dorsal setae simple. Ventral setae compound. Dorsal cirri long, articulate.

Key to the species of Leocrates.

? Leocrates iris, Grube, 1878, p. 105.
Leocrates, spec. Gravely, 1927, p. 7, pl. IX, fig. 5.
Median tentacle short, subulate. Lateral tentacles slender, slightly longer than the palps. Facial tubercle

Fig. 50.-Leocrates diplognathus Monro: a, head, dorsal view \(\times 18\); \(b\), chaetal blade \(\times 850\) (after Monro). L. claparedii (Costa) : c, prostomium. enlarged; \(d\), foot \(\div 15 ; c\), lower bristle \(\times 250\); \(f\), part of dorsal simple bristle \(\times 350\); g , jaws.
large, blunt, more or less acorn-like. Upper jaw-plate single, hooked. Dorsal setae capillary, spinous. Ventral setae with a bidentate sickle-shaped terminal piece.

Length: \(20-45 \mathrm{~mm}\). by 4 mm .
Colour: Flesh-coloured in life, discoloured in spirit.
Occurrence: Singapore; Andaman Islands; Nankauri Harbour; Bay of Bengal; Ceylon; Gulf of Mannar.

Distribution: Japan; Indo-China; Indian Ocean, Persian Gulf, Red Sea; Mediterranean Sea.
85. Leocrates diplognathus Monro. (Fig. 50, a-b).

Leocrates diplognathus, Monro, 1926, p. 313: Fauvel, 1932, p. 62; 1939, p. 285.
Paired tentacles about twice as long as the palps, which are furnished with very stout basal articles. Facial tubercle more or less conical and not very prominent. The anterior and larger pair of eyes, which are not clearly marked out, arise on a level with the unpaired tentacle. Behind the posterior median furrow the prostomium curves back in a remarkable wing-like pair of folds (everted nuchal organs). The upper jaw-plate is composed of two pieces set together in the form of a bifid fan. Dorsal setae with well marked spines. In the ventral setae the teeth of the blade are large and widely separated. The lamelliform guard approaches the sub-apical tooth.

Length: \(\quad 20-30 \mathrm{~mm}\).
Colour: Dorsum a dark chestnut-brown traversed by intersegmental bands of white.

Occurrence: Mergui Archipelago, 65 fms .
Distribution: Macclesfield Bank; China Sea; Annam; Mergui Archipelago.

\section*{Genus LEOCRATIDES Ehlers.}

Differs from Leocrates in the absence of setae in the dorsal ramus, which is reduced to an aciculum at the base of the dorsal cirrus.
86. Leocratides ehlersi (Horst). (Fig. 51, a-c).
L.corratides chlersi, Horst, 1924, p. 194, pl. XXXVI, figs. 10-12: Fauvel, 1932, p. 62.
Prostomium heart-shaped. Two pairs of eyes, the anterior larger. Median tentacle tapering. The frontal tubercle bears, on each side between the base of the palps and tentacular cirri, a cushion-shaped appendage. The dorsal jaw is double, each half consists of a long shaft with an expanded anterior plate. Ventral jaw simple, conical.

Parapodia uniramous, only a couple of minute acicula in the base of the dorsal cirrus. Terminal blade of the ventral setae short, hook-shaped, slender, with only a single tooth and lacking the secondary process beneath the bifid tip. Differs from L. filamentosus Ehlers only in having a double dorsal jaw.

Length: 25 mm .

Colour: A brownish violet subneural band.
Occurrence: Andaman Sea.
Distribution: Salhe Bay, Sumbawa; Andaman Sea.

\section*{Genus PODARKE Ehlers.}

Prostomium quadrangular, with three tentacles on its anterior margin. Two biarticulate palps. Four eyes. Proboscis unarmed, with or without filiform papillae.

Fig. 51.-Leocratides chlersi (Horst): \(a\), foot \(\times 30 ; b\), dorsal jaws \(\times 30\);
\(c\), ventral jaw \(\times 30\) (after Horst). Podarke latifrons (Grube): \(d\), head, enlarged; \(e\), short ventral bristle; \(f\), foot from mid-body.
Six pairs of tentacular cirri. Parapodia sub-biramous. Dorsal cirri long. Dorsal setae few, often bifurcated. Ventral setae compound.

Key to the species of Podarke.
Dorsal cirri without a big cirrophore. Several furcate dorsal setae .. .. angustifrons (Grube), p. 109.
Dorsal cirri with a big cirrophore. 1 or 2 dorsal furcate
\(\begin{array}{lll}\text { setae } & \text {.. latifrons (Grube), p. } 110 .\end{array}\)

Irma limicola, Willey, 1905, p. 267, pl. III, figs. 74-76.
Prostomium rectangular. Small palps. Median tentacle small, fusiform. Proboscis with numerous long cilia on the anterior margin. Long smooth, or faintly ringed dorsal cirri. 6-7 simple dorsal setae and, some-

Fig. 52.-Podarke angustifrons (Grube): a, foot \(\times 35 ; b\), long compound bristle \(\times 380\); \(c\), short compound bristle \(\times 380\); \(d\), forked bristle \(\times 520\) (from Fauvel, 1932).
times, a furcate seta with long unequal limbs. Ventral ramus stout, with a conical lobe and a shorter rounded one. Ventral cirrus subulate, short. Upper ventral setae with a long, slender, terminal piece, hook-like with a sub-apical spine. Lower setae with a gradually shorter and broader terminal piece. Furcate setae.

Length: 16 mm .
Colour: In life, brown with white rings.
Occurrence: Camorta Island, Nicobar Islands; India, Pamban Island.

Distribution: Philippine Islands; Indo-China; India; Indian Ocean, Persian Gulf, Red Sea; Australia (?) ; New Zealand (i).
88. Podarke latifrons (Grube). (Fig. 51, \(d-f\) ).

Podarke latifrons, Fauvel, 1939, p. 288.
Irma latifrons, Grube, 1878, p. 109, pl. VI, fig. 6, pl. XV, fig. 11: Monro, 1926, p. 315.

Prostomium broader than long. Palps small. Median tentacle small, fusiform. Proboscis with long cilia on the anterior margin. Long dorsal cirri, smooth or faintly ringed, borne on a big cirrophore. A single dorsal seta, simple or furcate, often altogether absent on a number of feet. Ventral ramus stout, with a conial lobe and a shorter rounded one. Ventral cirrus short, subulate. Upper ventral sctae with a longer, slender terminal piece ending in a hook with a sub-apical spine. Lower setac with a shorter and broader terminal piece. Both kinds of setae more distinct than in \(P\). angustifrons. Furcate setae scarce.

Length: 77 mm . by 4 mm .
Occurrence: Singapore.
Distribution: Philippine Islands; Hongkong; Annam; China Sea; Singapore; Australia.

\section*{Genus ANCISTROSYLLIS McIntosh.}

Body elongated. Prostomium small. Eyes small or absent. Three tentacles. Large ovoid palps with very small palpostyles. Proboscis unarmed. ' \(\Gamma\) wo pairs of tentacular cirri. Dorsal ramus reduced to a cirrus, a slender enclosed aciculum and stout spine straight or curved. Ventral ramus short, with a bundle of simple capillary setae and, sometimes, a few furcate setae. A long ventral cirrus.

Key to the species of Ancistrosyllis.
Body rounded, stiff. Head very small, retracted into the first segments. Dorsal spines straight ... ..
Body fiat, soft. A distinct neck about the fourth segment. Head larger. Dorsal spines furved larger. .. .. constricta Southern, p. 111.
89. Ancistrosyllis rigida Fauvel. (Fig. 53).

Ancistrosyllis rigida, Fauvel, 1919, p. 373, fig. 4; 1923b, p. 16, fig. 3; 1932, p. 64; 1939, p. 288: Augener, 1927c, p. 134; 1927, p. 50.
Kynephorus inermis, Ehlers, 1920, p. 27, pl. III, figs. 1-9.

Body stiff, rounded dorsally. Head very small, retracted into the first segments. Palps ovoid, with a very short palpostyle and a small papilla. Median tentacle inserted between the paps; lateral tentacles very small, inserted on the palpophores. Four very small eyes. Parapodia borne on lateral square cushions. Dorsal and

Fig. 53.-Ancistrosyllis rigid Fauvel: \(a\), anterior part \(\times 15\); \(b\), foot \(\times 100\); \(c\), tentacular cirri \(\times 100\); \(d\), forked bristle \(\times 700\); \(e\), capillary bristle \(\times 400\).
ventral cirri fusiform. Dorsal ramus reduced to 1-3 slender enclosed acicula and a large blunt, faintly curved or straight spine from the 15 th-20th setigerous segment backwards. Ventral setae capillary, winged, and 1-2 furcate setae. Two anal cirri. General appearance wiry.

Length: \(10-35 \mathrm{~mm}\). by \(0.5-1.5 \mathrm{~mm}\).
Colour: In spirit, yellowish brown with lateral pads whish or reddish.

Occurrence: Andaman Islands; Madras and Orissa coasts.

Distribution: Gambier Islands; Indo-China; Malayan Sea; Indian Ocean, Red Sea; Atlantic Ocean, Curaça.
90. Ancistrosyllis constricta Southern. (Fig. 54).

Ancistrosyllis constrict, Southern, 1921, p. 573, pl. XIX, fig. 1. Fauvel, 1930, p. 64.

Greatest width at the anterior end, a distinct neck at the 4th setigerous segment, after which the body becomes flat. Peristomium and three anterior segments longer than the succeeding ones. Flattened palps with a small palpostyle. Median tentacle twice as long as the laterals, which project a little beyond the palps. Dorsal cirri on the first setigerous segment very long and tapering. An

Fig. 54.-Ancistrasyllis constricta Southern : a, anterior end, dorsal view \(\times 31\); \(b\), 40th right foot \(\times 78\); \(c\), part of dorsal lobe of 80 th right foot, posterior view \(\times 257\); \(d\), anterior dorsal seta from lst foot \(\times 436\) (after Southern).
enclosed dorsal slender aciculum and, between the 30 th and 40th feet, a stout sickle-shaped seta. Minute papillae on the base of the dorsal cirrus. Ventral setae capillary, smooth or faintly serrated and, in the anterior feet, shorter and coarsely serrated setae.

Length: 19 mm .155 segments.
Occurrence: Chilka Lake; Vizagapatam. On muddy or sandy bottom.
Incertae Sedis.

\section*{Genus TALEHSAPIA Fauvel.}

The characters of the genus are those of the only species known.
91. Talehsapia annandalei Fauvel. (Fig. 55, \(a-h\) ).

Talehsapia annandalei, Fauvel, 1932, p. 251, pl. IX, figs. 13-20; non Fauvel, 1935, p. 333, fig. 6.

Body filiform, cylindrical; teguments smooth and shining. First five segments slightly swollen. The prostomium is a blunt cone, destitute of eyes, tentacles and processes of any kind. Mouth broad. Proboscis soft, cylindrical, transparent, without any papillac. Pharynx extending to the middle of the 5th setigerous segment, ventricle with a pair of horny jaws, shaped, on each side, as a brown, sharp hook with an accessory paragnath. The

Fig. 55.-Talehsafia annandalei Fauvel: a, anterior end. compressed. showing the jaws \(\times 6 ; b\), segments of posterior end \(\times 6 ; c\), dorsal ramus and stout acicular bristle \(\times 54 ; d\), jaws, dorsal view \(\times 43\); \(e\), foot \(\times 59 ; f\), \(g\), hispid setae \(\times 270 ; h\), anterior end, proboscis partly extruded, pharynx and jaws seen through the body walls of the cleated specimen \(\times 6\).
first five segments are slightly swollen. The fect consist of a blunt cylindrical setigerous lobe with a very small ventral cirrus. There is no dorsal cirrus. A stout aciculum, often reddish at the tip, does not protrude outwards. The setae are all simple, straight or slightly curved, and minutely hispid. In front view they look faintly bipectinate. Above the setigerous lobe a stout acicular bristle arises from a broad blunt cone, sometimes accompanied with a very slender, filiform capillary seta. Two short anal cirri (?).
F. 17

Length: \(\quad 30-32 \mathrm{~mm}\). by 1 mm . \(54-80\) segments, the last ones moniliform.

Colour: In spirit, ycllowish-white, with broad, rounded, purple spots on the sides, encircling the feet.

Occurrence: Talch-Sap, Gulf of Siam (brackish water?). Only two specimens known.

Remarks: At first, I wondered whether this species were not an aberrant Eunicid; later, a comparison with Loandalia Monro and Ancistrosyllis McIntosh suggested its attribution to the Hesionidae as more likely. The fragments of a worm from Annam which I attributed to Talehsapia (1935, p. 333) belong to a Loandalia spec. and not to the species from Taleh-Sap.

Family PHYLLODOCIDAE Grube.
Body generally long and slender; segments very numerous. Prostomium conical, oval or heart-shaped. Two eyes. Four or five tentacles. Proboscis unarmed. Segments 1-3 modified, bearing tentacular cirri. Fect uniramous. (Exceptionally biramous.) Dorsal and ventral cirri foliaceous. Setae compound.

Key to Subfamilies and genera.

Genetyllis castanea, Bergström, 1914, p. 158, fig. 53.
Prostomium oval or rounded. Tentacular cirri more or less flattened. Dorsal cirri very large, cordate, those on anterior feet broader, more rounded than the posterior ones. Ventral cirri reniform.

Length: \(10-20 \mathrm{~mm}\).
Colour: Deep red, rusty or chestnut-brown in spirit.
Occurrence: Tuticorin pearl bank; Ceylon.
Distribution: California; Japan; Australia; New Zealand \(_{i}\) Ceylon; Persian Gulf; Red Sea.
93. Phyllodoce quadraticeps Grubs. (Fig. 56, \(f-j\) ).

Phyllodoce quadraticeps, Grubs, 1878, p. 98, pl. VI, fig. 2: Graver, 1900, p. 198, pl. X, figs. 22-24: Fauvel, 1930, p. 511, 1932, p. 68.

Sphaerodoce quadraticeps, Bergström, 1914, p. 50.
Body long, slender. Prostomium nearly square, with a small posterior notch and a very minute occipital papalla. Short knob-like tentacles. Tentacular cirri of the three anterior pairs short, swollen, ovoid; those of the fourth pair subulate. Dorsal cirri thick, rounded, rather small.

Fig. 56.-Phyllodoce castaneda (Marenzeller): a, anterior end (after Izuka); \(b\), anterior foot \(\times 40\); \(c\), hind foot \(\times 31\). Ph. (i) zcylanica

Willey: d, head, e, dorsal cirrus (after Willey). Ph. quadratreps Grube: f, anterior end; g, hind foot. Ph. malmgreni Graver: \(h\), foot (after Gravies).

Length: 200 mm . by 2-3 mm.
Colour: Back dirty yellow; on each segment a broad dark-coloured transverse streak. Thick dorsal cirri pale yellow.

Occurrence: Camorta Island, shore collecting; Sumatra. Distribution: Pacific Ocean; Korea Surd, New Talcdonia, Philippine Islands; Indian Ocean, Bay of Bengal, Red Sea.
94. Phyllodoce malmgreni Gravier. (Fig. 56, h).

Phyllodoce malmgreni, Fauvel, 1919, p. 360; 1932, p. 68.
Prostomium heart-shaped. Tentacular cirri long, subulate. Papillac of the base of the proboscis more or less conical, scattered in numerous irregular longitudinal rows. Dorsal cirri sub-rectangular or sub-rhomboidal. Body slender.

Length: \(40-70 \mathrm{~mm}\).
Colour: Back yellowish, with a dark spot on each segment; " green in lite with a double row of black spots."

Occurrence: Vizagapatam.
Distribution: India; Red Sea.
95. Phyllodoce gracilis Kinberg. (Fig. 57).

Phyllodoce gracilis, Kinberg, 1857-1910, p. 55, pl. XXII, fig. 2: Fauvel, 1932, p. 69, fig. 12.

Fig. 57.-Phyllodoce gracilis Kinberg: \(a\), bristle \(\times 520 ; b, c\), feet \(\times 65\); d, e, dorsal cirri \(\times 65\); \(f\), \(g\), ventral cirri \(\times 65\) (from Fauvel 1932).

Long, slender body. Prostomium heart-shaped. Two large eyes. Tentacular cirri long, subulate. Base of the proboscis covered with numerous scattered small papillae. Dorsal cirri small, oval. Ventral cirri similar, smaller.

Length: 25-30 mm. by 1 mm .
Colour: In spirit, greyish-white, dorsal and ventral cirri thickly dotted with rusty brown spots.

Occurrence: Andaman Islands.
Distribution: Australia (?) ; Society Lslands; Andamen Islands.
96. Phyllodoce fristedti Bergström. (Fig. 58, a-b).

Phyllodoce fristedti, Bergström, 1914, p. 152, fig. 49, pl. III, fig. 1, Augener, 1926, p. 445.
? Phyllodoce macrolepidota, Schmarda, 1861, p. 83, pl. XXIX, fig. 229 (non Willey 1905).
Body very long and slender. Prostomium heartshaped, with an occipital papilla. Numerous irregular rows of small papillae on the basc of the proboscis. Tentacular cirri subulate, the longer ones reaching to the 6th -7 th segment. Average dorsal cirri oval-lanceolate, nearly twice as long as broad. Ventral cirri broad and blunt.

Fig. 58.-Phyllodoce fristedii Bergström: a, head and proboscis \(\times 4\);
\(b\), foot (after Bergström). Ph. (Anaitides) dissotyla Willey: \(c\), head; d, foot (after Willey).

Length: 200 mm . by 3 mm .
Colour: In life, body blue, cirri yellow. In spirit, light brown.

Occurrence: Ceylon, Trincomali.
Distribution: Indian Ocean.
Remarks: This species is closely allicd to Ph. laminosa, differing chiefly by its more narrow and longer dorsal rirri.

Incertae Sedis.
97. Phyllodoce ( \({ }^{\text {) }) ~ z e y l a n i c a ~(W i l l e y) . ~(F i g . ~ 56, ~ d-e) . ~}\) Anaitis zeylanica, Willey, 1905, p. 262, pl. 111, figs. 57-60.

Body slender, " head rounded, eycs large, tentacular cirri normal, clongate. Proboscis (dissected) consists of two well-separated portions, a thin walled proximal or adoral portion densely covered with papillae, not scrially disposed; a thick walled distal portion with six prominent rows of large sub-triangular papillae, six or seven in a row. Dorsal phyllodes broadly ovate (cordatc-lanceolate) as they are in a doren other species". (Willey.) Shafts of the setae terminating in a triangular apex, fringed at the sides and articulating on one side with a long, flagelliform, strongly serrated appendix. Anal cirri acuminate.

Length: 38 mm . by 2 mm .
Occurrence: South Mannar Island: 8-9 fms.
Remalks: V'ry likely a Phyllodoce or a Genetyllis, more or less akin to \(I^{\prime} h\). castanea (\%), but not an Anaitis.

Subgenus ANAITIDES Cirerniavsky.
Prostomium heart-shaped. Papillae on the base of the poboscis arranged in 6 longitudinal rows on each side.

9R. Phyllodoce (Anaitides) dissotyla (Willcy). (Fig. 58, \(c-d\) ).
Phyllodoce (Anaitides) dissotyla, Willey, 1905, p. 263, pl. III. figs. 63-6fi. Fauvel, 1911, p. 973.

Body long and slender. Prostomium longer than broad, heart-shaped, with a very minute occipital papilla. Two large eyes each with a lens. The antennae do not reach back to the cyes. Four pairs of long tentacular cirri. Proboscis with the adoral portion beset with longitudinal rows of rounded normal papillac; in two of the rows, median dorsal and median ventral, three large triangular papillac placed one behind the other, with normal papillae in front and behind in the same rows: two sets of three on opposite sides of the proboscis. Dorsal cirri rounded, not lanceolate, and strongly pedunculate. The setae are conspicuously heterogomph; their appendices with serrulated edge.

Length: \(18-25 \mathrm{~mm}\). by 1 mm .
Occurrence: Gulf of Mannar, 11 fms.
Distribution: India; Persian Gulf.
99. Phyllodoce (Anait:des) madeirensis Langerhans. (Fig. 59, \(d-h\) ).
Phyllodoce madeirensis, Langerhans. 1879, p. 307, pl. XVII, fig. 44: Fauvel, 1914, p. 111, pl. VI, figs. 5-13; 1939, p. 70. Phyllodoce sancti-vincentis, McIntosh, 1885, p. 166.
Phyllodoce sancti-josephi, Gravicr, 1900. p. 196, pl. X. figs. 2021.
? Phyllodoce foliosopapillata, Willey, 1905, p. 26t, pl. III, figs. 67-69.

Body slender, with a long tapering tail. Prostomium heart-shaped, with an occipital papilla. Proboscis with

Fig. 59.-Phyllodoce (Anaitides) madeirensis langerhans: d, anterior end and proboscis \(\times 7\) (after Rioja); \(e\), anterior foot: \(f\), foot from mid-body; \(g\), dorsal cirrus, enlarged; \(h\), bi istle.

12 longitudinal rows ( 6 on cach side) of papillae at the base and, sometimes, a dorsal median row of 4-6 papillae. Dorsal cirri oval, lanceolate or sub-rhomboidal, very variable in shape; ventral cirri longer than the foot.

Length: \(200-600 \mathrm{~mm}\). by \(1-3 \mathrm{~mm}\).
Colour: In spirit, yellowish-white or light browp.

Occurrence: Malacca Straits; Mergui; Andaman Islands; Ceylon; Laccadive Sea.

Distribution: Pacific Ocean, China, Annam, Philippinc Islands, Australia, Malay Archipelago; Indian Ocean, Persian Culf, Red Sca; Atlantic Ocean, Mediterrancan Sea.
100. Phyllodoce (Anaitides) tenuissima Grube. (Fig 60, d).

Phyllodoce tenuissima, Grube, 1878, p. 95: Fauvel, 1932, p. 70: Augener, 1927a, p. 118.
Phyllodoce macrolefidota, Willey (non Schmarda), 1905, p. 265, pl. III, fig. 70-71.

Body very long and slender. Prostomium heart-shaped. Two large eyes. A very small occipital papilla. Probos-

Fig. 60.- Eulalia albo-picta Marcnzeller: anterior part \(\times 20\); \(b\),
55th foot \(\times 56\) (after Marenzeller). Notophyllum splendens
(Schmarda): \(c\), head, enlarged (after Willey). Phyllodoce tenuissima Grube ( \(=\) Ph. macrolepidota Willey, nonSchmarda): d, foot (after Willey).
cis with 12 longitudinal rows of papillae at the base and a dorsal median row of three brown papillae. Dorsal cirri broadly lanceolate or with the apex truncate, sub-quadrangular.' Ventral cirri about the length of the foot.

Length: 200 mm . by 3 mm .
Colour: In life, bright green, with red and yellow markings. In spirit, yellowish with transverse dark-blue iridescent streaks.

Occurrence: Nicobar Islands; Ccylon.
Distribution: New Zealand; Australia; Philippine Islands; Nicobar Islands; Ceylon.

Remarks: Perhaps a mere colour variety of Phyllodoce madeirensis Langerhans.

\section*{Genus EULALIA Oersted.}

Body long and slender, segments numerous. Prostomium conical, oval or pyriform. Two eyes. Five tentacles. Proboscis long and papillose, rarely smooth. Fuur pairs of tentacular cirri, borne on three more or less distinct segments. Parapodia uniramous. Setac compound.

Key to the species of Eulalia.
1. Dorsal cirri heart-shaped .. 2

Dorsal cirri lanceolate .. 3
2. Proboscis smooth .. sanguinea Oersted, p. 125. Proboscis with papillae .. albopicta Marenzeller, p. 123.
3. Ventral cirrus of second tentacular pair flattened, winged .. magalhaensis Kinberg, p. 124.
Ventral cirrus of second tentacular pair not materially flattened, not winged \(\quad .\). viridis (Muller), p. 122.
101. Eulalia viridis (Muller). (Fig. 61, \(a-h\) ).

Eulalia viridis, Fauvel, 1923, p. 160, fig. 57, a-h (Synonymy); 1930, p. 12.

Prostomium rounded. Median tentacle longer, inserted between the eyes. Very long proboscis beset with very numerous small papillae. Tentacular cirri cylindrical or slightly spindle-shaped, inserted on three distinct segments. Dorsal cirri enlongated, lanceolate. Compound setae with rather short terminal piece. Body long and slender.

Length: \(50-150 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: Bright green in life, dark olive or yellowishbrown in spirit. Var. aurea Gravier, gold yellow.

Occurrence: Pamban.

Distribution: Cosmopolitan. Atlantic, Indian and Pacific Oceans.
102. Eulalia albo-picta Marenzeller. (Fig. 60, \(a-b\) ).

Eulalia albo-picta, Marenzeller, 1879, p. 128, pl. III, fig. 3: Izuka, 1912, p. 207: Fauvel, 1932, p. 71.

Prostomium broader than long. Median tentacle arising from the middle of the dorsal surface of the prostomium, somewhat longer than the paired ones. Two large round eyes. First pair of tentacular cirri borne on the first segment, second and third pair borne on the

Fig. 61.-Eulalia riridis (Müller): \(a\), anterior part, enlarged; \(b\), average toot \(\times 40 ; c\), another dossal cirrus \(\times 40 ; a\), and and 3rd tentacular cirri \(\times 40\); e, bristle \(\times 400\). var. aura Graver: \(f\), foot \(\times 40\).
var. ornate Saint-Joseph: g, head and middle segment \(\times 30 ; h\), dorsal cirrus \(\times 20\).
second, which has a pair of rudimentary parapodia with bristles; fourth pair borne on the third segment. Dorsal cirri cordate, with sharply pointed tips and broad bases, in anterior segments; they become lanceolate in the posterior part of the body. Ventral cirri cordate, much smaller than the dorsal, shorter than the foot.

Length: 20 mm . by \(3-4 \mathrm{~mm}\).; setae included.
Colour: Irregular, transversely elongated, white spots on the back.

Occurrence: Nankauri Harbour; Nicobar Islands.
Distribution: South Japan; Nicobar Islands.

\section*{Subgenus PTEROCIRRUS Claparède.}

Ventral tentacular cirrus of the second segment flattened and winged.
103. Eulalia (Pterocirrus) magalhaensis Kinberg. (Fig. 62)

Eulalia magalhaensis, Kinberg, 1857-1910, p. 55, pl. XXXIII, fig. l: Fauvel, 1919, p. 364, fig. 3; 1932, p. 71.
Steggoa magalhaensis, Bergström, 1914, p. 129, fig. 35.
Eulalia tenax, Grube, 1878, p. 99, pl. VI, fig. 3.

Pterocirrus brevicornis, Ehlers, 1904, p. 17, pl. II, figs. 10-12.
Pterocirrus ceylonicus, Willey, 1905, p. 266: Fauvel, 1918, p. 356. Steggoa brevicornis, Augener, 1927a, p. 120.
Prostomium oval. Two large eyes. Tentacles subequal, longer than the prostomium. Three tentacular segments distinct. Ventral cirrus of the second tentacular pair flattened and winged. Proboscis covered with small papillae. Dorsal cirri clongated, lanceolate. Ventral cirri short and blunt.

Length: \(\quad 30-80 \mathrm{~mm}\). by \(0.5-1 \mathrm{~mm}\).
Colour: In spirit, dark greenish-brown.
Occurrence: Singapore: Mergui Mrchipelago; Gulf of Mannar; Ceylon.

Distribution: South Pacific Ocean, Australia, New Zealand, Philippine Islands; Bay of Bengal, India, Persian Gulf, Red Sea.

\section*{Subgenus EUMIDA Malmgren.}

Proboscis smooth.
104. Eulalia (Eumida) sanguinea Oersted. (Fig. 63, \(f-k\) ).
Eulalia (Eumida) sanguinea Oersted, Fauvel, 1923, p. 116, fig. 59, f-k: 1930, p. 12.
Eumida communis, Gravier, 1896, p. 18, pl. XVI, fịs. 7-10.
Eulalia pallida, Claparède, 1868, p. 246, pl. XVI, fig. 61.

Fig. 63.-Prlagobia longiciriata Giceff: a, anterior part, \(\times 29\) (after Reibisch); \(b\), foot; \(c\), bristle \(\times 124\); \(d\), Proserrate bristle \(\times 124\). Eumida sanguinea Gersted: \(f\), head \(\times 17\); g, female, foot \(\times 33\); \(h\), dorsal cirrus of male \(\times 33\);
k. var. communis Gravier: foot \(\times 49\)
(after Gravier).

Body rather short and attenuated at both extremities. Prostomium heart-shaped, broader than long. Two black eyes. Tentacles short, the median longer and inserted in front of the eyes. Proboscis smooth. Tentacular cirri cylindrical. Dorsal cirri heart-shaped, ventral cirri lanceolate, shorter than the foot. Setae with swollen, spinous shaft and long terminal pieces.

Length: \(30-60 \mathrm{~mm}\).
Colour: Very variable in life, violet, ochraceous, yellow, red-brown, or spotted.

Occurrence: Gulf of Mannar; Persian Gulf.
Distribution: New Zealand; Annam; Indian Ocean, Persian Gulf; Atlantic Ocean, Mediterranean Sea.

\section*{Genus NOTOPHYLLUM Oersted.}

Body thick. Prostomium conical or rounded. Two eyes. Five tentacles. Four pairs of tentacular cirri, borne on three distinct segments. Dorsal cirri broad and foliaceous. Parapodia biramous. Dorsal setae simple, ventral setae compound. Two anal cirri. Proboscis with soft, diffuse papillac. Nuchal organs cirriform or foliaceous, hanging backwards.
105. Notophyllum splendens (Schmarda). (Fig. 60 c).

Notophyllum splendens, Augener, 1913, p. 140, fig. 11: Fauvel, 1930, p. 515.
Macrophyllum splendens, Schmarda, 1861, p. 82, pl. XXIX, fig. 227.

Notophyllum laciniatum, Willey, 1905, p. 263, pl. III, figs. 61-62. Notophyllum imbricatum, Moore, 1906, p. 217, pl. X, figs. 1-3. Phyllodoce multicirris, Grube, 1878, p. 100, pl. VI, fig. 4.
Body short and thick. Prostomium rounded, with median tentacle between two large eyes. Behind the prostomium two pairs of occipital lappets, hanging backwards, and each divided into three cirriform processes. Tentacles and palps fusiform. Two pairs of tentacular cirri shorter than the others. Broad reniform, closely imbricating, dorsal foliaceous cirri. Dorsal ramus with one aciculum and a few simple setae. Ventral setae compound, with rather long serrulate end-piece.

Length: \(15-50 \mathrm{~mm}\). by \(1-4 \mathrm{~mm}\).
Colour: Greenish or brownish, in spirit.
Occurrence: Gulf of Mannar; Ceylon.
Distribution: Alaska; Japan; Australia; New Caledonia; Philippine Islands; Ceylon.

Genus ETEONE Savigny.
Body linear, segments numerous. Prostomium triangular, with four small tentacles on the truncate anterior border. Generally two small eyes. Two pairs of tentacular cirri. Dorsal cirrus absent on the second setigerous segment. Proboscis smooth, or with soft papillae and small chitinous tubercles. Dorsal and ventral cirri foliaceous. Setae compound.

Key to the species of Eteone
Proboscis smooth, or with soft papillac. (Subgenus Eteone) barantollae Fauvel, p. 127.
Proboscis with lateral rows of large, soft papillac and small spinous tubercles (Subgenus Mysta) .. .. ornata Grube, p. 128.
106. Eteone barantollae Fauvel. (Fig. 64, \(a-d\) ).

Etcone baiantollat', Fauvel, 1932, p. 72, fig. 13.
Body filiform, sub-cylindrical, segments very numerous. Prostomium broader than long, notched on each side. Two very small black eyes. Four small, short, knob-like tentacles. Proboscis smooth and transparent at the base, and with five longitudinal rows of large, soft, depressed,

Fig. 64.-Etcone barantollae Fauvel: \(a, b\), anterior foot, front and back view \(\times 112\); \(c\), foot from mid-body \(\times 112\); \(d\), posterior dorsal cirrus \(\times 112\).
rounded or squarish papillae anteriorly. The median dorsal row is broader than the lateral ones which are parted, on the ventral side, by a smooth longitudinal stripe. Two pairs of tentacular cirri subulate, somewhat lanceolate and flattened; the ventral larger than the dorsal, reaching backwards to the 4 th segment. On the 2nd segment a setigerous foot and a ventral cirrus, but no dorsal cirrus; average dorsal cirri small, rather thin, rounded or semi-oval, more or less symmetrical, borne on a large and short cirrophore. Feet conical, elongate. Ventral cirri conical or oval, relatively narrow and much shorter than the foot. Setae short, and shaft swollen at the joint. Anal cirri foliaceous, lanceolate.

Length: \(30-35 \mathrm{~mm}\). by \(1.5-2 \mathrm{~mm}\).
Colour: In spirit yellowish-white, cirri and feet lighter.

Occurrence: Banks of the canal near Barantolla, SaltWater Lakes, near Calcutta.
107. Eteone (Mysta) ornata Grube. (Fig. 65 a-d).

Eteone ornata, Grube, 1877, p. 106; 1879, p. 15: Izuka, 1912, p. 201: Fauvel, 1932, p. 73.
Mysta maculata, Treadwell, 1920, p. 593, figs. 1-4.
. ." Body elongated, with three striking longitudinal rows of violet pigment spots upon a pale-yellowish colour, towards the middle part of the body the pigment spots become gradually smaller and blend into a single streak, while in the posterior region of the body they entirely disappear. Dorsal cirri comparatively small and borne on a distinct stalk, as in E. armata Claparède (1868) and E. siphonodonta D. Ch. Prostomium roundish, triangular, somewhat broader than long, and longer than the peristomium; two eyes, small and dot-like." (Izuka). Prostomium notched on each side.

Occurrence: Sandheads.
Distribution: North Japan Seas; Philippine Islands; India.

\section*{Genus PARALACYDONIA Fauvel.}

Prostomium conical; four small tentacles at the tip. Peristomium achaetous and destitute of tentacular cirri. First setigerous segment uniramous. Succeeding segments biramous, dorsal and ventral divisions wide apart. .Dor-
sal and ventral cirri not foliaceous. Dorsal setae simple, ventral ones compound. Proboscis unarmed.
108. Paralacydonia weberi Horst. (Fig. 65, \(e, f\) ).

Paralacydonia weberi. Horst, 1922, p. 221, figs. 1-2: Fauvel, 1932, p. 74.

Paıalacydonia motenscui, Augener, 1924, p. 311, fig. 3; 1927b. p. 344.

Body flattened, square in section. Tentacles bi-annular. Eyes absent. The buccal segment and the first two setigerous ones bear, on their dorsal side, a transverse ridge-shaped enlargement and constitute together a kind of shicld provided with two shallow grooves behind the head. Parapodia resembling those of Nephthys. Dorsal ramus with a low, rounded, notched anterior lip: posterior

Fig. 65.-Eteone ornata Grube (=Mysta maculata?) \(a\), head \(\times 17\); \(b\), foot from mid-body \(\times 37\); \(c\), 15 th foot \(\times 37\); \(d\), compound seta \(\times 243\) (after Treadwell). Paralarydonia weberi Horst: \(c\), foot from mid-body (after Horst); \(f\), anterior part.
lip without lobes; a short erect dorsal cirrus and a bundle of simple setac. Ventral ramus with a short rounded posterior lip, an anterior one bilobed, the upper lobe large, triangular, erect, the inferior lobe smaller, rounded; a digitiform ventral cirrus, a fascicle of heterogomph compound bristles and no inferior simple setae. In the space between both foot-lobes the border is densely beset with long cilia.
F. 19

Length: \(25-35 \mathrm{~mm}\). by 4 mm ., feet included.
Colour: In spirit, a V-shaped streak of pigment at the base of the prostomium, in front of the two rectangular pads of the shield, with a small rounded external dot. Faint transverse streaks of pigment on several segments.

Occurrence: Of Akyab, Burma, 250 fms.
Distribution: Samoa; East Indies; south ol Flores: New Zealand; Burma.

\section*{Genus LOPADORHYCHUS Grubc.}

Body short, prostomium broad. Two cyes. Four tentacles. Two pairs of large tentacular cirri, and a thind, qudimentary or wanting, inserted on ant achactons segment fused with the prostomium. Setac simple on the tist and succeeding segments; next, simple and compound setac. Dorsal and ventral cirri foliaceous. Feet conical with a rounded lamella. Proboscis unamed.
109. Lopadorhynchus uncinatus Fausel. (Fig. fi6).

Lopadorhynchus unctnatus, Fauvel, 1916a. p. 37, pl. I. figs. 2, 3. pl. IV, figs. 4-14; 1923a, p. 181, fig. 67; 1939, p. 75: Momo, 1937, p. 266.

Fig. 66.-Lopadorlynchus uncinatus Fauvel: \(a\), whole animal \(\times 4\);
\(b\), anterior part dorsal view and \(c\), ventral view \(\times 6\); \(d\), 3rd setigerous segment \(\times 23 ; c\), 19th setigerout scgment \(\times 23\), f , hook from the ist setigerous scgment
\(\times 25\); g, compound bristle \(\times 78\).

Body divided into two clearly distinct regions, 25-32 segments. Third pair of entacular cirri reduced to a small conical process inserted on the base of the second pair. The first two setigerons segments resemble each other; they are much larger than the succeeding ones, point forwards, and are armed with stout sigmoid sharp bown hooks. Both are destitute of vental ciri, but have a collar.

Length: \(9-20 \mathrm{~mm}\). by 2.5 mm .
Colour: In spirit yellowish and dotted with small star-shaped brown markings.

Occurrence: Reef on N. side of Faladu Island, Horsburg Atoll, Maldive Archipelago.

Distribution: Maldive Archipelago; Atlantic Ocean, Mediterrancan Sea.

\section*{Genus PELAGOBIA Greeff.}

Four tentacles. No palps. Two pairs of tentacular cirri on the same segment. Dorsal cirrus of the next setigerous segment reduced. Parapodia uniramous. Dorsal and ventral cirri slender, elongate. Setigerous lobe with one aciculum and compound setae with a denticulate terminal piece. Two anal cirri. Proboscis smooth with numerous small glands.
110. Pelagobia longicirrata Greeff. (Fig. 63, a-d).

I' 'agsobin longuinata, Giceff, 1879, p. 247, pl. XIN, tigs. 23-25:: lauvel, 1923a. p. 192, fig. a-c; 1939, p. 276: Bergetrom, 1914.

Body short, small, broad in the middle, 15-24 segments. Tentacles filiform. Proboncis cylindrical, unammed, with longitudinal glands. Tentacular cirri subulate, eyual, with a small setigerous lobe and short setac. Dorsal cirrus of the scond setigerous segment wanting. Next, long dorsal cirri; ventral ones shorter: a conical lobe with an aciculum and compound setae with a very slightly denticulate or smooth shaft and terminal piece with a sharp denticulate edge and the other winged, smooth.

Length: 3-8 mm.
Colour: Colourless, transparent, or orange-red or dark-red, in lifc.

Occurrence: India.
Distribution: Japan; Indo-China; Indian Ocean; Mediterranean Sca; Antarctic Occan.

Family ALCIOPIDAE Ehlers.
Transparent, pelagic. Prostomium small, between two very large spherical red eyes. Five short and simple tentacles. Proboscis crowned with a row of papillac and, often, two very long lateral ones. Parapodia uniramous; dorsal and ventral cirri foliaccous. Setae simple or compound. Dark segmental glands. One or two anal cirri.

Key to the genera.

\section*{Genus ASTEROPE Claparède.}

Body short, cylindrical. Five short tentacles, the median reduced to a mere tubercle. Proboscis with two long lateral papillae and horny denticles. Three pains of tentacular cirri. Broad foliaccous dorsal and ventral cirri. Parapodia without cirriform processes. Setae compound with a long slender terminal piece. Segmental glands coloured and bulging. Pelagic.
111. Asterope candida (Delle Chiaje). (Fig. 67, a-d). Asterope candida, Fauvel, 1923, p. 202, fig. 75 (Synonymy).

Two pairs of very small lateral tentacles. Tentacular cirri of the first pair longer and united at the base by a transverse membrane. The first two setigerous segments rudimentary and, in the female, with dorsal cirri modified into globular seminal pouches. Dorsal cirri lanceolate; ventral cirri oval. A jutting acicular bristle, and long, slender, compound setae. Pelagic.

Length: \(150-250 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).

Colour: transparent, with red eyes; segmental glands brown or violet.

Occurrence: In plankton.

\author{
Distribution: China Sea; Ammam; Indian Ocean; Atlantic Ocean; Mediterrancan Sea.
}

Fig. 67.-Asterope candida (Delle Chiaje): a, male, anterior part \(\times 10\) (after Claparede); \(b\), female, ventral view, with four seminal pouches (after Hering); \(c\), foot \(\times \mathbf{2 5}\); \(d\), bristle \(\times 400\).

Genus ALCIOPA Audouin and Milne-Edwards.
Body cylindrical, transparent. Five tentacles, the median one reduced to a mere tubercle. Proboscis short, with two long lateral papillac, without horny denticles. Three pairs of tentacular cirri. First three setigerous segments rudimentary. Dorsal and ventral cirri foliaceous. Feet without cirriform processes. Setae capillary, simple. Segmental glands coloured and bulging. Pelagic.
112. Alciopa cantrainii Delle Chiaje. (Fig. \(68 a-c\) ).

Alciopa cantrainii, Fauvel, 1923, p. 203, fig. 76 (Synonymy).
Body abruptly attenuated forward and backward, rather plump and short. 70-120 segments. Median tentacle ovoid. Lateral tentacles spindle-shaped. Latge spherical eyes, obliquely directed. Proboscis short, crowned with trilobed papillae, the two lateral ones a little

Fig. 68.-Alciopa cantrainii Delle Chiaje: a, male \(\times 2\) (after citceff); \(b\), female, anterior part, with two seminal pouches (after Hering): (. foot fonm mid-boly \(>3^{5}\).
longer. First three pairs of feet reduced to dorsal and ventral fusiform cirri and acicular bristles. In the female, two globular seminal pouches on the second segment. Thenext dorsal cirri foliaceous, oval. Ventral cirri similar, smaller. Feet without cirriform process, with a long jutting acicular bristle and long, slender, simple capillary setae.

Length: \(40-110 \mathrm{~mm}\). by \(2-5 \mathrm{~mm}\).
Colour: Transparent, with red eyes; segmental glands brown.

Occurrence: Singapore, in plankton.
Distribution: Pacific, Indian and Atlantic Occans; Mediterranean Sea.

Genus VANADIS Claparèdc. (Alciopa, pro parte).
Body long, transparent; segments very numerous. Five short tentacles. Proboscis cylindrical, with two very long lateral papillac, without horny denticles. 3-4 pairs of tentacular cirri. Dorsal and ventral cirri foliaceous. Fect with a cirriform process. Setac all alike, compound, with a long, slender, terminal piece. Segmental glands strongly colourcd. Pelagic.

\section*{113. Vanadis formosa Clapac̀de. (Fig. 70, a-c).}
ranadis formosa, Fausel, 1923a, p. 205, fig. 77. (Synonymy): Momo. 19:37. p. 268.

Body very long, 900 segments or more. Median tentatle ciriform; two pairs of lateral tentacles alike. Two large spherical eyes directed downwards. Proboscis long, with trilobed papillac and two lateral, very long, ciniform ones. Three pairs of tentacular cirri, the first longer. First pair of feet reduced to dorsal and ventral cirri. Two pairs of seminal pouches in the female. Feet from the 2nd, in male, and 3rd, in female, with a heart-shaped elongate dorsal and ventral cirrus, a long cirriform process, a jutting aciculum and long compound setae with a slender terminal piece. Pelagic.

Length: 200-300 mm. by \(5-6 \mathrm{~mm}\).
Colour: Transparent with red eyes; brown segmental glands.

Occurrence: Arabian Sca, in plankton.
İistribution: Pacific Ocean; Indian Ocean; Arabian Sca; Allantic Ocean; Mediterranean Sea.

\section*{Genus GREEFFIA McIntosh.}

Body short. Five tentacles. Proboscis with two long lateral papillat, without horny denticles. Three or four pairs of tentacular cirri. There are no rudimentary feet. Dorsal and ventral cirri foliaceous. Feet with two cirriform processes. Sctac compound, with long terminal piece. Dorsal and ventral segmental glands coloured.
114. Greeffía celox (Greeff). (Fig. \(69 a-c\) ).

Grecffia celox, Fauvel, 1923a, p. 208, fig. 78 a-c; 1939, p. 283.
Nauphanta cclox, Greeff 1876, p. 69, pl. IV, figs. 40-42.
? Greeffia oahuensis McIntosh, Monro, 1930, p. 82, fig. 25.

Body somewhat broad and short, tapering backwards. About 60 segments. Median and lateral tentacles short, alike. Proboscis short, with two cirriform papillae. Three or four pairs of short tentacular cirri. All feet well developed. Dorsal cirri foliaccous, heart-shaped, imbricated. Ventral cirri rounded. Feet with two cirriform processes. Aciculum little or not jutting. Long compound setae with short terminal piece. Dorsal transverse segmental glands and globular ventral glands under the feet. Pelagic.

Fig. 69.-Greeffia celox (Greeff) : a, anterior part \(\times 16\) (after Grecff); \(b\), foot \(\times 12\); c, proboscis (after Apstein). Corynocephalus alhomaculatus Levinsen : d, dorsal view; \(e\), \(f\), anterior part, dorsal and ventral view, enlarged; \(g\), ventral view of two segments with papillae (after Levinsen); \(h\), anterior foot \(\times 20\); \(i\), foot from mid-body (after Apstein).

Length: \(20-60 \mathrm{~mm}\). by \(6-12 \mathrm{~mm}\).
Colour: Transparent with red eyes; segmental glands very dark.

Occurrence: Cauda, Poulo Condore; in plankton.
Distribution: Pacific, Indian, Atlantic and Antarctic Oceans.

Remarks: Greeff attributes four pairs of tentacular cirri to this species. In European, as well as Indian Ocean specimens, I have always found only three pairs.

\section*{Genus CORYNOCEPHALUS Levinsen.}

Body short, plump, segments few. Median tentacle carinated. 'Two pairs of lateral tentacles, inserted under the anterior margin of the prostomium. Two large spherical eyes. (Proboscis unknown.) 4-5 pairs of tentacular cirri. There are no rudimentary feet. Large folizceous, imbricated dorsal cirri. Ventral cirri foliaceous. Fcet without cirriform processes. Setae of two kinds: (1) short, acicular; (2) capillary, simple. Large ventral papillae (nephridial?) under the feet. Dorsal segmental glands small. Pelagic.
115. Corynocephalus albomaculatus Levinsen. (Fig. 69, \(d-i)\).

Corynocephalus albo-maculatus. Fatuvel 1923, p. 208, fig. 78, \(d-i\) (Synonymy); 1939, p. 281 .
Alciopina parasitica, Claparede. 1868, p. 253, pl. XXXIII.
Body short and broad, about 50 segments; anterior margin of the prostomium semi-circular. Median tentacle like a claviform crest between the eyes, ending behind in a free tapering tip. Two pairs of lateral tentacles, foliaccous, lanceolate, recurved under the prostomium. 1-5 pairs of tentacular cirri. All feet well developed. Dorsal cirri large, foliaccous, rounded or sub-rhomboidal; imbricated. Ventral cirri oval or subtriangular. Anterior feet with short acicular setac, and, from the fourth setigerous segment backwards, these are mixed up with very slender, simple, capillary setac. From about the 10th segment, large rounded ventral glands on the base of the feet. Dorsal segmental glands small. Pelagic.

Length: 32 mm . by 5 mm .
Colour: Yellowish, with a longitudinal band of white spots on the ventral surface. Habitat: when young in the gastro-vascular cavities of Cydippe and Hormiphora.

Occurrence: Cauda, Ream, Poulo Condore, Ceylon.
Distribution: Indo-China; India; Indian Ocean; Atlantic Ocean; Mediterranean Sea.

\section*{Genus RHYNCONERELLA Costa.}

Body slender, cylindrical. Five tentacles. Two large spherical eyes. Proboscis with small papillae, without long lateral papillae, without horny denticles. 4-5 pairs of tentacular cirri. There are no anterior rudimentary
feet. Dorsal and ventral cirri broad, foliaceous. Feet without cirriform processes. Setae of two kinds: (1) simple, acicular; (2) compound, with a slender terminal piece. Segmental glands little raised. Pelagic.
116. Rhynchonerella fulgens Greeff. (Fig. 70, \(\left.a^{\prime}-d^{\prime}\right)\).

Rhynchonerella fulgens, Fauvel, 1923, p. 210, fig. 79, a-d; 1939, p. 284: Augener, 1926, p. 446, fig. 3: Monro, 1937, p. 268.

About 60-80 segments. Median tentacle spindleshaped; two pairs of longer, finger-like, lateral tentacles. Proboscis with about twelve short, sub-equal papillae.

Fig. 70.-Vanadis formosa Claparède: a, male, proboscis extruded, enlarged; \(b\), female, ventral side, with four seminal pouches, enlarged; \(c\), foot \(\times 8\). Rhynchonerella fulgens Greeff. \(a^{\prime}\), malc, ventral side, enlarged; \(b^{\prime}\), head (after Greeff); \(c^{\prime}\), proboscis half extruded, ventral view \(\times 25\); \(d^{\prime}\), foot (after Apstein).
Five (four?) pairs of tentacular cirri. The dorsal cirrus of the third segment longer and directed forwards, the ventral one very small. From the first setigerous segment all feet well developed, with lanceolate dorsal cirrus; ventral cirrus smaller, oval. Anterior feet with several simple acicular setae and a few compuond setae; next, long slender compound setae and a lower acicular one. Male with large nephridial papillae under feet 10 to 13.

Length: 8-20 mm.
Colour: Transparent with red eyes; segmental glands brownish-red.

Occurrence: Ceylon; Arabian Sea; in plankton.
Distribution: Pacific Ocean, China Sea, New Guinea, Sandwich Islands; India, Arabian Sea; Atlantic Ocean; Mediterranean Sea.

\section*{Family TYPHLOSCOLECIDAE Uljanin.}

Pclagic. Body cylindrical or fusiform, transparent. Prostomium pointed. Nuchal organs projecting. Dorsal and ventral cirri foliaccous. Parapodia very small, with only an aciculum and a few small acicular bristles. Anal cirri foliaceous.

\section*{Genus TRAVISIOPSIS Levinsen.}

Prostomium conical, ending in a more or less sharp tip. A large caruncle encircled by two prominent elongated pads (nuchal organs). Dorsal and ventral cirri wide. apart. A retort-shaped organ in the head.

\section*{117. Travisiopsis lobifera Levinsen. (Fig. 71, a-d).}

Travisiopsis lobifera, Levinsen, 1885, p. 336, pl. I. figs. 17-20: Fauvel. 1916, p. 79; 1923, p. 229, fig. 86; 1932, p. 66: Southern, 1911, p. 33, pl. I, fig. 4.
? Plotobia simplex, Chamberlin, 1919, p. 155, pl. 46, fig. 1.
The tip of the prostomium is short. The caruncle is an oval pad encircled by the nuchal organs, which are two elongated cushions projecting backwards, not as far as in T. lanceolata, as figured by Southern (1911, pl. I, fig. 3) . The anterior ends of the nuchal pads do not meet before the caruncle. On each side a large spoon-shaped foliaceous cirrus. One pair of like cirri on the first two segments; next, lanceolate dorsal and ventral cirri provided with special sieve-like cells. Feet with an aciculum and 2 acicular setac. Anal cirri short, broad, rounded or subrectangular, rather variable. Retort organ well marked.

Length: \(20-25 \mathrm{~mm}\).
Colour: Yellow; in spirit whitish.
Occurrence: Arabian Sea, 200 fms. to surface.
Distribution: Pacific Ocean (?) ; Indian Ocean, Atlantic Ocean.

Family TOMOPTERIDAE Grubs.
Pelagic. Body translucent, divided into three parts: head, trunk and tail. Two diverging tentacles. One anterior pair of cirri armed with a very long acicular bristle. The other feet biramous and achaetous, with foliaceous margin bearing chromophile glands, hyaline glands or rosettes. Proboscis unarmed.

Genus TOMOPTERIS Eschscholtı.
Prostomium transverse, ovoid. Large eyes. Proboscis long and stout. Both divisions of the parapodia more or less conical, skirted all round by a membranous wing or pinnule.

Fig. 71.-Travisiopsis lobifera Levinsen: \(a\), (after Levinsen); \(b\), bristles; \(c\), dorsal cirrus; \(d\), head, enlarged (after Southern). Tomopteris planktonis Apstein: \(f\), 7th foot (after Malaquin and Carus). T. helgolandica Greeff: \(h\), young specimen \(\times 15\) (after Apstein); \(i\), 6 th foot (after M. and G.).
T. cavallii Rosa: 'a', shh foot (after Rosa). T. elegant Chum: \(b^{\prime}\), 4th foot (after Rosa); \(c^{\prime}\), 4th foot (after Malaquin).

\section*{Subgenus TOMOPTERIS s. str.}

Rosettes absent, hyaline glands generally present. Tail and first cirrus nearly always absent.

Key to the species of Tomopteris (Tomopteris).
1. With a tail. Hyaline glands dorsal. Chromophile glands
ventral .. .. mortenseni Augener, p. 141.
Without a tail .. .. 2
2. Chromophile and hyaline glands present
Hyaline glands absent .. cavallii Rosa, p. 141.
3. Hyaline glands present only on the dossal pinnules of 3rd and 4th foot
elegans Chun, p. 142.
Hyaline glands only on the vental pinnules
planktonis Apstein, p. 142.

\section*{118. Tomopteris (Tomopteris) mortenseni Augener.}

Tomopleris mortenscui, Augener, 1927, p. 123, fig. 5: Fauvel, 1932, p. 65.

Body with a short tail of reduced parapodia; about 19 segments preceding the tail. Prostomium convex, not notched. Two large eyes, tar apart. First pair of cirri absent. Second pair with bristles longer than the body. Pinnules skirt the parapodia all round, and are more or less frilled and bear very large chromophile glands, from the th foot backwards, on the ventral one. Hyaline glands present. Sting absent. (Rosettes on the dorsal trunk of the feet??). Planktonic.

Length: 25 mm .
Occurrence: Arabian Sea.
Distribution: South Australia; Arabian Sea.
119. Tomopteris (Tomopteris) cavallii Rosa. (Fig. 71, \(a^{\prime}\) ) Tomopteris cavallii, Rosa, 1908, p. 304, pl. XII, fig. 20: Fauvel, 1923, p. 222: Monro, 1937, p. 269.

Body oval lanceolate, tailless. \(15-20\) pairs of feet. Prostomium notched. First pair of cirri absent; second pair with birstles about as long as two-thirds of the body. Parapodial rami conical, slightly diverging. Pinnules broad, rounded, overlapping. Big cupola-like chromophile glands on the inferior part of the ventral ramus, from the th foot backwards. Rosettes, sting and hyaline glands absent. Planktonic.

Length: 12-13 mm.
Occurrence: North Arabian Sea, Ceylon.
Distribution: Indian and Atlantic Oceans.
120. Tomopteris (Tomopteris) elegans Chun. (Fig. 71, \(\left.b^{\prime}-c^{\prime}\right)\).
Tomopteris elegans, Rosa, 1908, p. 294, pl. XII, fig. 16. Fauvel, 1923a, p. 223, fig. 84, \(b-c\).
Tomopteris kefersteini, Apstein, 1900, p. 41 (non Greeff).
Body oval, tailless, 14 pairs of feet. Prostomum conical with a deep notch at the back. First pair of cirri conspicuous, second pair with bristles as long as about twothirds of the body. Conical lobes of the feet diverging. Pinnules broad, oboval. Apico-inferior bulging chromophile glands on the ventral ramus from the 4th foot backwards. Hyaline glands on dorsal pinnules only on Srd and 4th feet.

Length: 2-8 mm.
Occurrence: Indian Ocean, India.
Distribution: Indian Ocean; Atlantic Ocean, Mediterranean Sea.
121. Tomopteris (Tomopteris) planktonis Apstein. (Fig. 71, f).
Tomopteris planktonis, Rosa, p. 301: Fauvel, 1923, p. 284, fig. 84, f: Monro, 1937, p. 270.
Body oval, lanceolate, tailless; 13-18 pairs of feet. Prostomium not notched. First pair of cirri wanting. Second pair as long as three-fourths of the body. Bristles very slender. Parapodial lobes conical, pinnules oval. Voluminous cupola-like chromophile glands near the ventral insertion of the pinnule, from the 4th foot backwards. Transparent hyaline glands only on the ventral rami.

Length: 3-11 mm.
Occurrence: Central Arabian Sea.
Distribution: Arabian Sea; South-Georgia ?; Atlantic Ocean, Mediterrancan Sea.

\section*{Subgenus JOHNSTONELLA Gosse.}

Rosettes present, hyaline glands absent (not always). Generally a well marked tail and a first cirrus.

Key to the species of Tomopteris (Johnstonella).
1. Rosettes on the first two feet and on the pinnules \(\quad . \quad 2\)
Rosettes on the ventral part of the first two feet
2. With a tail
Tail absent. Only chromophile glands. Sting absent
helgolandica Greeff, p. 148. 3
rolasi Greeff, p. 143.
3. Chromophile and hyaline glands present. A ventral sting .. ducii Rosa, p. 143.
Chromophile glands only. A ventral sting .. 4
4. Body abruptly attenuated into a tail .. .. aloysi-sabaudiae Rosa, p. 144.
Body gradually attenuated into a tail
dunkeri Rosa, p. 145.
122. Tomopteris (Johnstonella) helgolandica Greeff. (Fig. 71, \(h, i\) ).
Tomopterts helgolandica, Fauvel, 1923, p. 221, fig. 83, h, i. Tomopteris catharina, Rosa, 1908, p. 283.

Prostomium oval, with short tentacles. First pair of cirri often wanting in aged specimens. Second pair with bristles about as long as two-thirds of the body. Parapodial lobes conical, with round or oval pinnules, lanceolate on the tail. A yellow rosette on the ventral ramus of the first two feet. Chromophile glands very small, at the inferior part of the ventral pinnulc. Sting absent.

Length: \(12-17 \mathrm{~mm}\).
Occurrence: Amboina.
Distribution: Indian Occan; Atlantic Occan, Mcditerranean Sea.
123. Tomopteris (Johnstonella) rolasi Greeff. (Fig. 72, a).

Tomopteris rolasi, Greeff, 1882, p. 384: Rosa, 1908, p. 281: Fauvel, 1935, p. 297; 1939, p. 281.
Body tailless; 12-15 pairs of feet. Long tentacles. First pair of cirri sometimes absent. Second pair hardly shorter than the length of the body. Yellow rosettes on the trunk of first and second feet and on the ventral pinnules of all the feet. Chromophile glands large and ventral. Sting absent.

Length: 8-10 mm.
Occurrence: Annam; Gulf of Siam.
Distribution: China Sea: Coast of Guinea; Ambonia; Atlantic Ocean.
124. Tomopteris (Johnstonella) ducii Rosa. (Fig. 72, d).

Tomopteris ducii, Rosa, 1908, p. 273, pl. XII, figs. 1-2: Monro, 1937. p. 269.

Body with a naked tail, one fifth of the body; 19 pairs of feet. Prostomium convex, not notched. First cirrus
long, second pair with bristles about as long as two-thirds of the body. Chromophile and hyaline glands. Rosettes on the trunk of the first two feet and a smaller one on both pinnules of the third segment and the following ones. \(A\) sting present.

Length: 20 mm .
Occurrence: Bay of Bengal; Arabian Sea.
Distribution: Pacific Ocean; Bay of Bengal, Arabian Sea; Coast of Mexico.

\section*{125. Tomopteris (Johnstonella) aloysi-sabaudiae Rosa.}

Tomopteris aloysi-sabaudiae, Rosa, 1908, p. 274, pl. XII. figs. 36: Fauvel, 1932, p. 66.
Body abruptly attenuated into a tail about as long as a third of the body, ending in a naked cylinder. Pros-

Fig. 72.-Tomopteris (Johnstonella) rolasi Greeff: \(a\), anterior part \(\times 16\) (after Greeff). T. dunkeri Rosa: \(b\), head; \(c, 5\) th foot. \(T\). ducii Rosa: d, 6th foot (after Rova).
tomium slightly notched, with frontal horns. First pair of cirri generally wanting (a small pair on young specimens?). Second pair of cirri with bristle about as long
as two-thirds of the body. All feet provided with a sting. On the first two pairs of feet a large rosette on the trunk, and, further back, on the pinnules. A chromophile gland from the first foot backwards. No hyaline glands present.

Length: 15 mm .
Occurrence: Arabian Sea.
Distribution: Arabian Sea; West coast of Mexico.
Remarks: Very close to T. dunkeri; differs chiefly by its naked tail.

\section*{120. Tomopteris (Johnstonella) dunkeri Rosa. (Fig.} 72, \(b, c\) ).
Tomopteris dunkeri, Rosa, 1908, p. 276, pl. X11, figs. 7-9: Fauvel, 1935, p. 297; 1939, p. 282: Monro, 1937, p. 268.
A tail with reduced feet, about as long as threetourths of the body, not naked at the extremity. A notch between the prostomial lobes. Frontal horns. First pair of cirri often absent. Sccond pair of cirri with bristles about as long as the body. All feet provided with a sting. On the first two pairs of feet are rosettes on the trunks and, further back, in the pinnules. A chromophile gland from the 3rd foot backwards. No hyaline gland present.

Length: 25 mm .
Occurrence: Ceylon.
Distribution: New Guinea; Indo-China; Gulf of Siam; Indian Ocean, Ceylon, Red Sea.

\section*{Family SYLLIDAE Grube.}

Body small, slender, elongated. Prostomium generally rounded or quadrangular. Three tentacles, two palps, four eyes. Two pairs of tentacular cirri borne on the first segment, which is achactous. Proboscis divided into two regions: (1) pharynx, with chitinous walls and one or more tecth and (2) a more or less barrel-shaped proventriculus. Feet uniramous, with a dorsal and a ventral cirrus, of which the latter may, however, be absent. Setae generally compound, with a terminal falcate, unidentate or bidentate, process. Swimming feet with simple dorsal bristles, in sexual forms.

Subfamily SYLLINAE.
Palps entirely free. Ventral cirri present. Tentacles and cirri clearly moniliform. Normal and schizogamic reproduction.

Genus SYLLIS Savigny.
Palps separate throughout. Tentacles and dorsal cirri moniliform. Opening of the proboscis with papillae only. A single antero dorsal conical tooth. Proventriculus short. Ventral cirri present, pinniform, unarticulate. Bristles compound, with falcate terminal piece; rarely simple. Reproduction normal or by alternation of generations.

Key to the species of Syllis.

Ş̦llis djiboutiensis, Cravier, 1900, p. 147, pl. IX, fig. 3: Fauvel, 1919, p. 353.
Body elongate, tapering. Pharynx long, tooth terminal. Proventriculus long. Dorsal cirri elongated, 20-30 articles. Compound setac absent. Simple, stout, hooked bristles, bidentate, with upper tooth simple or bifid.

Length: \(20-50 \mathrm{~mm}\).
Colour: Orange or yellowish.
Occurrence: Ceylon, Tuticorin, amongst sponges; Maldive Archipelago.

Distribution: Pacific, Indian and Atlantic Oceans; Mediterranean and Red Sca.
128. Syllis (Syllis) gracilis Grube. (Fig. 73, f-i).

Syllis gracilis, Fauvel, 1929a, p. 259, fig. 90 (Synonymy); 1932, p. 76: Willey, 1905, p. 269: Gravely, 1927, p. 8: Augener. 1926, p. 432: Monro, 1937. p. 271.

Syllis longissima, Gravier, 1900, p. 159, pl. IX, fig. 7.
Body slender. Pharynx elongated, with anterior tooth. Dorsal cirri short, cylindrical or fusiform, with alternately \(7-8\) and \(10-12\) articles. Anterior and posterior setae compound; in the middle region of the body, large simple, ypsiloid, crutch-like sctae.

Length: \(\quad 20-50 \mathrm{~mm}\).
Colour: Pale yellowish brown, with sometimes streaks of small brown dots on the back of the anterior segments.

Occurrence: Andaman Islands; Ceylon; Gulf of Mannar; Tuticorin; Maldive Archipelago.

Fig. 73.-Syllis krohnii Ehlers: \(a\), anterior part, enlarged; b, compound bristle from mid-body \(\times 390\); \(c\), anterior bristle \(\times 390 ; d\), simple ventral seta \(\times 390 ; e\), aciculum \(\times 390\). S. gracilis Grube: f, anterior part, enlarged; \(g\), foot; \(h\), stout simple bristle \(\times 390 ; i\), compound bristle \(\times 390\).

Distribution: Indian Ocean, Persian Gulf, Arabian Sea; Pacific and Atlantic Oceans. Cosmopolitan.
129. Syllis (Typosyllis) variegata Grube. (Fig. 74, h\(n\) ).
Syllis (Typosyllis) variegata, Fauvel, 1923a, p. 262, fig. 7 (Synonymy); 1932, p. 76: Gravely, 1927, p. 8: Pruvot, 1930, p. 31: Monro, 1937, p. 270.
Syllis compacta, Gravier, 1909, p. 165, pl. IX, fig. 11.
Body long and slender, Pharynx more or less elongated, with an anterior conical tooth. Dorsal cirri alternately long and short, with numerous articles (20-25 and 30-45). Falcate terminal piece of all the setae more or less distinctly bidentate. On the last setigerous segments a dorsal and a ventral simple acicular seta.

Length: \(10-35 \mathrm{~mm}\).
Colour: Very variable.
Occurrence: Ceylon; Gulf of Mannar; Arabian Sea; Persian Gulf.

Distribution: Pacific, Indian and Atlantic Oceans; Mediterranean Sea.
130. Syllis (Typosyllis) prolifera Krohn. (Fig. 74, ag).

Syllis (Typosyllis) prolifera, Fauvel, 1923a, p. 261, fig. 97, a-g. (Synonymy); 1930, p. 13: Pruvot, 1930, p. 31.

Body long and slender. Pharynx rather short, with the conical tooth on the anterior third. Proventriculus

Fig. 74.-Syllis (Typosyllis) prolifera Krohn: a, anterior part (after Claparède); \(b\), head of the stolon Chaetosyllis (after Langerhans); \(c, d\), upper and inferior bristles from mid-body \(\times 390\); \(e\), posterior bristle \(\times 310 ; f\), simple ventral seta \(\times 390 ; g\), simple dorsal seta \(\times 390\). S. (Typosyllis) variegata Grube:
\(h\), anterior part \(\times 8\) (after Claparède); \(i\), foot;
\(k, I\), median and posterior compound bristles \(\times 890 ; m, n\), ventral and dorsal simple setae \(\times 390\).
short. Dorsal cirri alternately long and short, with numerous articles ( \(20-25\) and \(30-40\) ). Falcate setae, especially mesdian and posterior ones, short and conspicuously
bidentate. On the last setigerous segments a dorsal and a ventral, simple bidentate, acicular seta.

Length: \(10-25 \mathrm{~mm}\).
Colour: Very variable. Anterior part more or less brown, with transverse streaks.

Occurrence: Gulf of Mannar; Ceylon, Shingle Island.

Distribution: Pacific, Indian and Atlantic Oceans; Mediterranean Sea.

Remarks: S. variegata and S. prolifera are very likely only varieties of a single species.
131. Syllis (Typosyllis) krohnii Ehlers. (Fig. 73, \(a-e\) ).

Syllis (Typosyllis) krohnii, Fauvel, 1923, p. 259 a-c (Synonymy); 1930, p. 517.

Body thick anteriorly, tapering behind. A well marked occipital protuberance. Pharynx with an anterior conical tooth. Proventriculus short. Anterior dorsal cirri alternately short and long, slender and broad, more or less swollen at the tip, with numerous articles, short, close together and spotted. Falcate setae with a shaft swollen at the tip and a short unidentate terminal piece; the anterior ones with a small sub-apical tooth. On the last setigerous segments a dorsal and a ventral, slightly bidentate, acicular seta.

Length: \(15-30 \mathrm{~mm}\).
Colour: Transverse violet-brown streaks on anterior segments. Cirri spotted with brown or opaque white dots.

Occurrence: Gulf of Mannar, Shingle Island.
Distribution: New Caledonia: (Australia ?); Indian Ocean; Atlantic Ocean, Mediterranean Sea.
132. Syllis (Typosyllis) closterobranchia Schmarda. (Fig. 77, \(a-c\) ).
Syllis closterobranchia, Ehlers, 1904, p. 19, pl. III, figs. 1-1:
Augener, 1913, p. 29, fig. 23 (Synonymy): Fauvel, 1919, p. 354; 1930, p. 14; 1932, p. 77.
(?) Syllis brachychaeta Schmarda, Augener, 1927a, p. 145: Monro, 1937, p. 271.
(?) Syllis hyalina, Willey, 1905, p. 294.
Dorsal cirri short and spindle-shaped. Body slender. In the anterior and posterior regions of the body. the
setac are bidentate, in the median their sickle-shaped appendices are large and unidentate and they are very casily detached, the shaft then resembling the ypsiloid setae of S. gracilis, but in the latter it is the sickle which is fused with the shaft.

Length: 30 mm .
Uncoloured, in spirit.
Occurrence: Diamond Island, Andaman Island; Gulf of Mannar.

Distribution: Japan; Australia; New Zealand; New Caledonia; Indian Ocean; Red Sea.
133. Syllis (Typosyllis) exilis Gravicr. (Fig. 75, \(a^{\prime}-f\) ).

Syllis exilis, Gravier, 1900, p. 160, pl. X, fig. 19: Fauvel, 1917,
p. 195, pl. V, fig. 24; 1930, p. 14; 1932, p. 77: Augener, 1913,
p. 192.
? Syllis solida, Grube, 1878, p. 120, pl. VII, fig. 7.

Fig. 75.-Syllis (Haplosyllis) spongicola Grube: a, anterior part (after Claparede); \(b, c\), simple bristles \(\times 272 ; d\), aciculum \(\times 272\). \(S\). (Typosyllis) exilis Gravier: \(a^{\prime}\), foot \(\times 47\); \(b^{\prime}\), inferior unidentate bristle \(\times 272 ; c^{\prime}\), another inferior bristle \(\times 428 ; d^{\prime}\), \(e, f\), three ventral bristles from one foot; upper, median, and lower \(\times 272\).

Body stout, convex dorsally. A well marked cephalic hood. Pharynx with a large anterior tooth. Dorsal cirri long and slender, with very numerous short articles. The shafts of the lower setae of the anterior feet are noticeably
swollen and the terminal piece is a large, bent, simple, hook. The terminal pieces of the upper setae are more elongated and have an accessory process. The dorsal cirri are inserted high above the feet and alternate, as in Eusyllis ceylonica Augener, but the cirri are articulate and the setae different. In general appearance it looks like an Eusyllis.

Length: About \(20-50 \mathrm{~mm}\).
Occurrence: South Point, Andaman Islands; Madras coast; Maldive Archipelago.

Distribution: Japan; Australia; New Zealand; New Caledonia; Gambier Islands; Indo-China; Arabian Sea; Gulf of Oman; Red Sea.
134. Syllis (Typosy1lis) okadai Fauvel. (Fig. 76).

Syllis okadai, Fauvel, 1934, p. 307, figs. 1-2; 1939, p. 292.
Body broad, flattened. Prostomium with four large eyes. Palps long, not fused. Median tentacle longer than the lateral ones, which are slightly longer than the palps. Pharynx with anterior tooth. Anterior dorsal cirri

Fig. 76.-Syllis (Typosyllis) okadai Fauvel: a-e, sickle-shaped bristles \(\times 438\); \(f\), dorsal cirrus \(\times 175 ; g\), segments from mid-body, dorsal view \(\times 10 \mathrm{~h}\), anterior part, enlarged.
thick, cylindrical, blunt, with numerous short and close articles, the following ones more slender, with \(10-\) 15 articles, about as long as half the breadth of the body. Feet short, thick; ventral cirri finger-like. Shafts of the setae swollen and curved at the tip; falciform end-pieces short, curved, unidentate. On the last segments a long simple seta, straight or slightly curved.

Length: \(19-20 \mathrm{~mm}\). by 1 mm .
Colour: Palps and prostomium dark, first and second segments dark-violet, next four segments white, then three dark-violet and two brownish; next, the back is brown with two longitudinal rows of clear spots. The second white collar sometimes absent.

Occurrence: Corbyn's Cove, Andaman Islands.
Distribution: Seto, Japan; Ream, Gulf of Siam; Andaman Islands.
135. Syllis (Ehlersia) cornuta Rathke. (Fig. 79, g-i).

Syllis (Ehlersia) cornuta, Fauvel, 1923a, p. 267. fig. 100; 1930, p. 14.

Ehlersia sexoculata, Langerhans, 1879, p. 537: Saint Joseph, 1905, p. 181.

Body slender. Anterior tentacles slender, subequal. Pharynx very long, with an anterior tooth; proventriculus long. Dorsal cirri long and slender with about 12-20 articles. Compound setae of two kinds: (1) with a very long and very slender, slightly pectinate and bidentate terminal piece, (2) falcigerous with a short, spinous, bidentate end-piece. Both kinds present in the same feet. On the last segments, a dorsal and a ventral simple seta.

Length: \(10-15 \mathrm{~mm}\).
Uncoloured, in spirit.
Occurrence: Gulf of Mannar, Krusadai Island.
Distribution: Indo-China; India; Arabian Sea; Persian Gulf; Atlantic Ocean; Mediterranean Sea.

\section*{Genus OPISTHOSYLLIS Langerhans.}

Tentacle and cirri articulated. Tooth in the proximal part of the pharynx. A flap-like process, or hood, on the posterior part of the head.
F. 22

Key to the species of Opisthosyllis.
1. Body covered with papillac .. australis Augener, p. 156.

136. Opisthosyllis longicirrata Monro. (Fig. 77, \(f-i\) ). Opisthosyllis longicirrata, Monro, 1939, p 389, fig. 300.
Head more or less bilobed, grooved posteriorly. Two pairs of eyes, set in a rectangle. A large nuchal flap (hood). Median tentacle about three times as long as the palps and with 50-60 articles. Pharynx long, with

Fig. 77.-Syllis (Typosyllis) closterobranchia Schmarda: a, anterio part \(\times 31\); \(b\), foot \(\times 59\); \(c\), upper bristle from anterior foot \(\times 516\); \(d\), lower bristle from anterior foot \(\times 516\) : \(e\), bristle (after Ehlers) Opisthosyllis longicirrata Monro: f, foot from midbody; \(g\), head, from above; \(h\), large bristle from hinder region; \(i\), anterior bristle (after Monro).
tooth about the 8th setiger. Feet triangular, supported by 2-3 acicula. Anterior dorsal cirri very long, about 190 articles; shorter behind. Back-feet ending in a pair of small papilliform processes. Ventral cirri short. All bristles clearly bidentate, with blades slender and elongate, in the first region, shorter and broader backwards. In the posterior feet, \(2-3\) setae larger than the rest. There is no papillation on the body.

Length: 19 mm . by 1 mm .
Occurrence: Hululu, Male Atoll, Maldive Archipelago.

Distribution: Tahiti; Maldive Archipelago; Red Sea, Suez.
137. Opisthosyllis brunnea Langerhans. (Fig. 78, \(a-k\) ).

Opisthosyllis brunnea, Langerhans, 1879, p. 541, pl. XXXI, fig.
F: Augener, 1916, p. 274, fig. XXV: Fauvel, 1930, p. 15, fig. 2.
Palps elongated. Pharynx extending throurch about 11 segments, with an anterior crown of papillae and, at its back part, a large conical tooth inserted on a kind of

Fig. 78.-Opisthosyllis brunnea Langerhans: \(a\), tooth in pharynx \(\times 60\);

round bulb. Proventriculus from the 17th to the 28th setigerous segment. Dorsal cirri with 30-50 articles. Ventral cirri finger-shaped. Parapodia without papillae. The shaft of the setae is much swollen distally and bears a simple appendix, gradually shortening posteriorly, and
unidentate. On the last segments a simple seta and 3-4 large acicula. Stolon with long, slender, swimming setat.

Length: 40 mm . by 1 mm .
Occurrence: Gulf of Mannar, Krusadai Island.
Distribution: Indian Ocean; Atlantic Occan, Madei ra; Tropical coast of Africa.
138. Opisthosyllis australis Augener. (Fig. 80, g-i).

Opisthosyllis australis, Augener, 1913. p. 218, pl. XXVIII, fig. 35: Fauvel, 1923b, p. 13; 1930, p. 518.

Body plump, rounded dorsally, covered with small globular papillae. A well marked nuchal flap (hood). Pharynx with a posterior tooth in the 13th segment. Prostomium oval. Two pairs of cyes. Dorsal cirri long, with 38-40 articles. Ventral cirri finger-shaped. Parapodia with small globular papillae. Falciform end picces of the setae rather long and bidentate in the antc rior feet; they become shorter and unidentate posteriorly and are mixed with stout simple setae in the median und posterior regions.

Length: 18-20 mm.
Occurrence: Ccylon.
Distribution: Australia: Gambier Islands: Nicw Caledonia; India; Ceylon.

\section*{Genus TRYPANOSYLLIS Claparède.}

Body flat, ribbon-like. Palps well apart. Proboscis with a circular crown of small tecth (trepan) and a suggle conical dorsal tooth. Tentacles and cirri long, distinctiy articulated. Ventral cirri lanceolate. Bristles with mather large sickle-shaped terminal piece.

Key to the species of Trypanosyllis.

Tiypanosyllis zebra. Fauvel, 1923a, p. 269, fig. 101; 1930a, p. 15: 1932, p. 78: Pruvot. 1930, p. 35: Monro, 1937, p. 273.
Typhanosyllis richardi, Gravier, 1900, p. 68, pl. 9, figs. 12-13.
Body flatened, dorsum somewhat rounded anteriorly. Segments short and numerous. Prostomium broader than long. Dorsal ciri alternately long and shont, ais-

Fig. 79.-Tiypanosyllis zebra Grube: a, anterior part \(\times 17\); (after
Clapaicde); \(b\), trepan (after Langeihans); \(c\), foot, \(d\), compound bristle \(\times 437\). Syllis (Ehlersia) cornuta Rathke: g, anterior pait, conlarged; \(h\), \(i\), compound bristles \(\times 350\). S. (Ehlersia) ferrugina Langerhans; \(k-n\), bristles.
tinctly articulated. Terminal pieces of the setac bifid and spinous on the edge.

Length: \(\quad 30-60 \mathrm{~mm}\).
Colour: Anteriorly the dorsum is banded with violetbrown bars, two on each segment. Dorsal cirri white, or, often, violaceous or lilac.

Occurrence: Mergui Archipelago; Andaman Islands; Ceylon; Krusadai Island; Gulf of Mannar; Tuticorin: Madras coast; Persian Gulf.

Distribution: Pacific Ocean, Japan, China Sea, Annam; Indian Ocean; Atlantic Ocean; Mediterranean Sea.
140. Trypanosyllis gigantea (McIntosh). (Fig. 80, (e-f) Trypanosyllis gigantea, Fauvel, 1914b, p. 105, pl. VII, figs. 14-15; 1917, p. 200 (Synonymy); 1919, p. 355; 1932, p. 78: Augener, 1924, p. 371; 1927, p. 151: Benham, 1927; p. 56.
Syllis gigantea, McIntosh, 1885, p. 193, pl. XXX, figs. 1-3. pl. XXXIII, fig. 4, pl. XVa, fig. 14, pl. XXIVa, fig. 7.

Differs from T. zebra in: (1) its larger size; (2) absence of, or if present only very faint, transverse pigmented streaks on the dorsum and (3) the treminal picces of the bristle being simple hooks.

Fig. 80.-Autolytus orientalis Willey: \(a\), anterior part \(\times 7\); \(b\), bristle, much enlarged (after Willey). Eusyllis ceylonica Augener: \(h, l\), superior and inferior bristles from 25th foot \(\times 660\) (after Augener).

Length: \(\quad 80-90 \mathrm{~mm}\). by \(5-7 \mathrm{~mm}\).
Occurrence: Nankauri Harbour, Nicobar Islands. Distribution: South Pacific; Indian Ocean.
141. Trypanosyllis misakiensis Izuka.

Trypanosyllis misakiensis, Izuka, 1912, p. 185, pl. XX, figs. 2-6. Fauvel, 1982, p. 78: Monro, 1989, p. 391.

Body elongate, depressed; dorsum slightly convex. Scgments short and numerous. Prostomium bilobed. All the three tentacles equal. Dorsal cirri annulated, borne on a prominent cirrophore. Bristles stout, falcate, the end-piece bifid, with a basal spur (3 teeth according to Izuka). The posterior extremity of the worm is capable of producing successive crops of collateral sexual buds showing an external structure similar to that of the mother individual.

Length: 22 mm . by 2 mm . with 130 segments.
Colcur: In spirit, uniformly milk-white.
Occurrence: Madras Coast.
Distribution: Japan; Madras Coast.

\section*{Subfamily EUSYLLINAE.}

\section*{Genus EUSYLLIS Malmgren.}

Palps fused at the base. Three tentacles. Two pairs of tentacular cirri. Opening of the proboscis crowned with a row of soft papillae and a chitinous denticulated ring, and an anterior tooth. Tentacles and cirri smooth or more or less distinctly pseudo-articulate when contracted. Compound falciform setae.
142. Eusyllis ceylonica Augener. (Fig. 80, \(h, l\) ).

Eusyllis ceylonica, Augener, 1926, p. 453, fig. IV: Fauvel, 1930, p. 519.
(??) Typosyllis taprobanensis, Willey, 1905, p. 268, pl. III, figs. 77 -78.

Body short, thick, rounded dorsally. Four small eyes. A well marked occipital prominence. Pharynx with a chitinous ring, smooth or faintly denticulate, and an anterior tooth. Tentacles sub-equal. Dorsal cirri alternately long and short, more or less pseudo-articulate: the longer ones inserted on the sides much more above the feet than the shorter ones. The falciform end-pieces of the upper setae longer than those of the lower setae; both are conspicuously bidentate.

Length: \(20-30 \mathrm{~mm}\). by 2 mm .
Colour: Reddish-yellow, or with two brown trans verse bands on each segment.

Occurrence: Ceylon.
Distribution: New Caledonia; Ceylon.

\section*{Genus ODONTOSYLLIS Claparède.}

Palps fused at the base. Tentacles and cirri not distinctly articulate. A flap-like process, or hood, on the posterior part of the head. \(\Lambda\) transverse row of large tecth, pointing backwards, inserted on the anterior edge of the pharynx.
143. Odontosyllis gravelyi Fauvel. (Figs. 81, \(a-i ; 82\) ).

Odontosyllis gravelyi, Fauvel, 1930, p. 16, figs. 3-4. Syllis sp. Gravely, 1927, p. 8.

Body long, thick, rounded dorsally, very britlle; 80150 segments. Prostomium sub-rectangular. Four large eyes set in a trapezium. Three tentacles, the median

Fig. 81.-Odontosyllis gravelyi Fauvel: a, anterior part \(\times 10\); \(b\), foot with swimming bristles \(\times 50 ; c\), anterior foot \(\times 50 ; d\), \(e\), bristles with short bidentate end-piece \(\times 330 ; f, g\), bristle with long end-piece \(\times 330 ; h\), simple posterior seta \(\times 330 ; i\), simple
bidentate posterior seta \(\times 330\). O. rubrofasciata (Grube): \(k, l\), two falcigerous setae from one posterior foot \(\times 400\).
twice as long as the laterals. Two broad palps. Proboscis with 6-7 large pharyngeal teeth pointing backwards and two large lateral folds. Pharynx extending from the 4th-5th segments to the 10 th. Proventriculus twice as long. A rounded flap over the prostomium. Two pairs of long, unequal, tentacular cirri. Dorsal cirri unjointed,
rapidly decreasing in length, about as long as half the body's breadth. Ventral cirri broad and short. Compound setae of two kinds in every foot; the upper ones with a long needle- or awl-like terminal piece, slightly flattened, very indistinctly bifid and bulbous at the tip; the lower ones much more numerous, with an enlarged shaft and a short bidentate appendix. On the last segments, a small dorsal simple seta, slightly bent, and a ventral simple bifid seta. Mature specimens with long swimming bristles. Two long anal cirri. Phosphorescent.

rig. 82.-Opisthosyllis gravelyi Fauvel: a, section of anterior part \(\times 45\); \(b\), armature of the proboscis \(\times 45\).

Length: \(15-30 \mathrm{~mm}\). by \(1.5-2 \mathrm{~mm}\).
Colour: Yellowish white with a longitudinal darkbrown dorsal streak running the whole length of the body. On a variable number of anterior segments, a brown dorsal spot at the base of the feet. Swarming in May and September, a few days after the new moon.

Occurrence: Gulf of Mannar, anchorage at Krusadai Island and off the end of Sandy Point.
F. 23

Subfamily EXOGONINAE.
Genus PARASPHAEROSYLLIS Momo.
Dorsal cirri alternately short, bulbous and slender, moniliform. Palps fused at the base.

\section*{144. Parasphaerosyllis indica Monro (Fig. 80, \(c-d\) ). \\ Parasphaerosyllis indica, Monro, 1937, p. 273, fig. 8: Fauld. 1939, p. 298.}

Body slender and thread-like. Head broader than long, with two pairs of eyes, arranged in a traperium. Palps fused at the base only. Pharynx with an anterior tooth. Proventriculus short. Tentacles and the first 15 dorsal cirri moniliform, with about 15 articles. Two pairs of tentacular cirri. From the 16 th setigerous segment to the end of the stock large bulbous fusiform cirri, with a small terminal knob, alternate with slender moniliform cirri. The setae are slender, with a straight endpiece, faintly bidentate at the tip. The beginning of the stolon is marked by two pairs of eyes.

Length: \(8-11 \mathrm{~mm}\). by 0.5 mm .
There is no colour.
Occurrence: Arabian coast.
Distribution: Arabian Sea, Cauda, Annam.
Remarks: Monro places this species among the Exogoninae, which apcars unlikely because of its palps fused at the base only and its moniliform ciri i.

\section*{Subfamily AUTOLYTINAE.}

Genus AUTOLYTUS Grube.
Ventral cirri absent. Palps little developed, attached to the ventral surface of the cephalic lobes. Cirri unarticulate, filiform, present on every segment. Proboscis sinuous, with a crown of small teeth. Proventriculus ovoid. Falcate bristles with short bifid tips. Sexual generation shows dissimilar males and females (Polybostrichus and Sacconereis.)
145. Autolytus orientalis Willey. (Fig. 80, a, b).

Autolytus orientalis, Willey, 1905, p. 270, pl. IV, figs. 80-84: Augener, 1926b, p. 454, fig. 5: Fauvel, 1932, p. 80.
About " 30 setigerous segments in the anterior or parent individual. The parapodia contain two acicula and numerous, upwards of 20 , compound falcigerous setae; the head of the shaft is laciniate and the appendix is minutely bidentate and minutely fringed. The dorsal
cirri are rather short, lanceolate, petaloid, with strong basal articulation. The second dorsal cirrus, i.e., the cirrus of the first setiger, is the longest. The rounded reduced palps, joined together in the middle line along their own length, are only visible from below. The pharynx is long and has a sigmoid flexure; it is armed in front with a circle of 44 denticles, larger and smalles irregularly alternating. The proventriculus shows 28 glandular rows." (Willey.)

In both specimens from Chandipore the parent stock has about 30 setigerous segments. One bears a single stolon and the other two. Augener has figured the free swimming male stolon or Polybostrichus.

Occurrence: Ceylon; Orissa, Chandipore, near Balasore; taken at low tide on Chaetopterid tubes.

\section*{Incertae sedis.}

149. Sacconereis spec. , Fauvel, 1932, p. 80. Andaman Islands: in plankton.

Family NEREIDAE Johnston. (Fig. 83).
Body elongated, rounded or somewhat flattened. Prostomium with four cyes. Two subulate tentacles. Two massive two-joint palps. Four pairs of tentacular cirri. Proboscis armed with a pair of homy jaws and, generally, a series of horny teeth (paragnaths) which may be arranged in eight groups. Feet biramous (except in Lycastis) after the second foot. Dorsal and ventral cirri. Dorsal ramus with 2--3 lobes or ligules, ventral lamus with two fillets and one lobe. Setae compound, spinigerous and falcigerous. Generally an epitokous, Heteronereis, mature form.

Remarks: The chief characters used for the identification of Nereids are, first, those of the proboscis, next of the feet and, last, of the setae. The everted proboscis is armed, at its opening, with two lateral, horny, falciform jaws, more or less denticulate. The trunk is divided into two rings, an anterior distal, or maxillary ring, and an inferior, proximal, basal or oral ring. It is
divided into twelye areas on which are inserted the groups of horny denticles, or paragnaths. These areas are designated by Roman numerals as follows: Maxillay ring, dorsal median group I; two dorso-laterals 11; ventral median III; two ventro-laterals IV; Oral ring, median dorsal V; two dorso-laterals VI; median ventral VII; two ventro-laterals VIII.

Fig. 83.-Nereidae: \(a, b\), head with proboscis extruded showing the numbers of the groups of paragnaths; \(c\), first foot (uniramous); \(d\), average foot from mid-body (biramous); \(e\), homogomph spiniger (or aristate) bristle ; \(f\), heterogomph spiniger;
\(g\), long heterogomph falciger; \(h\), short heterogomph talciger; \(i\), dorsal homogomph falciger; \(k\), swimming bristle of Heteronereis stage.
Palapodia: Those of the first two segments are uniramous, all the others biramous. Each ramus is supported by a strong, enclosed, aciculum and bears 2-3 more or less flattened lobes, the size and form of which may vary materially and gradually from before backwards. The last ones are sometimes highly modified and then afford important features for identification. Consequently it is always advisable to examine carefully anterior, middle and posterior feet of any specimen.

The setae more rarely afford specific distinctions. Typically, in a Nereid's foot, there is a dorsal bundle of homogomph, spinigerous setae, a ventral upper bundle of homogomph spinigeraus and heterogomph falcigerous setae and a lower bundle of heterogomph spinigerous and
hetcrogomph falcigerous setac. Moreover, in some species, there is an homogomph falcigerous seta in the dorsal ramus. Large simple ventral setae or hooks are uncommon.

 on the proximal ring
10. The mid-dorsal missing on the distal ring
.. Platynereis Kinberg, p. 217.

\section*{Genus LYCASTIS Savigny.}

All feet uniramous. Proboscis without paragnaths.
Key to the species of Lycastis.
Dorsal setae numerous. Dorsal
cirri broad and flattened .. meraukensis Horst, p. 166.
Dorsal setae rare or missing. Dor-
sal cirri more elongated and
rather narrow .. indica Southern, p. 167.
150. Lycastis meraukensis Horst. (Fig. 85, b).

Lycastis meraukensis, Horst, 1918, p. 246. Fauvel, 1932, p. 82.
Head broader than long, rounded, trapezoidal, provided with a median longitudinal groove. Eyes situated laterally in the posterior margin of the head; the external of each pair is the larger and is placed somewhat more anteriorly than the internal. Antennae short, conical. Palps with a stout basal part and a small, papilliform, distal joint. Maxillae short and stout. The longest tentacular cirrus reaches to the 2nd or 3rd segment. Dorsal cirri enlarged and flattened, leaf-like, overlying each other (in small specimens they are slender and pointed). A fascicle of \(8-10\) dorsal slender setose bristles (missing in the posterior body region). Neuropodium cylindrical, with heterogomph spinigerous and falcigerous bristles, the terminal piece of which is rather short and broad and ciliated.

Length: \(150-200 \mathrm{~mm}\). by \(20-22 \mathrm{~mm}\).

Occurrence: Bangkok, Siam; Mergui.
Distribution: New Guinea; Bangkok; Mcrgui.

Fig. 84.-Lycastis indica Southern: \(a\), anterior end, dorsal view \(\times 15\); \(b\), foot of a specimen with dorsal bristles and narrow dorsal cirrus \(\times 70\).
151. Lycastis indica Southern. (Fig. 84, \(a, b ; 85, a)\).

Lycastis indica, Southern, 1921, p. 578, pl. XIX, fig. 2: Horst, 1924, p. 4: Fauvel, 1932, p. 82, pl. 11, figs. 1-2.

Longitudinal groove of the head ending in a pit: eyes situated more or less in a line and provided with lenses. Dorsal cirri rather narrow, length and breadth varying materially: they are very long and recurved on the back in the posterior region. Dorsal setae missing or very few, 1-2, rarely more. Terminal piece of the lalcate setae long and narrow, but thick. Hemigomph and heterogomph spinigerous setae.

Length: \(12-150 \mathrm{~mm}\). by \(2-5 \mathrm{~mm}\).
Colour: Reddish-brown pigment in the anterior part of the body, increasing in redness and density towards the tail.

Occurrence: Calcutta waterworks; Salt lakes, Calcutta; Chilka Lake, Madras; brackish waters of India;

Andaman Islands. Euryhaline from fresh water to brackish and sca-water.

Distiibution: Macassar; India.

\section*{Genus TYLONEREIS Fauvel.}

Feet biramous. borsal ligule foliaceous. All sctae homogomph spinigeroùs. Proboscis with soft papillac, without paragnaths. Pros̀tomium, tentacles; palps and tentacular cirri as nl thè genus Nereis Cuvier.

\section*{Key to the species of Tyloriereis.}

Ventral setigerous lobe tritóbed .. bogoyawlenskyi Fauvel, p. 168. Ventral setigerous lobe bilobed .. fauveli Southern, p. 169.
152 Tylonereis bơgờâtlenskyi Faiùvel. (Fig. 85, \(c, f\) ).
Tylonereis bogoyaw'ens हivi, Fauvel, 1914; p. 373, pl. XIX, figs. 1-7; 1932, p. 83: Gravely, 1927, p. If, p1. X, figs. 18-19.

Fig. 85.-Lycastis indica Southern: a, 70th foot \(\times 100\) (after Southern). L. meraukensis Horst: b, foot, Tylonereis fauveli Southern: \(c\), 7 th foof \(\times 50 ; d_{\text {, }}\) 30th foot \(\times 50\) (after Southern). \(T\). bogoyawlenskyi Fauvel: e e, foot from mid-body \(\times 35\); \(f\), 7 th foot \(\times 35\).

Prostomium broader than long, notched. Tentacles short. Proboscis with conical soft papillae, groups: \(\mathrm{I}=0\) or \(3 ; \mathrm{It}=0\) or \(1 ; \mathrm{II}=8-10 ; \mathrm{IV}=\) a group of \(4-5\) on
cach side; \(\mathrm{V}=0 ; \mathrm{VI}=\) one papilla on each side; \(\mathrm{VII}=2\) on cach side; VIII \(=0\), or a row of depressed lobes. Fect biramous. Setae long homogomph spinigers, all alike. Dorsal and ventral cirri very small. Dorsal ligule triangular, foliaceous. Dorsal fillet (setigerous lobe) elongated, expanded at the tip in the anterior segments, bifid in the posterior ones. Ventral sctigerous lobe at first trilobed, but bilobed in posterior feet. Ventral lower ligule decreasing in size backwards. A pair of anal cirri. Burrows in sand or mud.

Length: About 60 mm . by 4 mm ., feet included.
Colour: In life, of a bright pink colour, with a transverse brown line on each segment at the anterior end and a dark-red mid-dorsal line.

Occurrence: Krusadai Island, Tuticorin beach, Kilakaıai, Pamban backwater; Neendakara Bar and Veli Lakc, 'Travancore.

Distribution: Gulf of Mannar; Travancorc; Pcrsian Gulf.
153. Tylonereis fauveli Southern. (Fig. 85, c-d).

Tylonerens fauveli, Southern, 1921, p. 582, pl. XIX. fig. 3: Fauvel. 1930a, p. 19; 1932, p. 84.
Differs from \(T\). bogoyawlenskyi only in having the vential setigerous lobe bilobed, instead of trilobed, in the anterior as well as in the middle and posterior teet. Size rather large.

Occurrence: Mergui; Chilka Lake; Pamban.

\section*{Genus LEONNATES Kinberg.}

Proboscis with both soft and horny paragnaths. Falcate bristles with a convex denticulated border.

Key to the species of Lconnates.
End-piece of the falcigerous bris-
tles hooked at the tip \(\quad .\).
Fnd-piece of the falcigerous bris-
tles enlarged and abruptly
truncate at the tip
154. Leonnates jousseaumei Gravier. (Fig. 86, \(d-f\) ).

Leonnates jousseaumei, Gravier, 1901, p. 160, pl. XI, figs. 34-37: Fauvel, 1930a, p. 19, fig. 5; 1932, p. 85: Horst, 1924, p. 150: Monro, 1931, p. 43.
Body stout, a little flattened. Maxillary ring of the proboscis with small horny paragnaths, \(\mathrm{I}=0\) or 1 . Oral F. 24
ring with soft conical papillac; \(\mathrm{V}=\mathbf{O}\). Parapodia: dorsal ramus with three elongated ligules and a long dorsal cirrus: Ventral ramus with two lanceolate fillets and a longer ligule. Ventral cirrus subulate. Spinigerous setae all homogomph. Falcate homogomphs with a terminal piece hooked at the tip and boldly serrated on the con-

vex border. They are present on the first setigerous segments in both the ventral bundles of every foot and on the dorsal ramus of the posterior feet.

Length: 80 mm . by 6 mm .
Colour: Dark-brownish red, with a dark spot at the base of the dorsal rami.

Occurrence: Mergui; Gulf of Mannar; Pambam; Karachi.

Distribution: Macassar Straits; Annam; Bay of Bengal; Arabian Sea; Persian Gulf; Red Sea.
155. Leonnates decipiens Fauvel. (Fig. 87).

Leonnates decipiens, Fauvel, 1929, p. 180; 1930a, p. 20, fig. 5, \(f-m\).
Leonnates jousseaumei (non Gravier), Fauvel, 1927b, p. 427, fig. 106, f, g.
Body stout, a little flattened: 80-90 segments. Prostomium broader than long. Four hlack eyes. Palps stout, divergent, as long as the tentacles. Longer tentacular cirri reaching backwards to the 4th or 5th segment. Jaws dark, curved, smooth on edge. Maxillary ring with

Fig. 87.-Leonnates decipiens Fauvel: a, foot from mid-body \(\times 30\);

long and short spinigerous bristles \(\times 600 ; \mathrm{g}\), articulation of heterogomph bristles \(\times 600\).
small conical denticles, transparent, hardly visible. I= \(0 ;\) II =an oblique row; III - a small transverse group; IV \(=\) a crescentic group. Oral ring with soft conical paplilae. \(\mathrm{V}=0 ; \mathrm{VI}=\mathrm{a}\) single large papilla on each side; VII-VIII \(=\) a single row of 7-8 smaller papillae, sometimes more or less absent. Dorsal ramus with three ligules, the upper triangular, with well marked dark glands;
the two lower ligules subequal, conical, smaller; dorsal cirrus on the base of the superior ligule and a little longer. Ventral ramus with two unequal fillets and a slightly longer, blunt, ligule; ventral cirrus tapering, shorter. In the posterior region, dorsal ramus much longer than the ventral. Dorsal setae all homogomph spinigers. Ventral setae, in the anterior and posterior feet, homogomph and hemigomph spinigers and shorter heterogomph ones. On the middle region from about the 13 th and 15 th setigerous segment, the ventral heterogomph spinigers are superseded by falcigerous setae the terminal piece of which has a spinous convex edge and an enlarged and abruptly truncated tip. Even in the posterior feet, there are no dorsal falcigerous setae and the ventral falcigerous setae are absent, in the anterior and posterior feet, in contradistinction to jousseaumei Gravier. Two long anal cirri.

Length: \(\quad 20-300 \mathrm{~mm}\). by 2 mm .
Colour: Colourless, in spirit.
Occurrence: Gulf of Mannar; Krusadai; Pamb:m.
Distribution: Gulf of Mannar; Sue\% Canal.

\section*{Genus DENDRONEREIS Petcrs.}

Proboscis with only soft papillae. Prostomium deeply indented in tront. Dorsal cirrus of a number of anterior segments bearing numerous branchial filaments. Ventral division of the feet multifid in the mid-body segments, more simple in the posterior ones. Setae all homogomph spinigerous.

\section*{Key to the species of Dendronereis.}
\begin{tabular}{lll} 
Branchial cirri pinnate & \(\ldots\) & arborifera Peters, p. 172. \\
Branchial cirri bipinnate & \(\ldots\) & aestuarina Southern, 1. 173.
\end{tabular}

\section*{156. Dendronereis arborifera Peters. (Fig. 86, c).}

Dendronereis arborifera, Ehlers, 1868, p. 578, pl. XXII, figs. 5342: Fauvel, 1919, p. 399, pl. XV, figs. 5-8; 1932, p. 85.

Prostomium deeply cleft between the diverging tentacles, partly connected with the ovoid palpophores. Hour eyes. Proboscis with soft conical papillae on both rings. Dorsal cirri bearing lateral simple branchial filaments from the 8 th-10th to the 18 th-22nd segment. In the anterior feet, dorsal division with two triangular lobes, ventral division with 4-6 conical lobes and a few papillae.

In the posterior feet, dorsal division bilobed, ventral division with a single large triangular lobe and a small ventral cirrus. Dorsal and ventral setae all homogomph spinigerous, nearly alike.

Occurrence: Vizagapatam backwater and Canal.
Distribution: India; Madagascar; Mozambique.

\section*{157. Dendronereis aestuarina Southern. (Fig. 86, b) .}

Dendronercis aestuarina, Southern, 1921, p. 598, pl. XX, fig. 4. Fauvel, 1932, p. 86.

Prostomium deeply indented in front, situated between the diverging tentacles and shorter than the tapering palps. Four large eyes. Prosboscis with soft conical papillac on the basal ring. Maxillary aing devoid of papillae. Dorsal cirri bearing lateral pinnate gills, which commence on the 14th-15th foot. In the anterior feet the rentral division has a large number (15-19) of lobes, of which some form a fringe behind the setae. In the posterior feet, the dorsal division is bilobed and the ventral consists of two foliate lobes with a conical lobe between them, the ventral ligule and the ventral cirrus. Setae homogomph with long finely serrated terminal piece, which becomes shorter in the upper division of posterior feet.

Length: 40 mm . by 5 mm .
Occurrence: Gangetic delta (in brackish watc1): Madras; Travancore.

Distribution: Taleh-Sap (Gulf of Siam); India.

\section*{Genus DENDRONEREIDES Southern. (emended)}

Proboscis armed only with soft paragnaths. Dorsal setigerous lobe absent in first and second feet. In some of the anterior feet, gills are present in the form of numerous filaments situated below the dorsal cirrus: they are provided with vessels. Setae of two kinds, falcate homogomphs and spinose heterogomphs. In all the feet, except the anterior ones, there is a peculiar gland opening to the exterior beneath the dorsal cirrus. The ientral ligule is absent. In the post-branchial region the foot is greatly simplified.
158. Dendronereides heteropoda Southern. (Fig. 86, a; 88).

Dendronereides heteropoda, Southern, 1921, p. 603, text-fig. 10a, \(b\), pl. XXI, fig. 6, \(a-n\) Fauvel, 1932, p. 87, pl. II, figs, 3-9.

Body long and slender. Prostomium broad, cleft between the small tentacles. Four eyes. Palps blunt, ovoid. Proboscis with a number of papillae on the maxillary ring; on the oral ring: \(\mathrm{V}=3 ; \mathrm{VI}=2-3\) on each side; VII -VIII \(=\) two irregular rows. Anterior feet with dorsal and ventral cirri; 2-3 dorsal ligules and 3-4 ventral lobes.

Fig. 88.-Dendronereides heteropoda Southern: a, 25th foot \(\times 28\); \(b\), 34th foot \(\times 28\); \(c\), 4th foot \(\times 28\); \(d\), 8th foot \(\times 28\); \(e\), 11th foot \(\times 28 ; f, 15\) th foot \(\times 28 ; g\), 18 th foot \(\times 28\).

Branchial region from 8th to 40th-50th setigerous segments, with clusters of more or less branched bunches of gills inserted below the dorsal cirrus and above the dorsal ligule; ventral division trilobed. In the posterior abranchiate feet, dorsal and ventral divisions each reduced to a single lobe. Homogomph spinigerous setae and homogomph
falcate setae with smooth terminal piece. Two large anal cirri.

In epitokous males the gills are more numerous and are present on a greater number of feet. Posteriorly, the feet become longer and more simple. The setae are very numerous, very long and slender. Further back the feet and bristles become shorter again and the body is reduced to an elongated soft, white pouch, swollen with sperm. Pygidium with a few short papillae.

Length: 60-135 mm.
Colour: Anterior region of the body rusty red. At the back of the head a narrow transverse band, or two elongate spots of brown pigment.

Occurrence: Calcutta waterworks, Pulta Tanks; Boonbay; Vallarpadan; Barantolla.

Distribution: India; Diamond Isles; Shat-el-Arab.

\section*{Genus NEREIS Cuvier.}

Body vermiforn, numerous segments. Two tentacles. Two ovoid palps. Four eyes. Four pairs of tentacular cirri. Proboscis with two horny, curved jaws and conical horny paragnaths. Parapodia biramous, the first two setigerous segments excepted, which are uniramous. Dorsal and ventral cirri. Spinigerous and falcigerous compound setae. Generally an epitocous stage, Heteronereis.

transverse cluster of \(3-4\) rows; \(V=0 ; \mathrm{VI}=4-5\), in a round group on each side; VII-VIII = 2 irregular rows. Dorsal ramus of the anterior feet with two subequal ligules and a small dorsal cirrus. Dorsal ligule enlarged in the posterior feet with subterminal cirrus. In the middle and posterior feet only a single dorsal simple, large, hooked bristle and an aciculum. In the ventral ramus spinigerous and small falcigerous bristles.

Length: 30 mm . by 1 mm .

Occurrence: Mergui, Jack and Una Islands.
Distribution: Marshal Islands; Malay Archipelago; Mergui.
161. Nereis chingrighattensis Fauvel. (Fig. 90, \(a-h\) ).

Nereis chingrighattensis, Fauvel, 1932, p. 90, text-fig. 14.
Body cylindrical, tapering posteriorly, 80-100 segments. Prostomium not notched. Two pairs of black eyes disposed in a rectangle or a wide opened trapezium. Tentacles subulate, shorter than the large, conical, diverging palps. Peristomium somewhat longer than the succeeding segment. Tentacular cirri short, the posterior

Fig. 90.-Nereis chingrighattensis Fauvel: \(a, b\), proboscis, ventral and doral view; \(c\), 10 th foot \(\times 35\); \(d\), 66 th foot \(\times 35 ; e, f\), lower ventral spinigers from 65th and 30th feet \(\times 380 ; g\), \(h\), ventral hemigomph spinigers from 30 th and 65 th feet \(\times 580\).
ones reaching backwards to the 4-5th setiger. Jaws pale, curved, with 6-8 teeth. Paragnaths conical, yellow or nearly colourless. \(\mathrm{I}=\mathrm{a}\) cluster of \(4-5 ; \mathrm{II}=\mathbf{a}\) crescentic group; III =a transverse group of 3-4 rows; IV =an oblique group of 3-4 rows; \(\mathrm{V}=0 ; \mathrm{VI}=\) on each side, a transverse row of \(15-20\), with a few smaller outer denticles; VII_VIII = 2-3 irregular rows. Feet short, both rami
subequal. Dorsal cirri subulate, shorter than the dossal ligule. Dorsal ramus with three ligules, two subequal, triangular and a shorter conical one. Ventral ramus about the same length as the dorsal, with two fillets, the posterior one conical, the anterior one divided into two unequal lobes. Inferior ligule blunt. Ventral cirrus short subulate. In the posterior feet the median ligule of the dorsal ramus decreases in size and the ventral fillets are nearly similar, the anterior being entire or faintly bilobed. Setae numerous, slender, transparent, all of them spinigerous. Dorsal setae homogomph; the ventral setae homogomph, with long terminal piece, and shorter hemigomph. Lower ventral setae long hemigomph and short heterogomph. Falcigerous setac absent in both rami. Two long anal cirri.

Length: 50 mm . by \(2-3 \mathrm{~mm}\).
Colour: Colourless in spirit, with the exception of 2-3 yellow glands in the feet.

Occurrence: Creeks in Salt Water Lake, near Chingrighatta.
162. Nereis cricognatha Ehlers. (Fig. 91, a-c).

Nereis cricognatha, Ehlers, 1904, p. 29, pl. IV, figs. 3-7: Augener, 1913, p. 163; 1924, p. 334; 1927, p. 133: Horst, 1924, p. 158: Fauvel, 1932, p. 91.
Nereis arenaceodentata Moore, Benham, 1916, p. 134, pl. 46, figs. 1-3.

The proboscis carries numerous, horny paragnaths arranged in groups nearly fused together and forming a belt around the oral as well as the maxillary ring. Group \(=2,3\); \(\mathrm{II}-\mathrm{III}-\mathrm{IV}\) are coalescent; \(\mathrm{V}=3,4\) or 5 ; VI \(=\) round clusters of 5-6; VII-VIII = a broad belt more or less fused with V-VI forming a nearly complete ring. Dorsal ramus with two subequal ligules. The posterior feet are not materially modified, the dorsal upper ligule being only larger than the lower, but not swollen or foliaceous; the dorsal filiform cirrus is inserted at the base. The ventral falcigerous terminal pieces are all long, knifelike, with a small curved hook at the tip; they are homogomph. There are no dorsal falcigerous bristles on the posterior feet.

Length: \(20-30 \mathrm{~mm}\).
Colour: Colourless in spirit.
Occurrence: Andaman Islands; shores of R. Hughly at Budge Budge; Calcutta waterworks; Gulf of Mannar.

Distribution: New Zealand; Bass Strait, Tasmania: Philippine Islands; India.
163. Nereis glandicincta Southern. (Fig. 91, \(f-h\) ).

Nereisglandicincta, Southern, 1921, p. 539, pl. XXIII, fig. 9: Fauvel, 1932, p. 92; 1939, p. 314.

Head narrow in front, wide behind with two short tentacles in front. Four eyes varying considerably in size. according to the state of maturity. Proboscis: Group I \(=1-10\) unequal; \(\mathrm{II}=6-13\) large, curved; \(\mathrm{III}=\) a transverse

Fig. 91.-Nereis cricognatha Ehlers: \(a\), front view of the proboscis \(\times 14\); \(b\), 19 th foot \(\times 23\); \(c\), falciger \(\times 875\) (after Ehlers). \(N\). trifasciata Grube: \(d\), foot from mid-body \(\times 52\); \(e\), dorsal homogomph falciger \(\times 437\). ly elongated band in 3-4 rows; IV \(=6-12\) large denticles; \(\mathrm{V}=0\); \(\mathrm{VI}=0\) each side one small denticle on a large rounded papilla; VII-VIII=a single row of a few minute denticles (occasionally missing altogether). Sometimes, the denticles of VI are very small, transparent and difficult to detect. Jaws slender. Posterior feet not material-
ly altered. Dorsal ramus with three slender lobes persisting in the posterior feet. Ventral ramus with setigerous lobe trifid in the anterior and middle feet, bifid in the posterior ones. Ventral falcigerous bristles homogomph, with long, knife-like, ciliate terminal piece. There are no posterior dorsal homogomph falcate bristles. Male Heteronereis with three distinct regions.

Length: \(\quad 50-90 \mathrm{~mm}\).
Colour: A girdle of yellow glands on each segment.
Occurrence: Salt water lakes near Calcutta, from mud; Barantolla; Vizagapatam; Coasts of Cochin State.

Distribution: Gulf of Siam; Chantabun; Taleh Sap; Pulo Condore; Singapore; India.
164. Nereis unifasciata Willey. (Fig. 92, \(a-h\) ).

Nereis unifasciata, Willey, 1905, p. 271, pl. IV, figs. 85-88: Ehlers, 1817, p. 237: Horst, 1924, p. 153, pl. XXXI, figs. 3-4: Fauvel, 1950, p. 522, fig. 4; 1932, p. 93.

Fig. 92.-Nereis unifasciata Willey: a, anterior part; b, c, proboscis, dorsal and ventral view; \(d\), 10 th foot \(\times 35\); \(e\), 40 th foot \(\times 35\); \(f\), 63rd foot \(\times 35 ; g\), upper ventral falciger from 63 rd foot \(\times 450\); \(h\), lower ventral falciger from 52 nd foot \(\times 450\).

Longer tentacular cirri reaching backwards to 7th12th segment. Proboscis: Group \(\mathrm{I}=9-6\) in a longitudinal line; II and IV=crescentic clusters; \(I I I=\) a rectangular cluster of 3 rows; \(\mathbf{V}=0 ; V 1=0 n\) each side, an oval or square cluster of \(2-4\) irregular rows; \(\mathrm{VII}-\mathrm{VIII}=\) a single row of 6-7 large paragnaths. Anterior feet with short
rounded lobes, two in each ramus. In the middle and posterior feet dorsal ramus with two sub-equal, triangular, diverging ligules; ventral ramus with a conical setigerous lobe and a narrow, blunt, inferior ligule. Heterogomph ventral falcigerous bristles with a short sickle-shaped terminal piece. There are no posterior dorsal homogomph falcigerous bristles; in contradistinction to \(N\). trifasciata Grube, a closely allied species.

Length: \(10-30 \mathrm{~mm}\).
Colour: Rusty brown glands, in the feet and in a line across each segment.

Occurrence: Ceylon, Tuticorin.
Distribution: New Caledonia; Philippine Islands; Moluccas; Indo-China; India; Suez Canal.
165. Nereis trifasciata Grube. (Fig. 91, \(d, e\) ).

Nereis unifasciata (non Willey), Fauvel, 1919, p. 397; 1921, p. 7 , XXI, figs. 1-7: Augener, 1922, p. 177, fig. 3: Fauvel, 1932, p. 95; 1935, p. 106; 1939, p. 815.

Nereis unifasciata (non Willey), Fauvel, 1919, p. 397; 1921, p. 7. pl. I, figs. 8-9.

Long tentacular cirri reaching backwards to about the 7th segment. Proboscis: Group I=0; II and IV \(=\) crescentic clusters; \(\mathrm{III}=\) rectangular cluster; \(\mathrm{V}=0 ; \mathrm{VI}=\) on each side, a small cluster of 3-6; VII-VIII a single row of 2-7 small denticles. Anterior feet with short rounded lobes, two in each ramus. In the middle and posterior feet, dorsal ramus with two subequal triangular ligules, ventral ramus with a blunt setigerous lobe and a narrow conical inferior ligule. Dorsal cirri longer than the foot. Heterogomph ventral falcigerous bristles with a short sickle-shaped, smooth, or ciliated, terminal piece. In the posterior feet, a dorsal homogomph falcigerous bristle, with more or less clongated straight terminal piece.

Length: \(10-30 \mathrm{~mm}\).
Colour: Dark brown transverse streaks on the anterior segments. Dorsal glands in the feet.

Occurrence: Maldive Archipelago.
Distribution: China Sea; Philippine Islands; IndoChina; Maldive Archipelago; Madagascar; Red Sea; Juan Fernandez.
166. Nereis talehsapensis Fauvel. (Fig. 93, (a-h).

Nereis talehsapensis Fauvel, 1932, p. 93, pl. II, figs. 10-17.
Body stout, cylindrical, tapering posteriorly. 80 scg ments and more. Prostomium short and broad. Four eyes, of medium size, arranged in a wide-open trapezium. Two small tentacles, separated from each other at their base by the anterior rounded border of the prostomium: they are about as long as the palpophores. Palps short, large,

Fig. 93.-Nereis talehsapensis Fauvel: \(a\), anterior end, dorsal view, enlarged; \(b\), proboscis, ventral side, enlarged; \(c\), proboscis, dorsal side, cnlarged; d, inferior falcigerous bristle from posterior foot \(\times 350\); \(e\), joint of inferior ventral hemigomph bristle \(\times 350\); \(f\), 70th foot \(\times 42\); g , 10th foot \(\times 42\); \(h\), 30th foot \(\times 42\).
conical, diverging. Peristomium larger than the following segment. Upper tentacular cirri long and slender, the posterior ones reaching backwards to the 7th-11th setigerous segment: the inferior ones subequal, hardly over-reaching the second setigerous. Jaws clearly denticulate. Proboscis: Paragnaths conical, group I=2, one behind the other; \(\mathrm{II}-\mathrm{IV}=\) crescentic clusters; \(\mathrm{III}=\) rect-
angular cluster of 3-4 rows; \(\mathrm{V}=0 ; \mathrm{VI}=\) on each side, 4-5 large ones crosswise or in an irregular cluster; VII-VIII \(=3-4\) irregular rows of large conical denticles. Parapodia clongated, with somewhat slender divisions; posterior feet hardly altered. In the anterior feet, dorsal ramus with a long cirrus, three sharp pointed ligules, the upper one shorter than the two inferior ones, borne on an elongated common base. Ventral ramus with two unequal lobes or fillets, the anterior conical and the posterior rounded and much shorter, an inferior ligule as long as the conical fillet, a slender and short ventral cirrus. In the posterior feet, the median dorsal ligule disappears after having progressively decreased in size; the upper ligule is not enlarged. Dorsal setae homogomph spinigerous; upper ventral setac homogomph spinigerous and long hemigomph falcigerous, lower ventral setae hemigomph spinigerous, and heterogomph falcigerous, with an elongated terminal piece, ciliated and ending in a curved hook connected to the edge by a ligament. There are no dorsal homogomph fa!cigerous bristles in the posterior feet. Acicula rather pale. Two long, filiform, anal cirri.

Length: About \(15-20 \mathrm{~mm}\). by \(3-4 \mathrm{~mm}\).; feet included.

Colour: Discoloured in spirit.
Occurrence: Taleh-Sap, Gulf of Siam.
167. Nereis chilkaensis Southern. (Fig. 94, \(a-c\) ).

Nereis chilkaensis, Southern, 1921, p. 584, pl .XXII, fig. 8: Fauvel, 1982, p. 94.

Head considerably narrower in front than behind. Prostomium projecting a little in front between the tentacles. Palps large and stout. Posterior tentacular cirri reaching back to \(6-8\) th and even 12th segment. Proboscis: Group \(\mathrm{I}=6-10 ; \mathrm{II}=18-20 ; \mathrm{III}=\) a cluster of \(26-34\); \(\mathrm{IV}=\) triangular cluster; \(\mathrm{V}=0 ; \mathrm{VI}=\) on each side an irregular curved row of \(3-7\); VII-VIII \(=\) two alternating irregular rows. Anterior feet, dorsal ramus with a long cirrus, three ligules; ventral ramus with a long cirrus, three ligules; ventral ramus with a fillet produced outwards into two conical lobes, a blunt ligule and a short ventral cirrus. In the posterior feet, the dorsal ramus is relatively larger and more prominent than the ventral ramus, but the upper ligule is not enlarged and foliaceous. Falcate heterogomph setae with moderately, long terminal pieces,
smooth at the tip, spinose below. There are no doxsal homogomph falcigerous bristles in the posterior feet.

Fig. 94.-Nereis chilkaensis Southern: \(a\), 40th foot \(\times 45\); \(b\), anterior foot \(\times 45\); \(c\), falciger. N. reducta Southern: \(d\), head and proboscis; \(e\), proboscis, ventral view; \(f\), 60 th foot; \(g\), lower falciger (after Southern).

Length: \(\quad 40-100 \mathrm{~mm}\). About 80 segments.
Colour: Dorsum deeply coloured with purplish brown pigment, dark in front and growing paler behind.

Occurrence: Chilka Lake; Ennur backwater; Pamban; Madras Coast; Travancore.

\section*{168. Nereis indica Kinberg.}

Nereis indica, Kinberg, 1865, p. 160: Willey, 1905, p. 970: Fauvel, 1930a, p. 24; 1932, p. 96.
Nereis sp. near ezoensis, Gravely, 1927, p. 13, pl. X, fig. 22.
Proboscis: Group \(\mathrm{I}=1\) or \(0 ; \mathrm{II}=\) two curving rows; \(\mathrm{III}=\mathrm{a}\) lozenge shaped cluster; \(\mathrm{IV}=\) triangular clusters; \(=0\); VI \(=\mathrm{on}\) each side, a rounded cluster of 4-6; VIIVIII \(=1\) or 2 large rows and a row of numerous minute denticles. Tentacular cirri short. Dorsal ramus of the anterior feet trilobed. Posterior feet not modified, their upper ligule is not strongly enlarged. Ventral heterogomph falcigerous bristles with sickle-shaped terminal
pieces. There are no posterior dorsal homogomph falcigerous bristles.

Length: 50 mm .
Occurrence: Galle; Pamban; Waltair beach.
Distribution: Bangka Straits; Ceylon; Gulf of Mannar.
169. Nereis coutierei Gravier. (Fig. 95, i, k).

Nereis coutierel, Gravier, 1901, p. 167, pl. XI, figs. 36-41: Fauvel, 1932, p. 96; 1999, p. 312.

Body slender, small size. Prostomium not notched. Proboscis: group I-1; II and IV=small clusters; III =a small transverse cluster; \(\mathbf{V}=\mathbf{0} ; \mathbf{V I}==\) on each side, a small rounded cluster of 5-7; VII-VIII = a single row of 6-8 far apart. In the anterior feet, dorsal ramus with two conical equal ligules and a long dorsal cirrus. Ventral setigerous lobe blunt, rounded. In the posterior feet, the dorsal ligule is enlarged into a rounded crest. Ventral heterogomph falcigerous bristles with short sickle-shaped terminal piece. Dorsal homogomph falcigerous brisiles, not boldly denticulate, in the posterior feet.

Length: \(15-25 \mathrm{~mm}\).
Occurrence: Andaman Islands, weed washings; Gulf of Mannar; Addu Atoll.

Distribution: Indo-China; Indian Ocean; India, Persian Gulf, Red Sea, Suez Canal.
170. Nereis zonata-persica Fauvel. (Fig. 95, \(f-h\) ).

Nereis zonata-persica, Fauvel, 1911, p. 385, p1. XIX, figs. 10-16, pl. XX, figs. 24-25; 1932, p. 96; 1939, p. 312: Pruvot, 1930, p. 47, pl. III, figs. 65-68.

Body rounded. Proboscis: Group I=0 or 1; II-IV \(=\) crescentic clusters; III \(=\) - transverse cluster of 2-3 rows; V - (0; VI - on each side, a rounded or oval cluster of 610; VII-VIII \(=\) an anterior row of rather large denticles and 2-5 irregular rows of numerous small denticles. Dorsal ramus with a long cirrus and two conical sub-equal ligules. Ventral setigerous lobe short, rounded. Posterior feet not materially modified, dorsal ligule not enlarged. Ventral heterogomph falcigerous bristles with short sickle-shaped terminal piece. In the posterior feet, large homogomph dorsal falcigerous bristles with bi- or tridentate end-pieces.

Length: 15-50 mm.

Occurrence: Pamban; Mormugao Bay.
Distribution: New Caledonia, Indo-China; Indian Ocean, Persian Gulf, Red Sea.

Remarks: It is really a distinct species and not a simple variety of \(N\). zonata as I first described it.
171. Nereis kauderni Fauvel. (Fig. 95, a-d).

Nereis kauderni, Fauvel, 1921, p. 8, pl. I, figs. 1-7; 1932, p. 97; 1939, p. 311.
Nereis falcaria, Gravely, 1927, p. 12, pl. X, fig. 20.
Nereis mortenseni, Augener, 1923b, p. 21, figs. 7-14; 1924, p. 919, fig. 4.
(?) Ceratonereis falcaria, Willey, 1905, p. 272, pl. IV. fig. 89.
Body small, cylindrical, slender. Prostomium notched between the tentacles. Tentacular cirri short. Proboscis: Group \(\mathrm{I}=0 ; \mathrm{II}=\mathrm{a}\) more or less irrcgular row; III

Fig. 95.-Nereis kauderni Fauvel: a, anterior part \(\times 10\); \(b\), posterior foot \(\times 40\); \(c, d\), dorsal homogomph falcigers \(\times 335\). N. jacksoni Kinberg: \(e\), dorsal homogomph falciger \(\times 333\). N. zonata-persica Fauvel: f, g, dorsal homogomph falcigers \(\times 333\); \(h\), foot from mid-body \(\times 26\). \(N\). coutierei Gravier: \(i\), dorsal homogomph falciger \(\times 333\); \(k\), posterior foot \(\times 40\).
\(=\mathrm{a}\) variable cluster; \(\mathrm{IV}=\mathrm{a}\) crescentic group; \(\mathrm{V}=0 ; \mathrm{VI}=\) on each side, a small cluster of very minute paragnaths; VII-VIII \(=\) a single row of \(8-9\) denticles. Dorsal cirri longer than the foot. Dorsal ramus with two conical subequal ligules. Ventral setigerous lobe blunt. In the
posterior feet, the dorsal ligule is much reduced. Ventral heterogomph falcigerous bristles with sickle-shaped ciliate terminal piece. In the middle and posterior feet, \(1-2\) large homogomph falcigerous bristles with prominent bior tridentate terminal piece.

Length: 15-30 mm.
Colour; A pattern of elongated transverse pigment spots on the anterior segments.

Remarks: Although much alike, its identity with Ceratonereis falcaria Willey is very doubtful, since in the latter the paragnaths are missing on the oral ring, according to Willey. But they might have been overlooked (?).

Occurrence: Gulf of Mannar; Tuticorin; Maldive Archipelago.

Distribution: Pacific Ocean, Australia, New Zealand, New Caledonia, Indo-China; Indian Ocean, India, Maldive Archipelago.

\section*{172. Nereis jacksoni Kinberg. (Fig. 95, e).}

Nereis jacksoni, Kinberg, 1865, p. 69: Augener, 1922, p. 18: Pruvot, 1930, p. 44: Fauvel, 1930b, p. 524; 1932, p. 97.
Nereis denhamensis, Augener, 1913, p. 156, pl. III, fig. 51: Fauvel. 1917, p. 204, pl. VI, figs. 45-46.
Nereis heirissonensis, Augener, 1913, p. 159, pl. III, fig. 52.
(?)Ceratonereis falcaria, (non Willey), Benham, 1916, p. 136. pl. 46, figs. 4-10.

Body small, cylindrical, slender. Prostomium not notched between the tentacles. Tentacular cirri short. Proboscis: group \(\mathrm{I}=0 ; \mathrm{II}=\) two curved rows; \(\mathrm{III}=\) a transverse cluster; IV =on each side, crescentic clusters; \(\mathrm{V}=0\); \(\mathrm{VI}=\) on each side a small cluster of very small denticles; VIIVIII =a single row of about 7, wide apart. Dorsal ramus with two conical, subequal ligules. Dorsal cirri longer than the foot. Ventral setigerous lobe blunt. In the posterior feet, the dorsal ligule is more or less reduced. Ventral heterogomph falcigerous bristles with sickle-shaped ciliate terminal piece. In the middle and posterior feet, 1-2 large homogomph falcigerous bristles with prominent bi- or tridentate terminal piece.

Remarks: Differs chiefly from N. kauderni Fauvel in having its prostomium not notched.

Length: 15-30 mm.
Colour: Dorsal pattern variable.
Occurrence: Andaman Islands; Kilakarai; Maldive Archipelago.

Distribution: Pacific Ocean, Australia, New Zealand, New Caledonia, Indo-China; Bay of Bengal, Arabian Sea.
173. Nereis reducta Southern. (Fig. 94, \(d-g\) ).

Nereis reducta, Southern, 1921, p. 593, pl. XXI, figs. 7a-7k.
Body narrow. Palps long and pointed. Eyes small. Tentacular cirri rather short. Proboscis: Group I \(=a\) single large paragnath; \(\mathrm{I}=6\) of varying size; \(\mathrm{III}=11\); IV \(=8-10 ; \mathrm{V}=0 ; \mathrm{VI}=\) minute paragnaths; VII-VIII =-numerous paragnaths in longitudinal rows. Anterior feet with short fusiform, dorsal and ventral cirri, two upper and two lower lobes. In the posterior feet the upper dorsal lobe is much reduced in size and is smaller than the median ligule. The dorsal setac are few and the spinous heterogomph setae occur singly in the middle and posterior segments. The falcate setae have tips nearly straight and of medium size.

Length: 50 mm .96 segments.
Colour: Head and anterior segments pale brown.
Occurrence: Chilka Lake, about a mile inside the mouth. Only a single specimen.
174. Nereis gisserana Horst. (Fig. 96, e-i).

Nereis gisserana, Horst, 1924, p. 151, pl. XXX, figs. 6-7: Monro, 1939, p. 394, fig. 302.

Palps short and stout. Tentacular cirri very long, the longest reaching back about the 15 th setiger. Prob. oscis: Group \(\mathrm{I}=0 ; \mathrm{II}=\) a transverse row of about 5 ; \(\mathrm{III}=\). three groups, a middle one of three rows of small parag. naths and two latera! groups each of two; IV = a small patch of rather larger denticles; \(V=0 ; V I\), on each side, 3 in a transverse row; VI-VIII = a single row of 5-6, widely separated. In the anterior region, the lobes of the feet are short and blunt, but they gradrally lengthem from
before backwards. Dorsal ramus with two unequal conical lobes and long dorsal cirrus. The shorter lower dorsal languet is fused for part of its length with a slightly middle languet. Ventral ramus much shorter, especially in the posterior feet where the dorsal ramus greatly overshadows the ventral, but there is no special development of the upper dorsal languct. Heterogomph falcigers with short and broad end-piece, which becomes longer and hooked in the posterior feet.

Fig. 96.-Nereis heteromorpha Horst: a, posterior font (after Horst). N'. (Neanthes) capensis Willey: \(b\), foot from mid-body;
\(c, d\), proboscis dorsal and ventral view: N. gisserana Horst: c, \(f\), proboscis, dorsal and ventral view; \(g\), foot from mid. body; \(h\), falciger from mid-body; \(i\), falciger from hinder foot (after Monro).

Length: 45 mm . by 2 mm .

Occurrence: Maldive Archipelago.
Distribution: Malay Archipelago; Maldive Archipelagg; Amirante Islands.
175. Nereis longilingulis Monro. (Fig. 97, a-c).

Nereis longilingulis, Monro, 1937, p. 277, fig. 9.
Body much tapered behind. Head longer than broad, not incised between the tentacles. Palps stout, about equal to the tentacles. Proboscis without paragnaths in the larger specimens. In the small ones, group \(I=0\); II \(=\) small crescentic patches; \(\mathrm{III}=\) a transverse row of 4 relatively large paragnaths; IV = small crescentic patches; \(V=\)

Fig. 97.-Nereis longilingulis Monro: \(a\), 20th foot; \(b\), ventral talciger from mid-body; \(c\), ventral falciger from hinder region (after Monro).
\(N\). (Ceratonereis) burmensis Monro: d, 10 th foot; \(r\). hindel foot; \(f\), falciger (after Monro).
\(0 ; \mathrm{VI}=\mathrm{a}\) single small one on each side; \(\mathrm{VII}=a\) single small one; \(\mathrm{VIII}=0\). Anterior feet with two triangular lobes in each ramus, median feet with two dorsal flagelliform languets longer than the dorsal cirrus; in the ventral ramus the lips of the chaeta-sac and the ventral languets are prolonged into a long slender process. At the 70 th setiger all the languets are slender, but very much reduced in length. Ventral hemigomph falcigers with a long, straight blade, shorter in the posterior feet. There are no dorsal homogomph falcigers.

Length: 45 mm . by 2 mm . 80 setigers.

Remarks: Differs from C. Aagellipes Fauvel in having one, and not two, flagelliform processes arising from the ventral chaeta-sac, different blades to the falcigers, and paragnaths on both rings of the proboscis.

Occurrence: North Arabian Sea.
Distribution: Arabian Sea.
176. Nereis heteromorpha Horst. (Fig. 96, a).

Nereis (Lycoris) hetcromorpha, Horst, 1924, p. 152, pl. XXXI, figs. 1-2: Augener, 1926, p. 449.

Male Heteronereis with body divided into threc regions. Anterior atocous part with 14 segments, epitocous part with 32-45 segments; posterior part atocous, with reduced lobes having neither lamellae nor swimming bristles. Head with two pairs of large coalescent eyes, tentacles and palps bent backwards under the head. Tentacular cirri rather short. Dorsal cirri of the anterior seven parapodia swollen below the tip. In the epitocous parapodia the dorsal ligule is conically elongated, whereas the ventral one has a lamella-shaped distal extremity; a rather lange fan-shaped lamella is situated at the base of the dorsal cirrus which bears, along its ventral border, 14 papillae. Ventral cirrus provided ventrally with a large lamella and, dorsally, with an elongated onc; the neuropodial lobe bears a large cordiform lamella. In the caudal region, a dorsal, stout, pale aciculum and a ventral blackish one. Proboscis: Group \(1=1-2\) paragnaths behind one another; \(\mathrm{II}=\mathbf{a}\) crescentic cluster; \(\mathrm{III}=\) a transverse curved group in 3-4 rows; IV = a curved triangular onc; \(\mathrm{V}=0 ; \mathrm{VI}=\mathrm{on}\) each side, a transverse row of 5-6 denticles; VII-VIII \(=\) a monostichous belt of 12 paragnaths.

Length: 8-10 mm. Atocous phase unknoz'n.
Occurrence: Ceylon, Trincomali.
Distribution: Malay Archipelago; India.

\section*{Subgenus NEANTHES Kinberg.}

All groups of the proboscis present.
177. Nereis (Neanthes) capensis Willey. (Fig. 96, b-d) .

Neanthes capensis, Willey, 1904, p. 261, pl. XIII, fig. 10, pl. XIV, figs. 9-10: Fauvel, 1911, p. 384.
Neanthes albanyensis, Augener, 1918, p. 149, pl. II, fig. 6: Fauvel, 1917, p. 206, fig. 16; 1927, p. 430.
F. 27

Longer tentacular cirri reaching backwards to the 7th-11th segment. Proboscis: Group \(\mathrm{I}=1\) or 2 ; \(\mathrm{II}=\) triangular clusters; \(I I I=\) a transverse cluster; \(I V=\) rectangular cluster; \(\mathrm{V}=1\) or 3; VI \(=\) on each side, a cluster of 3-6; VII-VIII \(=3-4\) rows. Anterior feet with short rounded lobes, 3 in the dorsal ramus, and short dorsal cirri. Middle and posterior feet with sharper lobes, dorsal lobes not increased. End-pieces of the falciform heterogomph setae small, short, broad. There are no posterior dorsal homogomph falcigerous bristles.

Length: 30 mm . by 5 mm .
Colour: Two dark glands in the feet.
Occurrence: Persian Gulf.
Distribution: Australia; New Zealand; Persian Gulf; Suez Canal; Cape of Good Hope.
178. Nereis (Neanthes) meggitti Monro.

Nereis (Neanthes) meggitti, Mono, 1931, p. 580, figs. 1-6.
Prostomium as broad as long. The longest tentacular cirri reach back to the 7 th-10th setiger. Proboscis: Group \(I=\) a cluster of 4 very small paragnaths; \(I I=\) oblique clusters of \(10-12\) small ones; \(\mathrm{HII}=\) about 4 rows ol numerous small; IV =oblique groups of about \(15 ; \mathrm{V}=a\) group of 4-6 rather large ones; VI \(=4-5\) rather large paragnaths, on each side; VII-VIII =a continuous band of 4 rows of small paragnaths. In the anterior feet, dorsal ramus with three triangular, pointed, upper lobes of about equal size. Dorsal cirrus slender. In the posterior segments, there is no substantial enlargement of the upper dorsal lamella but, relatively to the dorsal ramus, the ventral ramus is much reduced. There are no dorsal homogomph falcigers.

Length: 30 mm . by 2 mm .
Colour: Male and female. Heteronereis: In spirit, vestiges of a narrow black stripe down the middle of the back.

Occurrence: Rangoon River, forty miles from the mouth, in fresh water.

\section*{Subgenus CERATONEREIS Kingberg.}

Paragnaths missing on the oral ring.
179. Nereis (Ceratonereis) costae Grube. (Fig. 98, a-f) .

Nereis (Ceratonereis) costae, Fauvel, 1923, p. 349, fig. 136 a-f; 1939, p. 320.

Ceratonereis pectinifera Grube, Willey, 1905, p. 272, pl. IV, figs. 90-91.

Tentacular cirri rather short. Prostomium not incised. Proboscis: Group \(\mathrm{I}=0\); \(\mathrm{II}=2\) crescentic rows; III \(=3-8\), set in a triangle or a lozenge; IV -square clusters. In the anterior feet, three dorsal ligules, the median one shorter. In the posterior feet the dorsal ramus over-

Fig. 98.-N. (Ceratonereis) costae Grube: \(a, b\), head and proboscis; \(c\), \(d\), 11th and 18th feet \(\times 20\); \(e\), posterior foot \(\times 20\); \(f\), falciger \(\times 350\). C. hircinicola (Eisig): g.n (not yet found in India).
shadows the ventral one. Dorsal cirrus longer; ventral cirrus short. Postcrior ventral falcigerous bristles with a stout yellow shaft and a hooked end-piece. There are no dorsal homogomph falcigers.

Length: 20-80 mm.
Colour: Very variable; yellowish, pink, green, with streaks of brown dots.

\section*{Occurrence: Ceylon.}

Distribution: Australia, Philippine Islands, IndoChina, Malay Archipelago; Indian Ocean,: Red Sea, Persian Gulf; Atlantic Occan.
180. Nereis (Ceratonereis) pachychaeta Fauvel. (Fig. 99, \(a-h\) ).
Ceratonereis pachychaeta, Fauvel, 1919, p. 403, fig. VIII, pl. XV, figs. 22-25; 1923, p. 41; 1933, p. 57.
Body short, tapering backwards. Prostomium not notched. Tentacular cirri short. Proboscis: Group I = \(1 ; I I=4-8\) in a single, curved, row; \(I I I=2-8\) behind one another; IV = triangular clusters of 4-6. Dorsal cirri slightly longer than the feet. Anterior feet with three

Fig. 99.-N. (Ceratonereis) pachychaeta Fauvel: a, anterior part \(\times 8\); \(b\), anterior foot \(\times 30 ; c\), posterior foot \(\times 30\); \(d\), foot from midbody \(\times 30\); e, large upper ventral falciger \(\times 300 ; \mathrm{f}, \mathrm{g}\), heterogomph and homogomph articulations \(\times 300 ; h\), lower ventral falciger from 20 th foot \(\times 300\).
dorsal, sub-equal, rounded ligules. In the posterior feet, two dorsal, unequal, pointed ligules; ventral ramus shorter, with several very stout heterogomph falcigers with endpiece hooked and more or less fused with the stalk. Lower falcigers with shorter hooked end-piece not fused.

Length: \(30-45 \mathrm{~mm}\). by \(3-4 \mathrm{~mm}\).
Colour: In spirit, copper coloured with transverse bands of tiny dark spots and dark glands.

Occurrence: Maldive Archipelago, Hulu Male.
Distribution: Tahiti, Gambier Islands; Maldive Archipelago; Red Sea; Gulf of Suez; Madagascar.
181. Nereis (Cexatonereis) burmensis Monro. (Fig. 97, \(d-f)\).
Nereis (Ceratonereis) burmensis, Monro, 1937b, p. 532, fig. 1.

Prostomium not incised. Palpostyles small, buttonlike. Four small black eyes in a rectangle. Longer tentacular cirri reach back to the 6th setiger. Proboscis: No paragnaths on the proximal ring, Group \(\mathrm{I}=\) a patch of very small paragnaths; \(\mathrm{I}=\) narrow oblique clusters of relatively large ones; III = a rather wide transversal band of about three rows of very small denticles; IV =an oblique cluster of about 10 . Short subulate cirri. Dorsal ramus with 3 triangular ligules. Ventral ramus with 4 languets, but only 3 in the posterior feet, which are not increased. Bristles delicate and slender. Ventral falcigers with long, straight, slender end-piece: they are confined to a short median region. Further back there are only spinigers. There are no dorsal homogomph falcigers. Heteronereis male with modification of the feet at about the 21st setiger.

\section*{Length: 45 mm . by 2 mm .}

Colour: In spirit, grey-green, with a black median dorsal stripe over about the first ten setigers and traces of black transverse segmented bands. Black pedal glands.

Occurrence: Off Bombay; Maungmagan, Burma.
Remarks: Feet very close to \(N\). chingrighattensis. Allied to Ceratonereis similisetis Grube, which has no falcigers and a different shape of feet.
182. Nereis (Ceratonereis) tripartita Horst. (Fig. 100, \(a-d)\).
Nereis (Ceratonereis) tripartita, Horst, 1924, p. 183, pl. XXXVI, figs. 1-2: Fauvel, 1932, p. 99, fig. 15.

Fig. 100.-N. (Ceratonereis) tripartita Horst: \(a, 9\) th foot \(\times 45\); \(b\), heterogomph falciger from hinder foot \(\times 400 ; c\), upper ventral falciger from 9 th foot \(\times 400 ; d\), lower veatrad talciger from 9 th foot \(\times \mathbf{4 0 0}\).

Tentacular cirri reaching hackwards to the 8th-9th segment. Proboscis: Group I \(=0\); II and IV =triangular clusters of numerous small, pale paragnaths; \(\mathrm{II}=\mathbf{= a}\) large transverse cluster of several rows. In the anterior feet, a dorsal cirrus longer than the foot, two sub-equal sharp conical dorsal ligules. Ventral setigerous lobe short and blunt; ventral cirrus long and slender. Posterior feet not increased. Homogomph and heterogomph spinigerous bristles. Ventral heterogomph falcigerous bristles with sickle-shaped, ciliate, terminal piece; some of them very stout, but compound. There are no posterior dorsal homogomph falcigerous bristles. Atocous specimen; those of Horst were all epitocous, divided into three regions.

Occurrence: Andaman Islands, in coral.
Distribution: Malay Archipelago; Andaman Islands.
183. Nereis (Ceratonereis) microcephala Grube. (Fig. 101, \(a-b\) ).
Nereis (Ceratonereis) microcephala, Grube, 1878, p. 65: Fanvel, 1932, p. 99, fig. 16.
Prostomium small, not notched between the tentacles. Four black eyes arranged in a widely opened trapezium.

Fig. 101.-N. (Ceratonereis) microcephala Grube: a, foot from midbody \(\times 60 ; b, 20\) th foot \(\times 60\).
Tentacles shorter than the palpophores which are very large, blunt, conical and diverging. Two inferior pairs of tentacular cirri shorter than the upper ones, which reach backwards to the 7th-8th segment. Proboscis: Maxillary ring small, oral ring (devoid of paragnaths) much larger. Group \(\mathrm{I}=0 ; \mathrm{II}=\) crescentic clusters of \(2-3\) rows; III = a broad and transverse cluster of 3-4 irregular rows; IV =several curved rows. The posterior feet are not
modified. In the anterior feet, dorsal ramus with two triangular subequal ligules and dorsal cirrus about the length of the ligules: ventral setigerous lobe conical, as long as the dorsal ramus; ventral ligule blunt and much shorter. Ventral cirrus small, much shorter than the ventral ligulc. Dorsal and upper ventral spinigerous bristles homogomph; lower ventral ones heterogomph. All setac long and slender. Falcigerous homograph ventral setac present in anterior feet, missing in the posterior ones.

Differs from C. tripartita in (1) the shape of the feet which are shorter and more blunt; (2) its very much shorter ventral cirrus, and (3) the absence of posterior rentral falcigerous bristles and in its more slender setae. The armature of the proboscis is the same.

> Occurrence: Taleh-Sap, Gulf of Siam.
> Distribution: Philippine Islands; Gulf of Siam.
184. Nereis (Ceratonereis) flagellipes Fauvel. (Fig. 102, \(a-h)\).

Nereis (Ceratonereis) flagellipes, Fauvel, 1932, p. 100, pl. III, figs. 1-8.

Piostomium broader than long, not notched between the tentades. Four rather large eyes, with a lens, arranged in a widely opened trapezium. Tentacles about the length of the palpophores. Palps stout, oroid. Tenta cular ciri rather short. the longer reaching backwards to the 6th setigerous segment. Peristomium hardly longer than the succeeding segment. Jaws very pale yellow. transparent, with 5-6 teeth, the inferior ones blunt. Paragnaths missing on the oral ring. On the maxillary ring they ate sharply conical, transparent, little conspicuous. Group I. 0 (or 1?) ; II-: small clusters of 3-4; 1II \(=\) a transverse row of \(3 ; \mathrm{I}^{-}=\)small clusters of \(2-5\). Paropodia: On the first 5-6 setigerous segments, the dorsal cirrus is more or less of the same length as the dorsal ligule. The dorsal and ventral rami are divided each into two elongated conical ligules whose tip is already slightly filiform in the upper dorsal one. The ventral cirrus is shorter. In the suceeding feet, the dorsal ligules become flagelliform (whip-like) and much longer than the cirrus. In the ventral ramus, the setigerous lobe is much elongated and divided at the tip into two filiform appendages corresponding to the two fillets. The ventral ligule is whip-like and nearly as long as the dorsal ligules, and the ventral cirrus is much shorter. Behind the 20th foot, the ligules still increase in length, especially the
ventral one, and are more or less coiled. (The posterior feet are unknown.) The dorsal bristles are slender homogomph spiningers. The upper ventral bristles are long and slender homogomph spinigers and heterogomph falcigers; the lower ventral ones are hemigomph, or faintly heterogomph, spinigers and long hetelogomph falcigers.

Fig. 102.-Nereis (Ceratonereis) flagellipes Fauvel: \(a\), anterior end, dorsal view; \(b\), proboscis, ventral view; \(c\), 5 th foot; \(d\), 21st foot; \(e\), 35th foot; \(f\), homogomph spinigerous bristle; \(g\), inferior falcigerous bristle from posterior foot; \(h\), inferior falcigerous bristle from anterior foot.

Only a single anterior fragment, 32 mm . by 2 mm . and 36 segments, was collected.

Occurrence: 25 miles south of Barwa Beacon, Ganjam Coast, 93 fms.
185. Nereis (Ceratonereis) mirabilis Kinberg. (Fig. 103, \(a-c)\).

Ceratonereis mirabillis, Kinberg, 1865, p. 70: Ehlers, 1887, p. 117-172, pl. XXXVIII, fig. 1-6: Gravier, 1901, p. 172, pl. XI, fig. 12: Fauvel, 1917, p. 207 (Synonymy); 1932, p. 98: Gravely, 1927, p. 13, pl. X, fig. 21.

Ceratonereis tentaculata Kinberg, Augener, 1913, p. 168: Horst, 1924, p. 180, pl. XXXV. figs. 4-7.

Postomium decply cleft between the tentacles. Palps clongated. Tentacular cirri and dorsal cirri rery lons. Pioboscis: Gioup \(I=0\); II and \(I V=\) triangular clusters, II = a trancverse cluster of several rows. Paragnatho miss ing on the oral ling. Dorsal ramus with two lons, slender, subequal lipules. Posterior teet little modified. Spinigerous sctae homogomph and heterogomph. Falcigerous setae heterogomph, with long, straight, ciliated

Fig. 103.-N. (Ceratonencis) mirabilis Kinberg: \(a\), 40th foot \(\times 80\); \(b\), head; \(r\), upper ventral taiciger \(\times\) a00: Penmeneis barbana Mouro: \(d, e\), probores, vental and donsal view id, \(f\), antenor foot 25 .
terminal piece, becoming shorter and more sickle-like in the posterior feet. Dorsal homogomph falcigerous bristles in the posterior feet.

Length: 30 mm .
Colour: In life, semi-transparent.
Occurrence: Andaman Islands, Gulf of Mannar, Krusadai Island, Pamban, Kilakarai, from coral reefs: Maldive Archipelago.

Distribution: Pacific Ocean; Indian Ocean, Persian Gulf, Red Sca; Atlantic Ocean, Brazil, West Indies.
F. 28

\section*{Genus PERINEREIS Kinberg.}

Parapodia biramous. Horny paragnaths on both rings of the proboscis. Paragnaths of Group VI transverse, ridge-shaped, or a transverse row of more or less flattened denticles.

\section*{Key to the species of Perinereis.}
1. Body divided into 3 regions ...
2. Paragnaths of groups VII-VIII \(\begin{array}{lrrr}\text { absent } & \text { of groups } & \text { VII-VIII } & \text { suluana Horst, p. } 204 .\end{array}\) Groups VII-VIII present .. 3
3. Heterogomph spinigers absent .. barbara Monro, p. 204. Heterogomph spinigers present 4
4. A transverse row of many small denticles in group VI
Only one or two laige flattened paragnaths in each group VI
5. Groups I and II absent Groups II present
..
6. Two transverse paragnaths in
each group VI
..

A single transverse paragnath in each group VI T ..
7. A single paragnath in group \(V\)

A triangular patch of three paiagnaths in group \(V\)
8. Paragnaths of gioup VI narrow and little flattened
Paragnaths of group VI broad and flattened
9. Group \(V\) missing

A triangular patch of threc paragnaths or a single large one, in group \(\mathbf{V}\)
10. A cluster of 4-12 paragnaths in group I. Posterior feet enlarged
One, two or three paragnaths behind one another in group 1. Posterior feet not materially enlarged
11. Tentacular cirri reaching backwards to the \(5-6\) th setigerous segment
Tentacular cirri reaching backwards to the 7-9th setigerous segment

180. Perinereis maindroni Fauvel. (Fig. 104, e-i).

Perinereis maindroni, Fauvel, 1943, p. 201, fig. 1, e-i.
Body small, slender, divided into three regions. Four eyes set in a trapezium. Tentacles shoiter than the conical palps. The longer dorsal cirrus reaches back to the third setigerous segment. Proboscis with rery small, thansparent, conical paragnaths, not casily detected. Group \(\mathrm{I}=1\) or 0; II and IV=curved rows; III =a small transverse cluster; \(\mathrm{V}=0 ; \mathrm{VI}=0\) each side, a transverse row of 5-6 conical or slightly flattened paragnaths; VII-

Fig. 104.-Perinereis maindroni Fausel: \(c\). \(f\). long and short spinigers \(\times 380\); \(g\), anterior foot \(\times 80\); \(h\), foot from mid-body \(\lambda 80\); \(i\), semi-cpitocous foot \(\times 80\).

VIII \(=3\) rows. Anterior region with a score of segments, the feet of which carry three dorsal subequal ligules and three ventral ones, with the intermediate one shorter. Dorsal cirrus about the same length as the upper ligule. Ventral cirrus short. Middle region: 20-24 segments. Dorsal ligule narrow, and about twice or thrice as long as the two others and the dorsal cirrus, which is inserted at its base. Posterior region: \(12-15\) segments, the last ones very small. The dorsal ligule decreases rapidly.

Setae very small and slender. Falciform endpieces rather long and slender. There are no homogomph talcigers.「wo long anal cirri.

Length: \(15-18 \mathrm{~mm}\).
Colou: In spirit yellowish, with. sometimes, a bown collar behind the head and a few stacaks on the back of the anterior segments.

Occurcnce: Pondichery (M. Maindron col.).
Remarks: Onc of the specimens is a sub-cpitocus male, with incipient lanellae on the ventral cirrus, but without oar-shaped setae. The others, though atocous, are nevertheless clearly divided into three regions, which is reyy unusual in atocous Nereids.
187. Perinereis barbara Monro. (Fig. 103, \(d-f\) ).

Peinereis barbara, Monro, 1926, p. 316, figs. 3-5.
Prostomium of the usual shape. Longest tentacular cirri reach back to the third setiger. Poboscis: Group I \(=2\) paragnaths, a smaller followed by a larger; \(11=a n\) oblicque distichous group of about l' panantaths; 111 . a small transverse group of about 9. İ - a large crescomia group; \(\mathrm{V}=a\) longitudinal row of 4 paragnaths; \(\mathrm{V}=\mathbf{=}\) small paragnaths on the bonder of wosat \(I\) 'and a single larger linea; paragnath, on each stde; V'll-VIIl a band of paragnaths about four deep. (Variations occur in group VI.) Anterior fect with long dorsal cinns and two dorsal lobes; the lip of the ventral seta-sac is just shorter than the infcrior one. Ventral languel sub-digitiform. Posteriorly the languets all become longer and more pointed. There is nothing remarkable about the setae and their arrangement, except that there appear to be no heterogomph spinigers present.

Length: 40 mm . by 2 mm .
Colour: In spirit, pale ycllow.
Occurrence: Singapore Beach.
Distribution: East Australia, Port Jackson; Singapore.
188. Perinereis suluana Horst. (Fig. 105, e).

Perinereis suluana, Horst, 1924, p. 175, pl. XXXIII, fig. 9: Monro, 1926, p. 318: Fauvel, 1932, p. 102.
Posterior tentacular cirri, rather slender and streaked with brown pigment, reach backwards to the 4th setigerous segment. The palps, longer than the tentacles, are
stout and cylindrical. The eyes are large, black, with a lens, and set in a square. Proboscis: group \(I=2-3\) in a line; \(I I\) and \(1 V=\) clusters; \(I I=\) a transverse cluster of \(3-1\) rows; \(\mathrm{V}=0 ; \mathrm{VI}=\mathrm{on}\) each side, a single ridge-shaped paragnath. Groups l'II-l'ill absent. In the posterior feet, the dorsal ligule is larger and protrudes above the ventral ramus but is not foliaccous and flag like. Falcigerous setac with a short teminal piere.

Colour: Prostom:um white with three longitudinal bown streaks. Back dak-biown with a narrow white line adoss the middle of each segment. Further on, the white line divides the segment into two unequal brown bands. In the posterior pat, the pigment is reduced to two or thace transterse, natiow, patches.

Occurrence: Andaman hlands.
Distrilution: Sulu Achipelago; Andaman Islands; Daros Island in the Amirante Islands.
189. Perinereis singaporiensis Giube. (Fig. 105, \(a-d\) ).

Peninencis singaponiensis, Grube, 1878, p. 84: Horst, 1924, p. 169.
 Faucel, 1932, p. 103: Mono, 1931, p. 36, figs. 1-2.

Proboscis: group \(\mathrm{I}=\mathbf{1 - 3 ;} 1 \mathrm{I}=\mathbf{a}\) rhomboidal cluster of 8. 9 ; \(1 \mathrm{II}=\mathrm{a}\) transverse tristichous group: \(\mathrm{IV}=\) crescentic goups; \(\mathrm{V}=0 ; \mathrm{VI}=\mathrm{on}\) cach side 2 transversely clongated paragnaths (with one or two conical ones between them:) : VII-VIII wo or three rows. Terminal piece of the fakigerous bristles rather long, little curved and ciltaced. Posterior feet not increased but dorsal ligules stout and protuding above the ventral ramus.

Length: 80 mm . by 3 mm .
Colour: A dark median stripe on anterior segments. Black pedal gland conspicuous.

Occurrence: Singapore; Mergui.
Distribution: New Caledonia; Malay Archipelago; Singapore; Mergui Archipelago, Jack and Una Islands; Burna, Diamond Island.
190. Perinereis vancaurica (Ehlers). (Fig. 105, \(f-g\) ).

Nereis vancaurica, Ehlers, 1864, p. 503, pl. XX: Fauvel, 1923, p. 34 (Synonymy); 1932, p. 103.
Nereis languida, Grube, 1867, p. 13, pl. 11, fig. 1.
Perinereis horsti, Gravier, 1901, p. 182, pl. XI, fig. 47.
Perinereis nankaurica, Augener, 1922a, p. 23.

Proboscis: group \(\mathrm{I}=1,2\); \(\mathrm{II}=\) crescentic clusters; III \(=\mathrm{a}\) square cluster; \(\mathrm{IV}=\) triangular clusters; \(\mathrm{V}=3\), set in a triangular patch; VI=on each side, two transverse elongated paragnaths; VII-VIII \(=3\) rows. There is sometimes an accessory denticle in group V. Tentacular cirri reaching backwards to the \(4-5\) th setigerous segment. Terminal pieces of falcigerous bristles straight and ciliated. Posterior feet not enlarged.

Fig. 105.-Perinereis singaporiensis Grube; \(a\), posterior foot \(\times 32\); \(b, c\), proboscis, dorsal and ventral view; \(d\), vential falciger \(\times 240\) (after Pruvot). P. suluana Horst: e, foot \(\times 40\) (after Horst). \(P\). vancaurica (Ehlers): \(f, g\), head and proboscis (after Monro).

Length: 80 mm . by 3 mm .
Colour: A dark median stripe on anterior segments.
Occurrence: Singapore; Mergui.
Distribution: Philippine Islands, Indo-China, New Zealand; Nankauri, Nicobar Islands, Red Sea; Atlantic Ocean, French Guiana.
191. Perinereis cultrifera Grube. (Fig. 106, \(a-l\) ).

Perinereis obfuscata, Grube, 1878, p. 86: Horst, 1924, 173, pl. XXXIV, figs. 5, 6.

Proboscis: group \(\mathrm{I}=1\), or a few in a line or a small cluster; II and IV=clusters; III=a rectangular cluster; V \(=\mathrm{I}\) or a triangular patch of \(3 ; \mathrm{VI}=\mathrm{on}\) each side, a single broad, flattened paragnath; VII--VIII \(=2-3\) rows. Tentacular cirri of variable length. Falcigerous setae with short sickle-shaped terminal pieces. Posterior feet not modified.

Fig. 106.--Permereis cultifera Grube: \(a\), natural size: \(b, c\), head and proboscis, dorsal and vential view; \(d, e, f\), anterior, midbody and posterior feet \(\times 15\); \(g\), heterogomph falciger \(\times 270\); \(h\). female. Heteromeres stage, \(i\), male Heteronereis stage; \(k\), its pygidium; \(l\), male epitocous foot \(\times 20\).

Length: \(10-250 \mathrm{~mm}\).
Colour: Dark or yellowish green.
This species is liable to extensive variation, especially as regards the armature of the proboscis, the length of the cirri and the shape of the dorsal ligule.

The principal varieties, or sub-species, are tabulated as follows:

Key to the varieties of P. cultrifera Grube.
1. Group V, a triangle of 3 paragnaths 2
Group V, a single paragnath ..
2. Group I, 1 to 3 in a longitudinal line
Group I, a small cluster of 4-8 perspicillata Grube, p. 208.
3. Tentacular cirri reaching backwards to the \(5-6\) th sctigerous segment .. ..
Tentacular cirri reaching backwards to the 7-8th setigetous segment
helleri Grube, p. 208.
4. Group I, 1 or 2 in a line .. floridana Ehleis, p. 208.

Goup I, a small cluster of \(4-5\)
cultifera var. typica
Grube, p. 208.

Group \(\mathrm{I}=1-3\) in a linc: \(\mathrm{V}_{-\infty}\) a uiangular patch of three. Tentacular cirri reaching to the 5-6ith segment.

Occurrence: Burma, Diamond INland: Nicobar islands, Camorta I; Andaman Islands; Cape Comorin.

Distribution: Cosmopolitan; Pacific, Indian and Atlantic Oceans.

\section*{var. floridana Ehlers.}

Group \(I=1-2\) in a line; \(V=\) a single large paragnath.
Occurrence: Singapore; Cape Comorin.
Distribution: Gulf of Siam; Malay Aıchipelago; India: Atlantic Ocean.
var. perspicillata (inube.
Group \(I=\) a small cluster of \(4-8\) paragnaths, \(V_{-}=\) triangle of three.

Occurrenct: Indo-China; Singapore; Monmugao Bay
Distribution: Philippine Islands; New Caledonia: Singapore; India; Persian Gulf; coasts of France.

\section*{var. helleri Grubc.}

Perinereis camiguina, Gube, 1878, p. 87: Augencı, 1922, p. 23.
Group \(I=2\), one behind the other; \(V\) a triangular group of 3 large paragnaths. Tentacular cirri reaching backwards to the 8-9th segment.

Occurrence: Mergui Archipelago; Gulf of Mannar; Bombay Harbour.

Distribution: Pacific Ocean, Philippine Islands; India; Atlantic Ocean.
var. striolata Grube.
Group \(I=\) a small cluster of \(4-5\); group; \(V=a\) single large paragnath. Tcntacular cirri reaching backwards to the 9 th setigerous segment.

Occurrence: Gulf of Siam; Singapore.
Distribution: Philippine Islands; Indo-China.
Remarks: Perinereis obfuscata differs from P. striolata in having shorter tentacular cirri.
192. Perinereis aibuhitensis Grube. (Fig. 107, a).

Perinereis aibuhitensis, Grube. 1878, p. 89, pl. V, fig. 3: Horst, 1924, p. 168, pl. XXXIII, figs. 4-6: Fauvel, 1932, p. 106.

Group \(\mathrm{I}=2\) in a line: II and \(\mathrm{IV}=\) clusters; \(\mathrm{III}=\mathbf{a}\) transverse cluster of 3 rows and, on each side, 3-4 in a longitudinal line; \(\mathrm{V}=3\), arranged in a triangle; VI=on each side, two stout obtuscly conical, hardly flattened

Fig. 107.-rerinereis aibuhitensis Grube: a, head and proboscis (after
(irube). \(P\). nigropunctata Hons ( \(=5\). maforii Southern): b. \(c\), head and proboscis, dorsal and ventral view \(\times 10 ; d\), falciger \(\times 500\); e, 10th foot \(\times 50 ; f, 70\) th foot \(\times 50\) (after Southern) F. 29
paragnaths: VII-VIII \(=3\) rows. Falcigerous bristles with long, straight terminal piece. Dorsal ligule of the posterior feet short and thick.

Occurrence: Andaman Islands; Vizagapatam; Mormugao Bay.

Distribution: Philippine Islands; Batavia; Macassar; China; India.
193. Perinereis nigro-punctata Horst. (Fig. 107, b-f) .

Perinereis nigro-punctata, Horst, 1924, p. 171: Fauvel, 1932, p. 107.

Perinereis marjorii, Southern, 1921, p. 595, pl. XXIII, fig. 10. Perinereis yorkensis, Augener, 1922a, p. 24, fig. 6, a-c.

Proboscis: group I=a cluster of 5-12 paragnaths; II and IV=triangular and crescentic clusters; III \(=\) a transverse group; \(\mathrm{V}=2\) large denticles arranged in a triangle; Vl=on each side, a single, large, semi-circular tooth; VII -VIII a double row. Falcigerous bristles with short sickle-shaped terminal piece. Dorsal ligule greatly enlarged in the posterior feet.

Length: \(50-60 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: Pale purplish brown. A V-shaped band behind the eyes. Three transverse black spots on the back of the anterior segments.

Occurrence: Nicobar Islands, Nankauri; Andaman Islands; Chilka Lake; Cape Comorin.

Disribution: Malay Archipelago; Nicobar Islands, Nankauri; India.
194. Perinereis cavifrons Ehlers. (Fig. 108, a-b).

Nereis (Perinereis) cavifrons, Ehlers, 1920, p. 47, pl. I, fig. 610.

Proboscis: group \(\mathrm{I}=2-3\), one behind the other: II and \(\mathrm{IV}=\) crescentic clusters; \(\quad \mathrm{I}=\mathrm{a}\) cluster; \(\mathrm{V}=0 ; \quad \mathrm{VI}=\mathrm{on}\) each side, a rather narrow transverse paragnath; VII-VIII \(=2\) or 3 irregular rows. Tentacular cirri reaching backwards to the 6 th segment. Dorsal cirri about the length of the dorsal ligule. Posterior feet not modified. Falcigerous bristles with short terminal piece.

Occurrence: Gangetic delta; coast of Travancore; Mormugao Bay.

Distribution: Java; Burma; India.

\section*{195. Perinereis neocaledonica Pruvot. (Fig. 108, \(c-g\) ).}

Perinereis neocaledonica, Pruvot, 1930, p. 50, pl. III, figs. 77-79: Fauvel, 1932, p. 107.

Body of large size, about 300 segments. Prostomium broader than long, notched between the tentacles. Palps short, globular. Proboscis: groups I and II are missing; III-IV =a dense cluster of very numerous and very minute denticles, the three groups nearly coalescent; \(\mathrm{V}=1\), 2 or 3 large paragnaths; \(\mathrm{VI}=\mathrm{on}\) each side, a transverse row of about 20 conical or slightly flattened paragnaths; VII-VIII=a belt of numerous very small denticles reaching to the groups VI. A similar patch of small denticles,

Fig. 108.-- Perinercis caustions Ehlers: a, anterior part \(\times 4 ; b, 10\) th foot \(\times 18\) (after Fhlews). P. neocaledonca Prusot: \(c, d\), proboscis. dowal and vental new: \(e\). lith foot \(\times 30\); \(f\). hinder foot \(\times 30\); \(g\), heterogomph falciger \(\times 175\) (after Pruvot).
sometimes continuous with the former, lies behind the large paragnaths of group \(V\). Jaws large, dark and smooth. Tentacular cirri very short. Dorsal cirri short. In the anterior feet, dorsal ramus with two ligules. Dorsal ligule of the posterior fect much enlarged, flaglike, with a small dorsal cirrus inserted near the tip. Hetcrogomph falcigerous bristles with a large shaft and a and a small terminal piece, easily deciduous.

Length: \(175-220 \mathrm{~mm}\). by 6 mm ., setae included.
Colour: Yellowish, in spirit, with traces of a longitudinal chestnut streak.

Occurrence: North Andaman Islands, under stones; Arabian Sea.

Distribution: New-Caledonia; New-Hebrides: Andaman Islands; Arabian Sea.
196. Perinereis nuntia (Savigny). (Fig. 109, \(a-g\) ).

Perinereis nuntia, Fauvel, 1919, p. 410 (Synonymy); 1932, p. 108.
Proboscis: Group I=0, or 1 to 3 behind one another; \(\mathrm{II}=\) clusters; \(\mathrm{III}=\) rectangular patch; \(\mathrm{IV}=\) triangular clusters; \(V=0,1,2\) or 3 set in a triangle; \(\mathrm{VI}=\) on each side, a single curved row of 5-18 conical, or flattened, ot conical and flattened mixed together; VII-VIII \(=3\) rows of large spikes, more or less flattened and, sometimes, ?-3 rows of smaller ones. Tentacular cirri reaching backwards to the 3rd-16th setigerous segment. Dorsal cirri of variable length. Parapodia with dorsal ligules blunt, conical, or tapering. In the postcrior feet, the dorsal ligule is enlarged.

This wide-spread species, fairly common in warm seas all over the world, is also liable to extensive variations, and has been described under many names.

These varieties may be tabulated as follows:
Key to the varieties of \(P\). nuntia Savigny.
1. Group V missing .. 3

Group V present .. 2
2. Group V, 1 paragnath .. 4

Group V, 3 in a triangle .. 5
3. Tentacular cirri reaching backwards to the \(10-15\) th segment; dorsal cirri longer than the dorsal ligule; paragnaths of VI mixed
Tentacular cirri reaching to the 3rd-5th segment; dorsal cirri shorter than the dorsal ligule; paragnaths of VI flattened
4. Group I, 1-3

Group 1, 7-13 .. .. var. majungaensis Fauvel.
5. Tentacular cirri reaching to the 10-16th segment. Paragnaths of group VI all conical .. var. typica Savigny, p. 213.

Tentacular cirri reaching to the 7th-8th segment. Paragnaths of group VI flattened or mixed
.. var. brevicirris, (Grubc), p. 214.
var. typica (Fig. 109, \(f-g\) ).

Perincreis nuntia var. vallata, Fauvel, 1919, p. 418 (Synonymy); 1932, p. 110: Augencr, 1913, p. 175.

Proboscis: group \(\mathrm{I}=1-3\) : \(\mathrm{II}-\mathrm{III}-\mathrm{IV}=\) clusters; \(\mathrm{V}=\mathrm{I}\), set far back; \(\mathrm{VI}=\mathrm{on}\) each side a transverse row of \(8-15\) paragnaths, conical, flattened, or both mixed together; VII-VIII \(=3\) alternate rows of spikes somewhat flattened. Tentacular cirri reaching to the 31d-6th segment. Dorsal cirri short, dorsal ligules blunt.

Length: \(50-80 \mathrm{~mm}\).
Occurrence: Bombay, under rocks, in sand.
Distribution: Chile; New-Zealand; Australia; Philippine Islands; India, Red Sca, Madagascar, Cape of Good Hope.

\section*{Genus PSEUDONEREIS Kinberg.}

Paragnaths of the proboscis of three kinds: conical, pectinate and transversc. Posterior feet enlarged.

Kcy to the species of Pseudonereis Kinberg.
1. Group VI, on each side, a single broad flattened paiagnath .. gallapagensis Kinberg, p. 215.
Group VI, on each side, one or several rows of paragnaths ..
2. Posterior dorsal homogomph falcigerous bristles pesent .. anomala Gravier, p. 217.
Posterior dorsal homogomph falcigerous bristles absent .. rottnestiana Augener, p. 217.
197. Pseudonereis gallapagensis Kinberg. (Fig. 110, \(a\) c).

Pseudonereis gallapagensis, Kinberg. 1857-1910, p. 52, pl. XX, fig. 3: Gravier, 1909, p. 629, pl. XVI, figs. 15-20: Fauvel, 1932, p. 111.
Paranereis elegans, Kinberg, 1857-1910, p. 53, pl. XX, fig. 8.
Pseudonercis variegata, Fauvel, 1921, p. 13 (Synonymy).
Pseudonereis ferox Hansen, Fauvel, 1914, p. 120, pl. VII, figs. 13-17.
Nereis longicirra (Schmarda), Michaelsen, 1892, p. 9, pl. 1. fig 9-10.
Mastigonereis longicirra, Schmarda, 1861, p. 109, pl. XXX1. fig. 250.

Proboscis: group \(\mathrm{I}=1-2\); \(\mathrm{II}-\mathrm{III}=\) dense rows of small pectinate paragnaths; IV \(=\) rows of pectinate denticles and a few conical paragnaths in front; \(\mathrm{V}=\mathrm{l} ; \mathrm{VI}=\), on each side, a single large, triangular or flattened paragnath; VII -VIII=two rows of laterally or longitudinally flattened spikes alternating. Tentacular cirri reaching backwards to the 3 rd-8th segment. Falcigerous setac without sickleshaped terminal piece. Homogomph dorsal falcigerous bristles absent. Dorsal ligule of the posterior feet enlarged.

Fig. 110.-Pseudonereis gallapagensis Kinherg: \(a, b\), head and proboscis, ventral and dorsal view; c, falciger (after Gravier). Ps. anomala Gravier: \(e\), proboscis, dorsal view; 1, posterior foot \(\times 44\);
\(g\), dorsal homogomph falciger \(\times 300\). Ps. rottnestiana Augener: \(h\), posterior foot \(\times 44\); \(i\), ventral falciger \(\times 300\).
Length: \(20-65 \mathrm{~mm}\). by \(3-5 \mathrm{~mm}\).
Colour: In life bluish-grey; in spirit, dark-brown with blue iridescence.

Occurrence: Andaman Islands; Diamond Island; Mormugao Bay.

Distribution: Pacific Ocean, Gallapagos, Peru, Chile, Magellan, Indo-China; Indian Ocean, India, Madagascar, Cape of Good Hope; Atlantic Ocean, Cameroon, SanThome, Brazil.
198. Pseudonereis anomala Gravier. (Fig. 110, \(e-g\) ).

Pscudonereis anomala. Gravier, 1901, p. 191, pl. XII, fig. 50-52: Fauvel, 1911, p. 395; 1932, p. 112: Gravely, 1927, p. 15, pl. X, fig. 25.
Proboscis: group I=1-3; II-III-IV=several rows of small pectinate paragnaths; \(\mathrm{V}=0\); \(\mathrm{VI}=\), on cach side a transverse row of \(6-10\) conical paragnaths; VII-VIII \(=\) a single row of large paragnaths, more or less flattened. Tentacular cirri long. Posterior dorsal ligules clongated, with dorsal cirrus near the tip. Posterior dorsal falcigerous bristles, with rather short, faintly curved, terminal piece.

Length: 20-65 mm.
Occurrence: Andaman Islands; Gulf of Mannar; Cape Comorin; Kilakarai; Mormugao Bay.

Distribution: Australia, Malay Archipelago, IndoChina; India, Arabian Sca, Persian Gulf, Red Sea, Madagascar.
199. Pseudonereis rottnestiana Augener. (Fig. 110, h, i).

Pscudonelcis rottnestiana, Augener, 1913, p. 184, fig. 20, a-c, pl. Ill, fig. 46: Fauvel, 1932, p. 112.
Proboscis: group \(1=0,1\) or \(2: 1 I-11 I=4-5\) rows of pectinate denticles; \(\mathrm{N}^{\prime}=1-\mathrm{s}\), 10 w s of pectinate denticles and a few conical paragnath in front: \(V=0 ; V I=0\) each side, a transverse sow of 6-10 conical paragnaths: VIIVIII=two alternating rows. Tentacular cirri reaching backwards to the 6th-9th setigerous segment. Dorsal ligule of the posterior feet enlarged, with dorsal cinus near the tip. Falcigerous bristles with short, sickle-shaped, terminal piece. Homogomph dorsal falcigerous bristles absent.

Length: \(25-35 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: Head dark coloured, body pale yellowochre.

Occurrence: Andaman Islands.
Distribution: South Australia; Andaman Islands.

\section*{Genus PLATYNEREIS Kinberg.}

Horny paragnaths arranged in pectinate rows of minute denticles. All dorsal groups on the maxillary -F. 30
ring, and at least the mid-dorsals (sometimes all, loth dorsal and ventral) on the oral ring generally missing.

Key to the species of Platynereis.
1. Dorsal cirrus of the 7th setigerous segment much longer than the others .. .. abnormis (Horst), p. 222.
Dorsal cirrus of the 7 th setigerous segment normal2
2. Heteronereis stage with oarshaped setae all compound and not conspicuously pectinate

3
Heteronereis stage with pectinate oar-shaped setac, and single setae in the last segments

4
3. Group II absent

Group II present
dumerilii (Aud. \& M.Edwards), p. 218.
4. Oar-shaped setae boldly pectinate .. .. polyscalma Chamberlin, p. 221.
Oar-shaped setae faintly pectinate. Stout hooks in the anterior and posterior feet .. pulchella Gravier, p. 220.
200. Platynereis dumerilii (Aud. \& M.Edwards.) (Fis. 111, \(a-f\) ).
Platynereis dumerilii, Fauvel, 1923a, p. 359, fig. 141: 1932, p. 113.
Platynereis insolita, Gravier, 1901, p. 197, pl. XII, fig. 53: Gravely, 1927. p. 16, pl. X, fig. 23.
Platynereis bengalensis Kinberg, Willey, 1905, p. 273, pl. IV, fig. 92-94.
Proboscis: paragnaths very minute, often pale and little conspicuous. Group \(I=0 ; I I I=0 ; I I I=a\) small transverse cluster in two rows; IV =several transverse pectinate rows; \(\mathrm{V}=0 ; \mathrm{VI}=\mathrm{on}\) each side, \(1-2\) concentrtic curved rows; VII-VIII \(=5-7\) clusters of small palc denticles (very variable). Tentacular cirri long, extending to the 10th-15th setigerous segment. Posterior feet not enlarged. Falcigerous bristles with short, hooked, sickle-shaped terminal pieces. Dorsal homogomph falcigerous setae with more elongated terminal piece in the posterior fect.

Length: \(20-60 \mathrm{~mm}\).
Colour: In life very variable, greenish, yellowish, pink, reddish, with violet chromatophores and dark pedal glands.

Occurrence: Andaman Islands; Nicobar Islands, Nankauri; Gulf of Mannar; Madras Coast; Pamban; Ceylon.

Distribution: Cosmopolitan; Pacific, Indian and Atlantic Ocean.

\section*{201. Platynereis fusco-rubida Grubs.}

Nereis (Platynereis) fusco-rubida, Grubs, 1878, p. 70: Fauvel, 1911, p. 403.

Fig. 111.-Platynerfis dumerilı Aud. \& M.-Edw.: a, b, head and proboscis; \(c\), foot from mid-body \(\times 30\); \(d\), posterior foot \(\times 30\); \(e\), dorsal homogomph falciger \(\times \mathbf{8 5 0} ; f\), ventral heterogomph falciger \(\times 350\). Ill. coccinea Belle Chiage: gen, (not yet found in the Indian area).

In the atocous condition this species is very close to Pl. dumerilii. The chief differences lie in the armature of the proboscis. There is a small row of paragnaths in the groups II, which are missing in Pl. dumerilii, and in groups VI a rectangular cluster, instead of the usual two rows. Such slight differences are hardly of specific value but, on the other hand, the proboscis agrees tolerably well with that of Pl. polyscalma. whose atocous condition is still unknown. Pl. fusco-rubida might, perhaps, be this atocous condition, as Pl. pulchella is the atocous condiion of a Heteronereis quite distinct from Pl. dumerilii.

Length: \(20-50 \mathrm{~mm}\).
Colour: Dark pedal glands.
Occurrence: Persian Gulf.
Distribution: Philippine Islands; Persian Gulf.
202. Platynereis pulchella Gravier. (Fig. 112, \(f-h\) ).

Platyneicis pulchella, Gravier, 1901, p. 202, figs. 55--56, pl. XII, figs. 210-212: Monro, 1936, p. 380, fig. 1-3; 1937, p. 279, fig. 10: Fauvel, 1939, p. 329.
Platynereis dumerilii var. fulchella, lauvel, 1911, p. 402, figr. 30-32.
In the atocous condition this species is so close to \(I l\). dumerilii that I considered it as a simple varicty characterised by a single row of paragnaths in the gronps II, instead of two, and by slightly different falcigers. In all but a few anterior segments, there are one or fow dorsal

Fig. 112.-Platynereis polyscalma Chamberlin: a. b, Heteronerest stage, anterior part, dorsal and ventral view (after Horst); \(c\), simple bristle from the last segment \(\times 270 ; d\), simple ribbed bristle from terminal segments \(\times 270\); \(e\), swimming bristle
\(\times 270\). Pl. pulchella Gravier: \(f\), ventral view of the proboscis; \(g\), simple ribbed bristle (after Monro);
\(h\), dorsal homogomph falciger from anterior foot
\(\times 380\). Pl. abnormis (Horst): \(\boldsymbol{i}\), 7th foot of the female \(\times 50 ; k\), 7 th foot of the male \(\times 50\) (after Horst).
homogomph talcigers, the terminal piece with downward curved, smooth tip and conspicuous terminal ligament having its basal attachment as far down as the tip of the articular cup.

But the epitocous condition is quite different from Pl. dumerilii and close to that of Pl. polyscalma, differing only in the presence of the said dorsal homogomph falcigers in the last segments of the antevior part and in the blades of the swimming bistles whose fringes are very fine and difficult to sec, and, last, the teminal, simple, tibbed bristles are finer.

Length: \(15-30 \mathrm{~mm}\). Heteronereis stage, about 15 mm., male with two tegions.

Occurnence: Andaman Islands; Nicobar Islands, Nankauri.

Distribution: Indo-China; Bay of Bengal, Arabian Sea, Persian Gulf, Red Sca.
203. Platynereis polyscalma Chamberlin. (Fig. 112, ac).

I'latine eis polsscalma, Chambelin, 1919, p. 919, pl. XXX, XXMI: Honst. 1924, p. 186; Fauvel 1931, p. 23. pl. HII, figs. 1-6; 1932. p. 11t: 1935. p. 323; 1939, p. 329. Glavier and Dantan, 1934, p. 121, figs. 123-124: Monro. 1935, p. 125.
(?) Platynereis integer, Treadwell. 1990, p. 595, fig. 4.
Atocous condition still unknown. Heteronereis stage: Prostomium snout-like, protruding, broadly rounded in front. Tentacles small, vential, pointing backwards; the palps have a similar disposition, but concealed under the head and lowered over the mouth. Four enormous eyes with lenses, the anterior pair much larger than the posterior and nearly ventral in position. Proboscis: group \(\mathrm{I}=0\); \(\mathrm{II}=\) chitinous alleas destitute of paragraphs: \(\mathrm{III}=\) pectinate cluster; IV = crescentic clusters of small pectinate denticles; \(V=0\) (or \(1:\) ): \(V I=0\) each side a round or oval cluster of pectunate paragnaths; VII-VIII a row of several oval clusters. Tentacular cirri reaching backwards to the 6 th- 9 th segment. Anterior dorsal cirri of the male swollen. the succeeding ones crenulated. Two large anal cirri with a filiform tip and a rosette of papillae. Swimming bristles compound, with long oval blades, bearing, on one side, below the apex, very long and spinelike delicate marginal tecth projecting at an angle. In the last segments simple setae with a ribbed blade.

In the male specimens, the epitocous transformations commence on the 15 th setigerous segment. The inferior
ventral ligule has three processes and the dorsal lamella of the ventral cirrus is bifurcated. The last \(15-16\) segments resemble a kind of narrow, slender, tail but the appearance is rather delusive as all these segments arc provided with epitocous bristles and lamellae, only the ventral division is much smaller. The anus is surrounded by a rosette of minute hollow papillae and the pygidium bears two anal filiform cirri.

As already stated, it might be, perhaps, the epitocous condition of Pl. fusco-rubida.

Length: \(10-20 \mathrm{~mm}\).
Occurrence: Nicobar Islands, Nankauri Harbour; Andaman Islands, in plankton.

Distribution: Funafuti, Gilbert Islands (Philippine Islands?), Java, Weiu Island, Indo-China, Gulf of Siam: Nicobar Islands, Andaman Islands.
204. Platynereis abnormis (Horst). (Fig. 112, i-k).

Nereis abnormis, Horst, 1924, p. 163, pl. XXXII, fig. 6: Augener, 1926b, p. 448: Fauvel, 1930, p. 23.
Platynereis abnormis, Fauvel, 1932, p. 118.
Proboscis: Group \(\mathrm{I}=0 ; 11=\) a small concave row of paragnaths; \(\mathrm{III}=0\); \(\mathrm{IV}=\mathrm{a}\) crescentic row of paragnaths; \(\mathrm{V}=0\); VI \(=\) a triangular row of paragnaths; VII-VIII \(=\) five small, transverse groups of paragnaths, three of them in the median part and one on each side. Tentacular cirri long. A very long dorsal cirrus on the 7th setigerous seg. ment. Falcigerous setae with sickle-shaped terminal pieces bent in the form of a hook with a dorsal prominence. Posterior dorsal homogomph falcigerous bristles.

The atocous specimens resemble Pl. dumerilii except in the characteristic, very long, dorsal cirrus of the 7th setigerous segment. The falcigers are also alike. The mutation of the feet occurs about the 14th to 15 th feet in the male and 16th in the female, according to Augener. In Heteronereis stages from Trincomali he noticed three regions; an anterior of 14 segments, with a long cirrus on the seventh, a middle one of 43, and a posterior, atocous, of 11 segments. Moreover, he mentions two other long filiform cirri on the eighth segment of the posterior region.

Length: male Heteronereis, 10 mm .
Occurrence: Trincomali; Krusadai; Pamban; from weeds.

Distribution: Malaya Archipelago; Ceylon.

\section*{Incertae Sedis-}
205. Nereis (s. str.) sp. m. ezoensis Izuka, Gravely, 197, p. 13, pl. X, fig. 22.

Does not agree with Izuka's species, and description insufficient for identification.
206. Nereis ehlersiana Grube, Willey, 1905, p. 272.

A male Hetcronercis stage, which cannot be identified (Ceylon).
:(07. Nereis festiva Grube, 1874, p. 326.
A Plalynereis spec. from Ceylon.
20). Nereis foliosa Schmarda, 1861, p. 104, pl. XXXI. fig. 243.
Very likely an Eunercis spec. from Ceylon.
:09. Nereis spec., Fauvel, 1932, p. 116.
A small Heteronercis, perhaps related to N. jacksoni Kinberg or kauderni Fauvel, from Pamban.

\section*{Family NEPHTHYDIDAE Grube.}

Body elongate, subtetragonal in cross section. Segments short and numerous. Prostomium small, flattened, polygonal. Four small tentacles. Proboscis with terminal bifid papillae and longitudinal rows of soft papillae. Two horny jaws inside the pharynx. First foot rudimentary. Parapodia biramous, both divisions wide apart, provided with membranous lobes and simple setae; a branchia coiled between the rami: a single anal cirrus.

\section*{Genus NEPHTHYS Cuvier.}

The characters of this genus are those of the family.

\section*{210. Nephthys inermis Ehlers. (Fig. 113, a-f).}

Nephthys inermis, Ehlers, 1887, p. 125. pl. XXXVIII, figs. 1 -ti; Faurel 1923a, p. 375, fig. 147; 1933, p. 47, fig. 3 a-d: Momo, 1937, p. 283.
Prostomium square, with two anterior, very short, button-like tentacles and two posterior very minute tentacles at the hind part, in front of two very small eyes. Proboscis utterly devoid of papillae, with a pair of

Fig. 113. - Nephthys inermis Ehlers: \(a\), head and proboscis \(\times 16\); \(b\), posterior part of the body \(\times 16 ; c\), 95 th foot \(\times 25 ; d\), 45 th foot \(\times 25\); e, simple bristle \(\times 970\); \(f\), forked, lyriform bristle \(\times 370\).
triangular chitinous jaws inserted very far back in the pharynx. Dorsal and ventral rami widely apart and short, with conical setigerous lobes, a digitiform dorsal cirrus, a gill, coiled inwards, a short dorsal lamella, and a rather long ventral cirrus. Anterior setae ciliated, but not camerated. Posterior setae of two kinds: (l) long, slender, faintly denticulate, and (?) short, bifurcate, lyriform.

Length: 60-80 mum.; 160 segments.
Occurrence: Maldive Archipelago.
Distribution: Indian Ocean, Maldive Archipelago, South Coast of Arabia, Aden, Gulf of Suez; Atlantic Occan, Gulf of Mexico, Adriatic Sea.

2: 1. Nephthys dibranchis Grube. (Fig. 114, e).
Nephthys dibranchis. Grube, 1877, 536: Ehlers, 1901. p. 14: Augener, 1924, p. 997 ; 1927a, p. 116: Mcintowh, 188.5, p. 161, pl. XXVI, figs. 8, 9, pl. XXVII, fig. 5: Fauvel, 1992, p. 117: Monro, 1937, p. 288.
Nephthys spiibranchis, Ehless, 1917, p. 235, pl. XV1, fig. 5-7.
Branchiae from the fifth setigerous segment, reduced or missing in the posterior segments. In the segments of the mid-body they are long, coiled inwards, with a long dorsal cirrus. Setigerous lobe conical, lamellae short, a long, slender, gill-like ventral ligule and a short ventral

Fig. 114.-Nephthys gravieri Augener: a, anterior part \(\times 40\) after Augener); \(b\), foot \(\times 66 ; c\), bristle from posterior row of the foot \(\times 330\). N. malmgreni Theel: \(d\), foot \(\times 66\).
\(N\). dibranchis Grube: \(e\), foot \(\times 40\).
F. 31
cirrus. Setae long, slender, and also bifurcate, lyriform, bristles.

Length: \(20-30 \mathrm{~mm}\). by 2 mm .
Colour: Whitish or pink.
Occurrence: Orissa Coast, Vizagapatam, Madras, Maldive and Laccadive Islands, Gulf of Oman, Persian Gulf.

Distribution: New Zealand; New Guinea; Australia; Arafura Sea; India, Laccadive Sea, Arabian Sea, Gulf of Oman, Persian Gulf; South America.
212. Nephthys gravieri Augener. (Fig. 114, a-c).

Nephthys gravieri, Augener, 1918, p. 123, fig. 6, pl. II, fig. 5; 1927a, p. 116: Fauvel, 1932, p. 118.

Setigerous lobes conical, blunt, anterior lamellae missing or much reduced, dorsal posterior lamella oval, ventral larger and more rounded. Branchiae broad, short, oval, with a small dorsal cirrus and a bent process at its base. Anterior bristles barred and short, posterior ones very long, boldly serrated on the concave border.

Length: 25-30 mm.
Colour: Yellowish or pink.
Occurrence: Off Puri, Orissa, Bay of Bengal, 847 tms.
Distribution: South Australia; Bay of Bengal.
213. Nephthys malmgreni Theel. (Fig. 114, b, d) .
(`) Nephthys malmgreni Theel, Fauvel, 1923a, p. 371, fig. 145.
The ventral cirrus of the first foot is longer than the posterior tentacles, the dorsal one is very small. Dorsal and ventral setigerous lobes sharp and conical, the dorsal and ventral anterior lamellae are mere rounded folds, shorter than the foot, the posterior lamellae are only a little larger. The gills are long, cylindrical, coiled inwards, or straight, with a short conical dorsal cirrus. The anterior setae are barred, the posterior ones nearly smooth.

Remarks: These Indian specimens differ slightly from the N. malmgreni from Europe, for the dorsal posterior lamella does not appear to be bilobed.

Length: 70-80 mm.
Colour: Yellowish-white, in spirits.
Occurrence: Andaman Sea, 279 fms. Off Akyab, Burma, 250 fms.

Distribution: Indian Ocean, Andaman Sea, Bay of Bengal; Atlantic Occan, North Sea, Mediterrancan Sca.
214. Nephthys polybranchia Southern. (Fig. 115, a-c).

Nephthys polybranchia, Southern, 1921, p. 607, pl. XXIV, fig. 11: Fauvel, 1932, p. 118.

Prostomium with four tentacles on the anterior border; two small eyes. Ventral cirrus of the first foot very small, the dorsal is quite rudimentary. Setigerous lobes bluntly conical. Dorsal lamellae shorter than the setigerous lobe, ventral lamellae a little longer, both rami

Fig. 115.- Vephthys polybranchia Southern: \(a\), anterior end \(\times 46\) (after Southern): \(b\), 13 th foot \(\times 50 ; c\), hind foot \(\times 50\). N. oligobranchia Southern: \(d\), anterior end and proboscis \(\times 30\) (after Southern); \(e, 14\) th foot \(\times 50 ; f\), hind foot \(\times 50\).
widely apart, but not very divergent. A small gill on the sccond foot, well developed ones from the seventh to the 30th segment, where they become short, broad, foliaceous, with a median ridge, and the dorsal cirrus is reduced to a small knob. They persist to the end of the body. The camerated or barred setae are restricted to the anterior feet and are replaced in the middle and posterior feet by long, slender, capillary setae with slightly flattened blades,
very finely serrated along one edge. The condition of the gills appears to be somewhat variable.

Length: About 20 mm . A brackish-water form.
Occurrence: Shanghai; Taleh-Sap; Calcutta Water Works (Pulta) ; Chilka Lake, Madras.
215. Nephthys oligobranchia Southern. (Fig. 115, d-ff).

Nephthys oligobranchia, Southern, 1921, p. 610, pl. XXIV, fig. 12: Fauvel, 1932, p. 119.
" Differs from N. polybranchia in the distribution of the branchiae which occur fully developed on the sixth foot, and disappear on the 20th to the 23rd foot, whereas in \(N\). polybranchia the branchiae are larger on the filth foot and persist almost to the end of the body: in that the branchiae contain a double vascular loop whereas there is only a single loop in N. polybranchia; in that the posterior lamellae of the feet are considerably surpassed by the spiral lobe." (Southern).

Remarks: As there are also several vascular loops in. at least, the anterior branchiac of \(N\). polybranchia, differences on that account are not of much value. Both may be only varieties of one species. Both live in water of variable salinity. The number and disposition of the papillae of the proboscis have not the value generally set on them for the identification of Nephthys for there is often a wide range of variation.

Length: \(10-20 \mathrm{~mm}\).
Occurrence: Calcutta Water Works (Pulta) and Salt Lakes; Chilka Lake; Vizagapatam; Cochin backwater.

Distribution: Taleh-Sap; Kiangsee; Mergui; Bay of Bengal; India.

\section*{Incertae Sedis-}
216. Nephthys dussumieri Valenciennes, Quatrefages, 1865, p. 427. From the coast of Malabar.

Family EUNICIDAE Grube.
Body elongate, vermiform. Prostomium with lobate palps more or less united. Tentacles subulate, 1 to 7 or morc. First two segments generally achaetous and apodous. Sometimes one pair of tentacular cirri on the second segment. Feet uniramous or sesquiramous. Dorsal cirri with or without branchiae, sometimes rudimentary or missing. Ventral cirrus sometimes missing. Setae
simple, or simple and compound, very varied in shape. Proboscis armed with lower jaw-plates (labrum) and a number of biserial toothed upper jaw-plates. Sometimes a membranous tube.

The Eunicidae are divided into subfamilies and genera as follows:

Key to the subfamilies and Genera of Eunicidae.
1. Prostomium without (visible) tentacles and palps. Dorsal Subfamily cirri rudimentary; no ventral ILIMBRICONERINAE cirri .. .. Grube, 14.
Prostomium with tentacles .. 2
2. No vental cirri. Dorsal sirri LYSARETINAE foliaceous. Three tentacles .. Kinberg, 12.
Ventral cirri piesent. Doisal cirri foliaccons

3
3. Two tentacles and two cylindrical palps. Upper jaw composed of fiom 2 to 4 longitu. dinal series of very small and numerous picces

STAIROCEPHAINAE
Kinberg, 11.
From 1 to 7 tentacles. Palps short, globular. Upjer jaw consisting of 4-: pairs of picces
..
4. Seven tentacles, 5 occipitals, mounted on ringed ceratopho. res and 2 frontals ovate ..
Fiom 1 to 5 occipital tentacles, ovate frontals absent ..
5. Bianchiae present. : tentacles

Branchiae absent
6. Tentacular cinsi present
.. Eunice Cuvier, p. 291.
Tentacular cirri absent
.. Marphysa Quatrefages, p. 29.
7. Three tentacles. Tentacular cirri absent
1.nsidice Savigny, p. 248.

One tentacle. Tentacular cirri absent

Nematonereis Schmarda. p. 249.
8. Tentacular cirri absent

Tentacular cirri present
ONUPHIDINAE: levinsen, 8.

EUNICNAL: Kinberg,

Anterior feet little modified, bearing hooked bristles, simple or compound ..
11. Tentacles and palps very large, more or less articulate. Dorsal and ventral cirri well developed
Tentacles and palps rudimentary. Dorsal and ventral cirri very short
12. Three short tentacles. Branchiae absent
Tentacles rudimentary or absent. Branchiae present
. .
13. Three subulate tentacles folded backwards into a dorsal groove Three short rounded tentacles partly hidden under the border of the first segment ..
14. Small parasitic worms Free, and often very large worms
15. Cirriform branchiae present .. Branchiae absent
16. Capillary setae and hooks simple or compound
Only winged capillary setae ..
17. With a stout acicular bristle. Jaws III and IV single hooks Dorsal acicular bristle absent. Jaws III and IV toothed plates. Four eyes
.. ..
18. Lower jaw well developed, with 2 hooks. Parasitic on Syllids
Lower jaw reduced, without hooks. Parasitic on Spio and Bonellia .. ..

Onuphis, Aud. \&
M.-Edwards, p. 253.

Staurocephalus Grube, p. 278.

Ophryotrocha Clap. \& Mecznikow.

18
Iphitime Marenzeller.
Halla Costs.

Aglaurides Ehlers, p. 250.
18
15
Ninoë Kinberg, p. 277.
16
Lumbriconereis Blainville (Grube rev.), p. 263.

17
Drilonereis
Claparde, p. 276.

Labrorostratus
Saint-Joseph.
Oligognathus
Spengel.

The genera Iphitime, Halla, Labrorostratus, Oligognathus and Ophryotrocha are not yet recorded from India.

The genus Nicidion which differs only from Eunice in the absence of gills may be regarded as a subgenus of the latter, if not as simple varieties. Other genera, such as Paramarphysa, Paradiopatra, Paraonuphis, are doubtful and further investigations are still wanted to settle their status.

\section*{Subfamily EUNICINAE Kinberg.}

Two palps. One, two or five occipital tentacles. Frontal tentacles absent. Anterior feet not modified. Bran-
chiae pectinate or simple, or missing. Setae simple, compound and acicular. A lower jaw and 3-5 pairs of upper jaws.

\section*{Genus EUNICE Cuvier.}

Leodice Savigny.
Eriphyle Kinberg.
Body very long. Head with five tentacles; cirrophcre not ringed; two bulbous palps. A pair of tentacular cirri inserted on the second apodous segment. Dorsal cirri elongate; ventral cirri short or knob-like. Branchiae simple, or more generally pinnate. Parapodia sesquiramous, with acicular setae, simple pectinate (or comb-like) and compound setac. Lower jaw of two pieces. Upper jaws with a pair of mandibles and two or three pairs of toothed plates, an unpaired left plate and sometimes paragnaths.

\section*{Key to the species of Eunice.}
1. Gills simple, or with only two filaments; beginning very far from the head 2

Gills branched
2. Comb and acicular setae absent Comb and acicular setae piesent
3. Gills begin about 28th foot .. Gills begin about 80th-100th foot
. gracilis Crossland, p. 243.
4. Gills bipectinate
.. investigatoris Fauvel, p. 239. Gills pectinate
.. 5
5. Acicular setae tridentate .. 6

Acicular setae bidentate .. 8
6. Gills well developed in the posterior part of the body ..
Gills absent in the posterior part of the body
7. Gills begin on 3rd or 5th foot. Tentacles smooth ..
Gills begin about 6th-7th foot. Tentacles annulate
. australis Quatrefages, p. 240.
8. Forming tubes of characteristic structure9
Without special tubes ..... 10
9. Compound setac with swordshaped terminal piece anteriorly, sickle-shaped posteriorly
tubifex Crossland, p. 232.
Compound setae all sickle-shaped floridana Pourtales, p. 235.
10. Gills occur only on the anterior third of the body, beginning about 6th to 9th foot ..
Gills continue nearly to the hind end of the body11

11. Gills begin about 3rd to Sth
 foot ..... 13

Gills begin about 10th to 30th
 foot and attain to from 4 to 16
 filaments anteriorly but are
 simpler in the posterior region ..... 12
12. Gills begin about 10th to 20th foot and attain to from 6 to 16 filaments afra Peters, p. 23.

Gills begin about 25th to 30th foot and attain to from 4 to 6 filaments
afia var. paupera
Grube, p. 236.
13. Very large species. Tentades smooth. Gills up to \(2,-30\) and more filaments ..
Smaller species. Tentacles annulated
aphoditors lallas, p. 233.
14
14. Gills begin about 4th to 6th foot and consist of 6-20 fila- tentaculata ments

Quatrefages, p. 234.

15
15. Gills suddenly disappear about 80th segment
savignyi Grube, p. 238.
Gills continue nearly to the last segments
.. grubei Gravier, p. 237.
217. Eunice tubifex Crossland. (Fig. 116, a-g).

Eunice tubifex, Crossland, 1904, p. 303, figs. 52-55, pl. XXI, figs. 1-8: Willey, 1905, p. 282: Fauvel, 1980, p. 26.

Prostomium bilobed. Tentacles short, smooth. Gills begin about 20th-35th foot and attain 3-6 filaments. Body with very large, thick, ventral glandular pads for about 50 segments, then rounded and decreasing. In the anterior feet, the compound setae have a smooth elongate knife-like end-piece. In the middle and posterior regions the end-pieces are bidentate, sickle-shaped hooks as in other species. A membranaceous tube.

Length: 150-220 mm. by 5-10 mm.
Colour: in spirit, dark mahogany, more or less checkered.

Occurrence: Ceylon, Gulf of Mannar, Krusadai Is. land.

Distribution: South Australia; Philippinc Islands; Indian Occan; Atlantic Occan.

Fig. 116.-Funice tubtex Chossland: \(a\), 20 h foot \(\times 16\); \(b\), , 0 th toot
 conded comperind seta fom e(th toot; \(g\), anterior patt (after Crossland). E. afra Peters: \(h\), falciger \(\times 245\); \(i\). head (after Crossland).
218. Eunice aphroditois Pallas. (Fig. 117, a-g).

Eunice aphoditois, Fauvel, 1917, p. 215, pl. VII (Synonymy); 1930t, p. 533; 1932, p. 193: Pruvot. 1930. p. 65: Monro, 1931, p. 44; Augener, 1926, p. 455.

Ennice oussaei, Quatrefages, 1865, p. 309, pl. X, figs. 1-4: Fauvel, 1917, p. 220, pl. VIII (Synonymy).
Eunice gigantea, Quatıefages, 1865, p. 311.
A very large species. Palps bilobed or multi-lobed. Tentacles short, blunt, smooth or faintly wrinkled. Tentacular cirri short. The gills, which begin about the 5th to 10 th foot, are generally branched on the 5th-6th foot and attain up to 25,30 , and cven 40 filaments. Acicular bristles black, blunt, missing in old specimens or irregularly distributed in the posterior region. Acicular, black, compound bristles with short sickle-shaped endpieçe.

Length: Up to 1 metre, and more, by \(20-25 \mathrm{~mm}\).
Colour: In spirit, a brown chequered pattern, often with a white collar on third and fourth setigerous segments. The colour fades in alcohol. Dark blue in life, patapodial lobes tipped with white, yellowish brown spots (when young).

Fig. 117.--Einnice aphoditois (Pallas): a antelior part. whuced:
\(b, 32\) nd foot \(\times 2 ; c . d\), falcigers \(\times 70 ; e\), comb-scta \(\times 175 ; f\), aciculat bristle \(\times 105 ; \mathrm{g}\), simple bristle \(\times 105\). E. Horidana Pourtales, \(a^{\prime}\), anterior part \(\times 1 \frac{1}{2} ; b^{\prime}, 31\) st foot \(\times 8 ; c^{\prime}\), uperior jaws; \(d^{\prime}\), labium (lower jaw); \(e^{\prime}\), acicular histle > \({ }^{\circ}\); \(f^{\prime}\), comb-seta \(\times 210 ; g^{\prime}\), falciger \(\times 10 \%\).

Occurrence: Singapore, Andaman Islands, Gangetic Delta, Ceylon, Maldive Archipelago.

Distribution: Pacific, Indian and Atlantic Occans; Mediterranean Sea.
219. Eunice tentaculata Quatrefages. (Fig. 118, m-p).

Eunice tentaculata, Quatrefages, 1865, p. 317: Fauvel. 1917, p. 209, fig. XVII (Synonymy); 1930, p. 25; 1932, p. 134.
Eunice pycnobranchiata, McIntosh, 1885, p. 294, pl. XXIV, figs. 13-15.
Eunice elseyi, Baird, 1870b, p. 344.
Eunice martensi, Willey, 1905, p. 281, pl. IV, figs. 102-104.
Palps more or less bilobed. Tentacles annulated, rather long. Tentacular cirri articulate. Gills begin about 3rd to 6 th foot and attain to \(6-20\) filaments and conti-
nue to the hind part of the body. Acicula and acicular setac black.

Length: \(200-350 \mathrm{~mm}\). by \(10-15 \mathrm{~mm}\).
Colour: Purple-violet in life. Brown or spotted in spirit, sometimes a white collar on the fourth setiger.

Occurrence: Ceylon, Galle, Gulf of Mannar, Laccadive Islands.

Distribution: New Zealand; Australia; Malaya Seas; Nicobar Islands; Andaman Islands; India; Laccadive Islands.
220. Eunice floridana Poutales. (Fig. 117, \(a^{\prime}-g^{\prime}\) ).

Eunice flotidana, Ehlers, 1887, p. 88, pl. XXII, fig. 17: Fauvel, 1923. p. 402, 1914b, p. 149, pl. I, figs. 5, 8, 11; 1912, p. 194.

Eunice gunneri, Roule, 1907, p. 33, pl. I1, fig. 11.
Fiunice amphiheliae, Roule, 1896, p. 446.
Eunice philocorallia, Buchanan, 1893, p. 173, pl. IX. figh. 2-6; pl. X, figs. 7-9; pl. XI.

Palps bilobed. 'Tentacles articulate or moniliform, the median twice as long as the laterals. Tentacular cirri smooth. Gills begin about 7th to 10th foot and attain to \(8-10\) filaments, and continue nearly to the last segments. Acicula and acicular setae black. Commensal with corals. A membranaccous tube.

Length: 100-200 mm.
Colour: Black, pink, or brown, with mahogany spots. Sometimes a pale collar on the fourth setigerous segment.

Occurrence: Laccadive Sea.
Distribution: Indian and Atlantic Oceans, Mediterrancan Sea.

\section*{221. Eunice afra Peters. (Fig. 116, \(h-i\) ).}

Eunice afra, Crossland, 1901. p. 289, pl. XX. fig 15: Willey. 1905, p. 279: Augener, 1926, p. 456: Fausel, 1930b, p. 25; 1932, p. 185: Pruvot, 1990, p. 69.

Tentacles smooth or faintly annulate. Gills begin about 18th to 20th foot and attain to 4-16 filaments, and continue to the hind part of the body. Acicula and acicular setae dark. Body nearly cylindrical anteriorly, broad and flattened posteriorly.

Length: 150-250 mm.
Colour: Dark coloured, more or less spotted with white dots, sometimes a clear collar on the fourth setigerous segment.

Occurrence: Mergui; Gulf of Mannar; Ceylon.
Distribution: Pacific Ocean, Philippine Islands, Malaya Seas; Indian Ocean, Zanzibar, Madagascar, Red Sca.

\section*{var. paupera Grube.}

Eunice paupera, Grube, 1878, p. 160: Pruvot, 1930. p. 69; Fauvel, 1930b, p. 537: 1932, p. 135.
Palps slightly bilobed, tentacles smooth or faintly wrinkled; the median reaches backwards to the fourth setigerous segment. 'Tentacular cirri smooth, subulate, somewhat shorter than the buccal segment. Gills hegin about 23rd-27th foot. First 2, 3 or 9 gills are simple: succeeding ones are bifid or trifid and the following ones decrease to two, or even one, filament. Gills are missing on the last tenth of the body, or more. Acicula and acicular setae black. The section of the body is stmi-cylindrical, and flattened in the hind part.

Remarks: This is a variety of E. afra, diftering only in its simpler gills (reduced to 3-4 filaments) beginning farther from the head. There is a whole range of intermediate forms.

Length: 200-250 mm.
Colour: Colourless in spirit.
Occurrence: India.
Distribution: New Caledonia: Philippinc Islands; Malay Seas; Red Sea.
222. Eunice coccinea Grube. (Fig. 118, \(n-e\) ).

Eunice coccinea, Grube, 1878, p. 153, pl. IX. fig. 1: Ciossland, 1904, p. 297, pl. XX, figs. 6-7: Willey, 1905, p. 280: Ehlers, 1908, p. 85: Fauvel, 1919, p. 575, fig. 5; 1932, p. 196.

Tentacles smooth. Gills begin about 6 th, 9 th, to 13 th foot; they attain to 6-20 filaments and occur only on the anterior third of the body, which is highly arched dorsally throughout its length. Acicular setae bidentate or blunt. Hind body rounded.

Length: 100-130 mm.
Colour: red or red violet, in spirit, with small white dots. A pale collar on the fourth setigerous segment.

Remarks: Differs chiefly from E. afra by the posterior part of the body being rounded instead of flattened, and gills more numerous and with more filaments.

\section*{Occurrence: Ceylon; Maldive Archipelago.}

Distribution: Philippine Islands; Malayas Seas; Indian Ocean, Red Sca; Atlantic Occan, Gulf of Guinea.

Fig. 118.-Eunice coccinea Gube: a, b. c, more or less worn out fal-
 antennata Savigus, , hind foot's falciger \(\times 930\) : \(g\), acicular bristle \(\times 105\). E. australis Quatrefages: \(h, i\), acicular bristles \(\times 105 ; k\), falciger \(\times 105 ; l\), comb-seta \(\times 105\).
L. tentaculata Quatrefages: \(m\), \(n\), falcigers \(\times 105\); \(o\), acicular bristle \(\times 105 ; p\), comb-seta \(\times 230\).
223. Eunice grubei Gravier. (Fig. 119, a-c).

Eunice griabei, (iravier, 1900, p. 258, pl. XIV, figx. 87-88: Crossland, 1904, p. 288: Pruvot, 1930, p. 68 (Synonymy): Fauvel. 1932, p. 136; 1939. p. 334.
(?) Eunice micropion, Marenzeller, 1879, p. 135, pl. V, fig. I: Monro, 1924, p. 55.

Tentacles articulate. Gills begin on 3rd-4th foot; they attain to 4-10 filaments and continue nearly to the last segments. Acicula dark or yellow. Acicular setae bidentate.

Length: \(150-230 \mathrm{~mm}\). by 7 mm .
Colour: In spiiit, uniformly dark grey-brown, iridescent.

Occurrence: Singapore; Camorta Island, Nicobars; Off Akyab, Burma.

Distribution: Japan (弓), New Caledonia, Amboina, Indo-China, Philippine Islands, Malayas Seas; Nicobar Islands, Maldive Archipelago, Red Sea, East Africa.

22t. Eunice savignyi Grube. (Fig. 119, \(h-k\) ).
Eunice savignyi, Grube, 1878, p. 150: Ehlers, 1908, p. 88, pl. IX, figs. 7-13: Fauvel, 1932, p. 136.

Tentacles articulate. Gills begin on 3rd or 4th foot: they attain to \(8-15\) filaments, but further back become reduced to one and finally disappear altogether about

Fig. 119.-Eunice grubei Gravier: a, comb-setac; \(b\), falciger; c, acicular bristle; \(d\), anterior foot; \(e, 37\) th foot (after Gravicr). \(\boldsymbol{E}\).
marenzeller: Gravier: f, toot. E. indica Kinberg: g, talciger \(\times 333\). E. savignyi Grube: \(h, 25\) th foot \(\times 23\) (atter Ehlers). \(i\), falciger \(\times 333 ; k\), acicular bristle \(\times 133\).

30th-40th fect. Acicular setae yellow, bidentate. The edge of the labrum is prominent, white and toothed.

Length: \(60-70 \mathrm{~mm}\). by \(3-4 \mathrm{~mm}\).
Colour: Brown-yellow, iridescent.
Occurrence: Ceylon; Persian Gulf.
Distribution: Philippine Islands; Ceylon, Persian Gulf, Agulhas Current.
225. Eunice investigatoris Fauvel. (Fig. 120, a-f).

Eunice investigatoris, Fauvel, 1932, p. 137, fig. 19.
Body cylindrical anteriorly, scmi-cylindrical in the middle and flattened in the hind part. Palps bilobed. The three median tentacles ane subequal and reach backwards to the 6 th- 7 th setigerous segment: the two outer tentacles are hardly as long. The tentacles are all subulate, slender and smooth. The buccal segment (peristomium) is thrice as long as the succeeding one. Two tentacular cirri set on a short achaetous segment. Gills from the 6th setigerous segment, the first one small, but already compound; they are very large about the 7 th-8th, with 18-20 filaments about the 14th setiger. Well developed

Fig. 120.-Eunice investigatoris Fauvel: \(a\), 5 th foot \(\times 23\); \(b\), 10 th foot \(\times 23\); \(c\), fragment of branched gill \(\times 23\); \(d\). comb-seta \(\times 295\); \(e\), compound seta \(\times 117\); \(f\), acicular bristle \(\times 117\).
on about forty segments, they deciease in size in the midbody and increase again very much in the postertor region, where they continue to the 6 th -7 th small segments preceding the pygidium. The posterior gills are dichotomously branched. In the mid-body there are already a few bifid or trifid filaments. Dorsal cirri long and smooth in the furst segments, then shorter than the gills: they are not knife-like, and, except the first ones, hardly thicker than the branchial filaments. Ventral cirri fingerlike in the first 5-6 feet, in the succeeding ones short and moniliform; they again become digitiform in the posterior
half of the body, becoming longer and longer toward the hind part, where they are twice as long as the fect. Pypidium with two long, smooth, ventral cirri. Acicula black. Acicular sctae black, bidentate, hooded, begimning about the 44th-45th foot. Comb-setae long, narrow, with 810 tecth and equal sides, or, sometimes, one longer. Capillary setac long, slender, faintly winged. Terminal pieces of the compound setac strongly bidentate, with a hood not protruding above the tip, the shaft is slighrly enlarged. Labrum dark, with anterior cdge toothed. i single specimen, 110 mm . long and 7 mm . broad, colourless or light yellowish-grey in spirit.

Occurrence: Persian Gulf, 25 fms. "Investigaton'.
2<6. Eunice antennata Savigny. (Fig. 118, f--g).
Eunice antennata, Crossland, 1904, p. 312, pl. XXII, figs. 1-7: Willey, 1905, p. 280: Augener, 1926, p. 456: Gravely, 1927, p. 17: Fauvel, 1917, p. 225, fig. XX; 1932, p. 138; 1939, p. \(\$ 34\); Pruvot, 1930, p. 72.
Tentacles deeply annulated. Gills beginning about the 4th-6th foot, continued to near the anus; they attin to \(10-15\) filaments and are much more developed in the anterior and posterior regions than in the mid-body. Acicular setae yellow, tridentate.

Length: \(100-160 \mathrm{~mm}\). by \(5-8 \mathrm{~mm}\).
Occurrence: Singapore: Andaman Islands; Cull of Mannar, Ceylon; Persian Gulf.

Distribution: Pacific Ocean, Philippines, Indo-China: India, Persian Gulf, Red Sea.
227. Eunice australis Quatrefages. (Fig. 118, \(h-l\) ).

Eunice australis, Fauvel, 1917, p. 228 (Synonymy), Fig. XXI: Augener, 1926, p. 437.
Eunice murrayi McIntosh, Crossland, 1904, p. 310: Willey, 1905, p. 281.

Tentacles deeply annulated. Gills beginning about 6 th -7 th foot; they attain to \(10-15\) filaments. They are found only on the anterior third of the body and disappear suddenly. Acicular bristles yellow, tridentate.

Length: 60-90 mm. by 5 mm .
Colour: In spirit, yellowish, with sometimes a white spot on the back of each segment.

Occurrence: Nankauri, Nicobar Islands, Andaman Islands; Off Cape Negrais, Burma; Ceylon.

Distribution: Australia; New-Zealand; India, Maldive Archipelago, Gulf of Oman, Zanzibar, Cape of Good Hope.

\section*{228. Eunice indica Kinberg. (Fig. 119, g).}

Eunice indica, Crossland, 1904, p. 318, pl. XXI, figs. 9-12: Willey, 1905, p. 280: Fauvel, 1919, p. 378 (Synonymy); 1932 p. 139: Monro, 1937, p. 296.

Tentacles smooth. Gills begin on 3rd foot; they attain to \(10-20\) filaments and are found only on the anterior third of the body. Acicular setac yellow, numerous (4-5), tridentate. Terminal piece of the compound setac sometimes tridentate with a sharp protruding guard. Closely allied to the European E. wittata D. Ch.

Length: 50--70 mm.
Colour: Ycllowish, discoloured in spirit.
Occurrence: Nankauri, Nicobar Islands; Mergui; Bay of Bengal; Ceylon; Maldive Archipelago; Gulf of Oman.

Distribution: Japan, New Caledonia, Gambier Islands; Indian Ocean, Persian Gulf, Red Sea.
229. Eunice siciliensis Grube. (Fig. 121, e-m).

Eunice sicliensis, Fauncl, 1923a, p. 405. fig. 1:9. e-m: 1917, p. 231 (Synommy): 1932, p. 138; Crossland. 1904. p. 323. pl. XXII, figs. 8-9: Willey, 1905, p. 282: Augener, 1926, p. 457: Gravely, 1927 p. 17.
Eunice leucodon, Fhlers, 1901, p. 128, pl. XVI, figs. 1-10.
Body divided into two distinct regions, an anterior narrow and rounded, and a posterior soft and flattened. Tentarles short, smooth or faintly annulate. Gills simple, beginning very far fiom the head, about (ioth, 70th, or 100th foot. Comb-setac and acicular setac absent. Lower jaw (labrum) white, calcarcous, gouge-like.
L.ength: \(150-300 \mathrm{~mm}\).

Colour: Anterior part pink or brown: middle hody slate-blue or dark green. In mature specimens. posterior part long, swollen, soft, with a brownish-red spot in the middle of the ventral part of each segment, as in the Palolo worm. In the short uncoloured posterior part, preceding the pygidium, this brown spot fades gradually or disappears altogether in different specimens. The sexual region very likely breaks off when mature and is regenerated later, as is the case of the Palolo worm, which is also an inhabitant of corals.

Occurrence: Nankauri, Nicobar Islands; Andaman Islands; Gulf of Mannar; Ceylon; Maldive Archipelago; Muskat Shore, Gulf of Oman; Persian Gulf.

Distribution: Cosmopolitan; Pacific, Indian and Atlantic Oceans, Mediterranean Sea.

Fig. 121.-Eunice sictliensis Grube: \(e, f\), head, dorsal ant vontial view; \(g\), upper jaws; \(h\), anterior foot \(\times 15\); , once of the first branchiate feet \(\times 15 ; k\), foot from mid-budy \(\times 15 ; l\), hind foot ンに; \(m\), falcigel -100 .
230. Eunice marenzelleri Gravier. (Fig. 119, f).

Eunice marenzelleri, Gravier, 1901, p. 229, figs. 78-82, pl. XIII, figs. 68, 69: Fauvel, 1919, p. 378.

Palps bilobed. Tentacles smooth, short and slender. Tentacular cirri smooth. Gills begin about the 28th foot; they are all simple, very long and persist to the hind part of the body. The dorsal cirri decrease from before backwards. Acicula and acicular setac brown. Simple setae, compound setae, and comb setae present.

Length: 140 mm . by 5 mm .
Colour: Uniform red-brown.
Remarks: The presence of acicular and comb-setae clearly differentiates this species from E. siciliensis Grube.

\section*{Occurrence: Persian Gulf.}

Distribution: Red Sca; Persian Gulf.
231. Eunice (Nicidion) gracilis Crossland. (Fig. 122, \(a-f)\).
Lunice gacilis, Faurcl, 1930a, p. 26, fig. 6; 1932, p. 140, fig. 20.
Nicidion giacilis, Crossland, 190.4, p. 327, figs. 65-66; pl. XXII, figs. 10, 11: Augener, 1913, p. 284.
Body small, filiform, rounded. Tentacles short, smooth of very faintly ammate. Gills beginning very far from the head, about 80th-100th foot or even farther batk. They ate simple, or consist of two flaments. Combsetac and acicular setac present. Prostomium broad, slightly notched in front. liyes large, reniform.

†ig. 122.-lituice (Nicidion) gracali, Cossland: anterior abranchiate foot >it: \(h\). foot. with simple gill \(\times 45 ; c\), foot with bithd gill \(\times 45\); \(d\), posterior falciger \(\times 380\); \(c\), acicular bristle \(\times 380\); f. comb seta \(\times 380\).

Length: 20-60 mm.
Remarks: The gills commence very far back from the head, at first small and simple, occurring very irregularly, except in the posterior region, where they consist of two filaments, and are longer than the dorsal cirrus; they are missing on incomplete specimens and on the young. Such was the case in Crossland's and Augener's specimens. The genus Nicidion differs only from Eunice in wanting gills: but already in several so-called Nicidion, which
proved to be only varieties or anomalies of Eunice species, gills were found in adult specimens, very far from the head. Thus Nicidion gracilis is, perhaps, a young specimen, or a varicty, of E. marenzelleri Grube, as N. edentulumt is a varicty of E. siciliensis Grube.

Occurrence: Mergui; Gulf of Mannar.
Distribution: Australia, Indo-China; Indian Ocem, Mergui, Gulf of Mannar, Zanzibar.

\section*{Genus MARPHYSA Quatrefages.}

Prostomium rounded or trilobed. Two bulbous palps. Five tentacles. Two eyes. Tentacular cirri absent. Dorsal cirri elongated, ventral cirri short. Gills simple or pectinate. Dorsal setae simple, capillay; ventral setae simple or compound, with knife-like, or sickleshaped, terminal pieces. Comb-setae. Acicular setac. Lower jaw (labrum) of two pieces. Upper jaw with a pair of mandibles, two pairs of toothed plates, an unpaired plate and sometimes paragnaths.

Key to the species of Marphysa.
1. Compound setac of two hinds, fallax Mar. \& knife-like and sickle-shaped .. Bobret/ky, p. 917.

Ventral setae all of ore hind
2
2. Gills only on a shont anterior part of the body ..
Gills on the greater part of the body
3. Ventral setae simple

Ventral setae compound
4. Terminal piece of the compound setae sickle-shaped
Terminal piece of the compound setae knife-like
5. Prostomiun horse-shoe shaped Prostomium bilobed

3

macintoshi Crossland, p. 246.
6. Compound setae present on the anterior and posterior parts of the body
Compound setae absent in the anterior and posterior pats of the body .. .. gravelyi Southern, p. 246.
Marphysa corallina Kinberg, recorded from Madagascar, Red Sea, Cape of Good Hope and Pacific Ocean, has not yet been found in the area of the Indian fauna.
232. Marphysa sanguinea Montagu. (Fig. 123, \(a-h\) ).

Marphysa sanguinca, Fauvel, 1923a, p. 408, fig. 161, (Synonymy); 1932, p. 141.
Marphysa furcellata, Crossland, 1903, p. 141, pl. XV. figs. 1314: Gravely, 1927, p. 18.
Prostomium bilobed. Tentacles short. Gills, which begin about 16 th- -30 th foot, attain up to \(1-7\) filaments, and continue to the hind part of the body. Dorsal setae capillary, ventral setac compound, with long knife-like

Fig. 123-Maphysa sanguinca Montagu: a, anterior pant, natural size; \(b\), foot trom mid body \(\times 12\); \(c\), upper jaws; d, lower jaw; \(c, f\), two kinds of comb-setac \(\times 80\); \(g\), acicular bristle \(\times 90 ; h\), knite-ended compound brstle \(\times 145 ;\) M. bellii Aud. \& M.-

Edw. (a species hardly distinct from M. stragulum (Grube); \(i\), antevior part \(\times 5\); \(k\), upper jaws; \(l\), acicular bristle \(\times 12() ; m\), falciger \(\times 1(0) ; n\). comb-seta \(\times 100\); o. cultriform seta \(\times 250 ; p\), foot from mid-hody \(\times 25\); \(q\), branchiate foot \(\times 25\).
terminal piece. Comb-setae very variable; in the posterior segment they are shorter, with a few large teeth. Acicular setae irregularly present in the posterior part of the body, sometimes almost entirely missing.

Length: Up to \(300-600 \mathrm{~mm}\).
Colour: In life pink-gray, iridescent, bright red gills. Very brittle. Posterior part often regenerated.

Occurrence: Vizagapatam, Pondichery, Gulf of Mannar, Pamban, Tuticorin, Travancore, Mormugao Bay, Goa.

Distribution: Australia, New Caledonia; Indian Occan, Red Sea: Atlantic Ocean, Mediterranean Sea.

\section*{233. Marphysa macintoshi Crossland.}

Mavphysa macintoshi, Crossland, 1903, p. 137, pl. XIV, fig. 3-6: Fauvel, 1930, p. 28.

Body long, slender, nearly cylindrical. Prostomiam broad, undivided, horse-shoe shaped. Setae and branchiac as in M. sanguinea Montagu.

Length: \(200-.300 \mathrm{~mm}\). by 4 mm .
Colour: No regular pigmentation.
Occurrence: Krusadai Island.
Distribution: Indian Ocean, India, Red Sea, Zanzibar.

\section*{234. Marphysa gravelyi Southern.}

Marphysa gravelyi, Southern, 1921, p. 617, pl. XXIV, fig. 13: Gravely. 1927, p. 19: Fauvel, 1932, p. 142.

Prostomium bilobed. Tentacles subequal, a little longer than the prostomium. The gills, which begin about 36 th-52nd foot, and attain up to \(8-9\) filaments continue to the hind part of the body. Dorsal setae simple, capillary. In the posterior segments the ventral compound setae, with knife-like terminal piece, are gradually replaced by capillary setae. Bifid acicular bristles. Bcdy flattened.

Length: Up to \(240-270 \mathrm{~mm}\). by 5 mm .
Occurrence: Chilka Lake, Adyar, Madras (in brackish water).

\section*{235. Marphysa mossambica Peters.}

Marphysa mossambica, Fauvel, 1919, p. 380 (Synonymy); 1992, p. 142: Crossland, 1903, p. 139, pl. XV, figs. 7-10: Giavely, 1927, p. 19: Monro, 1931, p. 45.
Nauphanta novae-hollandiae, Kinberg. 1857-1910, p. 43, pl. XVI, fig. 23.
Prostomium bilobed. Tentacles longer than the head. The gills which begin about 30th-33rd foot, attain to 7-8 filaments, and continuc to the hind part of the body. Dorsal and ventral setae simple. Compound setae missing altogether.

Length: Up to 280 mm .
Occurrence: Singapore; Nicolyar Islands, Nankauri, in Coral Reefs; Pondichery; Kilakarai; Gull of Mannar.

Distribution: Philippine Islands; Australia; Bay of Bengal, India, Red Sea, East Africa.
236. Marphysa stragulum (Grube). (Fig. 123, i-q).

Eunice stıagulum, Grube, 1878, p. 163.
Marphysa stragulum, Crossland, 1903, p. 136.
Body slender, clongated. Picstomium broad, rounded, undivided. Tentacles slightly longer than the head. The gills. which begin about the 12th-13th foot, are very large, with numerous filaments, covering the back entirely, but present only on 12-20 segments. Dorsal setae simple, capillary. Ventral setae compound, with a long knife-like terminal piece. In the posterior feet falcigerous setac. Acicular setac pale, unidentate.

Length: \(20-90 \mathrm{~mm}\). by \(2-4 \mathrm{~mm}\).
Occurtence: Ceylon: Cochin State Coast.
Distribution: Philippine Islands; Ceylon.
Note-This species is hardly distinct from M. bellii Aud. Edw.
237. Marphysa fallax Marion and Bobretzky. (Fig. 124, \(0-i)\).
Ma physa fallax, Fauvel, 1923a, p. 410, fig. 162, o-r.
Marphysa chevalensis, Willcy, 1905, p. 282.
Body long and slender. Prostomium rounded, bilobed. Branchiac, with 1-3 filaments, from about 10 th-1 th foot, absent on the 15--20 last ones. Upper setac simple; interior ones of two kinds: (1) compound falcigerous with bidenate end-piece, (2) compound with knile-like endpiece. Comb setae. Acicula yellow. Acicular setae bidentate.

I ength: \(15-10 \mathrm{~mm}\).
Colour. Back red, with white dots, second segment pale (In life). Mimics a I.ysidice.

Occurrence: Cheval Paar, Gulf of Mannar.
Distribution: Gulf of Mannar: Atlantic Ocean, Mediterrancan Sea, Alexandria, Adriatic Sea, English Channel.

\section*{Genus PARAMARPHYSA Ehlers.}

Differs from Marphysa in the absence of branchiac.

\section*{238. Paramarphysa orientalis Willey.}

Paramarphysa orientalis, Willey, 1905. p. 283. pl. IV, fig. 105: Fauvel, 1939, p. 336. Okuda, 1937, p. 287. figs. 42-33.

Prostomium bilobed. Tentacles short. Two cyes. Gills absent. Acicula and acicular bidentate setae dark. Upper setae simple, capillary. Comb-setac with long marginal laciniac. Compound setae all with falcigerous bidentate end-piece.

Length: \(10-28 \mathrm{~mm}\). by 1 mm . \(90-10.4\) setigelous segments.

Occurrence: Cheval Paar, Gulf of Mannar.
Distribution: Pacific Ocean; Palan Islands. IndoChina, Gulf of Siam, Poulo Condore; Ccylon.

\section*{Genus LYSIDICE Savigny.}

Threc tentacles. Tentacular cirri absent. Dorsal and ventral cirri. Branchiae absent. Sctae: simple capillary; comb-like, compound falcigerous and acicular setac. Lower jaw (labrum) of two pieces. Upper jaw with a pair of mandibles, two toothed plates, an unpaired plate and paragnaths.
239. Lysidice collaris Grube. (Fig. 124, \(a-g\) ).

Lysidice collaris, Marenzeller. 1879, p 28. pl. V. fig 2: Fauvel, 1917, p. 230 (Synonymy); 1932, p. 143: Giavely, 1!92, p. 19: Monro, 1931, p. 45: Willey, 19\%5, p. 28.4.
Lysidice sulcata, Treadwell, 1902, p. 200, fig. 47.
(?) Lysidice fallax. Ehlers, 1898, p. 15.
Eyes reniform or semilunar. Lystdece fallax Ehlens, often met with, like the "Palolo" worm, in swarms, is probably the epitocous condition of L. collaris, with large eyes, provided with a lens.

Length: \(50-150 \mathrm{~mm}\).
Colour: Preserved specimens are generally more or less completely colourless or light brown. Sometimes there are still traces of the white ring near the anterior end.

Occurrence: Singapore; Andaman Islands; Kilakarai; Pamban; Ceylon; Maldive Archipelago.

Distribution: Japan, Gambier Islands, New Caledonia, Philippine Islands, Australia, Gulf of Siam; Indian Ocean, Persian Gulf, Red Sca.

Note--Differs from L. ninella Aud. and M.-Edwards only by the shape of its eyes, reniform instead of rounded.

\section*{Genus NEMATONEREIS Schmarda.}

Body filiform. A single tentale; no palps. 2-4 cyes. No tentacular cirri. Dossal and ventral (irri present. Banchiae absent. Simple capilla!! setac, combsetac, falcigerous compound setae, ationar setae. Lower jaw of two pieces. [pper jaw with a prii of mandibles, two pairs of jaws, an unpaired plate.
240. Nematoncreis unicornis Grube. (Fig. 121. \(1,-n\) ).

N'matoncots tomomm, Faumel, ly23a p. 412. fig. los. h-n;

Prostomitum sounded anteriorly. Ino lage postaior eyes, with, sometimes, a smaller anterior pair. An occipital spindte-shaped tentacle. Dorsal cini subulate. Venmal cini pritom. deirula dah. Vicular setac bidemate, dank. Componud setac faliseoous, bidentate. Comb etat. [pper setac simple, dapillay, limbate.

foot from mid-hody \(\backslash 120 ; ~ l\), falciger \(\times 350\) : \(m\). aciculat bristle \(\times 900\); n. comb-seta \(\times 350\); 12 arphysa fallay Mar. \& Bobr: \(o\), anterior part: \(p\).
lower jaw: \(q\), ujper jans: \(r\), foot from midbody: \(s\), bidentate faldigen: \(t\), comb-seta: \(u\). acicular bistle; \(v\), cultriform compound bristle.

Length: 150-200 mm. by 1 mm .
Colour: Pink, iridescent, anteriorly orange, posteriorly greenish.

Occurrence: Gulf of Mannar: Pamban; Kıusadai; Cheval Paar.

Distribution: Malay Archipelago, Indo-China: Indian Ocean, India, Suez Canal; Atlantic Ocean; Mediterranean Sea.

\section*{Sub-family LYSARETINAE Kinberg.}

No palps. Three tentacles. Very large flattened dorsal cirri. Branchiae absent. All setae simple. Four anal cirri. Mandibles toothed. Jaws more or less symmetrical.

Genus AGLAURIDES Ehlers.
Syn. Aglaura and Oenone Savigny.
Prostomium rounded. Eyes present. Palps absent. Three short tentacles more or less hidden under the anterior border of the peristomium. Nuchal organs piotrusible. Parapodia sesquiramous. Dorsal arri lange, thick, flattened. Setigerous lobe with two unequal ligules. Setae simple, capillary. Acicular sctac. Lowet jaw of two pieces. Upper jaw with five pairs of symmetrical or asymmetrical toothed plates and two long supponts.
241. Aglaurides fulgida Savigny. (Fig. 125, \(a-f\) ).

Aglaurides fulgida, Willey, 1905, p. 284, pl. V, fig. 107 : Mirhaelsen, 1892, p. 9: Fauvel, 1917, p. 240, pl. V1, fig, i2? isy onymy); 1930a, p. 31; 1932. p. 151.
Aglaurides erythrapensis, Gravier, 1900, p. 278, pl. XiV, lig. 99103: Fauvel, 1914d, p. 131, pl. VIl, figs. 1-4.
Aglaurides symmetrica, Fauvel, 1919, p. 388.
Oenone fulgida, Augener, 1913, p. 290: Ciossland, 1924, p. 85, figs. 106-111.

Prostomium rounded. Two pairs of eyes, anterior large, posterior small. Tentacles very short, rounded. Peristomium biannulate on the sides, with longitudiral ventral folds. Dorsal cirri chopper-shaped. Anterior ligule short, rounded; posterior ligule mone elongated. tcicular setae yellow, bidentate, hooded. Upper jaw plates very variable in shape. One pair of mandibles and lour pairs of toothed plates.

Length: \(100-250 \mathrm{~mm}\). by \(5-10 \mathrm{~mm}\).

Colour: Orange above, light yellow at sides and below. Occurrence: Singapore; Mergui Archipelago, Paway Island: Nicobar Islands, Nankauri; Kilakarai; Pedro Shoal: Ceylon, Colombo; Maldive Archipelago.

Fig. 125.-Aglauider fulgida (Savigny): a, var. asymmetica; upper bow, donal rex of the plates \(\lambda .16\); \(b\), var. symmetica, upper
 \(\times 2 r ; r\) head; \(f\) acicular bristle \(\times 134\).
1)stribution: Polynesia, Australia, Philippine Islands, Indo China: Nicobar Islands, Ceylon, India, Mardive Archipelago, Persian Gulf, Red Sea; Atlantic Ocean, Gulf of Guinea, West Indies, Florida.

\section*{Sub-Lamily ONCPHIDINAE Levinsen.}

Two globular paps; two frontal tentacles (frontal paps) ; five occipital tentacles. Anterior feet more or less modified. Gills simple, or pectinate, or spiral. Capillay setae; compound or pseudo -compound setae only on the first setigerous segment; comb-setae. Four anal cirri. A labrum; upper jaws 3-5 pairs with an odd plate.

\section*{Genus DIOPATRA Audouin and Milne-Edwards.}

Head rounded. Two pad-like palps. Two small oval frontal tentacles. Five long occipital tentacles borne on long ringed ceratophores. An achaetous segment bearing two small tentacular cirri. Dorsal cirri subulate.

Ventral cirri subulate in a few anterior feet, the following ones pad-like. Pseudo-compound bristes in the antetior lect, succeeded by simple setac, combsetae and acicular setac. Gills lange, with a number of filaments inserted spiadly. Lower jaw (labrum) of two piecos. Upper jaw with a pair of mandibles, three pairs of toothed plates and an ampaired one. Tube membranaceous, sticking in the sand or mud.
242. Diopatra neapolitana 1.lle Chiaje (Fig. 126, ah).

Diopatra meapolitana. Fausel. 1923a, p. 419, hg. lik. a-h (Synonymy); 1930, p. 99; 1932, p. 144; 1933, p. 2f: Cumband, 1903, p. 132. pl. XIV, hg. 1.

243. Onuphis dibranchiata Willey.

Onuphis dibranchiata, Willey, 1905, p. 277, pl. IV, fig. 100: Gravely, 1927, p. 20, pl. IX, fig. 7.
Gills begin as a simple filament on the first foot and continue simple on the first 17 parapodia, thereatter becoming bifid and considerably longer than the dorsal cinti. First dorsal cirrus tumid at the base, rather shorter than the first filament. Pseudo-compound bristles with bi- or tri-dentate terminal piece in the first \(3-5\) feet. Tentacles with long ringed ceratophores. Tube covered with coarse sand grains.

Width: 3 mm .
Occurrence: Lagoon, Krusadai Island.
244. Onuphis furcatosetosa Monro. (Fig. 127, a-b).

Onuphis furcatosetosa, Monro, 1937, p. 290, fig. 15.
The gills have a woolly appearance. They begin on the first foot with two minute filaments and rapidly increase to 18 about the 15th foot and remain highly ramified. The first 3 setigers have flattened capillary bristles and the place of the usual compound hooks is taken by curious simple, or incipiently pseudo-compound, bristles having a very slight and scarcely noticeable noth, marking the place where the usual articulation is found, and very long hoods the ends of which are prolonged into two tapering points which form a terminal fork. Inside the hood an ill defined bidentate hook can be seen. Tubes formed of mud.

Length: 35 mm . by 3 mm .

Colour: A brown streak on the head and brown transverse segmental bands in the anterior region.

Occurrence: Gulf of Oman; Gulf of Aden; Red Sca, at depths of \(186-375 \mathrm{~m}\).

Fig. 127.-Onuphis furcatosetosa Monro: a. 12th foot; \(b\), forked bristle (atter Monoo. O. aucklandensis Augener; \(c\), hook from first foot
 \(\times 225\) (aftel Augener). O. Motohranchiala Matenzeller: \(f\), compound hook ftom 3rd foot \(\times 260 ; \mathrm{g}\). 3Yrd toot \(\times 28\); \(h\). first foot (after Marenzeller).
245. Onuphis conchylega Sars. (Fig. 128, a-m).

Onuph, conchalrga Sars, Fauvel, IGQ3a, p. 145, fig. 164, (Synonymy); 1939, p. 145: Willey, 1905, p. 276.

All the branchiac are simple and begin about llth19th foot. First and second feet larger and pointing forwards with a few stout. blunt, simple hooks, replaced in the third foot by pscudo-articulate, uni- or bi-dentate bristles. Tube membranaceous, fattened, coated with mud and shells.

Length: 100-150 mm.
Colour: Variable, body anteriorly with transverse brown stripes.

Occurrence: Andaman Sca: Gulf of Manna: Ceylon.
Distribution: Indian Occan; Atlantic Ocean, Mediterranean.

Hig. 12s-Onuphis conchylega Sars: \(a, b\), anteior patt. dorval and
 123; f, tuhe, seduced; \(g\), comb-seta \(\curlyvee 911\); \(h\), acicular bristle \(\times 117\); \(i\), pseudo-compound bristle \(\times 117\); \(k\), hook fom 2nd toot \(\times 78\); \(I\). winged capillary \(\times 78\); \(m\), capillaty bristle \(\times 78\).
246. Onuphis holobranchiata Marcnzeller. (Fig. 127, \(f-h)\).

Onuphis holobranchiata, Marcneller, 1879, p 132, pl. IV, fig. 1: Willey, 1905, p. 278, pl. IV, fig. 101: Augener, 1913. p. 283. Crossland, 1903, p. 155, pl. XVI, fig. 2: Fauvel, 1930a, p. 30; 1932, p. 146.
Gills all simple, beginning on the first foot. Eyes more or less conspicuous. Pseudo-compound bristles on the first four feet, with bi-dentate or tri-dentate teminal piece.

Length: 40 mm .
Colour: Transverse pigment streaks on the anterior segments.

Occurrence: Nankauri, Nicobar Islands; Gulf of Mannar.

Distribution: Japan; Nicobar Islands, Gulf of Mannar, Maldive Archipelago.
247. Onuphis aucklandensis Augener. (Fig. 127, c-e).

Onuphas aucklandensts. Augenci, 1924, 1). 418, fig. 11: Fauvel. 1932, p. 146.
Onuphis tenuisetis, Benham (non Mclntosh), 1909. p. 5.
Gills begin on the second loot, and are pectinate on the 3 rd-4th leet, and attain to \(6-7\) filaments. Tentacles long, reaching to 24 th-27th segment, with short ringed ceratophore. Bi- or tidentate pseudo-compound hooks in the first 3 teet. Eye, absemt.
L.ength: 8-120 mm. by \(6-7 \mathrm{~mm}\).

Ocrumence: Andaman Islands; Off Puri, Orissa.
Instribution: New Z.aland; Andaman Islands, India.
248. Onuphis eremita Audouin and Milne-Edwards. (Fig. 129, \(a-l\) ).
Onuph, cremita. Fauvel, 1923a, p. 414, fig. 163 (Synonymy); 1932, p. 146.

- F. 35

Onuphis basipicta, Willey, 1905. p. 275. pl. IV, figs. 98. 09: Augener, 1926, p. 457.
Onuphis landanaensis. Augener, 1918, p. 339, pl. V, fig. 135138, pl. VI, fig. 197.

Gills begin on the first foot, simple on the \(10-2 \cdot 2\) ceeding feet, pectinate in the succeeding region, and attain 5-6 filaments. Pseudo-compound bristles with bior tri-dentate terminal piece, in the first 3-5 feet. 'lemtacles with long, ringed ceratophores. Eyes absent.

Length: 80-120 mm.
Colour: Back violet, ventral side white. In sperit, yellowish-grey, inidescent, with brown spots.

Occurience: Akyab, Buma: Mergui Archipelago; Madras; Ceylon, Gaile and Trincomali.

Distribution: Indo-China: Bay of Bengal, India; Madagascan; Suez Canal; Atantic Ocean, Meditenancan Sea.
249. Onuphis investigatoris Fauvel. (Fig. 130, \(a-f\); 131, \(a-g)\).
Onuphis investigatoris, Fauvel, 1932, p. 147, fig. 21, pl. VI, figs. 1-6.

Body elongated, depressed, about the same bradth all over, except the fist \(5-6\) segments which ate rombled. longer and narower. Segments numerous. Palps wal globular. Two small oval or sub-cylindrical front watacles. Five occipital tentacles with short, ringed, winophore and long, smooth, subulate cinostyle. Median tentacle reaching backwards to the 7 th setigerous scgmeat, the outer pair reaching to the loth. Eyes absent. Bacal segment (peristomium). which is shonter and nanowes than the succeeding. bears two smooth filiform, tentaular cirri inserted in its anterior margin behind the lateral posterior tentacles. Dorsal cirri subulate in the firm feet, swollen at their basc in the succecding ones. Ventral cirri subulate in the 6 -7th feet. There is no conical tubercle between the setigerous process and the liase of the dorsal cirrus. Gills begin on the 5th-fih foot, simple (or rarely bifid), bifid on the intermediate region, pectinate further back, with as many as 10 filaments. They continue to the last segments where they are again simple. Posterior ligule well developed in the first feet, in form of a short conical knob about the 12 th -15 th foot. The change is progressive. Pygidium, an oval knob with two long filiform cirri. Up to the 5th-6th setigerous seg.
ment, capillary setae and pscudo compound hooks with bi-dentate ot tri-dentate hooded terminal piece. In the succeeding segments, winged capillay setae and yellow,

Fig. 190.- 1 )nuphis insestugations Fausel. a. first foot \(\times 2\); ; \(b\), fourth foot \(\times 24 ; 2\), Sixth foot \(\times 20\); \(d\), tenth foot \(\times 20\); \(e\), 30 th foot \(\therefore 20\) : fore from mid-bordy \(\times 20\).
bi-dentate, hooded acicular setar. From about the 10th15th foot, yellow acicula coding in a capillary tip. A bundle of very slender capillary acicula enclosed in the base of the dorsal cirri. Lower jaw soft, chitinous, elonggate, with blackish outer edge. Jaws soft, pale edged, light brown. M. I.: \(1+1\) mandibles without basal teeth; M. II, \(9+9\); M. III, 10| 10: M. IV. \(7+12\) to 13 , with a rriangular, dak, chitinous plate at the base. Tube thin. membranaceous, more or less coated with fine mud. A deep sea species.

Length: Up to 60 mm ., or more, by \(4-5 \mathrm{~mm}\).
Colour: Discoloured in alcohol.
Occurrence: Laccadive Sea, Arabian Sea, Gulf of Oman, Persian Gulf, 35 fms. to \(600-700\) fms., in brown mud, grey mud, green mud or globigerina ooze.

Fig. 131.-Onuphis investigatoris Fauvel: \(a, b\), hooks from first foot \(\times 270 ; c, d\), hooks from 4 th foot \(\times 270\); e, hooded hook trom mid. body \(\times 270\); \(f\), worn hook from mid-boly \(\times 270 ; \mathrm{g}\), hook enclosed in a foot from mid-body \(\times 270\).

\section*{Genus HYALINOECIA Malmgren.}

Eyes present or absent. Two pad-like palps. Two small fusiform frontal tentacles. Five occipital tentacles, borne on ringed ceratophores. An achactous segment devoid of tentacular cirri. Dorsal cirri subulate in the anterior feet, pad-like in the lollowing ones. Simple or pseudo-compound hooks in the anterior feet, simple capillary setae, comb-setae and acicular setae in the succeeding ones. Gills generally simple. Lower jaw of two pieces. Upper jaw with a pair of mandibles, 2-3 pairs of toothed plates and an unpaired plate. Tube membranaceous or horny, sometimes free.
250. Hyalinoecia tubicola O. F. Muller. (Fig. 126, iq).

Hyalinoecia tubicola, Fausel, 1923a, p. 421, fig. 166, i-g; 1932,
p. 149: Augener, 1924, p. 429: Mono. 1937, p. 293.

Onuphts tubicola, Ehlers, 1908, p. 83.
Hyalınoecta camiguina, Gube, 1878, p. 142: Willey, 1905, p. 279.
Gills simple, berginning about 18th-26th toot. The first two pairs of fect rather stout and pointing forwards, armed with simple capillary setae and stout hooks, bluntly bi-dentate and hooded (on young specimens they are pseudo-compound). Tube free, horny, transparent cylindrical, very slightly bent, open at both ends and prosided with internal valves. It has the appearance and rigidity of a large goose quill.

Length of the cubes: \(20-200 \mathrm{~mm}\). by \(8-10 \mathrm{~mm}\). Hyaline, colourless on yellow. Animal up to 215 mm .

Occurence: Bay of Bengal, Iaccadive Sea, Arabian Sea, (;ulf of Oman; in deep dredgings, down to \(1,005 \mathrm{fms}\).

Distilutıon: Japan, New Zealand; Indian Ocean, Red Sca: Atlantic Ocean, Mediterranean Sea.

\section*{Genus RHAMPHOBRACHIUM Ehlers.}

Two pad-like palps. Two small rounded frontal tentackes. Five occipital tentacles, borne on ringed ceratophores. An achactous segment bearing two small tentacular cirri. Dorsal cirri subulate. Ventral cirri padlike. Three anterior feet very large, directed forwards and bearing very long capillary bristles with a hooked endpiece. Gills pectinate. Lower jaw of two pieces. Upper jaw with a pair of mandibles, paired tooth-plates and an unpaired plate. Tube membranaceous.

Key to the species of Rhamphobrachium.

251. Rhamphobrachium chuni Fhlers. (Fig. 192, a-i).

Rhamphobrachium chuni, Ehlers, 1908, p. 76, pl. IX, Ggs. 615: Augener. 1927, p. 158, fig. 8: Fauvel, 1982, p. 150.
Tentacles short, subulate, nearly equal, borne on short ringed ceratophores. Eyes absent. The three anterior feet flattened, nearly imbricated, directed forwards
and enclosing the head, provided with subulate dorsal and ventral cirri and very long and slender setae ending in a pseudo-articulate tri-dentate hook enclosed in a hood (it is smooth in grown-up specimens). Gills begin about 12 th foot and consist of as many as \(i\) filaments. Tube membranaceous, covered with mud.

Length: 190 mm . by 4 mm .
Colour: Yellowish-grey with small dark dots on the anterior part and larger spots on the base of the dorsal cirri.

Occurrence: North Andaman Island: S. W. of Ceylon, 480 fms.; Laccadive Sea, 719 fms.

Distribution: New Zealand, Australia; Andaman Islands, Ceylon, Laccadive Sea, East Coast of Africa.
252. Rhamphobrachium diversosetosum Monro. (Fig. 132, \(c-h\) ).
Rhamphobrachium diversosetosum Monro, 1937, p. 295, fig. 17.
Palps globular, frontal tentacles ovate. Occipital tentacles slender, with short ceratophores. Two small eyes. The three anterior feet are elongated and carried

Fig. 132.-Rhamphobrachium chtuni Ehlers: a, anterior part, side view \(\times 4 ; b\), 34th foot \(\times 20\) (after Ehlers). Rh. diversosetosum Monro: \(c\), 2nd foot, bristles not figured; \(d\), 4 th foot; \(e\), compound bristle from 10th foot; f, hook from 4th foot; \(g\), acicular bristle; \(h\), tip of hook from 2nd foot (after Monro).
forwards beside the head: they have large dorsal and ventral cirri and carry a cirriform process and the usual enormously long bristles with curved tip. There is no tri-dentate hook. The 4th foot carries capillary bristles and compound bi-dentate hooks with sickle-shaped ends. These compound bristles are confined to the 4 th foot. For about the following 10 setigens the place of the compound bristles with sickle-shaped blades is taken by compound bristles with cultriform blades, which in turn disappear, their place being taken by a pair of yellow, bi-dentate, hooded, acicular hooks, and the four acicula are replaced by a pair of stout acicula with pointed ends. Comb-sctae present. Gills begin with a simple filament at the loth setiger and reach a maximum of about 8 flaments. On the terminal segment (59nd) of the larger fragment the gills are still richly branched.

I ength: 19-- 30 mm . by 3 mm . and 52 setigers (incomplete).

Occurnence: Maldive Archipelago, 183-974 m.
Sub-family LUMBRICONEREINAE.
Palps absent. Tentacles missing. Prostomium more or less conical. Dorsal cini mdimentary or missing. No rentral cimi. Branchate absont, or very rarely present. Sctae: simple winged cupillat. compomid on anple hooks Four anal cini. A lower jaw (labrme). Lpper jaws : .5 pairs, without unpaired plate.

Genus LUMBRICONEREIS Blainville.
Body long and cylindical. Prostomium conical or globular, devoid of palps and tentacles. Eves absent. First two segments apoilous and achaetous. Dorsal cirri absent or seduced to a small knob. Ventral cirri absent. Gills absent. Fect with two uncqual ligules. Simple winged setac and simple or compound hooks. Lower jaw (labium) bodica-like. Upper jaw with a pair of mandibles, three pairs of toothed phates and two supports.

Kiv to the species of Lumbriconereis.

253. Lumbriconereis simplex Southem. (Fig. 133, g-i).

Lumbriconereis simplex, Southern. 1921, p. 62\%, pl. VXVT. fig. 16.

Prostomum triangular, with rounded angles. Feet very vascular, with a large heart-shaped structure full of blood. Anterior lobe rounded, posterior lobe blunt conical. All the setae are simple, capillary, mone on less broadly winged. There are no hooks. Mandibles broad, fused throughout almost the whole length. Carricn short. Maxillae stout and boldly curved. M. III, bidentate, M. IV, a stout tooth which may be slighty bind at the tip.

Length: 32 mm . by \(1.7-2.7 \mathrm{~mm}\).
Colourless, in spirit.
Occurrence: Chilka Lake, in mud.
254. Lumbriconereis polydesma Southern. (Fig. 193, a -f).

Lumbriconereis polydesma, Southern. 1921, p. 622, pl. XXVI, fig. 15.

Very slender elongated body. Prostomium rounded. Feet uniform in the middle and posterior parts, with an anterior short rounded lobe and a posterior longer, conical or cirriform one. Only capillary winged setae in the

28 anterior fect, which do not disappear in the midale and posterior fect. The hooks, from the 29th foot, are all unjointed, with \(6-10\) small denticles above the main fang. M. III bi-dentate; M. IV unidentate. Acicula colourless.

Length: 185 mm . by 1 mm .
Colour: In spirit opaque white with a faint green iridescence.

Fig. 199.-Itumbriconereis polvdesma Southern: \(a\), anterior end, ventral view \(\times 20 ; b\). 80th foot \(\times 80 ; c\), 10 th foot \(\times 90 ; d\). 3 (6)th foot
 simpler Southern: g, anterior end, ventral view; h. 100th foot, showing blood vessels \(\times 60\); \(i\), 10 h foot \(\times 67\) (after Southern).

Occumence: In sand. just above high water mark, on the shore of Chiriya Island, Chilka Lake.

Remarks: This species is a connecting link between L. impatients Claparede and I.. heteropoda Marenzeller, differing from the latter by its much shoter feet, which are not erect.

mints. In the anterior feet capillary setae and compound hooks; in the succeeding feet, unjointed hooks. The capillaries disappear about 40th-60th feet. The variety japonica is hardly distinct.

Length: \(50-150 \mathrm{~mm}\).
Colour: Pink, red or brown, in life. Colour in alcoho red.

Occurrence: Ceylon, Tuticorin Pcarl-Oyster Banks.
Distribution: Pacific Occan; Indian Occan, Maldive Archipelago, Persian Gulf, Red Sea; Atlantic Ocean, Mediterranean Sca.
250. Lumbriconereis sphaerocephala Schmarda. (Fig.

Lumbucomera phaciocephala, Augener, 192.4, p. 121; 1927. p. 88: Phlers, 1904. p. 33, pl V, hg. 3-11: Fantel. 1930a, p. 30; 1930b, p. 540 : 1932 p. \(1: 52\).

Prostomium shont, globular. Feet with an antesior rounded lobe and a pontetior longe conical ligule, slightb) more clongated in the postesion fect. In the anterior fect, capillaty setae and compound hooks with short torminal piere. followed by smple hooks with denticles abore the main fang.
I.cngth: \(30-40 \mathrm{~mm}\).

Occurence: Andaman Islands: Cevlon.
Dtstubutom: New Zoaland, New Caledonia, Gambia Islands. Iamania, Bars Straits. Indo.China: Andaman Islands, India.

25\%. Lumbriconereis impatiens Claparede. (Fig. 134, \(a-t\) ).
Lamburimetm impatim. Yausel. 1923a, \(p\) 129. fig 171 a-1
 p. 247.

Prostomium cylindro-conical. Feet with an anterior short, rombled lolie and a posterion longer, conical. or cinifonm ligule, slightly erect. Acicula yellow. In the powterior feet. simple winged and unjointed hooks with denticles aboer the main lang and a long guad. In the middle and penterion teet, the capillaries disappear and the guard of the hooks is shorter.

Length: \(150-300 \mathrm{~mm}\).
Colour: In alcohol a lilac-red.
Occurvence: Ganjam Coast: Vizagapatam; Laccadive Sca; Maldive Archipelago: Persian Gulf.

Distribution: Maldive and Laccadive Archipelagoes, India, Persian Gull, Red Sea; Atlantic Ocean, Mediteranean Sea.
258. Lumbriconereis heteropoda Marenzeller. (Fig. 185. \(g-h)\).
Lumhriconereis heteropoda, Marenzeller, 1879. p. 30, pl. VI, hg. 1: Izuka, 1912, p. 141, pl. IV, fig. 19: Crossland, 1924, p. t. figs. 1-7: Fauvel, 1930a, p. 30; 1932. p. 158: Monro, 1937. p 297.

Lumbriconereis erecta, Moore, 1903, p. 454.
Prostomium conical. Feet increase in length posteriorly, with posterior cirriform ligule long and otion

Fig. 195.-Lumbriconercis bifilaris Ehlers: a. anterior part \(\times 20 ; b\), 105th foot \(\times 52\). L. sphacrocephala Schmarda: \(c, d\), anterior part, dorsal and ventral view \(\times 16: \mathrm{e}\). 4 th foot \(\times 70 ; f, 60\) h frot \(\times 52\) (after Ehlers). L. hrierofroda Maienzeller: g, hook: \(h\), hind fort.
erect. Only simple capillary setac in the anterior fect, followed by winged capillaries and unjointed hooks with small denticles above the main fang.

Remarks: differs from L. impatiens Claparede in having only winged capillary setac in the 10-40 anterior feet and the longer posterior ligules erect, or turned batkwards, in the middle and posterior fcet.

Length: \(150--300 \mathrm{~mm}\).

Occurrence: Portuguese India, Mormugao Bay; Bombay; Persian Gulf.

Iistribution: Japar, Indo-China; India, Persian Gulf, Red Sca.
259. Lumbriconereis bifilaris Ehlers. (Fig. 135, \(a-b\) ).
I.umbriconercis hiflais, Ehlers, 1901, p. 139, pl. XVIII, figs. 110: Fausel, 19:2. p. 153.

Body long and slender. Piostomium long, conical. Anterior feet with two rounded lips, the anterior shorter than the posterion. Posteriorly they pradually change to two very long cirriform processen of about equal length. In the anterion fee: winged capillary setae and unjointed hool. with small deaticlib above the main fang and a long guard. Abont the 5.th foot, only hooks with shorter guard

I rngth: About 110 mm . by 1 mm .
Occurrence: Taleh-Sap, Gulf of Siam.
Distribution: Coast of Chile, Taleh-广ap: Atlantic ()ccan, Coast of Morocco.
260. Lumbriconereis pseudobifilaris Fauvel. (Figs, 136, \(a-9.197, a-d)\).

Iumbrironcreis peudobifilaris, Fausel. 1932, p. 154, text fig. 22, pl. VI, fige. 7-13.

Body cylindrical, deeply annulated. Postomium conical, tather sharp, eyeless. The first two achactous segments each about the same size as the following. On the ventral side of the peristomium. three longitudinal ghooves reaching actoss the neat segment. Two large lateral mosth-pads. Anterior feet with a short rounded anteror lip and a posterior one tapering at the tip. On the succecding segnents the lips, or ligules, of the feet incicase in length and become cirriform, but the anterior one ret ains shorter and blunter than the posterior one. Setigerous lobe rounded, flattened between the lips and bearing only capillary winged setae, which are short in the first segments. Farther back, they are less numerous and have a yellow cylindrical shaft and a broad, flattened, transparent, sabre-like distal part ending in a long slender tip, straight or bent. Hooks absent. Several dark acicula. Dorsal and ventral cirri absent. Lower jaw (labrum) whitish, broad and denticulate. Upper jaws; mandibles with long smooth fang destitute of basal teeth, two very

long and slender dark supports; M. II, two symmetrical plates with 5 teeth on the right and 8 on the left; M. III, two dark hooked plates with several fine denticles on the (dge.

Fig. 197.-Lumbriconcreis pseudobifilaris Fauvel: \(a, b\), flat setae \(\times 220 ; c, d\), winged setae \(\times 220\)

Length: Up to 40 mm . or more by 2 mm .
Colour: In spirit, iridescent pearl-gicy.
Occumence: Ofl Akyab, Bumma, 250 fms. in sott green mud; West Narrakai, Cochin State; Travancore.
261. Lumbriconereis notocirrata Fauvel. (Figs. 138, \(a-h ; 139, a-d\) ).
Lumbriconcreis notocivrata, Fauvel, 1932, p. 156, pl. VII, figs. 18, text, fig. 23.
Body cylindrical, conspicuously annulate, segments up to several hundreds. Prostomium blunt, conical, without eyes. The first two achactous segments equal and the same length as the succeeding ones. The ventral side
of the peristomium divided into faint longitudinal furrows which do not extend on to the next segment. Two lateral mouth pads. Feet of the anterior segments small, succeeding ones with a setigerous process with two ligules, an anterior short and rounded, and a posterior long and conical, bccoming more and more clongated poster-

Fig. 138.-Lumbriconereis notocirrata Iauvel: a, anterior end. donsal view \(\times 5\); \(b\), anterior end, ventral view \(\times 5\); \(c\), foot from mid body \(\times 25 ; d\), anterior foot \(\times 2.5\); \(e\), posterior font \(\because 25 ; f\), anterior foot \(\times 25 ; \mathrm{g}\), foot from mid-body \(\times 25 ; h\), semi-anterior \(\times 25\).
iorly, and erect in the middle region and posterior seg. ments. Dorsal cirrus reduced to a small knob in the anterior fect; long and finger-like in the middle; bent, erect, and translucent in the posterior region, where the feet are long and protruding. In the hind part of the body, a little above and in front of the base of the foot.
the border of the segment protrudes as a small dorsal knob, or a transparent vesicle. Acicula yellow, four in the anterior fect, followed by three, two, or only one, in the posterior fect. A small bundle of very finc acicula enclosed in the base of the dorsal cirrus. In the anterior feet, smooth, sword-like, capillary setae with an unpained wing: in the succeeding ones, simple setac and simple hook, with bifid tip and rounded guard. In the posterior

Fig. 139.-Lumbriconereis notocirata Fausel : a anterion seta \(\times 2 \mathbf{2 0}\); \(b\), seta from mid-body \(\times 270\); \(c\), hook \(\times 270 ; \pi\), hook-tip \(\times 380\).
feet, hooks and 1-2 capillary setae. Lower jaw (labrum) black, short, broad, with parallel semi-circular streaks and a faintly denticulate anterior border. Upper jaws with long lanccolate supports. Mandibles with a smooth base; M. II. two symmetrical plates with \(4+4\) tecth; M. III, \(2+2 ;\) M. IV, \(1+1\).

Length: \(\mathbf{3 5 0} \mathrm{mm}\). or more, by 8 mm .
Colour: In spirit. Pale salmon-colour, with traces of transverse pale brownish-red streaks.
F. 37

Occurrence: Vizagapatam, channel connecting backwaters with the sea and beyond the ferry; Orissa Coast, 7 fms.

\section*{Genus ARABELLA Grubs.}

Syn. Aracoda Schmarda; Mactoria Grubs.
Prostomium ovate, devoid of paps and tentacles. Eyes present. First two segments apodous and achactous. Dorsal cirri reduced to a mere tubercle. Ventral cini absent. Feet with two unequal ligules. Simple winged setae. Lower jaw of two short pieces. Upper jaw with a pair of mandibles and 3-1 more or less asymmetrical pairs of toothed plates. Two or three long supports.

Key to the species of Arabella.
Acicular setae with peculiar asym-
metrical hood
No such setae
.. mutans (Chambertin). p. 97\%.
.. incolor (Montagu). p. 271.
262. Arabella iricolor (Montagu). (Fig. 140, \(a-h\) ).

Arabella tricolor, Fauvel. 1923a, p. 438, fig. 175 (Synonymy): 1932, p. 158: Augener, 1924, p. 430.
Aracoda multidentata, Augener, 1913. p. 99.

Fig. 140.-Arabella tricolor (Montagu): a, b anterior part, don sal and ventral view \(\times 4 ; c\), lower jaw \(\times 23\); \(d\), upper jaws \(\times 31 ; e\), anteriot foot \(\times 39 ; f\), hind foot \(<39 ; g\), upper bristle, kneed and crenulate \(\times 117 ; h\), lower winged capillary \(\times 117\). A. gentculata (Claparide) (a species conspecific with A. mutans (Chambertin) i): \(i\), crenate bristle \(\times 117\); \(k\), anterotor foot \(\times 39 ; l\), upper jaws.

Prostomium blunt, conical, with four eyes set ncar the posterior margin in a transverse line. Dorsal cirri reduced to a small bent knob, often wanting in the posterior part of the body and on young specimens. All the setac are simple, short, stout, geniculate; the upper ones with a denticulate crest, the lower ones with smooth wings. The mandibles are large dark hooks with a toothed base.

Length: 50-120 mm.
Colour: Body grey, iridescent, sometimes with transverse rows of dark dots in the anterior segments.

Occurrence: Camorta Island, Nicobar Islands; Madras Coast, Vizagapatam; Gulf of Mannar, Krusadai Island, Pamban, Shingle Island.

Distribution: Cosmopolitan; Pacific, Indian and Atlantic Occans.

21i3. Arabella mutans (Chambenlin). (Fig. 140, i-l; Fig. 113, \(g-i\) ).
Alabelln mutans, Monro, 1433, p. 88: Fauvel. 1943, p. 24.
Crnothon mutans. Chamberlin. 1919. p. 330. pl. XLI, fig. 1-9, pl. LXII, fig. 1.
Lhabella novercinita, (iossland, 1924, p. 71, figs. 89-95.
(i) Atacoda obscu:a, Willey. 1905, p. 285. pl. V, figs. \(108-112\).

Prostomium a pointed cone with four eyes at its base. Feet prominent though mall. Dorsal cirri rudimentary. Setae include: (1) capillaries with narrow plain bordes; (2) capillaries with broad borders bearing denticles proximally; (3) actcular setae with peculiar asymmetrical hoods. Acicula yellow. Jaws almost perfectly symmetrical: in var. logani, the first pair is nearly so, the second asymmetrical; in var. asymmetrica, while one of the first pairs ends in a long slender hook as usual, the other is toothed nearly its whole length, as in the gemus Notocimus.

Lcongth: ['p to 500 mm . by \(2-3 \mathrm{~mm}\).
Colow: Flesh colour or orange. Dark in spirit, sometimes with green dots.

Remarks: The jaws of Aracoda obscura Willey, a very small ( 16 mm .) dark specimen from Ceylon, agree with those of \(A\). mutans var. asymmetrica Crossland. The specimens fom the Maldives belong to the typical form with jaws almost perfectly symmetrical.

Occurrence: Ceylon (?), Maldive Archipelago.
Distribution: California, Galapagos Islands; India (?), Maldive Archipelago, Suez, Zanaibar; Cape Verde Island.

\section*{Genus DRILONEREIS Clapaiède.}

Body elongated cylindrical. Prostomium devoid of palps and tentacles. Eyes may be present. The first two segments apodous and achaetous. Dorsal cirri reduced to a mere tubercle. Gills and ventral cirri absent. Feet with two unequal lobes. Simple winged setac and a large acicular spine. Lower jaw small, or sometimes missing. Upper jaw with a pair of mandibles, a pair of toothed plates, and 2-3 pairs of small hooks.

Key to the species of Drilonereis.

264. Drilonereis filum Claparède. (Fig. 141, \(a-h\) ).

Drilonereis filum, Fauvel, 1929a, p. 436, fig. 17t, a-h, (Synons my); 1932, p. 159.
Body long and slender. Prostomium lanceolate. flattened, often with a longitudinal median groove. Two dark spots at the base. Pcristomium with vental lomsi

Fig. 141.-Driloncreis filum Claparide: \(a, b\), anterior part, dorsal and ventral view ; \(c\), upper jaws; \(d\), lower jaw ; \(e\), winged capillaty \(\times 120 ; f\), acicular bodkin-like bristle \(\times 120 ; \mathrm{g}\), tip of aciculum \(\times 310 ; h\), foot \(\times 8\). Dr. macrocephala Saint-Joseph: \(i\), head \(\times 9\); \(k\), upper jaws; \(l\), lower jaw; \(m\), acicular bristle. (Not yet found in the Indian area).
tudinal folds. Fect with an anterior rounded lobe and a posterior long, blunt, conical one. Dorsal cirrus reduced to a mere knob with five enclosed acicula. Capillary setae with two wings set at an angle. A very large blunt acicular bristle. Acicula with a filiform protruding tip.

Remarks: The dark spots on the back of the prostomium are pigmented nuchal organs.

Length: \(40-120 \mathrm{~mm}\). by 2 mm .
Colour: In life pink, yellow or grey-green.
Occurrence: Off Akyab, Burma.
Distribution: Gambier Islands; Bay of Bengal, Persian Gulf, Red Sea; Athantic Ocean.
265. Drilonereis major, Crossland. (Fig. 143, \(k, l\) ).

Ditlonereis major, Ciossland, 1924, p. 57, figs. 73-79: Fauvel, 1932, p. 159.
Body large, up to 430 mm . Prostomium flat, almost semi-circular in outline, peculiarly ridged on dorsal surlace. No semse organs of any kind (?). Setae all simple, the long capillaties slender, but slightly bent and not distinctly bordered. A very large blunt acicular bristle. Jaws of normal type. No teeth on bases of mandibles. decessony plate of supports triangular, generally more or less cquilateral. Rudiments of labrum usually absent, sometimes conspicuous.
I.ength: \(200-450 \mathrm{~mm}\). by 3 mm .

Occurrence: Bay of Bengal.
Distribution: Bay of Bengal, Gulf ot Suez.

\section*{Genus NINOË Kinberg.}

Prostomium conical. Palps and tentacles absent. The first two segments apodous and achaetous. Gills fllaments cirriform, sessile. Simple setae, and hooks. Four pairs of upper jaws. Labrum of two pieces.
2(ff. Ninoé chilensis Kinberg. (Fig. 142).
Ninoë chilensis, Kinberg, 1857, 1910, p. 45, pl. XVIll, fig. 32 : Ehlers, 1904, p. 141: Fauvel, 1932, p. 160, pl. VII, fig. 18.
Prostomium conical, rather long, eyeless. Nuchal organs present. Dorsal and ventral cirri missing in the anterior feet; further back, a large flattened process above the gills is, perhaps, a modified dorsal cirrus. Gills rudimentary on the second foot, they have three filaments on the third and their number may reach beyond \(10-1 \%\). They are well developed on about 30 segments, then they
dwindle and suddenly disappear. They represent the posterior lip of the feet. Behind the branchial region the fect are like those of Lumbriconereis, with a shont rounded setigerous process, devoid of cirri, and with simple winged setac and long simple hooks.

Fig. 142-Ninor chilensis hiablis thellht towt ind.
Length: \(10-30 \mathrm{~mm}\).
Occurrence: Bay of Bungal, 10.5 lms.
Distribution: Coast of Chile: B.ay of Bengal
Sub-family STAEROCHII.H!NA:
Two palps. Two tentades. I kbnum. Upper jan with four rows of very munaroms wothed plate. Hana podia sesquiramous. Simple and (wmposm. stace Don sal and ventral cirri. Gills absent. Fom amat cini.

Genus STAUROCEPHALUS Grube.
Syn. Prionognathus Keferstein; Doroillea Panfit; Stauro. nereis Verrill; Anisoceras Grube.
Two long palps, two tentacles, 2-4 cyes, two nuchal organs. A lower jaw (labrum). "pper jaw, several rows of maxillary teeth on each side. First two segments
achactons. Sespuiramous parapodia. Dorsal cirri jointed, ventral cint unjointed. Upper setac simple capillaties, geniculated on forked; lower setac compound, falciger, or spiniger.

Key to the species of Staurocephalus.
Dorsal cini unjointed. Wihhout forked setae eadinen: Cossland. p. 2aso.
Dorsal cirri jointed. Forted setae .. .. meftus Schmarda, p. 279.

Fig. 143.-Stanofephalus incertus (Schmarda): \(a\), head; \(b\), foot; \(c\), fonked bristle (after Haswell). Sf. Kardaneri Ciossland; d, anterior part, dorsal view \(\times 5\) : c. lower jaw \(\times 12\); \(\mathbf{f}\), 20 th foot \(\times 12\). Aiabella mutans (Chamberlin): \(g\), anterior region. dorsal view \(\because 12 ; h, i\), wo hooded acicular bristles \(\times 270:\) Dilonercis mator Cmaland: \(k\) anterior part, dorsal and ventral view \(\times 5 ; 1\), two forms of acicular bristles (after Crossland).

Prostomium rounded. 1-2 pairs of eyes. No nuchal papilla. Two tentacles with 6-13 joints; they are not much longer than the palps, which are faintly wrinkled, with a short terminal piece. There is no dorsal cirrus on the first segment. Dorsal cirri rather short, two-jointed, with the cirrophore longer than the cirrostyle. On the first segment l-2 capillary setae and a short bent seta. Ventral setae compound, with a long sickle-shaped end-piece, gradually decreasing in size. The forked \(\mathbf{Y}\) shaped setae with very unequal limbs, begin on the second setigerous segment. Four anal cirri. Toothed maxillary plates in two rows on each side.

Length: 3-8 mm.
Colour: Light-red.
Occurrence: Shingle Island, Gult ol Mannar.
Distribution: New Zealand, Australia, Pacific Oc(cm: Indian Ocean.
268. Staurocephalus gardineri Crossland. (Fis. 1.4., : f).

Staurocephalus (Dorvillea) gardineri, Crossland. 1921. p. 93. figs. 112-118.
Body of large size. Prostomium rounded, iemarkably flattened. Two pairs of eyes (i). Tentacles jointed, same: length as wrinkled palps. A nuchal papilla present. No dorsal cirrus on the first segment (\%). Dorsal cirri long, thick below, gradually pussing to a point: there is no endjoint. It is supported by the usual very slender aciculum. A stout aciculum in the foot. Dorsal setae slender, slightly curved, finely denticulated along the convex edge and ending in one or two very minute hooks. No forked setae occur. A longer ventral bundle of compound setae with a long bi-dentate sickle-shaped end-piece of gradually decreasing size; the shaft is not denticulated. Toothed maxillary plates in two rows on each side.

Length: 50 mm . by \(2.5-4 \mathrm{~mm}\). 100 segments.
Occurrence: Hulule, Male Atoll, Maldive Archipelago.
Distribution: Maldive Archipelago; Off Wasin, East Africa.

The prostomium has nine rings, of which the basal ones are larger than the others. \(60-70\) anterior feet unilamous, with a dorsal cirrus, a setigerous process with three ligules, a thick short ventral cirrus, an aciculum and a bundle of compound setar. The suceeding parapodia biramous; donsal ramus with a conical cirrus, foliaceous in the posterior segments, a blunt setigerous process with an aciculum and 2-3 straight, stout, blunt acicular bristles; ventral ramus with a posterior and two anterior tapering ligules, a stout ventral cirrus and a bundle of compound spinigerous setac. In the posterior region both rami are widely apart. 6-12 V-shaped paragnaths (chevrons) on each side of the proboscis, which is armed with two large, toothed, horny jaws and 25-55 X-shaped paragnaths in a nearly continuous belt.

Length: 35-350 mm.
Colour: In spirit brownish especially in the posterior part.

Occurrence: Vizagapatam; Vandrutti, Cochin State.
Distribution: Japan?, Australia?, India; Atlantic Ocean, Mediterranean Sea.
276. Goniada annulata Moore. (Fig. 145, a-h).

Goniada annulata, Moore, 1905, p. 549, pl. XXXVI, figs. 45-48: Fauvel, 1932, p. 121, pl. III, figs. 9-16.
(?) Goniada echinulata, Grube, 1869, p. 39.
Body divided into anterior cylindrical and posterior somewhat flattened regions. Prostomium conical, indistinctly annulate. Eyes absent (?). Proboscis thickly covered with pointed, hooked, papillae. Two horny jaws with a large hook and 3-4 smaller teeth; 5-6 double, Xshaped, ventral paragnaths and about 15 smaller ones. About 20 V -shaped chevrons on each side of the base of the proboscis. Anterior region of 48 segments, of which 27 are uniramous and the succeeding 21 already provided with capillary dorsal setae. Dorsal cirrus heart-shaped, foliaceous, pedunculate. Setigerous lobe with three conical tapering ligules; a thick ventral cirrus, an aciculum and compound heterogomph spinigers. A small dorsal ramus with two uncqual ligules, an aciculum and 5-6 very slender capillary setae are gradually developed from the 28th foot backwards. In the posterior region the dor-
sal ramus consists of a large heart-shaped foliaccous dorsal cirrus, a short setigerous lobe with an aciculum, two conical ligules and a bundle of slender simple capillary setae: ventral ramus with three triangular, subequal ligules, an

Fig. 145.-Goniada annulata Moore: \(a\), 8th foot \(\times 50 ; b\), 19th foot \(\times 50\); c, 39th foot \(\times 50\); d, 97th foot \(\times 50\); e, 112th foot \(\times 50\); \(f\), dorsal papilla \(\times 88 ; \mathrm{g}\), hooked papillae \(\times 88 ; h\), ventral papillae \(\times 88\).
aciculum and a bundle of compound spinigerous setae, and a conical ventral cirrus. The papillac of the proboscis are very peculiar, inserted on a low conical lobed base.

Length: 50 mm . by \(2-3 \mathrm{~mm}\).
Colour: In spirit whitish, with rusty brown specks.
Occurrence: South of Ceylon, 660 fms .
Distribution: Gulf of Georgia; North Pacific Ocean; Ceylon.
277. Goniada eximia Ehlers. (Fig. 147, e, f).

Goniada eximia, Ehleıs, 1901, p. 157, pl. XX, figs. 7-17: Monro, 1936, p. 141, fig. 25, \(a-j\); 1937, p. 285.

Body divided into two regions. Prostomium very small, blunt, eyeless. Prosboscis densely covered with small kid-ney-shaped papillac. Two large jaws, each with five teeth, a circle of about 22 small X-shaped paragnaths and a second row of smallet ones; 18 pairs of cherrons in the young, absent in the adult. Anterior region with 58-59 uniramous feet and the change to biramous is complete about the 96 th foot. Anterior fect with a large, flattened, dorsal cinrus, a setigerous lobe with two digitiform ligules and a third, triangular, behind, and a large ventral cirrus, an aticulum and compound heterogomph spinigers. In the posterior region, the dorsal ramus consists of a broad, thattened, dorsal cirrus, a triangular dorsal ligule, of about the same sice, an aciculum and a bundle of simple capiHary bristles, almost entirely enclosed. In the vent:al ramus, the two anterior lips are fused proximally, only their pointed ends remain fice and the posterior lip is a hroad flattened structure resembling a temnis racket in shape with a triangular process at the apex. A broad flattened ventral cirrus. Compound heterogomph falcigers.

Length: 250-760 mm. by \(4-13 \mathrm{~mm}\).
Colour: In spirit yellowish-green.
Occurrence: North Arabian Sea, 1519-1705 m.
Distribution: Magellan; Falkland Islands; Arabian Sea.

\section*{Sub-genus GONIADOPSIS Fauvel.}

V-shaped paragnaths absent on the sides of the proboscis. Body divided into three regions: (1) an antelior, with uniramous parapodia, short cinti and stout falcigerous setae; (2) intermediate, with uniramous parapodia, long cirri and spinigerous setae and (3) a posterior, with biramous parapodia, dorsal acicular setac and long spinigerous ventral setac.

Key to the species of the sub-genus Goniadopsis.

Goniada (Goniadopsis) incerta, Fauvel, 1932, p. 122, pl. IV, fig. 1-10.
Anterior and intermediate regions narrowly cylindrical, posterior region broader. Prostomium sharp conical, ringed, with four small tentacles at the tip, and two very small black, widely separated, eyes at the base. Proboscis cylindrical and apparently smooth, but covered with very minute globular papillae. No V-shaped chevrons. An-

Fig. 146.-Goniada (Goniadopsis) incerta Fauvel: a, anterior end, dorsal view, cnlarged; \(b\) and \(c\), two anterior feet \(\times 50 ; d\), anterior foot with long ventral cirrus \(\times 50 ; e, 37\) th foot, intermediate region \(\times 60\); \(f\), one of the first feet with dorsal bristles (about 50th) \(\times 50 ; \mathrm{g}\), foot of the enlarged biramous region \(\times 50 ; h\), posterior foot \(\times 50 ; i\), and \(k\), compound bristles from anterior region \(\times 225\).
terior region of 23-24 setigerous segments, with uniramous parapodia, including a broad, short, foliaceous dorsal cirrus, a setigcrous process with three ligules, one posterior and broadly triangular and two anterior finger-shaped and sub-equal, a thick short club-shaped ventral, cirrus, an aciculum and two bundles of stout compound setac, with a short, rather broad, ciliate end-piece. Middle region of about 30 segments, with uniramous parapodia including a long finger-shaped dorsal cirrus, a setigerous process with three ligules, one posterior triangular and two anterior slightly longer; a ventral cirrus twice or thrice as long, an aciculum and two bundles of mere slender compound setac, with a long tapering delicately spinose temminal piece. Posterior region with conspicuously biramous fect including, in the dorsal ramus, a short cirrus, a bilobed sctigerous process, with an aciculum and 2-3 short acicular setae, blunt at the tip; in the ventral ramus, a triangular posterior ligule, two anterior, slighty longer, finger-shaped ligules, a large blunt conical ventral cirrus, an aciculum and two bundles of compound spinigerous setae like those of the middle region.

Length: 50 mm . by \(1.5-2 \mathrm{~mm}\). The single specimen is a female with eggs.

Occurrence: Off Akyab, Burma, 530 fms.

\section*{279. Goniada (Goniadopsis) agnesiae Fauvel. (Fig. 14.t \(a-f)\).}

Goniada (Goniadopsis) agnesiae, Fauvel. 1930, p. 32, fig. 7, a-f.
Body divided into three regions: the anterior and middle ones slender, cylindrical, and the posterior one somewhat broader and more flattened. 150 segments and more. Prostomium elongated, tapering conical, ringed, with four slender tentacles at the tip and two small black, widely sepatated, cyes at the base. Proboscis cylindrical, armed with two large pectinate jaws, four bi-dentate paragnaths between the jaws and, on the other side, a semicircular row of ahout twelve smaller bi-dentate denticles apparently simple. There are no V-shape chevrons. Anterior region of about 28 segments, with uniramous parapodia including a broad, short, lanceolate dorsal cirrus, a setigerous process with three ligules, one posterior broadly triangular, and two anterior finger-shaped, unequal, a short ventral cirrus, an aciculum and a bundle of stout compound setae with a short blunt, slightly bent, end-piece. Middle region of 39 segments, with uniramous parapodia including a finger-shaped dorsal cirrus,
two ligules, one short, triangular, the other longer, fingershaped; a ventral cirrus, twice or thrice as long, an aciculum and two bundles of compound setac, thinner than the former, with long, narrow, delicately spinose endpiece. Posterior region with biramous panapodia including, in the dorsal ramus, a short conical cirrus, a blunt setigerous process with an aciculum and two short acicular setae, blunt at the tip; in the ventral ramus, a triangular posterior ligule, an anterior one longer and finger-shaped, a short, thick, ventral cirrus, an aciculum and two bundles of compound spinigerous setac, with a long terminal piece, like those of the middle region.

Length: 105 mm . by 1 mm .
Colour: Bright-red in front, pale ochraccous behind. In the posterior region only, a ventral spot in the middle of each segmont.

Occurrence: Gulf of Mannar, Krusadai Island; in sand; a single specimen, incomplete behind.

\section*{Genus GLYCINDE Müller.}

Syn. Eone Malmgren
Body divided into two regions. Proboscis beset with papillae. Two big horny jaws and numerous paragnaths. Lateral V-shaped paragnaths (chevrons) absent. Anterion parapodia uniramous; posterior parapodia hiramous. Branchiae absent. Dorsal setae acicular, ventral setae compound.
280. Glycinde oligodon Southern. (Fig. 147, \(a-d\) ).

Glycinde oligodon, Southern, 1921, 1. 629, pl. XXVIII, fig. 18: Fauvel, 1932, p. 123.
Anterior part of the body rounded, middic and posterior regions flat. Prostomium with a basal ocular segment and eight rings. Four small tentacles. Proboscis nearly square in section, with two dorsal bands, each of four irregular rows of transparent, horny, hooked papillae and two ventral bands of smaller soft mammillate papillac. Two large ventral jaws and a dorsal row of 4-5 small denticles. Anterior feet uniramous, with a large, broad, blunt, dorsal cirrus indented near the tip, a rounded setigerous lobe and a longer ligule, and a blunt, thick, conical ventral cirrus; compound spinigerous bristles. Middle and posterior fect biramous, a dorsal cirrus with a short, stout, swollen base, a dark spine accompanied by two or three dark brown setae having a curved tip, and a long,
slender, curved, spine on the crest; a small rounded papilla. Ventral ramus as in the anterior feet, except that the posterior lobe is rather longer and wider.

Fig. 147.-Glyrinde oligodon Southern: a, anterior end, ventral view \(\times 78 ; b\). 10 th right foot, postenior view, setae omitted \(\times 272 ; c, 30\) th foxt \(\times 117\); \(d\), 90 th foot \(\times 117\) jafter Southern). 281. Glycera tesselata Grube. (Fig. 152, \(a-c\) ).

Glycera tesselata, Fauvel, 1923a, p. 387, fig. 152; 1932, p. 124.
Branchiac absent. Parapodia with two anterior equal elongated lobes and two posterior lobes much shorter, rounded and equal to each other. Papillae of the proboscis long and slender. Supports of the jaws (ailerons) with two long dagger-like processes.

Length: 15-35 mm.
Colour: White spots on pink ground, in life. In spirit, brown with tesselated pattern.

Occurrence: Andaman Islands: Doarakara, Sunderbans; off Puri, Orissa; Hulule and Heratera Islands, Addu atoll, Maldive Archipelago.

Distribution: Pacific, Indian and Atlantic Oceans.
2S:. Glycera lancadivae Schmarda. (Fig. 147, g, h).
Glvcera lancadirae. Schmarda, 1861: Michaclenn, 1892, p. 12: Willey, 1905, p. 286, pl. VI, figs. 113--116; Fausel, 1930b, p. 540; 1932, p. 125: Monro, 1937, p. 184.

Branchiac absent. Parapodia with two anterior, equal, clongated lobes and a single posterior, rounded, slightly emarginate lobe. Papillae of the proboscis of two kinds, acuminate, and rounded, destitute of terminal nail-like appendage. Supports of the jaws (ailerons) with short unequal processes.

Length: 40-60 mm. and more.
Occurrence: Burma; Madras Coast; Ceylon; Laccadive and Maldive Archipelagoes.

Distribution: Burma, Ceylon, Laccadive and Maldse Archipelagoes, Persian Gulf.
282. Glycera longipinnis Grube. (Fig. 148, a-d).

Glycera longipinnis, Grube. 1878, p. 182, pl. VIII, fig. 9: Fauvel, 1932, p. 125, pl. IV, figs. 11-14.

Branchiae simple, large, inserted on the dorsal edge of the foot. Parapodia elongated, with two anterior subequal, cirriform lobes, and a single posterior, rounded or faintly emarginate, lobe. Papillae of the proboscis long, cylindrical, destitute of terminal nail-like appendage.

Supports of the jaws (ailerons) with two long dagger-like processes.

Fig. 148.-Glycera longipinnis Grube: a, foot of specimen from Sta. 168, with large gills \(\times 35 ; b\), branchiate foot of specimen from Sta. \(292 \times 35 ; c\), abranchiate foot of the same specimen \(\times 35\); \(d\), papillae of the proboscis \(\times 117\).

Length: 100 mm . by 2-3 mm.
Colour: Flesh-brown.
Occurrence: Bay of Bengal.
Distribution: Philippine Islands; Bay of Bengal, Persian Gulf.
284. Glycera alba Rathke. (Fig. 149, i-m).

Glycera alba, Fauvel, 1923a, p. 385, Gig. 150 (Synonymy); 1932, p. 126: Gravely, 1927, p. 9.

Glycera alba var. cochinensis, Southern, 1921, p. 627, pl. XXVII, fig. 17.
(?7) Glycera cinnamomea, Grube, 1874, p. 327.

Branchiae simple, inserted on the dorsal edge of the foot. Parapodia with two anterior, subequal, triangular or cirriform lobes and two posterior lobes, the upper one

Tig. 149.-(blycen rouxii Aud. \& M.Edw.: a. forn fomm mid body posterom now \(\times 15 ; b\), hind feot \(\times 23\); \(c\), papillae, d. compound seta \(\times 270\). Glycera alba Rathke: \(i\), papillae \(\backslash!140 ; k\). jaw's wing . 23; \(l\), foot from modbody \(x 31\); m. had ther 31 .
triangular, shorter than the anterior, the lower rounded and still shorter. Papillae of the proboscis obliquely truncated (unguiculate), with a transparent nail-like appendage. Supports of the jaws triangular, with a single process.

Length: 60-100 mm. by 3 mm .
Colour: Milk-white in life, yellowish in spirit.
Remarks: The variety cochinensis differs from the type only in possessing longer branchiae and more acute lobes of the feet.

Occurrence: Ganjam Coast; Cochin Backwater; Mormugao Bay.

Distribution: Indian Ocean, India, Red Sea; Atlantic Ocean.
285. Glycera prashadi Fauvel. (Fig. 150, \(a-h\) ).

Glycera prashadi, Fauvel, 1932, p. 126. pl. V, figs. 1-8.
Body tapering posteriorly, segments bi-annulate, Prostomium acutely conical, faintly ringed, with four very small filiform tentacles. Proboscis long, cylindrical, covercd with minute cylindrical unguiculate papillac, obliquely truncated, with a kind of transparent chitinous nail at the tip. Supports (ailerons) of the jaws triangu-

Fig. 150.-Glycera prashadi lauvel: a, suppont of the jaw (aileron), enlarged; \(b\), joint of compound bristle \(\Varangle 290 ; c\) and \(d\), papillae of the proboscis, front and side virw \(\times 290 ;\) foot foom midbody \(\times 26\); \(f\), posterior foot, 26 ; g. forot from midiborly \(\times 26\); \(h\), anterior abanchiate foot \(\times 20\).
lar, with unequal, rather long, diverging processes. Parapodia with two equal anterior long, acutely conical, lobes and two equal posterior triangular lobes, but shorter than the anterior ones. Dorsal cirrus globalar, knol)like, near the base of the foot. Ventral cirrus triangular, shorter than the posterior lobes. A bundle of simple
dorsal setac. Two bundles of ventral compound homogomph bristles with a long terminal piece, winged and fincly serrated. Posterior feet more elongated and slender.

Length: 8-10 mm. by \(3-4 \mathrm{~mm}\). feet included.
Colour: Discoloured in spirit.
Occurrence: Burma Coast, Mergui; Nankauri, Nicobar Islands; Bay of Bengal; Persian Gult.
286. Glycera sagittariae McIntosh. (Fig. 147, i; Fig. 151, a-d).

Glyera sagittariae, Mcintoh, 1885. p. 346, pl. XLM, fig. 8. pl. XXILA, fig. 10: Licadwell, 1903, p. 1174: Fauvel. 1932, p. 127, fig. 1 .

Branchiae simple, short, inserted on the dorsal edge of the feet. Parapodia with two equal anterior, elongated, tapering lobes, and two equal posterior blunt triangular lobes, but much shorter than the anterior ories. Dorsal cirrus more or less remote. Papillac of the proboscis of two kinds: short globular or ovate, and long

Fig. 151.-Glycera sagittariae Mclntosh: a, b, feet, setae omitted \(\times 65 ; c, d\), globular and elongated papillae \(\times 150\).
slender, without terminal nail-like appendage. Supports of the jaws (ailenons) with two long dagger-like processes. Only an anterior fragment. Might be described as a branchiate Gl. tesselata Grube.

Occurrence: Seven Pagodas, Madras Coast.
Distribution: Hawaii; Aru Islands; Madras Coast.
287. Glycera gigantea Quatrefages. (Fig. 159, \(d-k\) ).

Glycera gigantea, Fauvel, 1923a, p. 387, fig. 152, \(d-k\) (Synonymy); 1932, p. 128: Monio, 1931, p. 18.
Glycera siphonostoma D. Ch., Augener, 1927, p. 138.
Branchiae simple, rounded, vesicular, retractile into the anterior side of the feet. Parapodia with two anterior, digitiform equal lobes and two very short, rounded,

Fig. 1:22.-Glycera tesselata Grube: a, proboscis papillae \(\times 117\); b, jaw \(\times 73\); \(c\), foot from mid-body \(\times 39\). Glycera gigantea Quatretages: \(d\), proboscis papillae \(\times 117 ; e, f\), jaw's wings \(\times 23 ; g\), compound bristle \(\times 190 ; h\), foot from young stage \(\times 31 ; i, k\), foot from mid-body, front and back view, setac omitted \(\times 15\).
slightly unequal lobes. Papillae of the proboscis of two kinds: a few globular and others clongated, destitute of terminal nail-like appendage. Supports of the jaws triangular, with a long process on one side.

Length: 200-350 mm.
Colour: Pink anteriorly, grey behind, in life. Yellowish or copperish, in spirit.

Occurrence: Laccadive Sea, 430 fathoms.
Distribution: New Pomerania; Great Barrier Reef; 1 accadive Sea; Atlantic Ocean, Mediterranean Sca.
288. Glycera rouxii Audouin and Milnc-Edwards.
(Fig.
\[
149, a-d)
\]

Glycera rouxii, Fauvel, 1923a, p. 389, fig. 153, a-c; 1932, p. 128: Monio, 1937, p. 284.
Glycera goesi, Malmgren, 1867, p. 184, pl. XV, fig. Bl; Alwidson, 1898. p. 22, pl. I, figs. 13-11: Lauka, 1912, p. 238, pl. XXIV, fig. 1-2.
Glycera decifiens, Matenzeller, 1879, p. 140, pl. VI, fig. 3.
(弓) Cilycera nicoliarica, Grube, 1867, p: 24, pl. HI, fig. 1.
Branchiae simple, slender, retractile into the antertor side of the fect. Parapodia with two equal anterior pointed lobes and two posterior sub-equal shorter, broader, lobes. In the posterior feet, the posterior upper lobe is pointed and the inferior lobe is much shorter and blunt. Papillae of the proboscis either globular or lanccolate, conical, destitute of terminal nail-like appendage. Supports of the jaws triangular, with a long process on one side. The branchiac being retractile, in preserved specimens very often only a few, or none, are exserted, the animal then appearing as quite abranchiate.

Length: \(100-200 \mathrm{~mm}\).
Colour: Yellowish-brown, in spirit, with, often, feet danker.

Occurence: Indaman Islands: Chandipore, Or:isa Coast; Vi/agapatam; Gulf of Mannar; Pamban Backwater; Laccadive Sea.

Distribution: California; Japan; Andaman Islands, India, Persian Gulf; Atlantic Ocean, Mediterranean Sca.
289. Glycera cirrata Grube. (Fig. 153, a-e).

Glycela cirrata. Grube, 1869b, p. 35: Fauvel, 1932, p. 129, fig. 18.
Body large, tapering and very slender posteriorly, numerous biannulate segments. Prostomium acutely conical, with 11-12 faintly bi-annulate rings and four small terininal tentacles. Parapodia with two anterior long, sharp, equal lobes and two posterior similar, but shorter, equal lobes. Dorsal cirrus an ovoid knob, inserted near the base of the foot. Ventral cirrus sharp, triangular, about the same length as the posterior lobes. Branchiae retractile, beginning from about the 17 th to the 25 th-

30th foot, first simple, long, cirriform, then bifurcate, and next divided into 3, 4 or 5 branches; in the posterior scyments they are again simple. They are inserted at the base of the foot, near the dorsal cirrus, on the posterior

Fig. 153.-Glycera cinata Grube: \(a, b\), anterior feet, selae omitted \(\times 34\); \(c\), foot from mid-body \(\times 34\); \(d\), posterior foot \(\times 34\); \(e\), unguiculate papillae \(\times 110\).
side of the upper border of the dorsal ramus. Proboscis long, club-like, beset with cylindrical unguiculate papillac obliquely truncated, with a transparent nail-like app-ndage at the tip. Supports of the jaws (ailerons) triangular, with an elongated process on one side.

Length: \(10-15 \mathrm{~mm}\). by 5 mm ., feet included.
Colour: Yellowish in spirit.
Occurrence: Burma, Andaman Islands, Madras Coast.
Distribution: Burma, Andaman Islands, India, Persian Gulf, Red Sea; Brazil.
290. Glycera manorae Fauvel. (Fig. 154, a-i).

Glycera manorae, Fauvel, 1932, p. 130, pl. V, figs. 9-17.
Body rather large, tapering posteriorly; segments numerous, bi-annulate. Prostomium acutely conical, with 10-12 rings and four small terminal tentacles. Parapodia with two anterior sharp triangular, mucronate, equal lobes and two posterior nearly equal, similar, but shorter
and more blunt lobes. Dorsal cirrus an elongated knob inserted near the base of the foot. Ventral cirrus triangular, about the same length as the posterior lobes. Posterior feet more slender and clongated. Branchiae retractile, beginning about the 17 th foot, first simple, large, digitiform; those following divided into two long, more or less equal, branches. In the posterior fect, they are again simple. They are inserted at the base of the foot on its upper border, or slightly behind, near the dorsal cirrus. On a number of feet, one or two small retractile vesicutar

onc side. Dorsal setae capillary, with a narrow wing; they are grouped in two bundles. Ventral setac homogomph, compound, or hemigomph with a long, slender, finely serrated terminal piece.

Length: About 70 mm . by 5 mm ., feet included.
Colour: In spirit, rusty yellow, pedal lobes very dark at the tip.

Occurrence: Manora Shoal, Karachi.

\section*{SEDENTARIA.}

Family ARICIIDAE Aud. \& M.-Edw.
Body vermiform, segments numerous, divided into, two regions: (1) thorax more or less enlarged, depressed, and (2) abdomen much longer and somewhat cylindrical. Pıostomium conical, cylindrical or globular, without any appendages. Proboscis unarmed. Feet biramous, with acicula. Gills dorsal, generally simple, ciliate. A dorsal cinus. The ventral rami of the thorax are flattened pads with, or without, a fringe of papillae and vertical rows of stout bristles. In the abdomen, the ramus is bilobed, crect, with, or without, a ventral cirrus. Sometimes an intermediate cirrus between the two rami. Often transverse rows of papillae on the ventral side of a number of anterior segments. Setae simple, of many kinds. Lateral sense-organs, and dorsal sense-organs. One pair of erect, lanceolate, gills on each segment.

\section*{Key to the genera of Ariciddae.}

\hline
\end{tabular}

\section*{Genus ARICIA Savigny.}

Prostomium conical. A pair of erect lanceolate gills on each segment, except on a few anterior ones. Thoracic fcet with an erect dorsal cirrus and a bundle of serrated capillary setae. Ventral ramus pad-like, with vertical rows of stout bristles and foot papillae. Often transverse ventral rows of papillae on a few segments. In the abdomen, an erect dorsal cirrus, capillary setac and forked setae, sometimes an intermediate cirrus. Ventral ramus
bilobed, with capillary sctae and a ventral cirrus. Dorsal sense-organs anchor-shaped.

Key to the species of Aricia.

2. Intermediate cirrus present .. cuvieri Aud.\& M.-

Edw., p. 301.
Intermediate cirrus absent .. cxarmala Fauvel, p. 304.
291. Aricia cuvieri Aud. \& M.-Edw. (Fig. 155, 156).

Aıicia cuvieri, Fauvel, 1927a, p. 12, fig. 3 e-l. (Synonymy); 1932, p. 161.
A, icia ruvieri var. perpapillata, Eisig, 1914, p. 394, pl. XI, fig. 10; pl. XV, fig. 18-20; pl. XVIII, figs. 1-14.
Prostomium sharp conical, without cyes. 22-24 thoracic segments, with a fringe of \(10-15\) sharp conical

Fig. 155.-Aricia curieri Aud. and M. Edw.: e. forked bristle \(\times 400 ; f\), hook \(\times 160 ; \mathrm{g}\), 10 h foot \(\times 20 ; \mathrm{h}\). 75 th foot \(\times 25 ; \mathrm{i}\), dorsal aciculum \(\times 160 ; k\), ventral abiominal aciculum \(\times 160 ; l\), anterior region, side view \(\times 4\).
foot papillae, 3-5 vertical rows of large yellow, bent, blunt hooks (uncini). Transverse rows of ventral papillac on segments 17-20-27-32. Abdominal dorsal cirri choppershaped. Dorsal forked setac; a long intermediate cirrus. Ventral ramus bilobed, with fine serrulate setae and a small conical ventral cirrus. Spear-shaped spines and special glands absent. Gills fiom the 5th setigerous segment, broadly lanceolate.
var. persica Fauvel. (Fig. 156, \(a-d\) ).
Gills begin on the 7th setigerous segment, instead of the 5th. Intermediate cirrus much longer than the ventral ramus. 25 thoracic segments with vertical rows of genuine hooks with bent, blunt tip and guard, and \(9-3\)

Fig. 156.-Avicia chtrieri Aud. \& M.-Edw., var, persica Fauvel: a, abdominal foot \(\times 40 ; b, c, d\), uncini, front and side view \(\times 150\).
intermediate segments. About 10 foot-papillae on the mid-thoracic segments. Ventral papillae present from 23 rd to 31 st thoracic segments, in crowded rows of \(10-11\) on each side, nearly meeting in the middle. In the abdominal region, the gills are long. The intermediate cirtus (intercirrus) is about 1 times as long as the ven-
tral ramus, whilst in typical A. cuvieri it is shorter, or at most, of the same length.

Occurrence: Persian Gulf.
Iistribution: Of typical form, Atlantic Ocean, Mediterrancan Sea, North Sea.
292. Aricia nuda Moorc. (Fig. 157, a-d).

Aricia nuda, Moore, 1911, p. 311: Eisig. 1911, p. 345: Fauvel, 1932. p. 162, fig. 25.

Body large. Prostomium small, conical. Thoracic setigerous segments 15. Gills begin on the 5th setigerous segment; the posterior ones are very long and slender.

Fig. 157.-Aricin nudn Moore. a, 26th foot \(\times 30\); b, 28th foot \(\times 30\); c. subuluminus \(\times 300 ; d\), hastate spine \(\times 120\).

Ventral thoracic feet with a fringe of toot papillac and vertical rows of subuluncini [genuine hooks (uncini) absent], and capillary setae. From the 12th to the 15th setigerous segment \(4-5\) very large spear-headed spincs in
each foot. Ventral papillae (subpodiale) absent. In the abdominal feet, capillary setae and forked setac. Intermediate cirrus absent.

Occurrence: Off Akyab, Burma, 34 fms.
Distribution: California; Burma.
293. Aricia exarmata Fauvel. (Fig. 158, \(a-d\); Fig. 159, \(a-e)\).

Aricia exarmata, Fauvel, 1932, p. 163, figs. 26-27.
Body of very large size, depressed, enlarged in the thoracic region, semi-cylindrical in the abdominal region.

Fig. 158.-Aricia exarmata Fauvel: \(a, b\), thoracic fext, anterior and posterior view \(\times 11 ; c, d\), abdominal feet \(\times 11\).

Prostomium rather small, blunt, conical, without eves. Thoracic setigerous segments \(15-16\) (the 16 th often smaller, intermediate). Gills begin in the 5th setigerous segment. The anterior ones are triangular, lanceolate;
the abdominal ones long and narrow. Dorsal ramus with an asymmetrical chopper-shaped dorsal cirrus with pointcd tip; a bundle of camenated capillary setae. Ventral ramus a flattened vertical pad, with a narrow elongated lamella bearing a fringe of about 12-15 long conical papillae, several vertical nows of bent subuluncine and long serrated capillary setac. Genuine hooks (uncini) and sperar-shaped spines absent. Ventral papillae (subpodiale)

Fig. 159.-A, icia exa mata Fausel: \(a, b\) and \(c\), patts of camerated setae \(\times\) : 00 : \(d\). fonked seta \(\times 520 ; c\), subuluncinus \(\times 150\).
absent. In the abdominal region, a long dorsal cirrus faintly cultriform, a bundle of long slender, forked, serrated setac. Intemediate cirrus (inter-cirrus) absent. Ventral ramus eret, bilobed, with an aciculum and a few slender capillary setac. Ventral cirrus reduced to a small subulate knob. Proboscis with membranaceous lobes encircling the mouth. A dorsal three-lobed senseorgan.

Differs from .1. muda chiefly in the absence of large spear-headed spines.
F. 41

Length: Thorax 20 mm . long, \(9-10 \mathrm{~mm}\). broad and \(4-5 \mathrm{~mm}\). thick.

Occurrence: Bay of Bengal, 133 fms. (brown mud); a large number of specimens, all incomplete behind.

Genus SCOLOPLOS Blainville.
Prostomium conical, a pair of erect lanceolate gills on all segments except a few anterior oncs. Thoracic feet with an erect dorsal cirrus and a bundle of serrated capillary setae. Ventral ramus pad-like, with vertical rows of capillary setae mixed with hooks, or without them. One to three foot papillae, or none. Ventral papillac usually absent. In the abdomen, an erect dorsal cirrus, capillary setae and forked setae. Intermediate cirrus (inter-cirous) absent. Ventral ramus bilobed, with capillary setac. Ventral cirrus often absent.

Body flattened in front. Prostomium conical, composed of two rings. 17-19 thoracic segments. Short ventral hooks and capillary setae on the 8-9 anterior feet. Gills begin about 13th-15th foot. From about 18th foot a pocket-shaped, large, thin membrane behind and beneath the ventral cirrus. In the abdominal region, an erect dorsal cirrus, a bundle of capillary seriated setac; ventral ramus bilobed, with fine capillary setae. A small rounded lateral organ between the two rami.

Length: \(50 \mathrm{~mm} . \quad 210\) segments.
Occurrence: Chilka Lake, Manikpatna Island; Gulf of Mannar, Krusadai Island, in sand and mud; Tuticorin Beach.
295. Scoloplos kerguelensis McIntosh. (Fig. 160, a-c).

Scoloplos kerguelensis, McIntosh, 1885, p. 355, pl. XLIII, figs. 6-8; pl. XXIIA, fig. 19: Willcy, 1902, p. 275: Eisig, 1914, p. 878: Augener, 1914, p. 26: Fauvel, 1932, p. 165.

Prostomium large, conical but rather blunt. Anterior region spindle-shaped, not quite flattened, of \(12-19\) segments, with only long serrated bristles, devoid of thora-

Fig. 160.-Scoloplos kerguelensis McIntosh: a, anterior part, dorsal view, enlarged; \(b, 20\) th foot \(\times 31 ; c\), 8 th foot \(\times 31\) (after Mclatosh). Sc. marsupialis Southern : \(d\), short hook from 6th foot \(\times 870\); e, 4th right foot \(\times 78 ; f\), anterior end, ventral view \(\times 44 ; \mathrm{g}\), 30th right foot, with pouch \(\times 54\), (after Southern).
cic hooks, foot and ventral papillae. The two rami close to each other, without any well marked setigerous lobe, except in the 3-6 last thoracic segments, which have a very small conical dorsal cirrus and the ventral pad of which bears a very small, inconspicuous median point, which can hardly be considered as a foot-papilla. Gills begin on the 20th, 2lst, or 22nd setigerous segment, usual-
ly on the 21st; they are triangular, broad and short. The pygidium bears two long, filiform, anal cini.

Length: 25-120 mm. by \(1-2 . \mathrm{mm}\).
Colour: Red, in life.
Occurrence: Vizagapatam.
Distribution: Antarctic Ocean, Kerguclen, Falkland Islands, Australia; India.

Remarks: Eisig (1914, p. 378) considers it to be synonymous with Sc. armiger Müller, but this is open to doubt.
296. Scoloplos chevalieri (Fauvel). (Fig. 161, \(a-f\) ) .

Alicia chevalieri, Fausel, 1901, p. 83, figs. 22-28; 1907, p. 18. Gravier, 1906, p. 167, pl. II, figs. 193, 195.
Scoloplos chevalieri, Eisig, 1914, p. 418: Fauvel, 1930, p. 35.
Body long, slender. Prostomium sharp pointed. A pair of nuchal organs. 20-27 thoracic segments, each with a dorsal cirrus and slender serrated capillary setac. 4-5 vertical rows of short, brown, blunt, sigmoid hooks mixed

Fig. 161.-Scoloplos chevalicm (Fauvel): anterior part \(\times 20\); \(b\), \(c\), feet \(\times 40\); \(d\), hook from the anterior segments \(\times 350 ; e, f\), parts of capillary bristles, front and dorsal views \(\times 350\).
with 2-3 capillary setae. Podiale and ventral papillae absent. Lanceolate gills begin on the 7th segment. In the posterior part, gills longer than the broad foliaccous cirrus; dorsal capillary setae and 2-3 forked setae; a short ventral process with a stout blunt aciculum and capillary setae. There is no intermediate cirrus. Lateral organs. Two pairs of anal cirri.

Length: 50-60 mm. by 1-2 mm.
Occurrence: Gulf of Mannar, Kıusadai and Shingle Islands, Krusadai Lagoon, in muddy sand.

Distribution: Indian Ocean, Red Sea; Atlantic Ocean (Casamance River).
297. Scoloplos latus (Chamberlin). (Fig. 162, a-e).

Branchethus latum, Chamberlin, 1919, p. 358, pl. LXIV, figs. 711, pl. LXV, figs. 1-2.
Scoloplos latus, Fauvel, 1932, p. 167, fig. 28, a-e.
Body of large size, much depressed in the anterior part, semi-cylindrical in the middle and posteriorly, ventral side convex. Prostomium small, conical, blunt. Two small, rounded, nuchal organs. Peristomium achae-

Fig. 162.-Scoloplos latus (Chamberlin): a, anterior part, dorsal view \(\times 5 ; b\), cross section of the 15 th setigerous segment \(\times 6 ; c\), 33rd fort with 6 gill filaments \(\times 7\); \(d\), 58 th foot \(\times 20 ; e\), vential hook from the 13 th foot \(\times 117\).
tous. Thorax of 17-18 segments. Dorsal ramus with a conical dorsal cirrus, a short setigerous lobe with a bundle of serrate capillary setae. Ventral ramus a transverse compressed pad with camerated capillary setae, stout bent hooks and a single conical foot-papilla, inserted back-
wards in the middle of the foot. Ventral papillae (subpodiale) absent. In the abdominal region an erect dorsal cirrus, an aciculum and a bundle of slender capillary setae. Intermediate cirrus (intercirrus) absent. Ventral ramus erect, divided into two unequal lobes, one short and blunt, the other cirriform and tapering, an aciculum, a few capillary setae. Ventral cirrus absent. Gills begin on the 5th setigerous segment. The first few gills are simple, the next few are bifid, and from the 16th fcot they have 5-9 long, simple, filaments arising from a short transverse base separated from the foot. In the abdominal region, these long gill-filaments bend backwards, overlap and completely cover the dorsum. Dorsal sense organs, from the 16 th -17 th segment; they consist of two small elongated pads in the middle of each segment.

Breadth: Of thorax 10 mm .
Colour: greyish, colourless in spirit.
Occurrence: Off Akyab, Burma, 250 fms.
Distribution: Pacific Ocean, off Panama, Bay of Bengal.

\section*{Genus NAINEREIS Blainville.}

Theodisca Müller; Naidonereis Malmgren; Anthostoma Schmarda.

Prostomium rounded. Two eyes. A pair of erect lanceolate gills on each segment, except on a few anterior ones. Thoracic feet with an erect dorsal cirrus and a bundle of serrated capillary setae and forked setae. Ventral ramus pad-like, with a foot papilla and several rows of hooks and subuluncini. No ventral rows of papillae. In the abdomen, an erect dorsal cirrus, capillary setae and forked setae. No intermediate cirrus. No ventral cirrus. Ventral ramus bilobed, with capillary setae. Dorsal sense organs.
298. Nainereis laevigata (Grube). (Fig. 163, \(a-l\) ).

Theodisca hexaphyllum, McIntosh, 1905, p. 63.
Scoloplos hexaphyllum, Augener, 1926, p. 462.
Body flattened anteriorly, rounded posteriorly. Proboscis with large palmate lobes. 15-31 thoracic feet, gills
begin from 4th-11th setigerous segment, long, slender. Dorsal cirrus knife-like. Dorsal capillary setae crenate, forked sctac with unequal, short, ciliated limbs, subulate acicula. Ventral ramus semi-circular, pad-like, with an upper papilla, short yellow setae with a long, narrow, denticulate point (subuluncini) and truc hooks. In the posterior region, a dorsal cultriform cirrus, a bundic of

Fig. 163.-Nainereis lacyigata (Grube): a, anterior part, proboscis extuded \(\times 5\); \(b\), pygidium \(\times 5\); \(c, d, e\), anterior, middle and hind feet \(\times 22 ; f\), hook \(\times 330 ; g, h, i\), subuluncini, more or less worn \(\times 330 ; k\), ventral aciculum \(\times 247 ; l\), forked seta \(\times 330\).
capillary setae, \(1-2\) forked setae. Ventral ramus with two languets, long capillary setac and 3-5 stout acicula. No ventral cirrus. Anus dorsal. Four anal cirri. Statocysts on segments 1-23.

Length: 120-250 mm. by 4-5 mm.
Colour: in life, pink, red or brownish.
Occurrence: Ceylon, in sand at low water or under stones.

Distribution: Japan, Indochina; Persian Gulf; Atlantic Ocean, Mediterranean Sea.

\section*{Family SPIONIDAE Sars.}

Body vermiform, not clearly divided into distinct regions. Prostomium without tentacles, sometimes with lateral peaks. Eyes present. Two very long tentacle-like
palps. Proboscis unarmed. Parapodia biramous. Dorsal and ventral cirri foliaceous. Dorsal gills simple (ratiy pinnate) on a number of segments. Simple capillay setae and hooded hooks.

Key to the gencra of Spionidae.

Laonice Malngien, p. 315.

Genus NERINE Johnston.
Prostomium without frontal peaks, with one occipital, tentacle-like, keel. Gills from the second setigerous segment almost to the last segments. Dorsal lamella more or less joined to the gill in the anterior segments; an clongated ventral lamella. In the anterior region, only dorsal and ventral capillary setae; more posteriorly, hooded hooks in both rami. An anal cup.
299. Nerine cirratulus Delle Chiaje. (Fig. 164, g-n).

Nerine cirratulus, Fauvel, 1927a, p. 36, fig. 11, g-n, (S)nonymy).
Prostomium sharply conical, with a posterior occipital peak reaching to the 2nd-3rd segment. Four small eyes. Long slender palps. Gills from the second setigerous segment, absent only on a few last segments. Dorsal lamellac long, joined to the gills on the greater part of their length in the anterior region, but less in the posterior region. Ventral lamellae narrow, bilobed in the posterior part. Hooded hooks bidentate. A large anal cup.

Length: \(50-80 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: in life, blueish-green.

Occurrence: Vizagapatam Channel. Only the anterior part of a small specimen, which appears to belong to this species, was obtained.

Fig. 164.-Nerine cirratulus (Delle Chiaje): \(g\), anterior part enlargcd; \(h\), pygidum ; \(i\), 10 th foot \(\times 24 ; k\), 45 th foot \(\times 24 ; 1\), 85 th foot

Phonospio cirrifera Wiren (the top three figures); \(k\). anterior part, enlarged; \(l\), head, side view \(\times 32\); \(m\), first foot \(\times 48\).
Distribution: Atlantic Occan, Mediterranean Sca.
Genus SCOLELEPIS Blainville.
Prostomium with two frontal peaks, ending posteriorly in a crest (carina). Two long thick palps. Gills from the first setigerous segment to the last ones. Dorsal lamellae partly joined to the gills. Ventral lamellae not notched. Hooded hooks only on the posterior ventral rami: always absent on the dorsal ramus. Anal cirri.
300. Scolelepis indica Fauvel. (Fig. 165, \(g-m\) ).

Scolecolepis indica (sic), Fauvel, 1928, p. 93, fig. 2, \(g-m\); 1930a, p. 35, fig. 7, g-m; 1932, p. 170.

Body long, slightly broader and flattened anteriorly, filiform behind. Prostomium shield-shaped, with two frontal peaks well marked and laterally inserted. The prostomium ends posteriorly in a pointed keel extending back to the second setigerous segment, but not raised into an occipital tentacle. Two irregular clusters of very small F.4?
and numerous eye-spots. Two long and stout, spirally curling palps. Gills beginning on the first setigerous segment. In the anterior region, the long cirriform gills cross over the back. Dorsal lamella erect, lanccolate, attached to the outer border of the gill only at its basc. Ventral lamella rounded or oval, slightly mucronate, not notched; posteriorly it is reduced gradually to a decreasing crescent. Dorsal capillary setae neither winged nor dotted. Ventral setae similar but shorter and somewhat

Fig. 165.-Laonice cirrata Sars: \(a\), anterior part, enlarged; \(b\), 12th foot \(\times 16\); \(c\), 22nd foot \(\times 16\); \(d\), 40th foot \(\times 16\); \(c\). hooded hook \(\times 320\). Scolelepis indica Fauvel. g, head \(\times 6 ; h\), 10 th foot \(\times 32\); \(i\), 73rd foot \(\times 32 ; k\), pygidium ; \(l\), ventral hook from the last segments \(\times 320 ; m\), posterior ventral hook \(\times 320\).
dotted, with a bundle of 5-6 short, larger, curved ones with a tapering bent tip. Hooded ventral hooks bidentate, 2 to 6 in each ramus, from about the 70th setigerous segment. Dorsal hooks absent. In the last segments, gills short, no more marked lamellae, long and slender capillary setae; in the ventral ramus, 1-2 curved setae, 5-6 hooks and \(1-2\) long slender setae. Pygidium bearing 4 short finger-shaped cirri. Anus terminal.

Length: 60 mm ., or more, by 1 to 1.5 mm .

\section*{Colour: in life pink.}

Occurrence: Vizagapatam; Gulf of Mannar; Krusadai Island.

\section*{Genus LAONICE Malmgren.}

Prostomium rounded, without frontal peaks, ending posteriorly in a raised occipital tentacle. Two eyes. Palps large. Gills beginning at the second setigerous segment and existing only in the anterior part of the body. The dorsal lamella is not attached along the gill. Ventral lamella not notched. Genital pouches present. In the anterior region only dorsal and ventral capillary setae; more posteriorly hooded hooks on the ventral ramus only. Anal cirri.
301. Laonice cirrata Sars. (Fig. 165, a-e).

Laonice cirrata, Söderström, 1920, p. 220, fig. 128: Fauvel, 1927a, p. 38, fig. 12, \(a-e\).

Aonides cirrata, Fauvel, 1914b, p. 220, pl. XX, figs. 4-9.
Spionides japonicus, Moore, 1907, p. 204.
A long dorsal crest (sense organ) on the first 28-30 segments. Gills \(35-45\) pairs only, long, cirriform, folded on the back, separate from the dorsal lamella all along. Dorsal lamellac large, auriculate in the branchiate segments; smaller, triangular and ovate in the succeeding ones. Ventral lamellae oval, rounded in the succeeding segments. From about the 25 th foot, in mature specimens, pigeon-nest shaped genital pouches between the lamellae. Ventral hooded hooks bidentate from about the 40th-50th foot.

Length: \(90-120 \mathrm{~mm}\). by \(3-5 \mathrm{~mm}\).
Colour: yellowish, darker behind.
Occurrence: Off Puri, Orissa.
Distribution: Japan; India; Atlantic Ocean, Mediterranean Sea; Arctic Seas.

\section*{Genus POLYDORA Bose.}

Prostomium blunt or notched in front, ending posteriorly in a crest. Gills begin beyond the 6th-9th foot, rarely on the 2nd. Fifth setigerous segment highly modified, with peculiar stout dorsal bristles. Dorsal and ventral capillary bristles; ventral bidentate hooded hooks from the 7th-8th foot. An anal cup, simple or lobed.

Key to the species of Polydora.

302. Polydora (Carazzia) antennata Claparède. (Fig. 166, \(i-m\) ).
Polydora antennata, Fauvel, 1927a, p. 56, fig. 19, i-m, (Synonymy); 1930a, p. 36; 1932, p. 172.
Carazzia antennata, Mesnil, 1896, p. 227, pl. XIV, figs. 22-25.
Prostomium with two tentacle-like lobes in front and a small erect occipital tentacle. Four eyes. On the first setigerous segment well marked dorsal and ventral lamellae, ventral capillary setac but no dorsal ones. Large gills beginning on the 7th foot. Peculiar setae of the 5 th setigerous segment, pointed and hollowed at the shocshaped tip, arranged in the form of a horse-shoe with lanceolate setae. Ventral hooded hooks from the 8th foot. No peculiar posterior setae. Anal cup notched on dorsal and ventral borders.

Length: \(20-30 \mathrm{~mm}\).
Colour: uniformly yellowish.

Occurrence: Gulf of Mannar, Krusadai Island.

Fig. 166.-Polydoia (Polydora) armata Langerhans: ant antior part; b, 7th foot \(\times 32\); c, dorsal posterior bristles \(\times 240\); \(d\). stout hooks from the 5 th segment \(\times 176 ;\) e, pygidium \(\times 36\). 303 Polydora (Carazzia) kempi Southern. (Fig. 167,
\[
a-c)
\]

Polydora (Carazzia) kempi, Southern, 1921, p. 636, pl. 28, figs. 20.

Prostomium rather small and broad, bilobed, without caruncular prolongation, but with a large crect occipital tentacle. Four black eyes. On the first setigerous segment, no dorsal setae, a stumpy round papilla, a ventral lobe with a row of slender capillary setac. No ventral lamella. On the 2nd to 6 th segment dorsal and ventral bundles of capillary setae, the dorsal long, slender, the ventral flattened. A dorsal rounded lamella. The 5th setigerous segment is less modified than in any other species, with dorsal superior setae long and narrow capillaries; the inferior dorsal setae consist of two rows of modified setae; the anterior setae are bi-limbate capillaries,
short, with broad wings, rapidly tapering; the posterior row consists of rather stout hooks with curved tips. The ventral setae are lance-shaped. The gills appear on the 7 th segment, they are quite free from the dorsal lamellae; there are only \(10-11\) pairs of them. Ventral hooks appear on the 8th setigerous segment; they are not accom-

Fig. 167.-Polydora (carazzia) kempi Southern: a, anterior end, dorsal view \(\times 50 ; b\), lower dorsal setae from the 5 th foot \(\times 500 ; c\), ventral hook from the 8 th foot \(\times 720\) (after Southern). P. (Polydora) hornelli Willey: \(d\), anterior end, dorsal view \(\times 50\); \(e\), modified setae from the 5 th segment \(\times 320 ; f\), ventral hook from the 38 th foot \(\times 500\) (after Southern).
panied by any capillary setae and resemble those of \(P\). antennata. Posterior region unknown.

Occurrence: In a canal at Chingrighatta, Calcutta Salt Lakes.

Subgenus POLYDORA Bose.
304. Polydora (Polydora) hornelli Willey. (Fig. 167, \(d-f)\).
Polydora hornelli, Willey, 1905, p. 286, pl. V, fig. 117: Southern, 1921, p. 634, pl. 28, figs. 21, AD.

Prostomium slightly notched, with two round lobes; it is prolonged backwards over the first 2-3 segments.

No eyes. Tentacles stout, long. On the first setigerous segment a small dorsal and a small ventral lamella. No dorsal setae. A bundle of ventral capillary setae. 2nd to 6 th segments with two rows of setae. On the 5th setigerous segment an oblique row of long stout acicular, spoonshaped hooks, with a neck and a closely applied tooth, accompanied by delicate spatulate setac. Gills and ventral hooks appear on the 7th setigerous segment and continue to the end. Last segments and pygidium unknown.

Length: 31 mm . and more, by 1.5 mm .
Colourless.
Occurrence: Chilka Lake; Gulf of Mannar. In crevices of oyster shells.
305. Polydora (Polydora) ciliata Johnston. (Fig. 166, i. p).

Polydora ciliata, Fauvel, 1927a, p. 49, fig. 16, i-p, (Synonymy); 1932, p. 172.
Prostomium faintly notched in front, prolonged backwards over the second segment. Four eyes. On the first setigerous segment, dorsal and ventral lamellac, no dorsal setae, ventral capillary setac. 2nd to 6 th segments with both dorsal and ventral capillaries. On the 5th setigerous, stout hooks with a lateral spinc, and lanceolate setae. Ventral bidentate hooks from the 7th setigerous segment. Gills from the 7th to the 10th penultimate scgments. Anal cup notched dorsally.

Length: \(20-30 \mathrm{~mm}\). by 1 mm .
Colour: yellowish, both extremities and anal cup darker.

Occurrence: Chandipore, Orissa Coast.
Distribution: Australia; Indo-China; India, Red Sea; Atlantic Occan, Mediterranean Sea, Falkland Islands.
306. Polydora (Polydora) coeca Oersted. (Fig. 168, ak).

Polydora coeca, Fauvel, 1927a, p. 52, fig. 18, \(a-k\); Gravely, 1927, p. 23.

Prostomium dceply notched, prolonged backwards over the first two segments. Gencrally eye-less. Tentacles long and slender. On the first setiger, a small dorsal and a small ventral lamella, dorsal and ventral capillary setae. On the 5 th setigerous segment, stout spoon-shaped hooks, without lateral tooth, accompanied by lancet-
shaped setae. Ventral bidentate hooded hooks from the 7 th setigerous segment. In the posterior region, the anterior dorsal winged setae are replaced by 3-4 small, straight awl-shaped setae: there are no bundles of slender

Fig. 168.-Polydona (Polydora) cocca (Oersted): \(a\), anteior pat; \(b\), posterior foot \(\times 40 ; c\), foot from mid-body \(\times 40 ; d\), e, hooks from the 5 th setigerous segment \(\times 320\); \(f\), hooded hook \(\times 320\); \(g\), winged seta \(\times 320 ; h\), lancet-shaped seta from the 5th seg. ment : \(i, k\), posterior bodkin setae \(\times 320\). \(P\). (Polydora) flava Claparide: \(n\), anterior part \(\times 20\); o, fust setigerous segment \(\times 36 ; p\), 8th-setigerous segment \(\times 48 ; q, r\), special hooks from the 5 th segment \(\times 320\); \(s\), hooded hook \(\times 320\); \(t\), bundle of slender posterior setae \(\times 320\); \(u\), lancet-shaped seta from the 5 th segment \(\times 320\).
setae. Gills begin on the 8 th setigerous segment and are absent on the posterior half, or third, of the body. A deeply notched anal cup.

Length: \(20-40 \mathrm{~mm}\). by 1 mm .
Colour: yellowish. Boring in shells and coral rocks.
Occurrence: Gulf of Mannar; Krusadai and Shingle Islands. Amongst sponges.

Distribution: Indian Ocean; Atlantic Ocean, Mcditerranean Sea; Arctic Seas.
307. Polydora (Polydora) armata Langerhans. (Fig. 166, ( \(a-e\) ).

Polydora armata, Fauvel, 1927a, p. 55, fig. 19, a-e; Willey and Watson, 1905, p. 325.

Prostomium notched, with two rounded horns; prolonged backwards on the first two segments. Generally cye-less. Tentacles rather long. On the first setigerous segment dorsal and ventral lamellae, dorsal and ventral sclac. On the 5th setigerous segment 2-3 stout, peculias setae with blunt hooks, two lateral processes connected by a transverse ridge; no lance-shaped setne. Ventral, bidentate, hooded hooks from the 7th setigerous segment backwads. On the 8-12 last segments, on the dorsal ramus, a conical bundle of 8-18 stout brown acicular setae. Only 5-7 pairs of gills beginning on the 7th setigerous segment. Anal cup with a dorsal, and sometimes, a ventral notch.

Length: 4-5 mm.
Colourless: Burrows in shells and calcareous Algae.
Occurrence: Ceylon, commensal with the sponge Aulospongus tubulatus.

Distribution: India; Atlantic Ocean (Madeira), Mediterranean Sea, English Channel.
308. Polydora (Polydora) flava Claparède. (Fig. 168, \(n-u)\).
Polydowa flata, Fauvel, 1927a, p. 52, fig. 17, m-n; Augener, 1926, p. 461.

Prostomium notched into two sharp horns; prolonged backwards to the first two segments. No eyes. Tentacles long and slender. On the first setigerous segment, dorsal and ventral lamellae, dorsal and ventral setae. On the 5 th setigerous segment stout spoon-shaped hooks without lateral tooth, accompanied by lance-shaped setac. Ventral bidentate hooded hooks from the 7th setigerous segment backwards. From the 8th setigerous segment backwards a dorsal bundle of very numerous, very slender, needle-like setac. Gills from the 8th setigerous segment (sometimes 7 th or 9 th ), absent on the posterior third of the body. \(\Lambda\) broad anal cup with four notches.

Length: \(20-45 \mathrm{~mm}\).
Colour: yellowish.
Occurrence: Ceylon. In small muddy tubes on old shells and in rock clefts.
F. 43

Distribution: Japan; Sumatra; India; Atlantic Occan, Mediterranean Sea, English Channel.

\section*{Genus POLYDORELLA Augener.}

Closely allied to Polydora. Setac nearly similar, but modified setae on the 4th setigerous segment, instcad of the 5th. Pygidium not cup-like. Schizogamous.
309. Polydorella prolifera Augener. (Fig. 169, a-g).

Polydorella prolifera, Augener, 1914, p. 16, pl. 1, fig. 3: Fauvel, 1930a, p. 36, fig. 8.
Post-larval Chactopterid, Gravely, 1927, p. 24, pl. IX, figs. 1214.

Prostomium rounded, bilobed, with two eyes. Long, stout, cylindrical palps. On the first setigerous segment a dorsal and a ventral bundle of slender capillary setac. Up to the 6th setigerous segment, only capillary setae, with

Fig. 169.-Polydorella prolifera Augener: a, anterior part, dorsal vicw (tentacles fallen off) \(\times 45 ; b, c, d\), peculiar setae from the 4th setigerous scgment, side and front views \(\times 550 ; e, f\), spoon-shaped setae from the 4th segment \(\times 550 ; g\), hooded hook from the 7th foot. Dodecaceria fistulicola Ehlers: \(h\), anterior spoonshaped hook \(\times 550 ; i\), posterior hook \(\times 550\).
the exception of the 4th bearing the following modified setae: (1) a row of 3-6 large asymmetrical bristles with a denticulate or wrinkled crest and a blunt hook; (2) an inferior row of 3-6 smaller setae slightly enlarged at the tip, which is spoon-shaped, with a more or less blunt lateral process; (3) a few ventral, slender capillary setae.

About the 6th-7th setigerous segment appear the ventral hooks with a double curvature and a hooked tip with a very long and slender tooth running nearly parallel to the vertex which is provided with a broad hood. Gills, according to Augener, are only to be found on the 6th setigerous segment in a few specimens: they are simple filaments. 3-4 achaetous posterior segments. A conical pygidium, faintly notched, without cup or funnel. Anus terminal. "Proliteration takes place by the formation of the head of a daughter worm and a new tail for the parent between the ninth and tenth segments."

Occurrence: Gulf of Mannar. "Found in abundance, each in a minute mud-covered tube adherent throughout its length to the surface of a sponge." (Gravely).

\section*{Distribution: Australia; Gulf of Mannar.}

\section*{Genus PRIONOSPIO Malmgren.}

Prostomium short, rounded; frontal peaks and occipital tentacles absent. Eyes present. Long deciduous palps. Gills \(3-11\) pairs, often pinnate. Dorsal lamellae not bound to the gills. Ventral lamellae entire. Sometimes genital pouches present. Dorsal and ventral capillary setae. Dorsal and ventral pluridentate hooded hooks.

\section*{Key to the species of Prionospio.}
1. Piostomium with large wings. All the gills pinnate ... pinnata Ehlers, p. 323. Prostomium without large wings 2
2. Gills pinnate. Genital pouches absent
krusadensis Fauvel, p. 326.
Gills simple .. .. 3
3. Gills all subulate, 6-13 pairs .. cirrifera Wiren, p. 324.

Gills vely numerous, the first few pairs long and filiform, the rest foliaceous \(\quad\).. polybranchiata Fauvel, p. 324.

Prionospio africana, Augener, 1918, p. 402, pl. V1, figs. 162-163.
(?) Prionospio alata, Moore, 1923, p. 185.

Prostomium enclosed between two upturned membranaceous wings. 3-4 pairs of pinnate gills begimning on the first setigerous segment. Gills of the second pair generally smaller. As the gills are very casily lost the differences in size are to be ascribed to regeneration. A well marked transverse crest, or ridge, arises between the first two setigerous segments: there are no ridges posteriorly.

Occurrence: Off Akyab, Burma, 250 fms.; Madras, Vizagapatam; Mormugao Bay; Maldive Archipelago.

Distribution: Pacific Ocean; Indian Occan; Atlantic Ocean.
311. Prionospio cirrifera Wiren. (Fig. 164, \(k-m\) ).

Prionospio cirrifera, Söderström, 1920, p. 237, figs. 131-146: Fauvel, 1927a, p. 62, fig. 21 (Synonymy); 1932, p. 174.
(?) Prionospio multibranchiata, Berkeley, 1927, p. 10, pl. I, fig. 1.
Prostomium rounded in front, ending behind in a crest extending to the 2nd-3rd setigerous segments. There are no membranaceous prostomial wings. Gills \(6-13\) pairs, all simple, beginning at the second setigerous segment. Anterior dorsal lamellae very large, and from 3rd to 6th feet sharp pointed. In mature specimens, genital pouches begin about 5 th-7th setigerous segments. Ventral lamellae oval or rounded.

Length: 30 mm .
Colour: yellowish-white.
Occurrence: Vizagapatam.
Distribution: Vancouver (?); India; Atlantic Ocean; Arctic Seas.
312. Prionospio polybranchiata Fauvel. (Fig. 170, \(a-\) g).

Prionospio polybranchiata, Fauvel, 1929, p. 184; 1930a, p. 39, fig. 10, \(a-g\).
Prionospio multibranchiata, Fauvel, (non Berkeley) 1928, p. 94, fig. 3, \(a-g\).

Anterior region flattened, enlarged, tapering forwards; posterior region cylindrical. Above 40 segments. Prostomium elongate, anterior border rounded, ending posteriorly in a blunt ridge on the edge of the third setigerous segment. No eyes apparent. Two very long twisted palps reaching backwards to the 26th-50th segment. On the first setigerous segment the dorsal ramus is reduc-
cd to a small conical (achaetous?) nipple and a small ventral lamella and setae. Gills from the second setigerous segment, the first five pairs filiform, not pinnate, very long, reaching backwards to the 8th-10th setigerous segment; the following ones foliaceous, sub-triangular, elon-

Fig. 170.--Prionospio polybranchiata Fauvel: a, prostomium, enlarged; l. 4th gill and foot \(\times 24 ; c\), Ilth foot \(\times 48 ; d\), 29 th foot \(\times 48 ; e\), 40th foot \(\times 48\); \(f\), hook \(\times 360 ; \mathrm{g}\), posterior hook \(\times 360\). Stylarioides ernu (Claparide), var. indica Fauvel; \(h\), foot papilla \(\times 112 ; i, k, l\), three kinds of ventral setae from
the same foot \(\times 112\).
gate, bent on the back and partly attached to the dorsal lamella: their size then decreases but they still exist on the 40th setigerous segment. Dorsal lamellae triangular, erect, rather large and free on the first 5 setigerous segments, after which their size decreases and they become more oval or subtriangular, then obsolete. In the anterior region the dorsal ridges are reduced to a very slender transverse wrinkle on each segment. Anteriorly, both dorsal and ventral setae are capillary. Ventral pluri-dentate hooded hooks from the 22 nd setigerous segment. At the 40th they are still absent in the dorsal ramus. No genital pouches. Pygidium unknown.

Length: more than 11 mm . by 2 mm .
Discoloured in spirit.
Occurrence: Gulf of Mannar.
313. Prionospio krusadensis Fauvel. (Fig. 171, a-e).

Prionospio krusadensis, Fauvel. 1929, p. 182, fig. 2; 1930, p. 38. fig. 9 .
Body slender, filiform, slightly enlarged anteriorly. Prostomium, long, conical, with a blunt ridge running to the 2nd segment. A low lateral fold, which does not form a marked wing, on each side of the prostomium.

Fig. 171.-Prionospio krusadensis Fauvel : a. b, c, 6th, 15th, 20th feet \(\times 120\); \(d\), bristle from the 10 th setigerous segment \(\times 400 ; e\), ventral hook from the 18 th setigerous segment.
Two clusters of 4-5 small eyes. First setigerous segment with both rami obsolete and only dorsal setae (?). Branchiae three pairs, on the second, third and fourth setigerous segments; they are all pinnate, the third pair often smaller. On the anterior segments, the dorsal lamellae are large, oval, or sub-triangular, the 5-6 first ones subequal, the 4th often larger. The following lamellae are lower, more rounded or heart-shaped, gradually decreasing in size, but still conspicuous to the end of the body. Ventral lamellae smaller, at first oval, next rounded and
then very small. No noteworthy transverse ridges. In the anterior region dorsal and ventral setae long and capillary. In 3-4 segments, from the 10 th setigerous, on the ventral ramus a large golden seta, curved and dotted. From the 17th-18th setigerous segment ventral hooks with 3 teeth above the main fang. Dorsal hooks from the \(40 \mathrm{th}-42 \mathrm{nd}\) setigerous segment. There are no genital pouches. A median anal cirrus and two very small others.

Length: about 20 mm . by \(0.7-0.8 \mathrm{~mm}\).
Colour: yellowish in alcohol.
Occurrence: Gulf of Mannar, Krusadai Island.

\section*{Family DISOMIDAE Mesnil.}

Prostomium with two long tentacle-like palps. Feet biramous (at least in the anterior region). Setae of various kinds. Acicular setac. Dorsal and ventral cirri elongated or frilled. Body not clearly divided into regions.

\section*{Genus DISOMA Oersted.}

No median frontal tentacle, and nuchal organ without three tentacular lobes. Dorsal cirri fleshy, rounded, with a frilled or smooth border.
314. Disoma orissae Fauvel. (Fig. 172, a-m).

Disoma orissae, Fauvel, 1932, p. 174, fig. 29, a-m.
Prostomium elongated, slightly notched in fiont, bulging in the middle and ending behind in a crest reaching to the 2nd setigerous segment. On the raised part, four very small eyes, two dorsal and two lateral, and a small erect, tapering, median tentacle. On cach side, at the base of the prostomium, a small projecting nuchal organ. On the first setigerous segment a large lanceolate, subulate, dorsal cirrus and a ventral one directed forwards; a small bundle of capillary setae in front of the dorsal cirrus, and a fan-shaped ventral bundle of much longer setae extending beyond the prostomium. On the 2nd setigerous segment dorsal and ventral cirri, triangular, much smaller than the first ones, and ventral setae of two types: (1) an anterior row of very fine capillary sctae and (2) a posterior transverse row of stouter shorter bristles with blunt curved tips. Dorsal setac absent. On the 3rd setigerous segment, a large lanceolate, chopper-like, dorsal cirrus, a crescentic tip, a triangular ventral cirrus, smaller than the dorsal one, a small ligule under the ventral cirrus and, in
front of the parapodial lamella, a vertical row of 7 stout yellow acicular setac with blunt bent tips, an anterior row of slender capillary setae and, in front of the cirrus, a diverging fascicle of dorsal capillary setac. In short, the ventral setac of the second foot are shaped like those on the third, but the acicular bristles are smaller, paler and morc hyalinc. Between the third and fourth toot, a decp triangular notch on each side of the body divides the anterior part from the following region in which the first 6-7 segments are much larger than the others; as a result,

Fig. 172.-Disoma orissae Oersted: \(a \times 7 ; b\), anterior end, dorsal view \(\times 22 ; c, d\), winged bristles from the fith setigerous segment \(\times 110\); \(c\), ventral stout bristle from the 2nd segment \(110 ; 1\), sentral capillary seta from the 2 nd scgment \(\times 110 ; \mathrm{g}, \mathrm{h}\), stout bristles from the 3 rd segment \(\times 110 ; i\), capt
llary seta from the 3 rd segment \(\times 110 ; k\), tine dorsal setar from the 3 rd segment \(\times 110 ; l\), abdominal papillae \(\times 48 ; m\), posterior foot with bodkin and capillary setae \(\chi \times 4 \mathrm{~N}\).
this region is enlarged and flattened. On the 4 th setigerous segment, the first of the enlarged part though smaller than the next, the dorsal and ventral cirri are thick, rounded lamellae, and there is a bundle of dorsal and ventral setae. The condition is the same in the succeeding four segments, but the ventral bristles are large, stout, yellow, set brush-like, as in Aricia, and of two kinds: (1) stout, doubly curved, nearly sickle-shaped, with a broad wing showing a tendency to split into fine spines, (2) capillary, similar to the dorsal ones. The dorsal setae disappear about the 11th foot. From the 9th segment backwards the dorsal cirri become filiform and the ventral ones are modified about the 12th-13th feet. Bevond the

11th foot long filiform ventral papillae make their appearance, a single one at first under each foot, but increasing to 2 , 3, or 5 . From the 9 th foot backwards, the ventral setac are of two kinds: (1) stout, straight, bodkin-shaped, and (2) very slender capillaries.

Length: about 6 mm . by 1 mm . 25 segments, incomplete behind.

Discoloured, in spirit.
Occurvence: Off Puri, Orissa, 4-4! fms.
Family MAGELONIDAE Cunningham and Ramage.
Body filiform divided into two regions. Prostomitum oval, flatened, without tentacles. Two long papillated palps. A big proboscis. Parapodia biramous. Dorsal and ventral cirri lamelliform. Gills absent. Setac simple capillaries, or hooded hooks. Anal cirri.

\section*{Genus MAGELONA O. F. Müller.}

Anterion and posterior region separated by a peculiar segment. Piostomium broadly oval, spatulate. Proboscis ghobular. Two long palps with sucker papillac.
315. Magelona sp. juv.

Momo. 1997, p. 299, fig. 19.
Monto's specimen from the Maldives is a post-larva too young for its attribution to any of the known species of Magelona.

Magelona rosea Moore has been recorded fiom the Gulf of Siam; M. obokensis Gravier, from the Red Sca, and M. pacifica Monro from the Pacific Ocean (Galapagos Islands).

\section*{Family CIRRATULIDAE Carus.}

Body stout, subcylindrical, tapering at both ends. Prostomium without palps and tentacles. Peristomium ringed. Stout tentacular cirri (palps) inserted on the dorsal side of an anterior segment. Long slender simple gills inserted above the dorsal ramus. Feet biramous, both rami low and far apart. Capillary simple setae and simple acicular hooks. Dorsal and ventral cirri absent.

Key to the genera of Cirratuididaf.
1. Tentacular filaments numerous.
Stout palp-like tentacular cirri
absent \(\quad \cdots\)
One pair of stout large palps \(\quad .\).
F. 44

\section*{Genus AUDOUINIA Quatrefages.}

Lateral gill filaments from the first segments to nearly the last ones. Tentacular cirri numerous, as slender as the gills, and set in two clusters on 1-2 segments farther back than the first gill-bearing ones. Capillary setae and hooks in both rami.

Key to the species of Audouinia.
1. Tentacular cirri on the 3 rd setigerous segment. Segments ringed with black \(\quad\). semirincta (Ehlers), p. 330.
Tentacular cirri on 4th-5th or 5th-6th segments .. .. 2
2. Distance between the point of gill insertion and the dorsal ramus shorter than the distance between both rami. 4 -5 hooks in each ventral ramus .. .. ancylochaeta (Schmarda), p. 382.

Distance between the point of gill insertion and the dorsal ramus greater than the distance between both rami: 1-4 ventral hooks .. .. filigera (Delle Chiaje), 331.
316. Audouinia semicincta (Ehlers). (Fig. 174 c).

Audouinia semicincta, Fauvel, 1923f, p. 42; 1930b, p. 542; 1935, p. 539.

Cirratulus semicinctus, Ehlers, 1905, p. 290, pl. IX, figs. 11-14.
Gills from the first setigerous segment. Tentacular cirri in two clusters on the 3rd or 4th setigerous segments. In the middle region of the body the distance between the gills and the dorsal ramus is equal to the distance between both rami. Capillary setae in every foot. Dorsal and ventral hooks alike and slender.

Length: \(15-30 \mathrm{~mm}\).
Colour: Body streaked with transverse lines of black dots. Tentacular cirri alternately ringed black and white.

Occurrence: Corbyn's Cove, Andaman Islands.
Distribution: Honolulu, Gambier Islands, New Caledonia, Gulf of Siam; Andaman Islands; Red Sea.
317. Audouinia filigera (Delle Chiaje). (Fig. 173, \(h-l\) ).

Audouinia filigera, Fanvel, 1927a, p. 92, fig. 32, h-m; 1932, p. 178. Cirratulus cylindicus Schmarda, Willey, 1905, p. 294, pl. VI, fig. \(139-140\).

Gills from the first setigerous segment. Tentacular cirri in two dense clusters inserted on the 4th-5th or the 5th-6th setigerous segments. Capillary setac in every

foot. Dorsal and ventral hooks present, except in the anterior segments. Ventral hooks few, 1-3, 3-4, and stout. Distance from point of gill-insertion to the feet greater than the distance between the two rami.

Length: \(100-200 \mathrm{~mm}\). by \(4-5 \mathrm{~mm}\).
Colour: Dark orange or brown in life. Very dark, or discoloured, in spirit.

Occurrence: Mergui Archipelago, Paway Island; Ceylon; Rameswaram Island; Palan Bidang, Cape Comorin.

Distribution: Pacific, Indian and Atlantic Oceans.
318. Audouinia anchylochaeta (Schmarda).

Audouinia ancylochaeta, Fauvel, 1930b, p. 541, 1932. p. 178.
Cirratulus anchylochaetus, Schmarda, 1861, 1. 58; Augener 1914, p. 53 (Synonymy).

Timarete ancylochaeta, Ehlers, 1904, p. 53.
(?) Timarete fecunda, Kinberg, 1857-1910, p. 64, pl. XXV, fig. 1.

Gills from the first setigerous segment. Tentacular cirri inserted in two clusters on the 5th-6th setigerous segments. Capillary setae in every foot. Dorsal and ventral hooks 2-4 in each ramus, rather slender. Distance between point of gill insertion and the dorsal ramus shorter than the distance between both rami. Closely allied to A. tentaculata, if not conspecific.

Length: \(100-200 \mathrm{~mm}\). by \(4-5 \mathrm{~mm}\).
Colour: deep yellow, or red-brown, or greenish-brown, with red gills, in life.

Occurrence: Persian Gulf.
Distribution: Australia, New Zealand, New Caledonia; Persian Gulf.

\section*{Genus CIRRATULUS Lamarck.}

Body long, cylindrical. Prostomium conical. First three segments achaetous. Lateral gills from the first setigerous segments to the hind part. Tentacular filaments nearly as slender as the gills and beginning on the same segment. Capillary setae and acicular hooks.

Key to the genus Cirratulus.

Cirratulus filiformis, Fauvel, 1927a, p. 94, fig. 33, \(h-i\); 1930a, p. 43: Monro, 1937, p. 301.

Body long, slender. Prostomium pointed, eycless. On the first segment one pair of gills and 1-2 pairs of tentacles, hardly stouter. Capillary setac on both dorsal and ventral rami. No hooks.

Length: \(\quad 30-40 \mathrm{~mm}\). by \(0.5-1 \mathrm{~mm}\).
Colour: yellowish, or greenish-yellow.
Occurrence: Gulf of Mannar; Pamban; Maldive Archipelago.

In rock clefts and dredgings.
Distribution: Indian Ocean, Persian Gulf; Atlantic Ocean, Mediterranean Sea.
320. Cirratulus chrysoderma Claparède.

Cirratulus chrysoderma, Fauvel, 1927a, p. 95; 1930, p. 43.
Body slender. Prostomium triangular, eyeless. Gills and tentacles begin on the 4th setigerous segment. Gills on the anterior half of the body only. Only two pairs of tentacles. Gills inserted just above the dorsal ramus. Only long capillary setae on both rami. No hooks.

Length: \(20-70 \mathrm{~mm}\). by \(0.5-3 \mathrm{~mm}\).
Colour: greenish.
Occurrence: Gulf of Mannar; Pamban.
Distribution: Japan, Malayan Scas; India, Perstan Gulf; Mediterrancan Sea.

\author{
321. Cirratulus dasylophius Marenzeller. \\ Cirratulus dasylophius, Marenzeller, 1879, p. 146, pl. VI, fig. é: Fauvel, 1911, p. 411. \\ (i) Cirratulus complanatus, Willey, 1905, p. 294.
}

Prostomium triangular, eyeless. On the second setigerous segment one pair of gills and one pair of tentacular cirri; on the third and fourth segments one pair of gills and numerous tentacles: thence one pair of gills only and no tentacles on every segment. Capillary setae and hooks in both rami, with the exception of the first setigerous segment, in which hooks are wanting. Ventral hooks stouter than the dorsal. First dorsal hooks about 43rd, ventral hooks from 29th setigerous segment.

Occurrence: Persian Gulf; Ceylon (?).
Distribution: Japan; Indian Ocean, Persian Gulf.
322. Cirratulus cirratus O. F. Müller. (Fig. 173, \(a-g\) ).

Cirratulus cirratus, Fauvel, 1927a, p. 94, fig. 33, a-g; 1919, p. 427; 1939. p. 346.
Body cylindrical, Prostomium blunt-conical, on each side an oblique row of 4-8 large black eyes. Gills and tentacles on the first setigerous segment. The gills persist to the hind part of the body. \(2-8\) pairs of slightly stouter tentacles. Dorsal and ventral capillary setae on all the feet. Dorsal and ventral acicular setac, with the exception of a number of anterior segments.

Length: \(30-120 \mathrm{~mm}\). by \(1.5-3 \mathrm{~mm}\).
Colour: yellow-orange, red or brown.
Occurrence: Persian Gulf. In muddy sand.
Distribution: Japan; Indochina; Persian Gulf; Atlantic Ocean, Arctic Ocean and Antarctic Ocean, Kerguelen, Falkland Islands, Cape Horn.

\section*{Genus THARYX Webster and Benedict.}

Body cylindrical, slender, clongate. Peristomium and the two succeeding segments achactous. Prostomium conical. Lateral gills on a number of anterior segments. One pair of stout dorsal palps and one pair of gills on the first setigerous segment. Dorsal and venttal rami little remote. Capillary setae only.
323. Tharyx multifilis Moore.

Tharyx multifilis, Moore, 1909, p. 267, pl. IX, fig. 43: Fauvel, 1932, p. 179.
Prostomium long, sharply conical, eyeless (?). Gills absent on about the last 20 segments. Dorsal setae long. er than the ventral ones.

Occurrence: Madras.
Distribution: San Diego, California; Madras.

\section*{Genus HETEROCIRRUS Grube.}

Prostomium conical. Two stout dorsal palps and one pair of gills before the first setigerous segment. A number of lateral gills. Capillary setae and hooks.
324. Heterocirrus typhlops Willey. (Fig. 174, d).

Heterocirrus typhlops, Willey, 1905, p. 295, pl. V, fig. 138.
" A very small worm, total length 10.5 mm ., diameter less than half a millimetre. Capillary non-limbate setae in both fascicles; dorsal and ventral acicular setac com-
mence on the first setigerous segment; they resemble those of Cirratulus; the ventral acicular setac are two in number, more curved and thicker than the dorsal." "The disposition of such cirriform appendages as remain are inserted laterally over the fect." (Willey).

Fig. 174.-Dudecacena fistulicola Fhlers: a capillary blistle and ante-
 semicincta (Ehlers): \(c\), anterior part (after Gravier). Heterocirus typhlops Wille: d, amteion pat. after Willoy). Piomospio pmanta Fhlers: \(r\). anterior pat, side view (after Caullery)
Occurrence: Southwest Cheval Paar, Gulf of Mannar. Willey's description and figures hardly agree with Heterocirrus.

\section*{Genus DODECACERIA Ocrsted.}

Body stout. Prostomium blunt, generally eyelcss. Peristomium achactous, triannulate, with two stout palps. 'lentacular filaments absent. 4-15 pairs of gills. All setae simple. Dorsal and ventral capillary setae. Spoonshaped hooks on both rami, with the exception of the anterior region.
325. Dodecaceria fistulicola Ehlers. (Fig. 169, \(h, i\); Fig. \(174, a, b)\).
Dodecaceria fistulicola, Ehlers, 1901, p. 186, pl. XXV, figs. 5-9: Fauvel, 1930, p. 549; 1985, p. 340.
Dodecaceria joubini, Gravier, 1906, p. 156, pl. I, figs. 183-184.
(?) Dodecaceria opulens, Gravier, 1909, p. 643, pl. 17, figs. 3945: Fauvel, 1930a, p. 44.

Body flattened posteriorly. Prostomium bluntly conical. Two stout grooved palps, 5 pairs of large gills and 2-5 other pairs, much more slender. Capillary setae. Large spoon-shaped hooks with a swelling at the back of the cavity which, seen in profile, looks like a blunt lateral tooth. Anterior and dorsal hooks more slender.

Length: 15-25 mm.
Colour: black coloured, or very dark brown.
Occurrence: Pamban, Gulf of Mannar.
Distribution: Coast of Chile, Australia, New Caledonia, Annam; India, Red Sea?.

Remarks: Dodecaceria fistulicola Ehlers, D) joubum Gravier and D. opulens Gravier are three very closely related species, and may be only varicties. Ehlers' denomination has priority.

\section*{Family CHAETOPTERIDAE Aud. and M.-Edw.}

Body soft, divided into two or three regions. Prostomium little conspicuous. Mouth terminal, no extiusible proboscis. Two or four tentacles (palps and tentacular cirri). Anterior region of a few uniramous segments; middle region, when present, with biramous highly specialised segments; posterior region of numerous biramous segments, all of them similar. Dorsal setae capillary or lanceolate. In the fourth setigerous segment peculiar stout spines. Ventral setae pectinate uncini. Tube horny, more or less ringed, translucent, or opaque parchmentlike.

\section*{Key to the genera of Chaetopteridae.}
1. One pair of tentacles Two pairs of tentacles. Tube cylindrical, horny, ringed

Phyllochactopterus Grube, p. 388.
2. Two or three median segments. A dorsal continuous ciliated groove. Notopodia all conical

Mesochaetopterus Potts, p. 842.
2
rots, p. ozk.

Five median segments. No con-
tinuous ciliated groove. Me-
dian notopodia fused to form
fans or suckers
.. Chactopterus
Cuvier, p. 337.

\section*{Genus CHAETOPTERUS Cuvier.}

Body of large size, thick, soft, divided into three distinct regions. Two small filiform palps (tentacles). Anterior region with uniramous fect and oar-shaped setac. Stout modified bristles on the 4th setigerous segment. Middle region of 5 biramous segments, the first with two aliform appendages, the next with dorsal rami cup-shaped and the others paddle-shaped. Ventral rami coalescent, bearing pectinate uncini. Posterior region with dorsal rami unilobed; vental rami bilobed, uncinigerous. Tube consisting of layers of parchment-like membranes.

32 6 . Chaetopterus variopedatus Renier. (Fig. 175, a \(n\) ). n) .

Chaetopterus tanoprdatus. Fausel, 1927a, p. 77, fig. 26, a-n (Synonymy); l992, p. 176: Patom, 1930, p. 76.
(hat topterus cautus. Marcmelled, 1879, p. 143, pl. VI, fig. 5.
Chactoptenus appendiculatus Gube, Willey, 1905, p. 291, pl. V, fig. 126.

Fig. 175.- Chaetopterus variopedatus (Renier): \(a, b\), dorsal and ventral view. reduced \(1 / 3\); \(c\). foot of the 8 rd thoracic segment: \(d\). last thoracic foot; \(e\), posterior foot (after Joyeux-Laffine); \(f\), capillary seta of the dorsal ramus of the first segment of the mid-body region (wings) \(\times 47\); \(g, h\), uncini \(\times 310\); \(i\), stout bristle from the 4 th segment \(\times 23\); \(k\), thoracic capillary bristle \(\times 60 ; l, m\). thoracic lancet-shaped setae \(\times 47 ; n\), acicular bristles from the posterior feet \(\times 23\).
F. 45

Chaetopterus longimanus, Crossland, 1904, p. 272, pl. XVIII, fig. 1-2.
Chaetopterus longipes, Crossland, 1904, p. 277, pl. XIX, fig. 1-2.

The specific characters are mainly those of the genus. It is very doubtful whether there is really more than one species, although many have been described, but the characters used to discriminate them are of very little value. Specimens exhibit a great deal of variation which is probably a result of frequent autotomy, followed by more or less complete regeneration; individual specimens also present an extensive range of variation, for instance, the characters given by Crossland as distinctive of C \(\mathrm{C} / \mathrm{h}\). longimanus are often met with in Ch. variopedatus from the Atlantic Occan and English Channel. Ch. Iongipes is only a young form of the same. The number and sice of the anterior segments vary to a very large extent, as also the length of the feet.

Length: \(150-250 \mathrm{~mm}\). by \(15-25 \mathrm{~mm}\).
Colour: in life, greenish-yellow or whitish-yellow. Median region partly black. Phosphorescent.

Occurrence: Mcrgui Archipelago; Ceylon; Maldive Archipelago.

Distribution: Pacific, Indian and Atlantic Oceans. Cosmopolitan.

\section*{Genus PHYLLOCHAETOPTERUS Grube.}

Body slender, divided into three regions. Two long tentacles (palps) and two small posterior tentacles. Anterior region with uniramous feet bearing oar-shaped setae. One or more large peculiar spines on the 4th setigerous segment. Middle region with a number of biramous feet, dorsal rami foliaceous, lateral branchial lobes, and ventral rami bilobed. Posterior region with biramous feet, dorsal rami cylindrical; ventral rami uncinigerous. Tube horny, translucent, cylindrical, more or less ring. ed. Schiziparous reproduction frequent.

Key to the species of Phyllochaetopterus.

> 1. Middle region of two segments .. Middle region of numerous seg. ments 2. Glandular cirri on the first seg. ment of the middle region..2
aciculigerus Crossland, p. 341.

No glandular cirri on the first segment of the middle region
herdmani Willey, p. 342.
3. A single spine on the 4th segment
socialis Claparède, p. 339.
Several spines on the 4th segment
4. Large size . - ..

Small size
327. Phyllochaetopterus socialis Claparède.
(Fig. 176, \(a-l\) ).
Phyllochaetopterus socintis, lauvel, 1927a, p. 84, fig. 30, a-l; 1932, p. 177.
Phyllochactopterus pictus, Crossland, 1903, p. 174, pl. XVI, figs. 5-9.
(方) Phyllorhaetopterus samosus, Willey, 1905, p. 293, pl. V, figs. 133-196.

Two cyes. Anterior region 10-18 and more segments. Middle region 5-28 segments. Posterior region, numerous segments. On the fourth setigerous segment a single large modified spine, obliquely truncate at the tip. Rami

Fig. 176.-Phyllochaetopterus socialis Claparede: a, dorsal view \(\times 4\); \(b\), head and first segments \(\times 8 ; c\), section of mid-body \(\times 20 ; d\), hind foot with lancet-shaped bristle \(\times 106\); e. f, g. lancet-shaped and knife-shaped bristles of the thoracic fcet \(\times 106 ; h \cdot i\), stout bristle from the 4 th setigerous segment \(\times 62,106 ; k\), uncinus \(\times 390 ; l\), tubes \(\times 2\).
of the posterior region with one, rarely two, lanceolate setae. Horny tubes ringed, simple or branched.

Length: \(20-40 \mathrm{~mm}\). by \(1-2 \mathrm{~mm}\).
Colour: yellowish, with brown-reddish spots on the anterior region and tentacles.

Occurrence: Chandipore, near Balasore, Orissa: Ceylon; Bombay; Arabian Sea, Maldive Archipelago, Gulf of Oman.

Distribution: Australia; Indian Occan; Atlantic Occan, Mediterranean Sea, Falkland Islands.
328. Phyllochaetopterus elioti Crossland. (Fig. 177. \(e-h)\).
Phyllochactopterus elioti, Crossland, 1903, p. 172, pl. XII, fis 1, 3, 8, pl. XVIII, fig. 10-13; Fauvel, 1930a, p. 41.

Fig. 177.-Phyllochaetopterus gardineri Crossland: a, anterior part, dorsal view \(\times 3 ; b\), section of a segment of the 2 nd region \(\times 3\); \(c\), short bristle from the 4 th setigerous segment \(\times 47\); \(d\), clavate dorsal foot from the posterior region \(\times 47\). Ph. elioti Cross-
land : \(e\), stout bristle from the 4th setigerous segment \(\times 66\);
\(f\), foot of the posterior region \(\times 66 ; \mathrm{g}\), head \(\times 6 ; h\), side view of the 9 rd segment of the middle region \(\times 6\) (after Crossland). Ph. herdmani willey: \(i\), anterior end; \(k\), a branchial segment; \(l\), stout bristle from the 4th foot; \(m\), modified seta from the 3 rd foot of an aberrant individual (after Willey).

Two eycs. Anterior region of about 14 segments; middle region \(20-25\) segments; posterior region numerous segments. On the fourth foot, 2-3 stout cylindrical setac which are not noticeably curved. A single lanceolate seta in posterior dorsal rami. Tubes straighter, larger, more opaque than those of \(P\). socialis Claparede, indistinctly annulated, more or less covered with sand grains.

Length: of tube \(120-920 \mathrm{~mm}\).
Colour: milk-white anteriorly, black posteriorly. Reddish spots restricted to the long palps.

Occurrence: Gulf of Mannar, Krusadai I land. Mix'd with tubes of Mesochactopterus and Axiothella.

Distibution: India, Zanzibar.
329. Phyllochaetopterus gardineri Ciossland. (Fig. 177, \(a-d)\).
Phyllochaetopterus gadineri, Crossland. 1904. p. 280, pl. XIX, figs \(3-7\).

Fwo cres. Anterior region of 15 segments; middle igion of 91 ; postrior, numerous segments. On the tourth setigerous segine nt 3 suong, straight, flattened, light hown setace. Dorsal ami of the posterior region with one st iated seta. Tubes straight, occurring singly (?), 2.5 mm. broad.

Occurrence: Dredged off Minikoi Atoll, Maldive Dichipelago.

Remarks: "This species is very closely related to Ph. elioti. It is readily sepatable, however, by its much larger size." (Crossland).
330. Phyllochaetopterus aciculigerus Crossland. (Fig. \(1 ; 8, b-d)\).
Phyllochactopterus actculigerus, Crossland. 1904, p. 978. pl. XVIII, figs. 3-7.

No eyes. Anterior region of 9 segments; middle region of only tu'o; posterior region, numerous segments. On the fourth setigetous segment 8 thickencd setae, of a brown colour, proximally strongly striated. The first segment of the median region bears glandular ridges and two glandular cirri anching over the back; the second segment lacks these glandular appendages. The dorsal rami of the posterior region are very small, conical, and contain about 9 long bent setae. Tube unknown.

Breadth: 7 mm .

Occurrence: Mamaduvari, South Mahlos Atoll, Maldive Archipelago. One specimen only.

Remarks: Closely allied to Ph. major Claparède.
331. Phyllochaetopterus herdmani Willey. (Fig. 177, \(i-m\) ).
Phyllochaetopterus herdmani, Willey, 1905, p. 292, pl. V, figs. 127-132.
Anterior region of \(9-10\) segments; middle region of only two segments; posterior region, \(40-50\). On the fourth setigerous segment 8-9 modified, flattened setae. The first segment of the middle region bears neither glandular ridges nor glandular cirri. The dorsal rami of the posterior region carry a bundle of 4 spatulate setae. Narrow cylindrical tubes incrusted with relatively coarse sand grains and hard fragments of all kinds, including Foraminifera.

Occurrence: Ceylon, Galle shore: under stones.
Remarks: Closely related to Ph. aciculigerus, the absence of a pair of glandular cirri on the first segment of the middle region being the chief difference.

\section*{Genus MESOCHAETOPTERUS Potts.}

A pair of long peristomial tentacles. Body divided into three regions, the anterior with 9-13 setigerous segments. In the fourth setigerous segment are several enlarged dorsal setac. In the median region, 2-3 elongated segments with continuous lateral borders and transverse ridges. Notopodia rather enlarged, conical and fleshy, with a groove running down the internal border; the neuropodia are simple in the first, double in the succeeding segment, or segments. In the posterior region, a large number of segments similar to those of Chaetopterus, but with much shorter notopodia. A dorsal ciliated groove runs from the mouth, along the median line, to the posterior end. In one or more of the median segments the lips are enlarged to form a fleshy organ.
332. Mesochaetopterus minutus Potts. (Fig. 178, a).

Mesochaetopterus minuta, Potts, 1914, p. 963, pl. II-III, figs. 78: Fauvel, 1930a, p. 41: Monro, 1928, p. 92; 1931, p. 25.
Spiochaetopterus spec., Gravely, 1927, p. 24.
" Very small, slender, living in tubes of a translucent, horny material, coated with coarse sand. Prostomium
large and conical. Peristomial collar well developed. Just external to the tentacles is a pair of cyes. The anterior region contains \(10-13\) segments, the median region is composed of two segments. The first pair of notopodia are small and clavate, the second pair are of the type

Fig. 178.-Mesochaetopterus minutus Potts: \(a\), dotsal view \(\times 13\) (after Potts). Phyllochartopterus aciculigerus Crossland; \(b\), mid-body together with adjoining segments \(\times 6 ; c\), stout bristle from the 4th foot \(\times 47\); \(d\), setae from the anterior region \(\times 47\) (after Crossland).
described for the genus. The ciliated groove expands into \(a\) cup in the middle of the second segment. The posterior region is composed of segments which are double anteriorly, simple posteriorly; cach notopodium has a single seta." (Potts)

Length: 20 mm . by 1 mm .

Occurrence: Gulf of Mannar, Krusadai Island, edge of South Lagoon.

Distribution: Torres Strait, Great Barrier Reef; India; Atlantic Ocean, Cape Verde Islands; Panama.

Family CHLORAEMIDAE Malmgren.
Flabelligériens Saint-Joseph.
All segments nearly alike, short, papillose. Prostomium and buccal segment in the form of a retractile tube, with eyes, two stout palps and slender, retractile branchial filaments. The setae of the first segments are generally very long, directed forwards and forming a more or less marked cephalic cage. Parapodia biramous, rami far apart, generally without distinct setigerous processes. Dorsal setae simple, capillary, annulated or articulated. Ventral setae sigmoid, or hooked, or compound with sickle-shaped end-piece.

Key to the genera of Chloraemidae.

\section*{Genus FLABELLIGERA Sars.}

Body soft, short, transparent, enclosed in a thick mucous roating, containing long pediculate papillae. Dorsal setac capillary. Compound ventral hooks.
333. Flabelligera diplochaitos Otto. (Fig. 185, g-o).

Flabolligera diplochaitor. Fanvel. 1927a. p. 114, fig. 40, g-o: Monro, 1937. p. 304.

Burcal siphon short, with two groups of \(40-50\) slender green gills and two stout palps. Cephalic cage form-
ed by the four fascicles of the long setae of the first setigerous segment pointing forwards. Dorsal setae very long and annulated. Ventral hooks compound or semicompound, with faintly curved terminal piece. In each foot 4-6 hooks accompanied by a bundle of short, straight capillary, included, setac.

Length: \(50-100 \mathrm{~mm}\). by 10 mm .
Colour: Semi-transparent; blood green.
Occurrence: Arabian Sea.
Distribution: Arabian Sca; Atlantic Ocean, Mediterrancan Sea.

\section*{Genus STYLARIOIDES Delle Chiaje.}

Body clongated, more or less cylindrical or clubshaped. coated with papillae. Two stout palps. Gills filitorm, often very numerous, all similar, inserted on a more or less long peduncle, retractile. A cephalic cage. Dorsal setae long, capillary, annulated. Ventral setac simple or rarely pscudo-compound; those beyond the first segments ending in a somewhat stout hook, sometimes bidentate. Acicular setae slender. Blood green.

Key to the Species of Stylarioides.

3. A kind of dorsal oval shield coatcd with sand
No such dorsal shield
parmatus Grube, p. 346.
1
4. Body slightly and gradually tapering posteriorly. Gills inserted on two flattened lobes bifidus fauvel, p. 349.
Body very slender and twisted in the posterior part. Gills inserted on a horse-shoe shaped membranaceous lobe .- bengalensis Fauvel, p. 347.
334. Stylarioides hamocarens Monro. (Fig. 179, a). Stylarinides hamocarens. Monro, 1937, p. 302, fig. 21.

Body dotted with small papillae incrusted with mud. A well developed cephalic cage formed by the first three setigerous segments which are provided with pedal lobes:
P. 46
these lobes are absent over the rest of the body. In the next segment dorsal and ventral setae of this same type, but considerably smaller, striated and ending in fine flagelliform tips. There is no trace of ventral hooks. Gills

Fig. 179.-Stylarioides hamocarens Monro: a, anterior iegion, fiom above (after Monro). Sty. parmatus Grube: b, dorsal view, with shield.
numerous, filiform, borne on two scparate, divergent, stout, membranous lobes, with their sides folded inwards. When unfolded, these lobes are more or less spoon-shaped in outline.

Length: 23 mm . by 3 mm .
Colour: in spirit, dark green in front, merging into yellow behind.

Occurrence: North Arabian Sea, 759-1024 m.
335. Stylarioides parmatus Grube. (Fig. 179, b).

Stylarioides parmatus, Grube, 1878, p. 199, pl. XI, fig. 1: Willey, 1905, p. 289, pl. VIII, fig. 5: Augener, 1926a, p. 180, fig. 5: Fauvel, 1930a, p. 42; 1932, p. 179.
Stylarioides iris, Michaelsen, 1892. p. 108, fig. 6,

Body much swollen anteriorly, abruptly tapering into a filiform tail, and bearing on the front part of the dorsum a kind of oval shield firmly coated with sand. Setae of the cephalic cage long, slender, iridescent, belonging to the 3 anterior segments. Skin papillac in circular rows.

Length: about 30 mm .
Occurrence: Madras; Ceylon.
Distribution: New Zealand; Philippine Islands; Madras, Ceylon, Madagascar.
396. Stylarioides eruca Claparède, var. indica Fauvel. (Fig. 170, \(h-l\) ).

Stylarioides eruca, Fauvel, 1927a, p. 119, fig. 42, h-l.. (Synonymy).
Stylarioides eruca, var. indica, Fauvel, 1928, p. 93, fig. 3, \(h-i\); 1930a, p. 42, fig. 10, \(h-l, 1932\), p. 180.

Body subtetragonal, thickly coated with sand, segments clearly marked. Skin-papillae small, short, not arranged in regular longitudinal rows. 3-4 longer papillae behind each bundle of setae. Branchiae numerous, filiform, inserted on a short peduncle, deciduous. Cephalic cage formed by the setac of the first three setigerous segments, long, slender, not irridescent, and pointing forwards. In the third segment, the vential setae are already bidentate, and shorter than the dorsal ones. In the following segments, the ventral setae vary in length but are all ringed, bent at the tip, with a long slender sub-rostral spinc.

Length: 60 mm . by \(3-4 \mathrm{~mm}\). About 70 segments.
Occurrence: Nankauri Habbour (amongst corals); Gulf of Mannar, Krusadai Island.

Distribution: Indian Ocean (typical form: Atlantic Ocean, Mediterranean Sea).

Remarks: This variety differs from the type in having (1) shorter adhesive papillae, less numerous and less regularly arranged and (2) longer and more slender upper ventral setae.
397. Stylarioides bengalensis Fauvel. (Fig. 180, \(a-f\) ).

Styla ioides bengalensts, Fauvel, 1932, p. 180, fig. 30, a-f.
Anterior part of the body cylindrical or club-shaped; posterior part abruptly tapering into a filiform coiled tail. Segments numerous and hardly distinct. Body covered with small globular papillae which do not firmly
retain the sand. Buccal tube very long and protrusible, cylindrical, frilled at the edge. Branchiae slender, filiform, very numerous, set in several rows on a membranous horse-shoe shaped branchial lobe with edges rolled as in Serpulids. Two canaliculate palps with sinuous cdges. Mouth opening trilobed, the two ventral lobes larger than

Fig. 180.-Stylarioides bengalensis Fauvel: \(a, b\), base and tip of a dorsal seta \(\times 380\); c, part of a bristle of the cephalic cage \(\times 380\) : \(d\), ventral ramus \(\times 4.5\); e, ventral hook \(\times 120\); \(f\), skin-papillae \(\times 150\).
the dorsal. Cephalic cage formed by the setae of the first three setigerous segments arranged in three close-set concentric circles. The setigerous lobes of the third foot are more protruding and less far apart. These bristles, 3 to 5 in each bundle, are very long and stout, ringed and beautifully iridescent. On the next three segments, very small and slender dorsal capillary setae and a few fine ventral capillaries. On the following segments sigmoid ventral hooks.

Length: about 60 mm . by \(6-7 \mathrm{~mm}\).

Colour: in spirit, whitish-grey under the thin coating of fine reddish ooze adhering to the skin-papillae.

Occurrence: Sandheads, River Hughli; Madras Coast.
338. Stylarioides bifidus Fauvel. (Figs. 181, \(a, b ; 182\), \(a-c\) ).
Stylarioider bifidus, Fauvel, 1932, p. 182, fig. 31, pl. VII, figs. 1516.

Body gradually tapering backwards, segments clearly marked. Skin-papillac rather short and well apart, cylindrical in the anterior region, nearly globular in the hinder part. The body is not coated with sand but with

Fig. 181-Stylarioides bifidus Fauvel: a. anteior end. doral view,
\(\times 6\); b. branchial appatatus protruded (semishematic). (From Faurl 1982.)
fine ochraccous ooze. Buccal siphon ovate, with a delicate frilled membrane at the base; mouth small, with two short, canaliculate, puckered palps behind. Gills very small, slender, very numerous, inserted on two flattened, elongated, diverging lobes, free from the base and without any connecting membranes. Cephalic cage formed mainly by the first three setigerous segments and partly by the two succeeding ones. The bristles of the cephalic
cage are long slender, articulate, hardly iridescent and few in the first three segments, in which the feet are stout, protruding and directed forwards. Both rami are close together, the ventral one slightly behind the other. The dorsal setae of the following \(10-12\) segments are long, capillary, ringed, directed forwards, gradually decreasing in length; the ventral setae are shorter and fewer and

Fig. 182.-Stylarioides bifidus Fauvel : a, ventral hook \(\times 6.7\); b, part of a dorsal seta \(\times 150 ; c\), naked papillae \(\times 65 ; d\), large ooze coated papilla \(\times 65 ; e\), smaller coated papillae \(\times 65\).
some still exist with the ventral hooks which appear farther back and are only well marked in the posterior region. They are yellow, sigmoid, ringed, with a blunt tip and are about 5-6 in each ventral ramus.

Length: \(\quad 70-80 \mathrm{~mm}\). by \(4.5-5 \mathrm{~mm}\).
Colour: in spirit, greyish-white, with small, sparsc, orange-coloured tubercles.

Occurrence: Travancore Coast; Arabian Sea, 300-555 fms.

Genus BRADA Stimpson.
Skin papillae. The setae of the anterior segments do not form a marked cephalic cage. Two stout palps. Cirriform branchiac in two clusters, retractile into the mouth. Dorsal ringed capillary setae; stouter simple ventral bristles. One pair of ncphridial papillac protruding on one of the anterior segments.

Key to the species of Brada.
1. Body long and slender. Skin papillae small and not sandretaining
Body shorter, Large skin papillae setaining sand grains .. mammillata Grube, p, 352.
339. Brada talehsapensis Fauvel. (Fig. 183, a-d).

Bhada talehsapenws, Fauvel, 1932. p. 161, fig. 32, pl. VII, fig. 17.
Body long, cylindrical, neally of the same breadth throughout, abruptly truncated at both ends, with a small rounded knob in front. About 45-60 segments. Few

Fig. 183.-Brada talehsapensis Fauvel : a, ventral hook \(\times 150\); \(b\), part of a dorsal seta \(\times 150 ; c\), papillae \(\times 150\); \(d\), anterior end, dorsal view, \(\times 12\).
small skin-papillae, cylindrical, enlarged at the tip. On the ventral side of the 5th setigerous segment one pair of small, short, rounded nephridial papillac. Bristles of the first setigerous segment directed forwards, but few, slender, articulate, not iridescent. From the 2nd setigerous segment backwards, dorsal bristles shorter, bent, ringed, about \(4-6\) in each ramus. Ventral rami close to the dorsal ones. Ventral setae, 5-6 yellow curved hooks, with a slightly bent, smooth, translucent tip.

Length: about \(27-38 \mathrm{~mm}\). by 2 mm .
Colour: in spirit, greyish-white, with a coating of fine rusty, reddish ooze.

Occurrence: Talèh-Sap, Gulf of Siam.
340. Brada mammillata Grube.

Brada mammillata, Grube, \(187 \%\) p. 541: McIntohh. 188\%, p. 370. pl. XLIII, fig. 11, pl. XXIIIA, fig. 7-8. Nhless. 1897, p. 109 : Fauvel, 1932, p. 185.
Body gradually and faintly tapering backwards. Do1sal skin-papillae large, rounded, disposed in rows far apart, sand-retaining. Ventral papillae very small. On the ventral side of the 5th setigerous segment a pair of small conical nephridial papillac. Bristles of the finst setigerous segment slender and directed forwards; they do not form a cephalic cage and are not iridescent. On the succeeding segments dorsal setae shorter. Ventral curved hooks from the 2nd setigerous segment, inserted on a round lobe encircled with long cylindrical papillae. Two short, stout, frilled palps. Gills numerous, slender, borne on two semi-circular pads.

Length: \(40-50 \mathrm{~mm}\). by 5 mm .
Occurrence: Arabian Sea, 555 [ms.
Distribution: Patagonia; Kerguclen Island; Arabian Sea.

Remarks: Brada villosa (Rathke), a species smaller but very like Br . mammillata, has been reported from the Arabian Coasts (Fig. 184, e-l).

\section*{Genus DIPLOCIRRUS Haase.}

Body elongated or club-shaped, covered with sandretaining papillae. Two palps. Branchiae of two kinds (1) filiform, (2) enlarged. Setae of the first setigerous segments longer than the others, directed forwards and forming a cephalic cage. Dorsal and ventral setac capillary, ringed.
341. Diplocirrus glaucus (Malmgren). (Fig. 181, \(a-d\) ).

Diplocirrus glaucus, Haase, 1914, p. 195, fig. 3-5: Fauvel, 1997a, p. 120, fig. 48, \(a-d\); 1932, p. 186.

Trophonia glauca, Malmgren, 1867, p. 192, pl. XIV, fig. 78.
Body swollen anteriorly, moniliform posteriorly. Skin-papillac small, clongated, sparsely disposed. Buccal siphon long, protrusible, with four broad flat branchiae inserted on the anterior border and four slender cirriform branchiac. Four eycs. Two long flattened palps. Setac of the lst setigerous segment tew, very slender,

Fig. 184.-Diplocirrus glatucus (Matugien): a. (after Malmgren): \(b\), anterior pat, gills extruded, dorsal wew after Haase) : \(c\). bristle \(\times 120 ;\) d, base of a bistle \(\times 320\). lbada willosa (Rathke: e sude view \(\times 5 ; f\), papillae \(\times 48 ; g\). three segments and nephidial papilla \(\times 10 ; h\), foot encrusted with sand \(\times 48 ; i\), part of a dorsal bristle \(\times 320\); \(k\), ventral bristle \(\times 120\); l, tip of a ventral bristle in good condition, unbroken.
pointing forwards. On the 2 nd setigerous segment they are shorter and decrease rapidly on the following ones, the rami of which are well apart. Ventral setae shorter than the dorsal, more curved, with longer articles. There are no hooks.

Length: \(20-25 \mathrm{~mm}\). by 2 mm .
Occurrence: Mergui, 5 fms .
F. 47

Distribution: Mergui Archipelago; North Atlantic Ocean.

Remarks: Though the retracted branchiae could not be observed in the Mergui specimen, it may, somewhat doubtfully, be attributed to Diplocirrus glaucus by the appearance of the setae.

\section*{Incertae sedis}

\section*{342. Ilyphagus hirsutus Monro.}

Ilyphagus hirsutus, Monro, 1937, p. 304, fig. 22.
The description of this " sac-like creature, shaped like an Echiurus, with a dense uniform, fur-like covering of long cirriform papillae" is really too scanty to fix its place. By its setae, it appears to belong to the Chloraemidae. One might wonder whether it be not a bad specimen of Buskiella abyssorum McIntosh ?

Length: 39 mm . by 14 mm .
Occurrence: Arabian Sea, 3385 m .

Family SCALIBREGMIDAE Malmgren.
Body club-shaped, or short fusiform. Prostomium small, bilobed, or with frontal peaks. Sometimes eyes in clusters. Two nuchal grooves. Peristomium achactous. Proboscis soft, unarmed. Skin generally tessellated or corrugated. Segments subdivided into annuli. Dorsal and ventral rami each bearing setac of two kinds, viz. simple capillary setae and furcate setae, sometimes also acicular setae. Gills, when present, limited to a few anterior segments.

Key to the genera of Scalibregmidae.
1. Acicular setae on the first segments .. .. Parasclerocheilus Fauvel, p. 355.
Acicular setae absent .. Scalibregma Rathke, p. 354.

\section*{Genus SCALIBREGMA Rathke.}

Body arenicoliform. Prostomium T-shaped, with two elongated frontal peaks. Gills present on the anterior segments. Parapodia prominent, flattened. Dorsal and ventral cirri, Acicular setae absent.
343. Scalibregma inflatum Rathke. (Fig. 185, \(a-f\) ).

Scalibregma inflatum, Ashworth, 1901, p. 237, pls. XII-XV: Fauvel, 1927a, p. 123, fig. 44, a-f; 1932, p. 186: Moore, 1923, p. 217.

Four pairs of gills on the setigerous segments 2-5. Four anal cirri. Finger-shaped dorsal and ventral cirri

Fig. 185.-Scalibregma inflatum Rathke: \(a\), dorsal view \(\times 5 ; b\), head; c. 35th foot \(\times 12\); \(d\), first branchiferous foot \(\times 10\); \(e\), capillary bristle \(\times 480\); \(f\), forked scta \(\times 480\). Flabelligera diplochaitos (Otto): g.h. compound bristles \(\times 120 ; i, k\), club-shaped papillae \(\times 120 ; l\), elongate papillae \(\times 120 ; m\), ventral bristle \(\times 120\); \(n, o\), tip and base of a dorsal annulate bristle \(\times 120\).
from the 16 th -18 th segments backwards. Lateral ciliate organ between the rami. Acicular setae absent.

Length: \(10-60 \mathrm{~mm}\). by \(2-10 \mathrm{~mm}\).
Colour: in life vermilion-red, spotted with yellow.
Occurrence: Gulf of Oman; 609 fms.

\section*{Genus PARASCLEROCHEILUS Fauvel.}

Body fusiform, elongated. Prostomium T-shaped, with two long frontal peaks and eye-spots. Nuchal organs protractile. Peristomium achactous. Proboscis unarmed. Anterior segments divided into superficial rings. A few anterior segments bearing branchiae. Dorsal and ventral rami reduced to stout rounded processes. Dorsal cirri absent \(A\) cirrus-like process above the ventral ramus in
the posterior region. Lateral organs. Acicular setae in the dorsal ramus of the first setigerous segments. Forked setae in the following segments. Anal cirri finger-like.
344. Parasclerocheilus branchiatus Fauvel. (Fig. 186, \(a-k\) ).
Parasclerocheilus branchiatus. Fauvel. 1928, p. 159, fig. 1, a-k, 1930a, p. 44, fig. 11; 1932, p. 188.

Body rather long, nearly uniform in breadth, slowly tapering backwards, rectangular in section, with a more or less marked ventral groove. Prostomium globular, with two diverging, thick, tentacle-like processes. Four red pigmented plates, linear, arched, converging (eye-spots).

Fig. 186.-Parasclerocheilus branciialus Fanvel: a, anterior wgion, proboscis extruded, dorsal view \(\times 6 ; b\), pygidium \(\times 8 ; c\), dorsal foot \(\times 24 ; d\), 10th foot \(\times 24 ; e, 40\) th foot \(\times 24\); \(f\), hook from the 2nd segment \(\times 240 ; \mathrm{g}\), tip of a lower hook \(\times 520 ; h\), tip of an upper hook \(\times 320 ; i\), curved seta from the 2 nd setigerous segment \(\times 240 ; k\), forked seta \(\times 320\).

Two protractile cushion-shaped nuchal organs. Peristomium achaetous. Proboscis huge, campanulate. Segments divided into four rings, nearly smooth on the ventral side, rough and corrugated on the dorsal. In the first four setigerous segments, the dorsal ramus carries, in front of a bundle of long capillary setae, large curved acicular setae with a hook at the tip. Of the other dorsal and ventral setae some are capillary, slender and smooth,
while the others are shorter and slightly bent. In the succeeding segments, the dorsal and ventral rami are similar, and in the lorm of thick rounded processes, without cirri, and each bearing a bundle of capillary setae and shorter, forked, setac with limbs unequal and ciliated on the inner edge. From the 29th setigerous segment to the last one a short slender finger-like process is inserted aboue the ventral ramus. In the last segments this process reaches onc-fourth or one-third of the breadth of the body. A lateral organ lies between the two rami. There are six pains of branchiae from the 2 nd to the 7 th setigerous xement, arborescent, densely ramified as in Scalibregma. The first pain, the smallest, has \(6-7\) filaments, the four last ones are sub-equal and much larger. They are inserted behind the donsal setae. Pygidium short, with broad terminal vent and 6 anal cirri: 1 dorsal, 1 ventral and 2 on cach side.

Length: 35 mm . by 3 mm .
Colour: Discoloured in alcohol, with the exception of the reddish-carmine eyc-spots.

Occurrence: Mergui Archipelago, Paway Island; Gulf of Mannar, Krusadai Island.

Distribution: India, Gulf of Oman.
Incertae sedis
345. Oncoscolex microchaetus Schmarda, 1861, p. 56. Trincomalee.

\section*{Family OPHELIIDAE Grube.}

Body rather short, dorsum arched, ventral side flat, or with a longitudinal groove. Prostomium conical, destitute of appendages. Cephalic eye-spots hidden under the skin. Often lateral eye-spots on the segments. Sigments mote or less clearly subdivided into annuli. Pioboscis unarmed. Nuchal organs protrusible. Gills ciniform (very ramely branched) or absent. Feet biramoas, often reduced to dorsal and ventral bundles of capillary setac. Dorsal cirri absent. Sometimes a few ventral cirri. Lateral sense-organ between the parapodial rami. Pygidium bearing papillae, and often an anal funnel.

Key to the genera of Ophelimar.

\section*{Genus ARMANDIA Filippi.}

Body elongated, not divided into distinct regions, a deep median and two lateral ventral grooves. Prostomium conical. Eyes on the brain under the skin. Segments divided into annuli. Cirriform gills all along the body from the 2nd setigerous segment. Parapodia with only two bundles of capillary setae. A small ventral cirrus. Anal funnel fringed with papillae, and a median cirrus. Lateral eye-spots on many segments.

\section*{346. Armandia ianceolata Willey.}

Armandia lanceolata, Willey, 1905, p. 288, pl. V, fig. 120; Augener, 1914, p. 33; 1926, p. 462: Fauvel, 1930b, p. 547; 1932, p. 189.

29 (occasionally 50 ) setigerous segments. Gills from the 2 nd setigerous segment, absent on the last 3 segments. Generally 11-12 pairs of eye-spots beginning about the 7th setigerous segment. Anal funnel compressed, short, fringed with 12-20 small papillae. A median anal cirrus.

Length: 20-35 mm. by 2-3 mm.
Colour: whitish.
Occurrence: Mergui Archipelago; Ceylon; Pamban.
Distribution: Australia, New Caledonia, Indo-China; India, Persian Gulf.

\section*{347. Armandia leptocirris Grube.}

33 to 38 setigerous segments. Gills from the 2 nd setigerous segment to the last one. \(10-12\) pairs of lateral eyes from about the 7th setigerous segment. Anal funnel long, compressed, slantingly cleft, fringed with long papillae. A long median anal cirrus.
L.ength: \(15-30 \mathrm{~mm}\).

Colour: Decoloured in spirit.
Occurrence: Andaman Islands: Gulf of Mannar; Krusadai Lagoon, burrowing in sand.

Distribution: New Caledonia, Philippine Islands, Indo-China; Andaman Islands, Gulf of Mannar, Persian Gulf, Red Sca.

\section*{Genus AMMOTRYPANE Rathke.}

Body vermitorm, not divided into distinct regions. A deep ventral groove all along the ventral side and two lateral ridges. Prostomium conical. Cephalic eyes hidden under the skin. No lateral eyes. Segments divided into annuli. Cirriform gills from the 2 nd setigerous segment nearly to the end. Parapodia with short setigerous lobes and two bundles of simple setae. A small ventral cirrus. Anal funnel with papillac and anal cirrus.
348. Ammotrypane aulogaster Rathke. (Fig. 187, a-e).

Ammotypane aulogaster, Fausel, 1927a. p. 133, fig. 47, a-e; 1932, p. 190: Hoagland. 1920, p. 625.
Prostomium conical, ending in a filiform clavate tip. Gills absent only on the last 3-4 segments. Ventral cirri small, conical. Anal funnel spoon-shaped, with a large ventral opening fringed with small papillae. Two large ventral papillae and a median anal cirrus with a long cirrostyle borne on a cylindrical cirrophore.

Length: about 50 mm . by \(3 \mathrm{~mm} . \quad 60-68\) segments. Colour: pearl-grey. Gills red.
Occurrence: Orissa Coast; Madras, Ennur Backwater; Persian Gulf.

Distribution: Philippine Islands; India, Persian Gulf; Atlantic Ocean, Arctic Seas.

\section*{Genus POLYOPHTHALMUS Quatrefages.}

A longitudinal ventral groove. Prostomium short. Cephalic and lateral eye-spots. Nuchal organs protrusible. Gills and ventral cirri absent. Biramous parapodia with capillary simple setae. Anal funnel fringed with papillae.
349. Polyophthalmus pictus Dujardin. (Fig. 187, l-o). Polyophthalmus pictus, Fauvel, 1927a, p. 137, fig. 48. 1-n; 1930b, p. 546; 1932, p. 191.

Polyophthalmus setosus, Michaelsen. 1892, p. 16, fig. I4.
Polyophthalmus australss Grube, Willey, 1905, p. 289.
\(27-28\) setigerous segments. There are no prominent setigerous lobes. Only a single bundle of capillary setac

Fig. 187.-Ammotryfane aulogaster Rathke: a, side view \(\times 2 ; b\), amerior part \(\times 8\); \(c\), anal tube, ventral view, median cirrus lost \(\times 5\); \(d\), posterior part with anal tube, side view sib; foot from mudbody \(\times 8\). Polyophthalmus fictus (Dujardin): 1 , side view \(\times 5\); \(m\), head, nuchal otgans everted \(\times 10\); \(n\), postetior part with anal tube \(\times 10\); o, several kinds of dorsal patenns.
in each foot, except in the last ones. Nephridial pores on segments \(8-11\).

Length: \(10-25 \mathrm{~mm}\). by \(1-2 \mathrm{~mm}\).
Colour: extremely variable, brown spots or streaks, more or less conspicuous and arranged in several different dorsal patterns; this has caused it to be described under
many names which are really synonymous. The \(P\). longisetosus Michaelsen, found pelagic at Ceylon, is only the epitocous swimming form, with long bristles, which swarms on the surface when mature.

Occurrence: Gulf of Mannar, Ceylon, Pamban, Kilakarai; Maldive Archipelago, Fehendu.

Distribution: Pacific, Indian and Atlantic Oceans, Mediterrancan Sca. Cosmopolitan.

\section*{Genus TRAVISIA Johnston.}

Body divided into two distinct regions, an anterior enlarged and a posterior narrow, square in section. There is no marked ventral groove. Prostomium small, conical. Two nuchal organs. Proboscis unarmed, soft, globular, more or less lobed. Segments divided into annuli. Branchiac from the 2nd setigerous segment, cirriform, or very rarely branched. Dorsal and ventral rami reduced to a bundle of capillary setae. In the posterior region, huge lateral fleshy processes. Ventral cirri absent. A lateral sense organ between the rami. Pygidium, a rounded lobe. 350. Travisia arborifera Fauvel. (Fig. 188, a-f).

Travisia arborifcra, Fauvel, 1932, p. 191, fig. 33, a-f.

Fig. 188.-Travisia arborifera Fauvel: a, posterior foot \(\times 65\); b, posterior gill \(\times 65 ; c\), gill from mid-body \(\times 85\); \(d\), part of a gill \(\times 85 ; e\), polygonal glandular areas of the tegument \(\times 75 ; f\), part of a seta \(\times \mathbf{3 5 0}\).

Body short, plump, spindle-shaped. 36 setigerous segments subdivided into annuli. Posterior segments imbricated, square in section. Skin divided into polygonal glandular areas. Prostomium rounded, ending in a small conical tip. Two small nuchal organs. Gills branched, beginning on the 2nd setigerous segment and missing only on the last \(6-7\) segments. Dorsal and ventral rami far apart and each reduced to a bundle of simple, sinooth, or very finely barbed capillary setae inserted in a pit. A small triangular fleshy lamella in front of the gills; a similar, slightly larger, lamella in the ventral ramus. In the posterior part of the body these lamellac are larger. A lateral pit-like sense organ between the rami, conspicuous even on the first setigerous segment. Nephridial pores from the 3rd to the 14th setigerous segment. Pygidium ending in a knob with \(6-8\) short cirri. Vent terminal.

Length: \(10-38 \mathrm{~mm}\). by \(3-10 \mathrm{~mm}\).
Occurrence: Andaman Sea, 53 fms.: off Puri, Orissa, 4-4 \(\frac{1}{2}\) fms.

Family CAPITELLIDAE Grube.
Body divided into a thorax and an abdomen. Prostomium conical, without appendages. Proboscis unarmed, papillose. Peristomium achactous. Branchiae simple, compound, or absent altogether. Parapodia biramus. Dorsal and ventral cirri absent. Capillary setae and hooks borne on uncinigerous tori. Lateral sense-orgars.

Key to the genera of Capitellidae.

A broad, round, anal plate without acicular bristles, two long anal cirri .. ..
5. Eleven thoracic sctigerous segments

(?) Notomastus zeylanicus, Willey, 1905, p. 287. pl. V', figs. 118119.

Thorax tessellated, segments bi-annular. Peristomium bi-annular, achaetous. First dorsal tori close to each other, coalescent; farther back they are well apart. Gills rudimentary and are represented by lateral processes of the

Fig. 189.-Notomastus latericeus Sars: a, anterior part \(\times 3 ; b\), prostomium ; \(c\), anterior abdominal segment, with a pair of large genital pores behind the dorsal tori ; \(d\), section of the anterior patt of the abdominal region; \(e\), section of the posterior region; \(f\). capillary bristle \(\times 120 ; g, h\), hooks, dorsal and side view. \(>360\). Clymene santanderensis Rioja: \(a^{\prime}\), head, side view /3; \(b\) '. head from above \(\times 9 ; c^{\prime}\), anal funnel \(\times 5\); \(d^{\prime}\), vential hook \(\times 120 ; e^{\prime}\), acicular hook from the first setigerous seg. ment \(\times 96 ; f^{\prime}\), capillary bristle \(\times 96 ; g^{\prime \prime}\), winged bristle \(\times 96 ; h^{\prime}\), pinnate bristle (after Rioja).
dorsal ridges and of the upper end of the ventral tori. Genital pores from the 2nd abdominal segment. Very brittle in the posterior part.

Length: \(150-300 \mathrm{~mm}\). by \(3-5 \mathrm{~mm}\).
Colour: in life, bright red anteriorly.
Occurrence: Andaman Islands; Bay of Bengal; Ceylon; Gulf of Oman.

Distribution: Magellan, Chile; Bay of Bengal, Gulf of Oman; Atlantic Ocean; Mediterranean Sea, Falkland Islands.
352. Notomastus giganteus Moore.

Notomastus giganteus, Moore, 1906, p. 227, pl. XI, figs. 24-25: Fauvel. 1932, p. 194.
Dasybranchus giganteus, Moore, 1909, p. 279, pl. IX, fig. 57.
Body of large size. Prostomium rounded, with a small conical tip. Without eyes. Thoracic segments biannulate and partly tessellated. Eleven segments with capillary dorsal and ventral setae. First abdominal dorsal toil very small, connected across the dorsum by a low tansverse fold: posterionly they become obsolete. First abdominal ventral tori ending in a sharp upper process which decreases in size farther back. Gills retractile and usually obscured anteriorly; on the middle and abdominal segments they become conspicuous bushy tufts, composed of numerous (about 20-30) filaments arising from the posterior end of the dorsal tori, or posteriorly, when the tori become obsolete, replacing them. A pair of large genital pores on the first 9 abdominal segments.

Length: 140 mm . and more, by 7 mm .
Occurrence: Off Puri, Orissa, 4-4 \(\frac{1}{2}\) fms.; N. E. of Ceylon, 200-350 fms.

Distribution: North Pacific Ocean, Gulf of Georgia, San Diego, California; India, Ceylon.

\section*{Genus DASYBRANCHUS Grube.}

Thorax with thirteen setigerous segments bearing only capillary setae. Abdomen with only hooks inserted on dorsal and ventral tori. Retractile gills inserted at the upper end of the abdominal tori.
353. Dasybranchus caducus Grubc. (Fig. 190, \(a-h\) ).

Dasybranchus caducus, Eisig, 1887, p. 823, pl. XVII-XXIII: Fauvel, 1927a, p. 148, fig. \(a-h\) : Monro, 1937, p. 305.
Dasybranchus cirratus, Grube, 1867, p. 28, pl. III, fig. 4.
Prostomium small, conical. Peristomium long, achaetous. Compound gills, with numerous simple filaments, from about the 20th abdominal segment. Body tough. Genital pores from the last thoracic segment.

Length: \(250-300 \mathrm{~mm}\). by \(10-15 \mathrm{~mm}\).
Colour: in life thorax blood red, abdomen yellowish. Gills red.

Occurrence: Burma, off Akyab; Andaman Islands; Gulf of Mannar; Maldive Archipelago.

Distribution: Pacific, Indian and Atlantic Oceans.

Fig. 190.-Dasybranchus caducus Grube : n, anterior part, natural size : \(b\), postomium, side view ; \(c\), posterior end; \(d\), segments of the middle region of the abdomen, from above downwards, dorsal tori, lateral knobbed-organ, branchial vesicles, compound gills, ventral tori; nephridiopores between the gills; \(c\), last thoracic scgments and first abdominal ones, side view ; \(f\), thoracic bristle ; \(g\), \(h\), hooks, front and side view. D. gajolac Eisig: \(i\), prostomium ; \(k\), compound gill; \(l\), parapodial gland ; \(m, n\), hooks (after Eisig).

\section*{Genus HETEROMASTUS Eisig.}

Thorax with eleven setigerous segments, the first five with only capillary setae, the next six with long stalked hooks. Abdomen with only shorter hooks inserted on tori. Posterior segments campanulate, or strobiliform. The parapodial gills are but an extension of the ventral tori. A median anal cirrus.
354. Heteromastus similis Southern. (Fig. 191, \(a-d\) ).

Heteromastus similis, Southern, 1921, p. 640, pl. XXIX, fig. 3:
Fauvel, 1930a, p. 46; 1932, p. 195.
Heteromastus sp., Gravely, 1927, p. 26.

Prostomium conical, pear-shaped. Peristomium long, achaetous. Body long, slender, swollen at the anterior end, tapering gradually to the tail. The first abdominal segments are not conspicuously elongated. Lateral lobes absent in the posterior moniliform segments.

Fig. 191.-Heteromastus similis Southern : a, anterior end, side view \(\times 12 ; b\), posterior end, side view \(\times 36 ; c, 180\) th segment, dorsal view \(\times 36 ; d\), ventral hook from the 86 th segment \(\times 420\). Baiantolla sculpta Southern: \(r\). dorsal view of segments \(115-118 \times 25\); \(f\), lateral view of gills and dorsal lobes in the posterior segments
\(\times 636\); g, tip of a dorsal hook from the 7 th foot \(\times 553\). Mastobranchus indicus Southern. h, tip of a long hook from the ventral division of the 11th foot \(\times 713\); \(i\), tip of the dorsal hook from the 14 th foot \(\times 713\) (after Southern).

Length: 215 mm . and more by \(1.5-1.8 \mathrm{~mm}\).
Remark: Hardly distinct from, and, probably synonymous with, \(H\). filiformis Claparède.

Occurrence: Taléh-Sap, Gulf of Siam; Chilka Lake; Vizagapatam; Kutikal, Gulf of Manner.

\section*{Genus HETEROMASTIDES Augener.}

Thorax with 12-13 setigerous segments with capillary setae on both rami: abdomen with hooks. There are no gills. An anal plate with two cirri.
355. Heteromastides bifidus Augener. (Fig. 192, \(a-b\) ).

Heteromastides bifidus, Augener, 1914, p. 64, fig. 8, pl. 1, fig. 11: Fauvel, 1930a, p. 47, fig. 12.

Prostomium bluntly finger-shaped. Two lateral clusters of small eye-spots. Abdominal segments more or less moniliform. The 4-5 penultimate segments are provided with a small triangular process pointing backwards, the

Fig. 192.-Heteromastus bifidus Augener: a, anterior region, side view \(\times 40 ; b\), posterior region and pygidium \(\times 40\).
last carries, on each side, a small globular swelling. A broad, round, anal plate, slightly slanting, bearing two long finger-shaped diverging cirri.

Length: 10 mm . by 0.8 mm .: upwards of 70 segments.
Occurrence: Gulf of Mannar, Krusadai Island.
Distribution: Australia; India.

\section*{Genus PARAHETEROMASTUS Monro.}
"Thoracic region of twelve segments of which eleven are setigerous. Of these eleven, the first four carry bordered capillary bristles only, and the remaining seven only hooks with narrow stems and long guards. The abdomen carries only hooks, different from those of the thorax. There is no tessellation of the thorax. In the abdominal region, there is little development of the parapodial tori and no branchiae are present. The pygidium has a single rather short cirrus." (Monro)
356. Paraheteromastus tenuis Monro. (Fig. 194, \(c-f\) ).

Paraheteromastus tenuis, Monro, 1937, p. 536, fig. 2b.
The body swells out in the anterior thoracic region. Division between thorax and abdomen not conspicuous. Prostomium short, conical, without eyes. The first 4 setigerous segments carry only short, widely bordered capillary bristles. The remaining 7 thoracic segments carry only rather large hooks with narrow stems and long guards. The abdominal hooks are smaller than the thoracic and have a subterminal enlargement and shorter and more rounded guards.

The body in the long abdominal region is externally almost as featureless and homogeneous as that of an Oligochacte. The parapodial ridges are very little developed. In the hindmost part they are represented by a slight swelling of the segments in the dorso-lateral and ventro-lateral regions. There are no branchiae and the hinder abdominal segments are not campanulate. A short pygidial cirrus.
I.englh: 50 mm . by 0.5 mm .140 segments.

Colouless, in spirit.
Occurrence: Maungmagan, Burma.

\section*{Genus MASTOBRANCHUS Eisig.}

Thorax of eleven setigerous segments with only dorsal and ventral capillary setae. Abdomen with capillary setae and hooks on the dorsal ramus and hooks only on the ventral ramus. Thotacic feet claviform. Anterior abdominal segments long, cylindrical, the posterior ones strobiliform or campanulate. Parapodial gills simple, next compound and retractile.
357. Mastobranchus indieus Southern. (Fig. 191, h, i).

Mastobranchus indicus, Southern, 1921, p. 645. pl. XXX, fig. 25.
Prostomium small, rounded. No eyes. Skin of the anterior region tessellated. Lateral organs not very distinct. 4 pairs of genital pores behind the segments 8-11. Tori in segments 2-4 very short, longer on the subsequent segments. The right ventral bundles of the llth foot contain two very elongate hooks. The dorsal bundles on 13th and 14th segments contain only capillary setae, the ventral bundles only hooks, that are much larger and shorter than those of the right llth foot. In the dorsal bundle of the 15 th segment there are only hooks.

Length: 46 mm . by 3 mm . Only an imperfect specimen with 90 segments. Gills and posterior part unknown.

Occurrence: Barantolla, near Calcutta; from brackish pools, salt lakes.

\section*{Genus BARANTOLLA Southern.}
" Capitellidae having 12 thoracic segments, of which the first is achactous. Segments \(2-7\) have only capillary setae, segments \(8-12\) only elongate crochets. The abdominal segments have short crochets only. The anterior thoracic segments have reticulate markings on the skin, and the sculpture of the thoracic segments is rather elaborate. Branchiae in the form of short finger-shaped lobes behind the dorsal setae of the middle and posterior seg. ments. These segments are provided each with a membranous collar, produced into four shallow parapodial lobes." (Southern)
358. Barantolla sculpta Southern. (Fig. 191, e-g).

Barantolla sculpta, Southern, 1921, p. 643, pl. XIX, fig. 24: Fauvel, 1932, p. 196.
Body widest near 4th-5th segment, very gradually tapering backwards. Prostomium two-ridged, without eyes. Proboscis covered with minute papillae. First four segments tessellated. Capillary setae with narrow wings. In segments \(8-12\) only long hooks resembling those of Heteromastus, ending in a strong tooth with 5-6 slender spines on the crest and a long hood. Abdominal crochets much smaller. Gills begin about 55 th-60th-70th seg. ments; they lie under the dorsal parapodial lobes, each consisting of 3-4 short rounded lobes hidden by the parapodial lobes: the larger possess up to \(9-11\) fingershaped lobes. A median anal cirrus.

Length: \(55-60 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\). Segments numerous.

Occurrence: Taléh-Sap; Gulf of Siam; Barantolla, near Calcutta.

\section*{Genus CAPITELLETHUS Chamberlin.}

\section*{Capitellides Ehlers, non Mesnil.}

Thorax exclusively with capillary setac, abdomen with crochets exclusively. Branchiae none. Eleven setigerous thoracic segments; no other macroscopic distinction between thorax and abdomen.
359. Capitellethus dispar (Ehlers).

Capitellethus dispar, Chamberlin, 1919, p. 466: Fauvel, 1930b, p. 548; 1932, p. 197.

Capitellides dispar, Ehlers, 1907, p. 24, fig. 15.
Notomastus zeylanicus, Augener, 1926a, p. 172; 1927a, p. 218 (non Willey?).

The characters of the one species are those of the genus. The body slender, filiform, without any apparent difference between the thorax and the abdomen, is very like that of an Oligochaete.

Length: 15 mm . by 0.8 mm .
Occurrence: Vizagapatam.
Remarks: Augencr identifies this species with Notomastus zeylanicus Willey (1905), but I very much doubt their synonymy.

\section*{Genus BRANCHIOCAPITELLA Fauvel.}

Thorax with seven setigerous segments, bearing dorsal and ventral capillary setae. On the 8th and 9 th segments ventral hooks and a dorsal copulatory organ with modified large spines. In the abdomen dorsal and ventral hooks and dorsal cirviform gills.
360. Branchiocapitella singularis Fauvel. (Fig. 193, af).

Branchiocapitella singularis, Fauvel, 1932, p. 197, pl. VII, figs. 9-14.

Body slender, filiform, slightly enlarged in the thorax; about 200 segments or more. Skin faintly tessellated in the anterior segments. Prostomium blunt conical, without eyes. Peristomium achaetous, short ventrally and overhanging the prostomium on the dorsal side where it is twice as long. The first 8-9 segments biannulate, larger and more swollen than those following. Maximum breadth about the 6 th segment. The first 7 setigerous segments bearing cach two dorsal and two ventral bundles of capillary setac. On the 8 th and 9 th segments ventral hooded hooks and a dorsal copulatory apparatus armed with 8 large, bent, acicular spines (two in each ramus) converging towards the boundary of the two segments between which opens the male genital pore. In each dorsal ramus there are two bristles, a long one and a shorter supplementary seta. An ovate gland lies between the posterior bristles. From the 10th setigerous segment
backwards dorsal and ventral hooded hooks. In the abdominal region the body is semi-circular in section. Dorsal and ventral uncinigerous tori are short, little raised, transverse pads. About the 80th setigerous segment

Fig. 193.- Branchiorapitella singularis Fauvel: \(a\), anterior end, dorsal view \(\times 8 ; b\), posterior region, dorsal view \(\times 8 ; c\), cross section of abdomen \(\times 10 ; d\), segments 6 to 11 and dorsal capulatory organ \(\times 25\); e, right posterior pair of copulatory spines \(\times 147\); \(f\), abdominal hook \(\times 630\) (from Fauvel 1932).
the gills make their appearance; they are small, fingershaped, with one or two filaments inserted on the inner end of the dorsal tori. Pygidium a short faintly bilobed knob.

Length: up to 95 mm . by 1 mm .
Decoloured, in spirit.
Occurrence: Barantolla or Vizagapatam.

\section*{Genus SCYPHOPROCTUS Gravier.}

Thorax of 14 segments, of which 12 carry only capillary setae. Abdomen with only hooded hooks. No gills. An anal cup-shaped funnel with radiating acicular bristles. Two long anal cirri.
361. Scyphoproctus diiboutiensis Gravier. (Fig. 194, a, b).

Scyphoproctus diboutiensis, Gravier, 1906, p. 181, pl. III, figs. 200-204: Fauvel, 1930a, p. 48.
Prostomium short, conical, eyeless. The first two segments achaetous. Capillary setae long and slender. Dorsal and ventral abdominal tori without processes. The

I-ig. 194.-Scyphoproctus djiboutiensis Gravier: a, anterior part, dorsal view ; \(b\), anal funnel, side view (after Gravier). Paraheteromastus tenuis Monro: \(r\), segments from mid-abdominal region: d, terminal segments, side view; \(e\), anterior thoracic bristle; \(f\), abdominal hook; g. thoracic hook (after Monro).
anal funnel is a cup-like plate, the walls of which are stiffened with bundles of acicular setae. It is provided with two long finger-shaped cirri.

Length: 25 mm . by 0.6 mm .
Colour: yellowish-brown.
Occurrence: Gulf of Mannar, Krusadai Island.
Distribution: India, Red Sea.

\section*{Genus PULLIELLA Fauvel.}

Body divided into threc distinct regions: (1) thoracic, the 9 segments of which bear only capillary setae in both rami; (2) abdominal, with hooks in both rami and dorsal tori well apart; (3) posterior with dorsal acicular setae and ventral hooks. The last segments are partly fused together. Pygidium with two stout, conical, ventral cirri. Branchiae absent.

3if. Pulliella armata Fauvel. (Fig. 195, a-h).
Pulliella armata, Fauvel, 1930a, p. 48, fig. 13; 1930b, p. 549; 1935, p. 342.

Body swollen at both ends. Three regions clearly distinct. Prostomium blunt, two eyes. Peristomium achaetous, biannulate. The nine following segments are short, close together, biannulate, smooth, without any

Fig. 195.-Pulliella armata Fauvel : a, anterior region, side view \(\times 6\); \(b\), posterior region, side view \(\times 6\); \(c\), pygidium and last segments, from above \(\times 6 ; d\), a row of posterior dossal acicular spines \(\times 48\); \(e\), ventral posterior hook \(\times 280 ; f, g\), dorsal anterior hooks \(\times 280\); \(h\), tip of a posterior acicilar dorsal seta \(\times 280\).
pattern and each carrying two dorsal and two ventral bundies of capillary setae, inserted into hollow (retractile?) eminences. In the next three segments, the dorsal and ventral hooks are arranged in transverse rows, faintly raised but not forming true tori. The following abdominal segments bear two short prominent dorsal tori well
apart. The first ventral tori are longer than, and closer to, the dorsal tori; next they become nearly as short as the dorsal tori. The posterior region numbers \(8-11\) segments, larger than the preceding ones, short, conspicuous, separated from each other by a narrow and deep constriction. They carry, on the dorsal side, stout, bodkin-like acicular setae, arrayed in two rather wide apart rows; and on the ventral side hooks like those of the abdomen. Pygidium on the ventral edge of the last setigerous segment, with two stout, conical, diverging cirri under the anus. On the 4th-5th abdominal segments, a dorsal raised swelling between the tori and somewhat behind them. There are no branchiac.

Length: \(15-25 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Remarks: This species is a connecting link between Scyphoproctus and the other Capitellids.

Occurrence: Pulli Island, Gulf or Mannar.
Distribution: New Calcdonia, Indo-China; India.
Family ARENICOLIDAE Johnston.
To my knowledge no species of Avenicola has been, as yet, recorded from the area of India. Arenicola species are of rare occurrence in the tropical part of the Indian Ocean.

\section*{Family' MALDANIDAE Malmgren.}

Body nearly cylindrical; segments long and few. Prostomium small, destitute of appendages. A median keel on each side of which is a nuchal groove: often with a more or less rimmed cephalic plate. Buccal segment (peristomium) achactous. Parapodia biramous, a dorsal setigerous lobe with capillary bristles, a ventral uncinigerous torus. Dorsal and ventral cirri absent. Ante-anal segments often achactous. An anal funnel with cirri, or an anal plate. Cutancous glands well developed. Tube membranaceous, coated with sand or mud, or hard, arenaceous.

\section*{Key to the genera of Maldanidae.}
 Quatrefages, p. 384.
\begin{tabular}{|c|c|}
\hline 2. Anal segment having a deep fun nel with cirri on the margin; the anus lies in the centre.. & 3 \\
\hline Anal segments forming a smooth plate without cirri & 5 \\

\hline Cephalic keel short and flat .. & Asychis Kinberg, p. 385. \\
\hline
\end{tabular}

Remarks: In the Maldanidac the head, anterior segments, and the pygidium, provide the most important features which differentiate species and genera. Petaloproctus and Nicomache differ mainly in the structure of their pygidium, whilst the head and anterior segments are almost alike. Incomplete specimens can, therefore, be but exceptionally identified with certainty. Unfortunately, Maldanidae are very brittle worms and are often incomplete in the collections.

\section*{Genus CLYMENE Savigny.}

A slanting, rimmed, cephalic plate. Acicular ventral bristles in the first three setigerous segments. Sevelal ante-anal achaetous segments. Pygidium funnel shaped, bordered with cirri. Anus at the tip of a cone enclosed in the funnel. Glandular coloured belts on the anterior segments.

Key to the subgenera of Clymene.
Anal cone sunk in the bottom of the funnel .. .. Euclymene Verrill, p. 376.
Anal cone protruding. Ventral cirrus much longer than the others \(\quad . \quad\).. Praxillella Verrill, p. 380.

Euclymene annaidalei, Southern, 1921, p. 648, pl. XXVIII, fig. 22, pl. XXIX, fig. 22. \(h-k\) : Fauvel, 1932. p. 199.

Body with twenty-one segments; 19 setigerous and two achaetous ante-anals. Large concave cephalic plate: rim with two lateral notched sides and a posterior crenate portion. Nuchal grooves rather long, almost parallel. Numerous ocelli. In the three anterior segments in each ventral ramus a single acicular hook with a simple, boldly curved tip. Caudal funnel fringed with short, bluntly rounded cirri, the median ventral cirrus stouter than the others.
I.ength: 40-80 mm.

Colourless, in spirit. \(\Lambda\) conspicuous double band of glands on the mid-ventral surface lying over the ventral nerve-cord and running back from the 7 th setigerous segment to the caudal ring. Tube of sand grains.

Occurrence: Camorta, Nicobar Islands, Andaman Sea; Chilka Lake.
364. Clymene (Euclymene) insecta (Ehlers). (Fig. 196, \(i-m\) ).
Clymene (Euclymene) insecta, Fauvel, 1932, p. 199.

Praxillella insecta, Augener, 1926a, p. 192.
Body with 19 setigerous segments and 3 ante-anals. Dorsal cephalic plate oval, a long keel: rim with two lateral sides notched, posterior part smooth. Nuchal grooves long, parallel. Ventral acicular hooks of the three anterior segments with a slightly smooth tip. Caudal funnel fringed with short cirri, the ventral median cirrus slightly longer than the others.
F. \({ }^{0}\)

Occurrence: Vizagapatam, Madras.
Distribution: New Zealand; India.
365. Clymene (Euclymene) grossa Baind. (Fig. 196, fh).

Clymene grossa Baird, Ehlers, 1901, p. 190, pl. XXV, figs. 1-1: Fauvel, 1932, p. 200.

Body with 19 setigerous segments and one achactous ante-anal. Cephalic plate oval, with a long keel and elongate parallel nuchal grooves: Posterior part of the rim

Fig. 196.-Euclymene annandalei Southern: a, anterior end, dorsal view \(\times 14 ; b\), posterior end, ventral view \(\times 10\) (after Southern). E. watsoni Gravier: c, posterior part, side view ; d, head, dorsal view ; e, acicular bristle from the 2nd foot (after Gravier). E. grossa Baird: \(f\), head, dorsal view; \(g\), anal funnel \(\times 2\); \(h\), hook
\(\times 210\). E. insecta (Ehlers) : \(i\), head \(\times 5 ; k\), posterior part \(\times 3\); l, hook \(\times 270\); m, top of acicular bristle from the first segments \(\times 270\) (after Ehlers).
of the plate denticulated. The five anterior segments are short, with an anterior raised margin, especially the fourth. 2-3 large, yellow, straight acicular hooks in the
ventral rami of the three anterior segments. Anal funnel with short subequal cirri.

Length: \(100-125 \mathrm{~mm}\). by 6 mm .
Occurrence: Andaman Islands.
Distribution: Magellan Strait; Andaman Islands.
366. Clymene (Euclymene) watsoni Gravier. (Fig. 196, \(c-e)\).
Clymene watsoni, Gravier, 1906, p. 198, pl. III, figs. 214-216: Fauvel, 1932, p. 200.

Body of 19 setigcrous segments; 2-3 ante-anals. Cephalic plate oval, a short keel. Nuchal grooves short, nearly parallel. Posterior rim cienate. Anterior segments short, with a raised anterior margin. 2-3 acicular bent hooks on the 3 anterior ventral rami. Caudal funnel with numerous short, triangular, equal cirri.

Length: about 200 mm .
Colour: the 4th, 5th and 6th setigerous segments deep red.

Occurrence: Sinai Peninsula.
Distribution: Red Sca, Djibouti, Suez.
36i. Clymene (Euclymene) santanderensis Rioja. (Fig. 189, \(a^{\prime}-h^{\prime}\) ).
Clymene santanderensis, Rioja, 1917, p. 1, fig. 1: Fauvel, 1927a, p. 177, fig. 61, \(a-h ; 1932\), p. 200.

(?) Macroclymene monilis, Augener, 1918, p. 485, fig. 78.
Segments very numerous, about 40. Body very brittle. Cephalic plate oval, rim with two lateral and one posterior notch. Keel and nuchal grooves straight and long. Ventral acicular spines on the first three setigerous segments bent hooks with enlarged manubrium; one in cach ramus. One achaetous ante-anal segment. Pygidial funnel fringed with numerous alternating cirri. The first four anterior segments very short. The 7-8 last segments very short, but with setac.

Length: \(100-175 \mathrm{~mm}\).
Uncoloured, in spirit.
Occurrence: Vizagapatam.
Distribution: India; West Coast of Africa (?), Santander.

Remarks: Very long fragments, with very numerous segments, from Vizagapatam but not one whole specimen. The identification, although very probable, is nevertheless a little doubtful.

\section*{Subgenus PRAXILLELLA Verrill.}
368. Clymene (Praxillella) gracilis Sars. (Fig. 201, ad).

Clymene (Praxillella) gracilis, Fauvel, 1927a, p. 178, fig. 62; m-p; 1932, p. 201: Moore, 1923, p. 238.

Prostomium long and tapering. Ocelli picsent. Cephalic plate oval, rim notched on the side's and back. Keel and nuchal organs straight and long. 1-3 ventral acicular spines in the first three setigerous segments. I achactous ante-anals. Anal funnel with a longer median cirrus. Anal cone protruding.

Length: \(35-75 \mathrm{~mm}\). by \(1-2 \mathrm{~mm}\).
Occurrence: Persian Gulf.
Distribution: California; Persian Gulf; Atlantic Ocean, Mediterranean Sea.

\section*{Genus AXIOTHELLA Verrill.}

Axiothea Malmgren.
A cephalic rimmed plate. Pygidium funnel shaped, fringed with cirri. Without collar. Denticulated uncini from the first setigerous segment.

Key to the species of Axiothella.
Slender bipinnate setae present australis Augener, p. 381.
Slender bipinnate setae absent .. obockensis (Gravier). p. 380.
369. Axiothella obockensis (Gravier). (Fig. 197, a-e).

Axiothea obockensis, Gravier, 1906, p. 206, pl. IV, figs. 221-222. Axiothella obockensis, Fauvel, 1990a, p. 51, fig. 14, a-e; 1932, p. 202.

Long oval, slanting, cephalic plate, with a smooth rim; a long keel and two parallel nuchal grooves. Ocelli present. Two ante-anal achaetous segments. Anal funnel with a long ventral cirrus. A ventral row of numerous small hooks on the first setigerous segment. Long slender bipinnate setae absent.

Length: \(10-45 \mathrm{~mm}\).

Occurrence: Gulf of Mannar, Krusadai Island, Kilakarai.

Distribution: India, Red Sea.
370. Axiothella australis Augener. (Fig. 197, f, g).

Axiothella australis, Augener, 1914, p. 65, pl. I, figs. 7-8; Fauvel, 1930a, p. 59, fig. 14, \(f-\mathrm{g}\).
Axiothea, spec., Gravely, 1927, p. 26.
Body of 18 setigerous segments, two achactous anteanals. Cephalic plate oval, slanting, relatively short, rim crenulate or notched; a long keel, two straight nuchal

Fig. 197.-Axiothella obockensis (Gravier): a, b, anterior region, dorsal and side views \(\times 9\); \(c\), posterior region, ventral side \(\times 9\); \(d\), e, hooks from the first setigerous segments \(\times 550\). A. australis Augener : \(f\). hook from the first segment \(\times 550 ; \mathrm{g}\), hook from the 10 h segment \(\times 550\).
organs. Anal funnel with alternating cirri, no longer ventral cirrus. Hooks of the first segment less numerous, with strongly curved manubrium. Long slender bipinnate setae present.

Length: 19-40 mm. by 2 mm .
Occurrence: Gulf of Mannar, Krusadai Island, in a colony of Polydora caeca, and a number of specimens with Mesochaetopterus.

Distribution: South Australia; India.

\section*{Genus MALDANE Grube.}

Cephalic keel convex, arched: rim divided into three parts by two deep lateral notches. Nuchal grooves short. Anal plate oval, slanting, with the rim notched on each side. Anus dorsal; ante-anal segments achaetous. Anterior segments without collar. Ventral setae absent on the first segment. Dorsal setae of three kinds. Uncini from the second setigerous segment. Glandular belts. Tube coated with mud.
371. Maldane sarsi Malmgren. (Fig. 198, a-i).

Maldane sarsi, Arwidsson, 1906, p. 151, pl. VII, figs. 192-199: Fauvel. 1927a, p. 197. fig. 69, a-i; 1992. p. 202: Monro. 1937, p. 307: Augener, 1927a, p. 227: Mesnil and Fauvel, 1939, p. 14, figs. 9, 10.
(i) Maldane cristata Treadwell. Monro, 1997, p. 30ti, fig. 23.

Fig. 198.-Maldane sarsi Malmgren: a, anterior part, side view \(\times 3\); \(b\). head, from above \(\times 4 ; c, d\), posterior part, side and ventral view \(\times 3\); \(e, f\), hook, side and front view \(\times 330 ; \mathrm{g}\), winged kneed seta \(\times 330 ; h\), straight winged seta \(\times 330\); \(i\), part of a spinous bristle \(\times 390\).

Body of 19 setigerous segments, two achaetous anteanals. Cephalic keel strongly arched. Rim smooth but notched on each side. Nuchal grooves short, diverging, straight or faintly curved. Anal plate oval, slanting, with the rim notched on each side, smooth or faintly crenate on the ventral side. Anus dorsal, puckered under the anal plate border. No acicular hooks on the anterior segments. Uncini with a strong hooked end. Numcrous denticles on the vertex, and sub-rostral filaments. A thick tube of mud.

Length: \(50-120 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: Anterior part more or less spotted with brown marks.

Occurrence: Andaman Sea; Bay of Bengal; Laccadive Sea; Arabian Sea; Gulf of Oman.

Distribution: Pacific Ocean, California, Japan, Australia, Malayan Seas; Indian Ocean; Atlantic Ocean, North Sea; Antarctic Occan.

Remarks: The varicty tropica Monro differs only from the type in the absence of a glandular crescent on the donsal surface of the 5th setigerous segment, but that is also sometimes absent in specimens of \(M\). sarsi from the north seas. Maldane cristata Treadwell has a high keel, a deep cephalic pouch and a denticulate ventral border of the anal plate, but these characters are also frequently met with in typical M. sarsi, the anal plate being very variable. Moreover, the cephalic pouch is always present, more or less deep but often inconspicuous, its anterior dorsal edge being appressed on the head, especially on specimens dead in their tubes.

\section*{Genus MALDANELLA McIntosh.}

A rimmed cephalic plate. Nuchal grooves straight, parallel. Anal funnel fringed with cirri, with anus at the bottom. Ventral setae and hooks absent on the first setigerous segment. Uncini from the 2nd setigerous seg. ment. Anterior segments short, collarless. Glandular belts on the first 7 segments.
372. Maldanella harai (Izuka). (Fig. 199, i-n).

Maldanella harai, Fauvel, 1914b, p. 260. pl. XXIII, fig. 1; 1927a,
p. 186, fig. 64, i-n (Synonymy); 1992, p. 203.

Clymene harai, Izuka, 1902, p. 111, pl. II1, figs. 9-12.
Axiothea campanulata, Moore, 1903, p. 485, pl. XXVII, fig. 99; 1906, p. 239.

Prostomium eyeless. Cephalic plate slanting, with a smooth rim faintly, or not, notched. Keel and nuchal grooves extending to about half the length of the plate. 19 setigerous segments and 2 achactous ante-anals. Anterior border of the first 7 setigerous segments glandular. Dorsal setae of two kinds: (1) winged, and (2) slender,

Fig. 199.-Pctaloproctus terricola Quathelages. a, anterior patt . 2.i; \(b\). head from above; \(c\), posterior part, dorsal view \(\times 2.5\); \(d\), posterior part, side view \(\times 2.5\); e, vential hook \(\times 120: f\), anterior acicular hook \(\times 24 ; \mathrm{g}\), winged bristle \(\times 120 ; h\), patt of a pennate bristle \(\times 400\). Maldanella harai (Izuka): i, head, side view; \(k\), anterior part \(\times 2\); \(l\), posternor 1 egion \(; 2\left(\begin{array}{l}\text { after }\end{array}\right.\) Izuka); \(m\), ventral hook \(\times 120 ; n\), head, from above \(\times 1\).
smooth capillaries. Uncini from the 2nd setigerous segment. Anal funnel elongated, fringed with small, nearly equal cirri. Tube of mud.

Length: \(70-180 \mathrm{~mm}\). by \(3-6 \mathrm{~mm}\).
Colour: Decoloured in spirit.
Occurrence: Bay of Bengal, 637-800 fms.; Laccadive Sca, 1,154 fms.

Distribution: Japan; Bay of Bengal, Laccadive Sca; Atlantic Ocean.

\section*{Genus PETALOPROCTUS Quatrefages.}

Head arched, without cephalic plate. Nuchal grooves short. A large anal foliaceous plate, without cirri, surrounding the anus. Ventral acicular bristle on the first
three segments. Anterior segments short, middle ones more elongated, posterior ones shorter, with a dorsal fleshy lobe. Achaetous ante-anals rudimentary. Glandular belts on the anterior segments. Hard, thick tube of concrete sand.
373. Petaloproctus terricola Quatrefages. (Fig. 199, \(a-\) h).

Petaloproctus terricola, Fauvel, 1927a, p. 194, fig. 68, \(a-i\), (Synonymy); 1932, p. 203.
Maldane cristagalli, Claparède, 1868, p. 457, pl. XXVI, fig. 4.
Head rounded, without any trace of rim. Kcel archcd. Nuchal grooves short and diverging. 22 setigerous segments; achactous ante-anals wanting. A large ventral spine on the first three setigerous segments. Dorsal setac of three kinds: (1) winged, (2) slender capillaries, (3) tong, slender, filiform, barbed threads. A large raised fleshy pad ending backwards in a blunt lobe on the dorsal side of the last \(6-7\) segments. Last segment very short. 'Tube thick, hard, sandy.

Length: \(150-200 \mathrm{~mm}\). by \(3-4 \mathrm{~mm}\).
Colour: Anterior part red, spotted white, 2nd-3rd segment pink, the next four red-brown with clear belts. Posterior region dark.

Occurrence: Koweit Harbour.
Distribution: Malay Scas; Indian Ocean, Persian Gulf; Atlantic Ocean, Mediterranean Sea.

\section*{Genus ASYCHIS Kinberg.}

Cephalic plate, rim divided into three parts by two deep lateral notches. Keel flat and short. Nuchal grooves curved. Anus dorsal, above the large oval foliaceous. more or less lobed, plate. First ventral setigerous segment without ventral setae or hooks. Uncini from the 2nd setigerous segment. Anterior segments short. Achacous ante-anals short, rudimentary. Dorsal setac of three kinds.

Key to the species of Asychis.
1. Anal plate with long filiform piocrsses, simple or forked ..
Anal plate without filiform processes
2. Anal plate with 9 long filiform processes, simple or forked. Lateral sides of the cephalic plate smooth .. .. trifilosa Augener, p. 388 F. 51

Asychis theodori, Augener, 1926a, p. 189, fig. 6: Fauvel, 1932, p. 204.

Cephalic plate rim divided into three smooth lobes by the deep lateral notches. First segment achactous,

Fig. 200.-Asychis gotoi (Izuka): a, anterior patt, side view \(\times 16 ; b\), anal funnel, side view \(\times 10\). A. theodori Augencr : \(c\), head, from above \(\times 14\); \(d\), anal plate \(\times 14\); \(e\), collar, ventral view \(\times 14 ; ~ f\), ventral hook from 2nd foot \(\times 450\) (after Augener).
with anterior border drawn out into a collar notched on each side and in the middle of the ventral lobe. 19 setigerous segments and two achactous ante-anals. Dorsal lobe of the rounded anal plate smooth, ventral lobe bluntly denticulated.

Length: 54 mm . by 1.5 mm .
Colour: greenish ochraceous.
Occurrence: Persian Gulf, 25 fms.
Distribution: Ncw Zcaland; Persian Gulf.
375. Asychis gotoi (I/uka). (Fig. 200, \(a-b\) ).

Aswhy gotor, Ianvel, 1932, p. 255; 1934, p. 57, figs. 2-3; 1939, p. 16, fig. 11: Mennil and Fancl, 1940, p. 22.

Matdane gotor, Ituka, 19M2, p. 109, pl. III, figs. 1-8.
Maldane coronatn. Moore, 1603, p. 483.
Rim of the cephalic plate divided into three lobes by deep lateral notches: dorsal lobe serrated, lateral lobes fringed with cirni of unequal lengths. First segment produced into a collar notched on each side. 19 setigerous segments. No achactous ante-anals. The dorso-posterior margin of the anal plate is expanded into a petaloid plume having sis to twelve corners, each of which is prolonged into a long slender cirrus. Tube membranous coated with mud.

Length: 80-120 mm . by 6 mm .
Occurrence: Andaman Sea, 405 fms.; Laccadive Sea, 1,022 fms.

Distrbution: Japan, Java; Andaman Sea, Laccadive Sea; Adriatic Sea.
376. Asychis disparidentata (Moore).

Asychis disparidentata, Fauvel, 1932, p. 505.
Maldane disparidentata. Moore, 1904, p. 494, pl. XXXVII, figs. 32-35; 1909. p. 282.
Cephalic plate broadly oblong, elliptical; frontal ridge low, broad, inconypicuous, equal to one-third of the cephalic plate. Nuchal grooves short. Posterior lobe of the cephalic rim divided into about 15 low, broad, truncate teeth, irregular and not constant; lateral lobes considerably more elevated and bearing 5 or 6 larger, more prominent, rounded tecth. Anterior margin of the first setigerous segment produced into a collar. 19 setigerous segments, an achactous ante-anal. Anal plate with a dorsal lanceolate lohe arched over the anus and a ventral lobe smooth or slightly irrcgular, but entirely without lohes or processes.

Length: 40 mm . by 2 mm .
Occurrence: Capc Comorin, 902 fms.
Distribution: California; India.
Remarks: May be a mere variety of \(A\). biceps.
377. Asychis trifilosa Augener. (Fig. 201, g-h).

Asychis trifilosa, Augener, 1926, p. 187, fig. 7: Fausel. 1932, p. 205: Mesnil and Fauvel, 1939, p. 17, fig. 12.

Lateral lobes of the cephalic rim smooth, dorsal lobe faintly and finely crenate or smooth. First setigerous segment not produced into a collar, but one is present on the

Fig. 201.-Cymene (Praxillella) gracilis Sars: a, head \(\times 3\); \(b\), ventral hook \(\times 240 ; c\), posterior region \(\times 2\) : \(d\), acicular hook from the first foot \(\times 80\). Myriochele picta Southern : e, head, side view \(\times 56\); \(f\), hooks \(\times 1385\) (after Southern). Asychis trifilosa Augener: \(g\), head, dorsal view \(\times 8\) (after Augener); \(h\), anal funnel, enlarged.

5th. 19 setigerous segments; one (\%), or none, ante-anal. Anal plate with a dorsal petaloid lobe bearing three very long filiform cirri, simple or forked at the tip; ventral lobe narrow and smooth, forming a hollow cup. Anus dorsal and wrinkled.

Length: 160 m . by 4 mm .
Occurrence: Gulf of Oman, in greenish brown mud. Distribution: New Zealand; Malay Archipelago; Gulf of Oman.
378. Asychis gangeticus Fauvel. (Fig. 202, a-i). Asychis gangeticus, Fauvel, 1932, p. 206, pl. VIII, figg. 1-9.

Body nearly cylindrical, tuncate at both ends. 19 setigerous segments; achactous ante-anals absent. Cephalic plate rounded, slanting, with a inembranous rim divided into three parts by deep lateral notches; posterior and

Fig. 202.-Asychis gangeticus Fauvel: a, anterior part. side view \(\times 2.5\);
\(b\), pygidium, ventral view \(\times 2.5\); \(c\). anterior end, side view \(\times 4\); \(d\), Pygidium, side vicw \(\times 4\); \(e\); pygidium, dorsal view \(\times 4\); \(f\), head \(\times 4 ; \mathrm{g}\), harbed seta \(\times 250 ; h\), winged seta \(\times 50 ; i\), hook \(\times 105\) (Fauvel 1932).
lateral parts smooth, faintly wavy. Prostomium flattened, broadly rounded in front. Kecl broad, long and depressed. Nuchal grooves transversely curved. A longitudinal furrow on each side of the achactous buccal segment. Anterior rim of the first setigerous segment produced into a collar sheathing the buccal segment, deeply notched on either side. Buccal segment and the first three setigerous segments somewhat uniformly glandular, the and 6th with broad ventral glandular pads, next with only large, raised, glandular tori. There is no glandular dorsal crescent-shaped pad on the 5th setigerous segment. Dorsal setae of three kinds: (1) long winged setae, slightly bent; (2) slender setae, barbed at the tip and shorter, and (3) very slender smooth capillary setae. On the following segments a transverse row of uncini, whose large fang is crested with a rather large tooth and numerous tiny denticles. The subrostral barbs are few and slender, the manubrium is clearly enlarged. The last two setigerous segments are very short, with raised glandular tori; the last one reaches the base of the caudal funnel. Pygidium with: (1) a broad triangular, foliaceous dorsal lobe with a rounded border, lateral borders rolled inwards, and a dorsal keel ending in a rounded valve above the anus, and (2) a foliaceous ventral lobe divided by a deep indentation into two lateral lobes sheathing the base of the rolled in dorsal lobe. The length of the pygidial apparatus equals that of the last three setigerous segments.

Length: 140 mm . by \(5-6 \mathrm{~mm}\).
Colour: in spirit yellowish brown with glandular bands and whitish tori.

Occurrence: Gangetic Delta. A single specimen. Incertae sedis

\section*{NICOMACHE TRUNCATA Willey}

Nicomache truncata Willey, 1905. p. 290, pl. V. fig. 122-123.
As Willey's specimen from Ceylon is only an anterior fragment of 6 segments, in the absence of the posterior end and anal plate it is not possible to decide with any certainty whether it belongs to the genus Nicomache Malmgren or the genus Petaloproctus Quatrefages.

\section*{Family OWENIDAE Rioja.}

\section*{Ammocharidae Malmgren.}

Body cylindrical, anterior segments longer than broad, posterior ones shorter. Prostomium fused with the buc-
cal segment (peristomium), devoid of appendages or ending in a lobed membrane. Dorsal setae capillary, ventral uncini very numerous, very small, set in transverse rows, and with a bent hooked tip. Anal cirri absent. Tube coated with sand or shell fragments.

Key to the genera of Owenidae.
Prostomiun rounded, devoid of appendages
M) riochele
Malmgren, p. 391.

Prostomium bearing a branchial laciniate membranc .. Owenia Delle Chiaje, p. 391.

\section*{Genus OWENIA Delle Chiaje.}

Prostomium bearing a branchial laciniate membrane. Buccal segment achaetous. The first three setigerous segments long and without uncini. Dorsal setae slender, spinous. Uncini bidentate. Pygidium bilobed. Glandular belts and spinning glands.
379. Owenia fusiformis Delle Chiaje. (Fig. 203, \(a-f\) ).

Ouena fusiformis. Giavier, 196, p. 294; Augener, 1914, p. 77; Fauscl, 1927a, p. 203, fig. 71 a-f (Synonymy); 1932, p. 208.
Ammochares assimilas, Malmgren. 1867, p. 210, pl. XII, fig. 65.
Ammochares oncntalis Giube, Willey, 1905, p. 290, pl. V, figs. 124-125.

Uncini with an elongated manubrium and a curved hook with two parallel teeth. The two ante-anal segments without dorsal setae. Tube membranaceous, open and tapering at both ends, coated with overlapping sand grains and flat bits of shells, imbricated.

Length: \(\quad 50-100 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: in life, greenish or yellowish with paler transverse glandular belts.

Occurrence: Mergui Archipelago; S. of Ceylon, 1,500 fms.; Tuticorin Pcarl Bank.

Distribution: Pacific, Indian and Atlantic Oceans. Cosmopolitan.

\section*{Genus MYRIOCHELE Malmgren.}

Body slender, cylindrical, divided into two regions. Prostomium devoid of appendages. Mouth oblique, subventral. Peristomium achaetous. First three segments
without uncini. Dorsal setae capillary, slender, spinulose. Uncini bidentate, Pygidium obtuse-conical. (Fig. 205, \(g-m)\).

Fig. 203.-Owenia fusiformis Della Chiaje: a, natural site; b, tube. natural size ; \(c, d\), head from above, mouth closed or opened, with the labial organ, much enlarged (after Watson); e, dorsal bistle \(\times 300 ; f\), uncini, front and side view \(\times 5.50\). Myriorhele hern Malmgren : \(g\), enlarged ; \(h\), anterior part, ventral view; \(i\), posterior region ; \(k\), dorsal bristle \(\times 470 ; l, m\), uncini \(\times 550\) (a species hardly distinct from M. picta).
380. Myriochele picta Southern. (Fig. 201, \(e, f\) ).

Myriochele picta, Southern, 1921, p. 638, pl. XXXI, fig. 30.
Prostomium and peristomium fused in a rounded eyeless mass. Behind the mouth, a clavate diverticulum. The three thoracic segments carry only capillary setae. The first abdominal segment is as long as the three thoracic segments, the second is still longer and is the largest of the body. The succeeding eight diminish only slightly in length, but the three posterior are much shorter. Dorsal capillary setae and ventral hooks in all the abdominal segments. The hooks are bidentate and arranged in irregular transverse rows. Five pairs of thread glands in the first five segments. Tubes cylindrical, covered with small quartz grains.

Length: 3-4 mm.

Colour: on the back of the head, a conspicuous patch of reticulate purplish-brown pigment. A transverse dorsal band at the posterior end of the buccal segment.

Occurrence: Chilka Lake, on a muddy bottom.
Family SABELLARIIDAE Johnston.

\section*{IIERMELLIDAE Auct.}

Body divided into three regions. Prostomium not conspicuous, between two large opercular stalks bearing modified setae (paleac) set in concentric circles. Two palps. Anterior region of two short segments with rudimentary feet, and 3-4 parathoracic biramous segments with oar-shaped setae; abdominal region with uncinigerous dorsal rami, and ventral rami with capillary setac. Simple gills. A caudal tail-like unsegmented, achaetous and apodous region. Hard, thick, sandy tube.

Key to the genera of Sabellarimde.

and erect. Inner paleae spoon-shaped. 2-3 pairs of dorsal acicular bristles. A triangular finger-like cirrus between the opercular stalks.

Several varieties of this species have been described: one of these is found in Indian waters.

\section*{var. alcocki Gravier. (Fig. 204, \(k-m\) ).}

Middle paleae alternately long and short, erect, or all elongated.

Occurrence: Mcrgui Archipelago, Paway Island; Matlah River, Gangetic Delta.

Distribution: Indo-China; Indian Ocean, Persian Gulf, Atlantic Ocean.
382. Sabellaria cementarium Moore. (Fig. 205, \(a-g\) ).

Sabellaria cementarium, Moore, 1906, p. 248, pl. XII, figs. 4551: Fauvel, 1932, p. 209, fig. 34.

Outer paleac ending in a long slender, sharp, smooth spine arising between shorter, smooth spines. Middle paleac short, smooth, spoon-like. Inner paleae hollow, clongated, smooth or denticulate along the edge Tube

Fig. 205.-Sabellaria cementarium Moore: \(a\), outer palea \(\times 65 ; b\), inner palea \(\times 65 ; c\), intermediate palea \(\times 65 ; d\), dorsal interpeduncular hooks \(\times 150 ;\) e,f,tips of outer paleae \(\times 150 ; \mathrm{g}\), tip of an inner palea \(\times 150\).
very thick, hard, made of large translucent quartz grains firmly cemented together; with an inner diameter of about 3 mm .

Occurrence: Tuticorin beach.
Distribution: Pacific Ocean (Alaska); India. 383. Sabellaria pectinata Fauvel. (Fig. 206, \(a-g\) ).

Sabellaria pectinata, Fauvel. 1928b, p. 163. fig. 3, a-g; 1930a, p. 53, fig. 15; 1932, p. 210.

Outer paleae having broad paddle-shaped tips with a central triangular spike bearing numerous lateral spines. The middle paleae are cup-shaped, with a short smooth

Fig. 206.-Sabellaria pectinata Fauvel: a, outer palea \(\times 62 ; b, c\), inner palcae \(\times 78 ; d\), intermediate palea \(\times 78 ; c\), uncinus \(\times 310 ; f\), wat. shaped bristle \(\times 155 ; \mathrm{g}\), capillary bipectinate bristle \(\times 15 \%\). Poma. tostegus polytrema Philippi, var indica Fauvel : h, i, two kinds of operculum, side and front view \(\times 27\).
tip. Inner palcae elongated, spoon-shaped with spinose edges. A median cirrus between the opercular lobes. Tube of somewhat minute, transparent, sand grains held together by a white cement.

Length: \(10-12 \mathrm{~mm}\)., tail not included, by \(1-1.5 \mathrm{~mm}\).
Colour: Pigment spots on the anterior part, buccal tentacles dotted with red-brown.

Remarks: Differs from S. spinulosa Leuckart in the form of its operculum.

Occurrence: Gulf of Mannar, Krusadai, Shingle Island.
var. intermedia Fauvel. (Fig. 207, \(a-h\) ).
Sabellaria pectinata var. intermedia, Fauvel, 1932, p. 210, fig. 35.

Opercular pillars fused along about two-thirds of their length. There are a few dorsal acicular bristles and a median cirrus between the opercular lobes. The first

Fig. 207.-Sabellaria pectinata Fausel: var. intermedia Fauvel: \(a, b\), \(c\), outer, inner and intermediate paleae, drawn to the same scale \(\times 65\); d, intermediate elongated palea \(\times 120\); \(\varepsilon\), outer palea \(\times 150\); f, tip of an outer palea. side view \(\times 150 ; \mathrm{g}\), thort intermediate palea \(\times 120 ; h\), inner palea \(\times 120\).
four or five abdominal segments bear large gills which seem to be absent on the next abdominal segments of the smaller specimens. The outer paleae are denticulate and gradually decrease in size but resolve at the tip into a few smooth spines. The inner paleae are like those of the typical form, but the middle paleae are either short and broad or elongated, toothed and erect, or alternating
as in S. spinulosa, var. alcocki. The outer paleae are of a type intermediate between those of \(S\). cementarium Moore and the typical S. pectinata Fauvel.

Occurrence: Matlah River, Gangetic Delta.

\section*{Genus PALLASIA Quatrefages.}

Opercular stalks elongated, each bearing two concentric rows of paleae. Dorsal hooks. Grooved, frilled, clongated palps. Numerous filiform tentacles on the ventral side of the opercular stalks. Three or four biramous parathoracic segments with oar-shaped setae. Dorsal filiform gills. Broad dorsal abdominal pinnules with pectinate uncini; ventral capillary setae. Tail smooth, achactous. Thick tube of firmly cemented sand grains.

Key to the subgenera of Pallasia.

Pallasia porrecta, Ehlers, 1908, p. 136, pl. XVIII, figs. 11-15, pl. XIX, fig. 1-3.
Lygdamis porrectus, Johansson, 1927, p. 86.
(?) Pallasia chrysocephala, Quatrefages, 1865, p. 322.
Outer paleae smooth, flat, lanceolate, pointed; inner paleae needle-shaped. One pair of brown dorsal hooks. Four thoracic segments bearing narrow, oar-shaped, setac with laciniate tips. Tube straight, thick-walled. coated with Foraminifera.

Length: More than 25 mm . by 4.5 mm .
Colour: yellowish white, with brown streaks on the ventral part.

Occurrence: From West Sumatra, 1280 m . Volcanic ooze.

Family STERNASPIDIDAE Malmgren.
Body very short and plump. Prostomium small, without appendages. First three segments armed, each with an incomplete belt of bristles. A pair of sexual papillac on the 7th setigerous segment, next eight segments achaetous. A ventral posterior shield with radiating bristles. A bundle of anal gills.

\section*{Genus STERNASPIS Otto.}

Body swollen at both ends, segments short and few. Mouth subterminal. Anterior bristles short and stout. Horny shield composed of two trapezoid plates with radiating bundles of capillary setac. Filiform gills set on two posterior plates. Anus terminal.
387. Sternaspis scutata (Ranzani). (Fig. 210, \(a-g\) ).

Sternaspis scutata, Moore. 1903. p. 487: Augener, 1926, p. 283: Faunel, 1927a, p. 216. fig. 76, a-g (Sjnonymy); 1932, p. 213; 1933, p. 52.

Fig. 210.-Sternaspis scutata (Ranzani): \(a\), ventral view \(\times 1 ; b\), branchial plates \(\times 4 ; c\), a worn anterior bristle \(\times 52 ; d, e\), anterior bristles with transparent tip \(\times 52\); \(f\), tip of a posterior barbed bristle \(\times 130 ; \mathrm{g}\), posterior smooth capillary bristle \(\times 130\).
F. 53

Sternaspis fossor, Stimpson, 1853, p. 29, pl. II, fig. 19.
Sternaspis costata, Marenzeller, 1879. p. 142. pl. V1, fig. 4: Southern, 1921, p. 649, pl. XX, fig. 5A, 5 B.
Body sausage-like, narrowed in the middle, expanding at both ends. The anterior segments often retracted into the following ones. Densely coated with small filiform papillae. Prostomium reduced to a mere small knob. Shield plate divided into two unequal parts by a slanting line and marked with ridges and striae.

Length: \(\quad 10-30 \mathrm{~mm}\). by \(8-10 \mathrm{~mm}\).
Colour: greyish. Shields purple, violet or red or dark. Gills red.

Occurrence: Burma, Mergui: Andaman lslands; Chilka Lake, plentiful in mud ; Ganjam Coast, Madras.

Distribution: Pacific Ocean, Japan, Petchili, New Zealand, Australia; Indian Ocean; Atlantic Ocean, Mediterranean Sea; Arctic Scas.

Remarks: Having had the opportunity to compiare specimens of Sternaspis from the gulf of Petchili with those of India, Indo-China and Europe, I have failed to find any constant differences between St. costata Marenceller and St. scutata Ranzani. The so-called accessory plates of Marenzeller are only the anterior border of the shield plates seen under the more or less transparent skin.

\section*{Family AMPHICTENIDAE Malmgren.}

Segments few, body short, conical, divided into three regions: (1) thoracic, (2) abdominal with biramous segments, and (3) caudal (scapha), very small and leal-like; with hooks at the base. An operculum of an anterior row of large golden setae (paleac). Two pairs of anterior foliated branchiae. A free, slightly conical tube of sand grains.

Key to the genera of Amphictenidae
\begin{tabular}{|c|c|}

\hline Antennal veil smooth. Stricture between abdomen and scapha less distinct & Petto Malmgien. \\
\hline
\end{tabular}

\section*{Genus PECTINARIA Lamarck.}

Antennal veil fringed. Dorsal cephalic rim smooth or serrate. Uncini from the 4th setigerous segment.

Dorsal setae of two kinds: (1) with slender smooth tips, and (2) with serrated tips. Uncini pectinate, with numerous, and often unequal, teeth. Tube free, thin wallcd, straight or curved.

\section*{Subgenus PECTINARIA Lamarck.}
388. Pectinaria (Pectinaria) antipoda Schmanda. (Fig. 211, e-g).
Pertinaria antipoda, Shmarda, 1861. p. 46. pl. XXIV, fig. 199: Nilson, 1928. p. 69. fig. 2: Piuvot. 1990, p. 78, pl. III, figs. 93 -95: Fauvel, 1932, p. 214.
Cistemder antipoda, Augener. 1927. p. 231, fig 13.
17 setigerous segments and 19 uncinigerous. Achaetous ante-scaphal segments absent but the 17 th segment has only capillary setac. Dorsal rim of cephalic plate smooth. Antemal veil fringed and funnel shaped above the buccal tentacles. Dorsal setae narrow winged, with a straight smooth tip, or a geniculate spinulous tip. Uncini with \(6-7\) large decreasing teeth and \(9-3\) very small ones above the basal gouge-like process. Scapha ovate, with indented edges. Rigule very faintly bilobed, with a very small anal cirrus.

Length: about 40 mm . b) 12 mm .
Ocrurence: Koweit Harbour, Persian Gulf: 31 fms.
Distribution: Australia; New Caledonia; Persian Gulf.
Subgenus AMPHICTENE Savigny.
389. Pectinaria (Amphictene) crassa Grube. (Fig. 211 a-d).

Pertinaria cıassa, Grube. 1870, p. 321: Nilsson, 1928, p. 58, fig.
18: Pruvot. 1930, p. 80, pl. 111, fig. 89-92: Fauvel, 1952, p. 215. Amphictene crassa, Augener, 1926, p. 463, fig. 9.

17 setigerous and 13 uncinigerous segments. Achaetous ante-scaphal segments absent. Dorsal rim of the cephalic plate serrated. Antennal veil fringed and funnelshaped above the buccal tentacles. Dorsal setae winged, with a straight smooth tip, or a geniculate spinulous tip.

Fig. 211.-Amphictene crassa Grube : a, anterior part, side view ‥1.5;
\(b\), scapha, dorsal view \(\times 2.5 ; c, d\), hook, side and ftont view \(\times 36.5\). Pectinaria antipoda Schmarda; e, scapha, ventral view enlarged; \(f\), scapha, dorsal view, enlarged; \(g\), hook \(\times 350\) (after Piuvot).

Uncini with two parallel rows each of 6-7 large decreasing teeth and 2-3 very small ones above the basal gouge-like process. Scapha longer than broad, with denticulate cdges and small cirriform processes. Semi-circular ligule.

Length: 60 mm . by 15 mm .
Occurrence: Cochin backwater, near Ernakulam; Trincomalee.

Distribution: New Caledonia, Philippine Islands; Andaman Islands, Ceylon, Arabian Sea.

\section*{Subgenus LAGIS Malmgren.}
390. Pectinaria (Lagis) abranchiata Fauvel. (Fig. 212, \(a-e\) ).

Pectinaria (Lagis) abranchiata, Fauvel, 1932, p. 215, pl. VIII, figs. 10-14.

16 setigerous segments with capillary setae, 12 uncinigerous (from the 4th segment to the 15th). An achaetous segment in front of the scapha. Antennal veil fringed with 15-20 claviform papillae; it is funnel-shaped above

Fig. 212-- \({ }^{2}\) ectinaria (Lagis) abranchiata Fausel: a, anterior end, side view \(>10 ; b\), anterior end, ventral view \(\times 10 ; c\), scapha \(\times 14\); d, uncinus \(\times 1200 ; c\), uncinus, front view \(\lambda 1200\)
(from Fauvel 1932).
the buccal tentacular cirri and is not bound to the first setigerous segment. Dorsal rim of the cephalic plate smooth. On cach side, about 15 stout golden paleae with a very slender rolled-in tip; the inner paleae are shorter and more slender than the others. Two narrow dorsal clongated pads at the back of the third segment. Thora(ic ventral shields with transverse glandular pads from the

2nd segment to the 5th, followed by a rounded median patch to the 6th (2nd uncinigerous). Branchiae absent. Glandular triangular lobes of the 4 th segment absent. Ventral body walls thin and transparent. Dorsal capillary setac narrow winged; some are long, straight, stiff, with a slender, very faintly spinous tip, while others have bent finely serrated tips. Uncini pectinate, with several ventral rows of numerous teeth above the large gouge-like lower process. The hooks at the base of the scapha, about \(10-12\), are short, stout and set in a curved row on either side. Scapha short and stout, with erect cdges bearing short ovate knobs. Anal ligule triangular, with a smooth edge and a very small cirrus. Tube straight (?), very brittle, made of a single layer of transparent quartz grains held together by a yellowish cement.

Length: \(11-17 \mathrm{~mm}\). by 3 mm .
Colour: Whitish yellow, in spirit, with golden paleae.
Occurrence: Cochin backwater, near Ernakulam.

\section*{Incertae sedis}
391. Pectinaria panava, Willey, 1905, p. 295, pl. V, fig. 137.

The characters given are not even sufficient for a generic identification. Cicylon.
392. Pectinaria capensis Gmelin, Quatrefages, 1865, p. 334.
"Seas of India and Cape of Good Hope."
Family AMPHARETIDAE Malmgren.
Body divided into two regions: (1) thorax with dorsal capillary setae and ventral uncinigerous pinnules, and (2) abdomen bearing only uncinigerous pinnules. Prostomium conical or trilobed. Buccal tentacles long, smooth or pinnate, retractile into the mouth. Three or four pairs of subulate, seldom pinnate, gills inserted on the anterior segments and having in front two bundles of paleae, sometimes absent.

\section*{Key to the genera of Ampharetidae.}

3. Paleac present. Tentacles smooth Palcac absent. Tentacles smooth
4. A large, curved hook on each side, behind the gills .. Melinna Malmgren, p. 413.
Large hooks behind the gills absent

Amphicteis Grube, p. 407.
Amage Malmgren, p. 410.

Melinopsis McIntosh, p. 112.

\section*{Genus AMPHICTEIS Grube.}

Prostomium with a median groove and two ridges. Buccal tentacles smooth. Four pairs of gills. 17 bristled segments. Uncinigerous pinnules commencing on the 4th setigerous segment. Uncini uniserial, subtriangular, with few teeth. Anal segment with two cirri.

Key to the species of Amphicteis.
A close set group of 4 gills on cither side of the firt and second setigerous segments .. gunneri Sars, p. 407.

Four pails of gills set further posterobranchiata back on the third segment .. Fautel, p. 408.
393. Amphicteis gunneri Sass. (Fig. \(213 a-k\) ).

Amphicicis gunneri, Malmgren, 1865, p. 365, pl. XIX, fig. t6: Fauvel; 1897, p. 411, pl. XXV. figs. 150-161; 1932, p. 216: Hessle, 1917. p. 116.
Amphicters japonica, McIntosh, 1885, p. 431. pl. XXVHA. figs. 3-5.

17 thoracic setigerous and 15 abdominal uncinigerous segments. Numerous eye-spots. Golden paleac straight or curved at the tips, which are more or less tapering. Gills inserted on the first and second segments in two close-set groups of four each. Feet with a clavate papilla at the ventral edge distally. Abdominal pinnules with a dorsal short process; the dorsal cirri replace the absent dorsal ramus. Uncini with a single row of 4-7 teeth. Tube membranous, coated with mud.

Length: \(20-40 \mathrm{~mm}\). by \(3-5 \mathrm{~mm}\).
Colour: in life, pink or yellowish with white dots and brown spots.

Occurrence: Andaman Islands, 290 fms.: off Akyab, Burma; Orissa Coast; Gulf of Oman, 609 fms.

Distribution: Japan, Indochina; Bay of Bengal, Gulf of Oman; Atlantic Ocean, Mediterranean Sea; Antarctic Ocean.

Fig. 213.-Amphicteis gunneri Sars: a, side veiw \(\times 2.5 ; b, c\), anterior part, dorsal and ventral view, gills cut off \(\times 6 ; d\), thoracic foot with cirrus and pinnules \(\times 12 ; e\), last thoracic segment and first abdominal pinnules \(\times 2.5 ; f\), uncinus \(\times 240 ;\) g, five and sixtoothed uncini from the same foot \(\times 400 ; h\), capillary winged bristle \(\times 120 ; i, k\), smooth and sharp paleae \(\times 15\).
394. Amphicteis posterobranchiata Fauvel. (Fig. 214, \(a-e)\).

Amphicteis posterobranchiata, Fauvel, 1992, p. 217, pl. IX, figs. 7-11.

17 thoracic setigerous segments with dorsal capillary setae; 13 abdominal segments with uncinigerous pinnules. Prostomium lobed, with a median groove and two diverging glandular ridges. Edge of the nuchal organs raised into a curved pad. Buccal segment as long as the three succeeding segments. Golden-yellow paleae ending in a very slender straight or curved tip, about \(20-25\) on either side. Eight large subulate gills, the first six disposed in two crowded groups of three, on the first setigerous segment, separated in the middle of the dorsal surface by a
raised rectangular cushion. The fourth pair is set far back from the first thrce on the third setigerous segment. Uncinigerous pinnules commence on the 4th setigerous segment. Dorsal ramus cylindrical, with a small clubshaped cirrus on the last thoracic segments. Capillary setae winged and smooth. Uncinigerous pinnules shaped as a flattened knob, pedunculate and bearing a single

Fig. 214.-Amphictris posterobranchiata Fauvel: a, dotsal view of antetior end >5: \(b\), dorsal view of anterior end of anothet specimen \(\times 5\); \(c\). abdominal pinnules \(\times 8\); \(d\), thoracic uncinus \(\vee 333 ; c\), abxdominal uncinus \(\times 333\) (from Fauvel).
retrogressive row of pectiniform uncini uith three large bent teeth. The manubrium has a dorsal spine on which a " soie-tendon" is inserted. In the abdomen, the pinnules are flattened, sub-rectangular, with a very shoit, dorsal, blunt process. The dorsal cirri, reduced to a pedunculate small knob, persist in place of the setigerous lobes. Two anal cirri. Tube membranaceous coated with mud.

Length: up to 42 mm . by 5 mm .
Colourless, in spirit.
Occurrence: Bay of Bengal, 606-678 fms.: off Ceylon, 660 fms.; off Cape Comorin, 670 fms.; Arabian Sea, 541 fms.
F. 54

\section*{Genus AMAGE Malmgren.}

Body rather short. Bristled thoracic segments it to 17 in number. Uncinigerous pinnules commencing on the 4th setigerous segment. Uncini subtriangular, pectiniform. Prostomium with two ridges. Buccal tentacles smooth. Three or four pairs of gills. Anal segment with two cirri. Paleae absent.
395. Amage bioculata (Moore). (Fig. 215, d, e).

Samytha bioculata, Moore. 1906. p. 253, pl. XII, fig. 52, 53; 1908, p. 350: Hessle, 1917, p. 122.
Amage bioculata, Fauvel, 1932. p. 218.
17 thoracic setigerous segments. 13-14 abdominal uncinigerous segments. Prostomium quadrate, broader than long. Numerous cye-spots. Paleae absent. Four pairs of much crowded, slightly flattened, slender and

Fig. 215.-Lanice socialis (Willey): a, anterior part, ventral view tentacles omitted; \(b, c\), hooks, front and side view (after willey). Amage bioculata (Moore): d, e, hooks \(\times 600\) (afteı Moore). Meli. nopsis dubita (Hoagland) : \(f\), anterior part, dotsal view \(\times 5\); \(g\), seta from the 2 nd segment \(\times 350\); \(h\), hook \(\times 350\) (after Hoagland).
elongated gills. First foot with a very small tuft of setac. In the abdomen dorsal ramus reduced to a small achactous papilla, projecting from the dorsal angles of the body. Uncinigerous pinnules are compressed lappets, constricted at the base, apparently lacking cirri. Uncini roughly triangular, bearing 4-5 long, slender, acute, overlapping teeth.

Length: 9 mm .
Occurrence: Off Puri, Orissa, Bay of Bengal; 13 fms.
Distribution: North Pacific Ocean, Gulf of Georgia; India.

Genus SCHISTOCOMUS Chamberlin.
"Like Phyllocomus in lacking tentacles and postbranchial spines, in bearing fifteen pairs of fasciae of capillary setae and four pairs of branchiac. It differs from that genus in having the branchiae of two types, one pair being of the ordinary, smooth, simple, subulate form and the other three with the edges divided, two pinnately, bearing two close series of lamellar branches, and one with an essentially single series of branches in the genotype." (Chamberlin).
396. Schistocomus hiltoni Chamberlin. (Fig. 216, a-e).

Schistocomus hiltoni, Chamberlin, 1919, p. 17: Fauvel, 1932, p. 219, pl. VIII, figs. 15-19.
Body swollen and somewhat abruptly truncate in front, tapering backwards to a slender tail. 15 thoracic setigerous segments; about 32 abdominal uncinigerous segments. Prostomium projecting forwards as a single hood with rounded anterior corners, devoid of ridges and eyes. Buccal segment broad and short, concave dorsally, ventrally with a lower lip closing the mouth. Buccal tentacles absent (i). Paleae and post-branchial hooks absent. Four pairs of branchiae of two types. On the first setigerous segment, a pair of outer subulate gills and two inner pinnate gills attarhed near the middle of the dorsum. On the 2nd and 3rd setigcrous segments a broad pinnate gill on each side. On the 5 th setigerous segment a transverse, slender, whitish ridge, faintly raised. Uncinigerous pinnules from the 4th setigerous segment; in the thoracic region they bear a small papilla at their upper border; in the abdomen this process becomes cirriform and the dorsal ramus is reduced to a flattened blunt achactous lobe and a small rounded papilla. The ovate pygidium bears a crown of short cirri. Dorsal capillary setac
winged. Uncini sub-rhomboidal with 6 large curved teeth set in a single vertical row.

Fig. 216.-Schistocomus hiltoni Chamberlin: a, anterior end, vential view \(\times 8 ; b\), anterior end, dorsal view \(\times 8\); \(c\), thoracic uncinus \(\times 500 ; d\), pygidium \(\times 12\); \(e\), last thoracic and first abdominal pinnules \(\times 12\) (from Fauvel 1932).

Length: 24 mm . by 4 mm .
Colour: light yellow, with brown spots.
Occurrence: Madras Coast; 5-10 fms.
Distribution: Laguna Bay, California; Madras Coast.

\section*{Genus MELINOPSIS McIntosh.}

Differs from Melinna in the absence of hooks behind the gills and the presence of a dorsal membranous collar. 397. Melinopsis dubita (Hoagland). (Fig. 215, f-h). Melinna dubita, Hoagland, 1920, p. 624, pl. 1, figs. 13-16. Melinopsis dubita, Fauvel, 1932, p. 220.

Prostomium ending in a folded upper lip. Buccal segment largely covered by the following one; next four segments forming a collar-like structure with a prominently developed lateral region, extending obliquely from ventral to dorsal surface. First two segments marked by a row of fine setac. Third segment with similar setae ventrally and a delicate tuft of similar, but larger, capillary setae dorsally. Fourth segment with a small prominent tuft of dorsal setae, but without any ventral setae. The succeeding 13 thoracic segments with a conspicuous dorsal, cylindrical, setigerous lobe, bearing winged capillary setac. Uncinigerous pinnules from the 5th setigerous segment. Abdomen with numerous segments bearing only square uncinigerous pinnules without any process. A small dorsal globular knob. Uncini pectinate, with four lange teeth above the ligament process. Buccal tentacles of two kinds: (1) long, slender, and (2) short, thick, smooth, grooved. Four pairs of gills, stout, tapering, broad and flattened. Tube composed of a tough inner membrane and a very thick outer coating of fine mud, 140 mm . long by \(8-10 \mathrm{~mm}\). and a bore of only \(2-3 \mathrm{~mm}\).

Occurrence: Bay of Bengal 300 fms.; Laccadive Sea, 430 fms.

Distribution: Mindanao, Philippine Islands; Bay of Bengal, Laccadive Sea.

\section*{Genus MELINNA Malmgren.}

Body long, slender, tapering behind; segments numerous, 50 and more. Prostomium without glandular ridges. Buccal tentacles smooth. Four pairs of long, subulate, fasciculate gills. Paleae absent. A pair of large hooked spines behind the gills. A dorsal transverse membrane on the 6 th segment. Segments 2 to 6 coalesced in the form of a vagina partly ensheathing the mouth and the sides of the branchiae and bearing a ventral row of very fine setac. Uncinigerous pinnules from the 7th segment. Dorsal capillary setae winged. Uncini subtriangular, with a few teeth.
398. Melinna aberrans Fauvel. (Fig. 217, a-f).

Melinna aberrans, Fauvel, 1932, p. 221, pl. IX, figs. 21-26.
14 thoracic setigerous segments with dorsal capillary setae (first foot very small, rudimentary). At least 90 abdominal uncinigerous segments. Body slender, greatly tapering posteriorly. Prostomium broad, short, anterior border faintly lobed, without glandular ridges, and bear-
ing, on either side, a transverse row of many cye-spots. Buccal segment partly sheathed into the next, which forms a ventral collar decply notched in the middle. Buccal tentacles stout, smooth and few. Eight clongated, subulate, ringed gills crowded into two groups and bound together by a membrane reaching up to a third of their length; in each group they are fasciculate at the base.

Fig. 217.-Melinna aberrans Fauvel: a, anterior end, side view \(\times 12\); \(b\), anterior end. dorsal view \(\times 12 ; a\), anterior end, ventral view, tentacle and gills cut short \(\times 12\); d. sinall ventral seta from anterior segments \(\times 500\); e, postbranchial hook \(\times 200 ; f\), uncinus \(\times 700\) (from Fauvel 1932).

Segments 2 to 5 form a long groove, the lateral edges of which are raised up, and united behind the gills by a transverse membranc; the anterior margin of the membrane is convex and smooth. Scgments 2, 3, and 5 bear a transverse row of very fine, sharp, wingless ventral setac. There is also a small bundle of dorsal capillary winged setae on the 5th segment. The 4th segment bears, on either side behind the gills, a large bent hook. On the 6th segment there is a small tuft of dorsal capillary wing.
ed setae, but ventral sctae are absent. The next 12 segments bear dorsal capillary winged setac and uncinigerous tori. Uncini with a single row of 5 tecth. In the abdomen the uncinigerous pinnules are rectangular and devoid of cirriform processes. Tube membranous, cylindrical, coated with a thick layer of fine mud and sand.

Length: about 20 mm . by 1 mm .
Colourless, in spirit.
Occurrence: Vi/agapatam Harbour and Channel con. necting backwater with the sea.

\section*{Family TEREBELLIDAE Grube.}

Body divided into thorax, with dorsal capillary setac and uncinigerous tori, and abdomen, generally devoid of dorsal setae but bearing uncinigerous pinnules. Prostomium bearing filiform grooved tentacles, not retractile into the mouth. Branchiae ramose, rarely filiform or subulate, 1 to 3 pairs (or none) inserted on segments 2, 3 and 4. Paleac absent. Dorsal capillary setae generally winged, with smooth or spinulose tip. Incini avicular or pectiniform. V'entral glandular scutes or shields in the thorax. Membranaccous tube coated with sand.

Key to the genera of Tereblilidae.

\end{tabular}

Subfamily AMPHITRITINAE Malmgren.
Branchiae bushy, rarely cirriform, or wanting. Dorsal setae smooth or serrated, thoracic uncini in double rows.

\section*{Genus LOIMIA Malmgren.}

Seven thoracic bristled segments. Three pairs of arborescent gills. First segments with lateral lobes. Dorsal capillary setae winged, smooth at the tip. Uncini pectinate, opposed back to back; in double rows from the 7th to the 17th thoracic setigerous segments. Statocysts in the second segment.
399. Loimia medusa (Savigny). (Fig. 218, a-f).

Loimia medusa, Malmgren, 1865, p. 380, pl. XXV, fig. 80: Willey, 1905, p. 302, pl. Vi, figs. 155-159: Fauvel, 1914a, p. 145, pl. VII, figs. 6-9; 1932, p. 224; 1935, p. 543: Augener, 1926, p. 465: Gravely, 1927, p. 25.
Loimia annulifilis Grube, Willey, 1905, p. 301, pl. VI, figs. 153. 154: Gravely, 1927, p. 25: Augener, 1927d. p. 142.
Loimia montagui Grube, Willcy, 1905, p. 303, pl. VI, figs. 160163.

Loimia crassiflis Grube, Willey, 1905, p. 302: Michaelsen, 1892, p. 20.

Loimia variegata Grube, Willey, 1905, p. 304: Augener, 1926. p. 466, fig. 10.

Thoracic region swollen; abdomen long and slender. A large rounded foliaceous arched lip over the mouth. Lateral lobes of the first segments large and foliaceous. 3 pairs of subequal gills with numerous, slender, branches. The uncini are flat pectinate plates with \(4-5\) long curved
tecth set in a single row. Capillary dorsal setac winged, with a smooth tip, on 17 thoracic segments. About \(9-10\) ventral shiclds. Tube membranous coated with sand and debris.

Fig. 218.-Loimia medusa (Savigny): a, ventral view \(\times 3\); \(b\), abdominal hook \(\times 440 ; c, d\), thoracic hooks \(\times 440 ; c\), abdominal hook \(\times 440\); \(f\), hook, front view \(\times 440\).

Remarks: Loimia annulifilis Grube is only a colour variety often met with, the tentacles of which are ringed, with purple bands. L. crassifilis Grube, L. montagui Grube, L. variegata Grube are only varieties. The number of teeth of the uncini is not characteristic for it varies with age, size and wear.

Length: \(60-120 \mathrm{~mm}\). by \(6-10 \mathrm{~mm}\).
Colour: in life variable, grey or yellowish with dark brown transverse thoracic bands and a dark streak under the tori. Ventral shields red.

Occurrence: Burma; Andaman lslands; Bay of Bengal; Ceylon; Gull of Mannar.
F. 55

Distribution: Pacific Ocean, California, Japan, Indochina; Indian Ocean, Persian Gulf, Red Sea; Atlantic Ocean.

\section*{Genus LANICE Malmgren.}

17 setigerous thoracic segments, 3 pairs of arborescent gills. Lateral lobes on the first segments. Ventral scutes more or less fused. Dorsal capillary setae winged, with a smooth tip. Uncini avicular with transverse rows of denticles on the vertex: they are opposed back to back, in double rows, on a number of thoracic tori. Tube coated with sand.
400. Lanice socialis (Willey). (Fig. 215, a-c).

Polymnia socialis, Willey, 1905, p. 299, pl. VI, figs. 146-148.
Dorsal surface smooth and convex. The first segment, which forms the lower lip, is long below and deeply cleft, the right half slightly overlapping the left. Lateral lobe of the 2 nd segment is a semi-lunar, symmetrical, frec dermal fold. The band of ventral scutes, rounded in front, attenuate behind, ends, as a white streak, in the region of the 13 th-14th tori. Dorsal setae narrowly limbate, with a smooth tip. Thoracic uncini uniserial in the first six tori, biserial and opposed back to back in the rest, uniserial again in the abdominal pinnules. The uncini are avicular with a number of denticulations arranged in arcs across the vertex. Narrow, sand encrusted, tubes.

Length: 20 mm . by 2 mm .
Occurrence: Ceylon, Galle; 16-30 fms.
Remarks: This species is very closely allied to \(L\). conchilega (Pallas) of Europe.

\section*{Genus POLYMNIA Malmgren.}

Generally 17 thoracic setigerous segments. Eye-spots numerous. Three pairs of arborescent gills arising from a main stem. Lateral lobes in anterior segments. Well marked ventral scutes. Dorsal capillary setae smooth at the tip; they commence on the third gill-bearing segment. Uncini with an clongated base, a lateral spur and denticles above the main fang; they are set in biserial rows on a number of thoracic segments.
401. Polymnia nebulosa (Montagu). (Fig. 219, a-g).

Polymnia nebulosa, Fauvel, 1917, p. 267, figs. 28; 1927a, p. 257, fig. 89; 1930a, p. 55, 1932, p. 224.
Polymnia triplicala, Willey, 1905, p. 300, pl. VI, figs. 149-154.
Polymia trigonostoma, Augener, 1914, p. 80.
Body plump, soft, very brittle. 17 thoracic segments. \(\Lambda\) raised cephalic ridge, with very numerous, small eyespots. Upper lip well developed. Buccal segment collar shaped. Oval lateral lobes on segments 2-3. Ventral scutes wrinkled. Three pairs of gills with a sub-dichoto-

Fig. 219.-Polymma nebulora (Montagu): a, anterior part \(\times 4 ; b\), capillary bristle \(\times 150\) : \(c\), uncinus from the 2 nd segment \(\times 400\); d, double row \(\times 150\); e, \(f\), uncini trom a double row, front and side view \(\times 400 ; \mathrm{g}\), abdominal uncinus \(\times 400\).
mously divided large stem. Nephridial papillae from 3rd to 8 th segment. Uncini with an elongated convex base, a process for a ligament, a main fang, two large teeth and 1-5 small denticles on the vertex. Tube of shell frag. ments and dèbris.

Length: 5-150 mm. by 8-8 mm.

Colour: in life orange grey, pink or brown, with small white dots. Uncoloured in spirit.

Occurrence: Gulf of Mannar, Pamban Island, Ceylon, Andaman Islands, Maldives, Nicobars.

Distribution: Pacific Ocean; Indian Ocean, Persian Gulf, Red Sea; Atlantic Ocean, Mediterrancan Sea.

\section*{Genus NICOLEA Malmgren.}

15-25 thoracic setigerous scgments. Eyes present. Two pairs of ramose gills. The first segments do not show lateral lobes. Ventral scutes. Dorsal capillary setae smooth at the tip. Uncini from the 2nd setigerous segment; they are avicular with transverse rows of denticles on the vertex and are set in uniserial, alternate or semiopposite, rows on a number of thoracic segments. Tube membranous, coated with sand.
402. Nicolea gracilibranchis (Grube). (Fig. 220, d).

Nicolea gracilibranchis, Marenzeller, 1884, p. 207. pl. II, fig. 2: Hessle, 1917, p. 173: Fauvel, 1930a, p. 56, 1932, p. 29,.
Terebella gracilibranchis, Grube, 1878, p. 230; pl. XII, lig. 6.
Two pairs of gills. 17 thoracic setigerous segments with smooth capillary setac and very projecting abdominal pinnules, whose uncini are bidentate above the main fang. The eyes are hidden under the cephalic folds. The posterior lip is bilobed. The anterior segments have not lateral lobes. There are \(14-15\) ventral scutes. On the segment before the first setigerous lies a small papilla behind the second gill. Nephridial papillae are conspicuous on the 3rd and 4th setigerous segments.

Length: 70 mm .
Occurrence: Singapore; Madras Coast, Gulf of Mannar, Tuticorin, Pamban.

Distribution: Hawaii; Japan; Philippine Islands; India.

\section*{Genus TEREBELLA Linnacus.}

Dorsal capillary setae on a very large number of segments, commencing on the 4th segment (3rd gill-bearing) ; they are winged, with a serrated tip and often of two kinds. 2 or 3 pairs of arborescent gills. Lateral lobes on the first segment absent. Ventral scutes. Uncini from the 2 nd setigerous segment, set in biserial opposite rows on a large number of segments.
403. Terebella ehrenbergi Grube. (Fig. 220, a-c).

Terebella ehrenbergi, Grube, 1870, p. 511: Gravier, 1906, p. 213, pl. IV, fig. 224-225: Hessle, 1917, p. 188: Fauvel, 1930a, p. 55; 1992, p. 226; 1939, p. 553.
Leprea ehrenbergi, Marenzeller, 1884, p. 201, pl. I, fig. 3.
Leprea inversa, Willey, 1905, p. 297, pl. VI, figs. 141-142, pl. VII fig. 197.
Eyes conspicuous. Three pairs of gills. 13 ventral scutes. The dorsal setac are absent in the last segments. Posterior bristles with broadly winged tips minutely pectinate and spirally twisted. Uncini biserial with 2-3

Fig. 220.-Terebella ehrenbergi Grube: \(a\), gill; \(b\), dorsal capillay bristles; c, hooks, side and front view (after Gravier). Nicolea gracilibranchis (Grube) : d, thoiacic hook (after Marenzeller).
main teeth above the fang and 2-3 rows of small denticles. Nephridial papillae long on segments 3, 6, 7 and 8, short and little conspicuous on segments \(9,10,11\) and 12. The nephridial papilla between the 1st and 2nd pair of gills is long and crect.

Length: \(\quad 30-40 \mathrm{~mm}\). by 2.5 mm .
Colour: in life, pink tentacles with pigment streaks or annular bands.

Occurrence: Diamond Island, Burma; Port 13lair, Andaman Islands; Gulf of Mannar, Krusadai, Pamban, Rameswaram, Kilakarai.

Distribution: Japan, China Sea; Andaman Sea, Gulf of Mannar, Red Sea.

\section*{Genus PISTA Malmgren.}

Thorax with 15-17 setigerous segments. Eyes sometimes present. One, two, or three pairs of bushy gills with a stout main stem. Lateral lobes often very conspicuous on the first segments. Distinct ventral scutes. Dorsal capillary setae with a smooth tip (very exceptionally serrated). Uncini from the 2nd setigerous segment; those of the first segments with a long process or shaft.

\section*{Key to the species of Pista.}
1. Dorsal setae serrated .. indica Fauvel, p. 422.

Dorsal setae smooth
2. Gills forming whorled tufts .. typha Grube, p. 424.

Gills arborescent
3. Uncini of the first segments with a stout inferior shaft
Uncini of the first segments with a slender process
4. Shaft of the uncini of the first segment very broad
. robustiseta
-Shaft of the uncini of the first segment more slender
5. Gill divisions few and very thick

Gills densely ramified
6. Uncini of the first two uncinigerous segments differing from the following
Uncini of the first two uncinigerous segments not unlike the following

macrolobata Hessle, p. 426.
404. Pista indica Fauvel. (Fig. 221, a-d).

Pista indica, Fauvel, 1940, p. fig. 1.
Body rather short and plump, abdomen cylindrical, with numerous short segments crowded together. 16
thoracic setigerous segments. Prostomium with an eyeless lobe bearing long, and rather thick, grooved tentacles. Buccal segment expanded into a dorsal arched lip. Obsolete lateral lobes on segments 2 and 3. 8-9 ventral scutes. Three pairs of bushy gills, all about the same size. Pygidium without papillac. Dorsal setae capillary with narrow wings and a finely serrated tip. Uncini from the 2nd setigerous segment. The first four uncinigerous tori

Fig. 221.-Pista indica Fauvel: a, anterior part, side view, tentacles cut of \(\times 10 ; b\), thoracic bristle \(\times 400 ; c\), thoracic hooks \(\times 160\); \(d\), uncini \(\times 520\).
short, with a transverse row of big, long, brown hooks with smooth tips. On the two following tori a single row of small avicular uncini; next, the succeeding thoracic and abdominal segments bear two alternating rows.

Length: \(15-20 \mathrm{~mm}\). by \(2-2.5 \mathrm{~mm}\).
Decoloured, in spirit.
Occurrence: West Narrakal, Cochin State; Chepparam, Cheriya Kamakakudi, Emakulam Backwater (17 specimens).

Remarks: With the exception of the serrated dorsal setae all the characters are those of the genus Pista.
405. Pista typha Grube. (Fig. 222, a-c).

Pista typha, Caullery, 1915, p. 77: Hessle, 1917, p. 155: Augener, 1927a, p. 154, fig. 17: Fauvel, 1932, p. 226, fig. 36.
Terebella (Pista) typha, Grubc. 1878, p. 232, pl. XII, fig. 4.
17 thoracic setigerous segments. Two pairs of unequal gills with a long stem and an oval whorled tuft of filaments. Semicircular lateral lobes on the 2nd and 3rd

Fig. 2es.-Psta typha Grube: a, hook from the 2ud uncinigenwus segment \(\times 500 ; b\), hook from the 7 th setigetous segment \(\times 500\); \(c\), abdominal hook \(\times 500\).
segments. Uncini of the first segments with a long and slender basal shaft. Rather long nephridial papillae are conspicuous on the 3 rd and 4th setigerous segments.

Length: 45 mm .
Occurrence: Bay of Bengal, Sandheads, Gangetic Delta; Laccadive Sea.

Distribution: Japan, Philippine Islands, Malayan Seas, South Australia; Bay of Bengal, Laccadive Sea.
406. Pista robustiseta Caullery. (Fig. 223, a-e).

Pista robustiseta, Caullery, 1915, p. 71, fig. 1A: Hessle, 1917, p. 159: Fauvel, 1932, p. 227, fig. 37.

17 thoracic setigerous segments. Eye-spots present. Two pairs of arborescent gills with stout stems. Conspicuous lateral lobes on the first three segments. Uncini of the first segments with a stout, broad and long shaft, becoming more slender in the following ones. About 1419 ventral scutes.

Length: \(\quad 20-30 \mathrm{~mm}\).
Occurrence: Gulf of Oman, 609 fms .
Distribution: Japan; Malayan Sea; Gulf of Oman.

Fig. 229.-Pista robustiseta Caulley \(a, b\), hooks from the first uncinigerous segment \(\times 210 ; ~ c\), hook from the 3 ird uncinigetous segment \(\times 210\); d, thoracic hook \(\times 210\); e, abdominal hook \(\times 210\).

408. Pista macrolobata Hessle. (Fig. 225, a-d).

Pista macrolobata, Hessle, 1917, p. 157, pl. II, figs. 4, 36; Fauvel, 1932, p. 229, fig. 39.
17 thoracic setigerous segments. Eyes absent. Two pairs of arborescent gills. Large lateral lobes on the buccal segment sheathing the head. Lateral lobes on the 3rd and 4 th, none on the 2 nd. \(17-20\) rectangular ventral scutes. All the thoracic uncini avicular, with iery slender processes. Nephridia in 3rd, 6th and 7th segments. Abdominal pinnules elongated, rectangular and protruding.

Length: 70 mm . by 4-5 mm.
Occurrence: Tor, Sinai Peninsula.

Distribution: Japan; Red Sea.

IG. 225.- Piva macrolobata Hessle: a, hook from the first uncinigerous segment \(\times 380\); b, hook from the 2nd uncinigerous segment \(\times 980\); c. hook from the 15th uncinigerous segment \(\times 980\); \(d\), abdominal hook \(\times 980\)
409. Pista herpini Fauvel. (Fig. 226, \(a-h\) ).

Pista herpini, Fauvel, 1928, p. 160, fig. 2, \(a-h ; 1930 a, ~ p . ~ 57, ~ f i g . ~\) 16, \(a-h ; 1932\). p. 230.
Body narrow, slender, clongate, slightly swollen anteriorly. 17 thoracic setigerous segments. Prostomium large, without lateral folds. Eye-spots absent. Buccal segment expanded into two rounded lobes encompassing the protomium and united ventrally by a fold ending in a notched lower lip. Second segment short, with a ventral transverse ridge, but without marked lateral lobes. On the 3 rd segment two large, flattened, rounded lobes pointing forwards, or bent backwards. There are no lobes on the 4th segment (first setigerous). The \(15-17\) ventral shiclds are somewhat fused with the tori. Two pairs of branchiae, which may be either bushy or divided on a single plane; they are often borne on long stalks, the first pair being the larger. Nephridial papillae inconspicuous. Pygidium with terminal anus surrounded by short papillac. Dorsal setae capillary, broadly winged at the end, with a short smooth tip. The uncini are in a single row on the first six uncinigerous segments, double-alternating in the ten following (from the 7 th to the 16th) uncinigerous or to the last thoracic (17th setigerous); behind that in a single
row. Uncini avicular with a broad base, a small ligament, a transverse row of 3-5 teeth and 2-3 rows of small denticles above the main fang. The uncini of the first two uncinigerous segments have a long narrow, faintly chitinised

Fig. 226.-Pista herpini Fauvel : \(a, b\), anterior region, ventral and side view \(>6 ; c, d\), capillary setac \(\times 160 ; e, f\), uncini from the first uncinigerous segment \(\times 320 ; g, h\), thoracic uncini, front and side view \(\times 320\). Lysilla pambanensis Fauvel \(: i\), ventral side, contracted, most of the tentacular cirr fallen off \(\times 6 ; k\), anterior region, ventral side, much swollen, showing nephridia through the integument \(\times 16 ; 1\), posterior region \(\times 6\).
process. Tendinous processes (soies de soutien) in the abdominal tori, which are rectangular pinnules standing out boldly. Tube membranaccous, cylindrical, with a coating of sand, fragments of shells and algac.

Length: \(10-15 \mathrm{~mm}\). by 2 mm.
Colour: Tentacular cirri white.
Occurrence: Gulf of Mannar, Pamban; Persian Gulf.
410. Pista pachybranchiata Fauvel. (Fig. 227, a-f).

Pista pachybranchiata, Fauvel, 1932, p. 231, pl. IX, figs. 1-6.
Body cylindrical, not swollen anteriorly, abdomen very long. 17 thoracic setigerous segments. Prostomium rather small, without lateral folds. A narrow streak of very small dark eye-spots. Buccal segment expanded into two large
rounded lobes encompassing the prostomium. On the 3 rd segment, two rounded lobes. There are no lobes on the 4 th segment (first setigerous) \(15-18\) ventral scutes, first rectangular, then hexagonal. Uncinigerous tori rather short. Two pairs of gills with few branches, very thick, subulate, simple or furcate; the second pair is slightly the smaller. Nephridial pores on 3rd, 4th and 5th setigerous segments. Uncini in a single row on the anterior uncini-

Fig. 227.-Pista pachybranchiata Fauvel: a, left gill of 2nd pair \(\times 10\); \(b\), right gill of 2 nd pair \(\times 10 ; c\), anterior end, ventral view \(\lambda ;\); d, uncinus from 2nd uncinigerous segment \(\times 400 ; e\), abdominal uncinus \(\times 400 ; f\), uncinus from 9 th uncinigerous segment \(\times 400\).
gerous segments, double-alternating on the succeeding ones of the thorax. Uncini avicular, with a broad base, numerous transverse rows of small teeth above the main fang. They are hardly different from those of the first seg. ments, and have only a very slender, faintly chitinised, basal process. The abdominal tori are small rectangular pinnules. Dorsal setae capillary, long, slender, with a single wing, appearing finely serrated under a high magnification. Pygidium? Tube?

Length: \(100-120 \mathrm{~mm}\). by \(4-5 \mathrm{~mm}\)., feet not included, \(6-6.5 \mathrm{~mm}\). if setae included.

Colourless, in spirit.

Occurrence: Lacadive Sea, 1,150-1,170 fms.
Remarhs: This species is an intermediate link between Amphitrite O. F. Müller and Pista Malmgren.

Subfamily THELEPINAE Hessle.
Branchiae filiform. Uncini in simple rows.

\section*{Genus THELEPUS Leuckart.}

Dorsal setae on a large number of segments. Two or three pairs of filiform gills, each in a transverse series. Numerous cye-spots. No lateral lobes on the first segments. Uncini commence on the 9 rd setigerous segment: they are always in a single row.

Key to the species of Thelepus.
1. Two pairs of gills .. cincinnatus Fabicius. 1. 431.
Three pairs of gills
2
2. Abdomen tapering: pimule, square and projecting
Abdomen smooth, swollen, ablruptly decreasing; pinnules small, lacking in the posterior part of the tail
setosus.
Quatrefages.
plagiostoma
Schmarda, p. 430.

Remarks: The cosmopolitan Th. setosus (Quatrefages) has not as yet been recorded from India, but it exists in the Red Sea and in Indochina. It differs chiefly from plagiostoma Schmarda in the condition of the posterior part of its abdomen. It is next to impossible to distinguish specimens when the tail is wanting; otherwise both species are easily discriminated.
411. Thelepus plagiostoma Schmarda. (Fig. 228, a-f).

Thelepus plagiostoma Schmarda, Augener, 1914, p. 95 (Syno. nymy): 1926a, p. 239: Fauvel, 1919, p. 455, fig. 10; 1932, p. 233.
Thelepus rugosus, Ehlers, 1901, p. 211; 1904, p. 59; 1908, p. 146.
Thelepsus japonicus, Marenzeller, 1884, p. 12, pl. 11, fig. 4.
Thelepus crispus, Johnson, 1801, p. 428, pl. XVII, fig. 175-179.
Three pairs of filiform gills. Posterior part of the body generally swollen, but abruptly tapering to the pygidium. Dorsal sctae nearly to the end of the body. Posterior segments very short, densely crowded, nearly smooth, and lacking uncini. Abdominal pinnules small,
not projecting. Uncini with a transverse row of two teeth above the main fang, and a basal knob.

Length: \(100-180 \mathrm{~mm}\). by \(8-10 \mathrm{~mm}\).
Colour: brown or reddish.

Fig. 228.-Thelepus plagiostoma Schmarda: \(a, b\), dorsal bristles \(\times 140\); \(r\), \(d\), two uncini from one foot \(\times 330\); \(e, f\), uncini, front view.

Occurrence: Malacca Strait.
Distribution: Chile, California, Japan, New Zealand, Australia; Indian Occan.
412. Thelepus cincinnatus (Fabricius).

Thelepus cincinnatus, Hessle, 1917, p. 212: Fauvel, 1927a, p. 271, fig. 95, \(i-m\) (Symonymy); 1932, p. 233. fig. 46.

Two pairs of filiform gills. Abdomen long, gradually tapering, often coiled. Eye-spots numerous. Ventral scutes indistinct. Dorsal setae sometimes nearly to the end of the body. Abdominal pinnules rectangular, pro-
truding. The uncini have, above the main fang, a transverse row of two rather large teeth, a median tooth and often two small denticles. The basal knob is more or less enlarged at the tip (variable). Pygidium crenate.

Length: \(100-200 \mathrm{~mm}\). by \(5-10 \mathrm{~mm}\).
Colour: brown, pink or orange-yellow. Gills red.
Occurrence: Port Blair, Andaman Islands.
Distribution: Japan; Andaman Islands; Atlantic Ocean, Mediterranean Sea.

\section*{Genus STREBLOSOMA Sars.}

\section*{Grymaea Malmgren: Eugrymaea Verrill.}

Two or three pairs of clusters of filiform branchiae. Smooth-tipped dorsal setae commencing from the 2nd segment (first branchiferous) and extending to the abdominal region. Uncinigerous tori commencing on the 7 th setigerous segment. Uncini avicular, uniserial.

Key to the species of Streblosoma.
Abdominal pinnules sessile .. cespitosa Willey. p. 433.
Abdominal pinnules standing well out .. persica Fauvel, p. 432.
413. Streblosoma persica (Fauvel). (Fig. 229, Fig. 230, \(c-m)\).
Streblosoma persica, Fauvel, 1930a, p. 58.
Grymaea persica, Fauvel, 1911, p. 419, pl. XX, figs. 35-43.
Prostomium rounded, with a transverse row of eyes. Tentacles few, long, stout, grooved. Three pairs of gills, each of numerous simple, coiled filaments. Smooth-tipped capillary setae on nearly all the segments. First foot on the first branchial segment. Tori from the 4th setigerous segment. Uncini avicular, in single rows, retrogressive, with several rows of denticles on the vertex and a knol, at the end of the manubrium. Abdominal pinnules standing well out. \(20-25\) ventral biannulate scutes.

Length: \(\quad 30-40 \mathrm{~mm}\). by \(2-2.5 \mathrm{~mm}\).

Occurrence: Gulf of Mannar, Krusadai Island, Pamban.

Distribution: Gulf of Mannar; Persian Gulf.

Fig. 299.-Streblosoma persica (Fauvel): side view \(\times 10\).
414. Streblosoma cespitosa (Willey). (Fig. 230, a, b).

Grymaca respitosa, Willey, 1905. p. 305, pl. VII. figs. 164. 165; Fausel. 1919. p. 457.
(f) Phenacia exilts Grube, Michaclsen, 1892, p. 20.

Prostomium with eyes. Tentacles stout, plainly grooved. Branchial filaments numerous, forming dense coils. Dorsal setae narrowly limbate. First foot rather large, on the first branchial segment. Uncini from the 4th setigerous segment; they are avicular with a button-like knob on the end of the manubrium. The thoracic tori graduate insensibly into the abdominal tori which are sessile. not pinnuliform. The dorsal capillary setae are absent on the posterior half of the body.
F. 57

Length: 30 mm . by \(3-4 \mathrm{~mm}\).
Occurrence: Ceylon.
Distribution: India, Persian Gulf, Red Sca.
Subfamily POL.YCIRRINAE Malmgren.
Cephalic lobe very large, foliaceous, bearing numerous grooved tentacles. Branchiae absent. Ventral scutes paired and narrow. Dorsal setae capillary, smooth or serrated.

\section*{Genus POLYCIRRUS Grube.}

Branchiac absent. Cephalic tentacles very long, very numerous, filiform or swollen at the tips. Number of thoracic segments very variable. Uncini elongated toothed plates, all alike or of two kinds. Ventral scutes square, paired. Eyes absent. Nephridia well developed. Cinculatory apparatus absent.
415. Polycirrus coccineus Grube. (Fig. 230, n-y).

Polycirtus coccineus, Fauvel, 1919, p. 458, pl. XI; 1931a, p. 59. Anisocurus dectpiens, Gravier, 1906, p. 22\%, pl. V, fig. \(233-238\).

Fig. 230.-Sireblosoma respitosa Willey: a, anterior end, side view \(b\), hook (after Willey). Str. persica Faurl: c, d, e', hooks, sule and front view \(\times 400 ; f\), dorsal flattened bristle \(\times 168 ; k, h\), winged dorsal bristles \(\times 168 ; i, k, l, m\), hooks, side and homt view \(\times 400\). Polycirrus coccineus Grube : \(n\), tip of a capil lary bristle \(\times 248\); \(o\), thoracic hook \(\times 400 ; p, q\), abtominal hooks, side and front view \(\times 400\).

Tentacular cirri very numerous, entangled, more or less enlarged at the tip into a tongue-shaped process. 16 -20 thoracic setigerous segments bearing boldly seirated bristles. Thotacic uncini on the last thoracic segments, avicular with a broad short base. Abdominal uncini with a nanow elongated base.

Length: (i0-80 mm.
Colour: Tentacular cirri yellow.
Occurrence: (iulf of Mannar, Pamban, Krusadai Island.

Distribution: India, Persian Gulf, Red Sea.
Cenus LYSILLA Mahngren.
Branchiae absent. Dorsal setae capillary, very small. U'ncini absent.
416. Lysilla pambanensis Fauvel. (Fig. 226, \(i-l\) ).

I ysilla pambunensis, Fauvel, 1928, p. 162, fig. 2. i-l: 1930a, p. :59, fig. 16, \(i-6\).
Body often much swollen anteriorly, ventral side convex, dorsal concave; posterior region narrow, cylindrical. In the anterior region the skin is covered with small papillac, glandular, sounded, hemispherical or flattened and often little conspictous. In the posterior region the supeafial rings are often very distinct, even nearly monilitorm. There are 13-18 thoracic segments bearing dorsal sctac. I wide, frilled, prostomial lobe, eye-less and bearing numerous tentacular cirri, some cylindrical slender, panally twisted, others much stouter, strongly enlaged at the tip and grooved. A prominent upper lip, hoillowed, spoon like. A small triangular fleshy knob under the lowe lip. First segment as a large \(Y\)-shaped pad with bent cdges. The ventral shields are short, narrow, spuate, sunk intes a vental groove. They are not visible when the thonacic region is much swollen. Small pointed nephridial papillae on the three finst setigerous segments, sometimes on the next seven; a swelling with a small central spot (nephridioporc?) is visible on the base of the foot. It appears to have 8-9 pairs of nephridia, the first 4-5 pairs. often visible through the transparent teguments, being short and oval. The dorsal capillary setae, very slender and smooth, noticeably emerge from the long cylindrical foot which is slightly enlarged at the tip. Tori and uncini are utterly wanting, as well in the abdomen as in the thorax. Anus terminal, without papillae.
\[
\text { Lengtl:: up to } 90 \mathrm{~mm} \text {. and more, by } 2 \mathrm{~mm} \text {. }
\]

Colour: in spirit, yellowish-white, more or less closely dotted with rusty brown. Tube unknown.

Occurrence: Pamban, Rameswaram.
Subfamily CANEPHORINAE Malmgren.
A single branchia, quadripartite, pectinated. Ventral scutes absent. Dorsal setac smooth or striated. Uncini of two kinds.

\section*{Genus TEREBELLIDES Sars.}

Cephalic lobe rounded-ovate with a dense series of grooved tentacles. A single dorsal gill with four pectinate divisions. Dorsal setae long, tapering and winged. Uncini uniserial, of two kinds: (1) elongated, acicular, thoracic; (2) pectiniform, abdominal.
417. Terebellides stroemi Sars. (Fig. 231, i-q).

Terebellides stroemi, Malmgren, 1865, p. 396 , pl. XX, fig. 48. Augener, 1926, p. 343: Fauvel, 1927a, p. 291, fig. 1\%. i-q (Synonymy); 1932m, p. 234.
Terebellides ypsilon, Grube, 1878, p. 241, pl. XIII, fig. 6.

Fig. 231-TTerebellides stroemi Sars: \(i, k\), anterior region, side and ventral view \(\times 8 ; h, l, m, n\), uncini, side and front view \(\times 600 ; 0\), ventral thoracic hook \(\times 400 ; p\), kneed acicular bristle from the 6 th segment \(\times 150 ; \mathrm{g}\), dorsal bristle \(\times 150\).

Terebellides intoshi, Caullery, 191:5, p. 111, fig. 1.
(弓) Terebellides sieboldi Kinberg, Ehlers, 1904, p. 61.
Aponobranchus perrieri, (iavier, 1906, p .232, pl. V, figs. 239242.

Body rather short, 50-60 segments. 18 thoracic setigerous segments. Eyes absent. A single gill, with a stout stem bearing four pectinate lobes with reniform lamellac. It is inserted on segments 3-4. Segments 3 to 6 have, ventrally, a free anterior border. Dorsal setae commence on the 3rd segment. Lincini of the 6th setigerous segment are long, acicular, geniculate, unidentate hooks; those of the next twelve segments end in a blunt tip with small denticles above. Abdominal uncini avicular, with a short base and transverse lows of teeth above the main fang. Abdominal pinnules distinct. Tube membranous, coated with mud.

Remarks: The peculiar gill assumes very different appearances according to the more or less contracted condition of the organ, depending on preservation or regeneration (it is sometimes easily deciduous).

Length: \(30-60 \mathrm{~mm}\). by \(2-8 \mathrm{~mm}\).
Occurrence: Banka Strait; Andaman Islands; Off Ikyab, Burma; Bay of Bengal; Ganjam Coast, Madras Coast; Laccadive Sca.

Disthbution: Pacific, Indian and Atlantic Oceans; Mediterranean Sea, Arctic and Sub-Antarctic Oceans.

Incertae sedis
418. Polymnia labiata, Willey, 1905 , p. 298, pl. VI, fig. 143-145.
The figures of the uncini are more sugestive of a Pista than of a Polymnia but the description of the unique specimen is too incomplete for an accurate identification.

Oc,urrence: Trincomalee Pearl banks.
419. Physelia viridis, Schmarda, 1861, p. 41, pl. XXV, hig. 201: from Ceylon, is perhaps a Loimia (?).
420. Neottis gracilis, Kinberg, 1855.

From Singapore: is very likely a Thelepus or a Streblosoma.

\section*{Family SABELLIDAE Malmgren.}

Body somewhat cylindrical or slightly flattened; divided into two regions: (1) thoracic consisting of a few segments, with dorsal capillary setae and ventral uncini-
gerous tori, and (2) abdominal, much longer, with dorsal uncinigerous tori and ventral capillary sctae. Ventral glandular shields divided by a longitudinal groove. First segment with a more or less developed, entine or notched, collar. Gills forming a funnel surrounding the mouth, they are composed of two semi-circular, or spiral, lobes bearing a number of filaments or radioles, with two rows of barbules. Operculum absent. Tube fommed of mucus, or membranous, or horny.

Key to the genera of Sabflididae.

Eurato ponifera, Willey, 1905, p. 309, pl. VII, figs. 1-3.
Branchial fan well developed. At the base of the gills four stout, brown, glandular lobes form pads of a sery peculiar kind. Body broad and short, bearing between the two divisions of the feet small eye-spots, occasionally wanting.

Length: 60-80 mm. by \(7-8 \mathrm{~mm}\).
Colour: Body pink, gills pale, streaked with brown.
Ocrurrence: Andaman Islands; Ceylon.
Instribution: Australia: Indian Occan, Red Sca.
422. Sabella melanostigma Schmarda. (Fig. 232, \(h-n\) ).

Sabella guinenss, Augenci, 1918, p. Bi. , pl. VII, figs. 247--249.
Branchial filaments with several pairs of cyes on the donsal side. Collar low, erect, broadly notched on the dorsal side. The ventral groove is missing or hardly cons-
picuous in the posterior part. A big, dark purple spot above cither parapodium. Pickaxe setae very peculiar, ending in a very thin, transparent membrane curved in the shape of a shovel or coal scuttle.

Fig. 232.-Sabella porifera Grube: \(a, b\), anterior region, dorsal and ventral view, enlarged: \(c\), pick-axe seta (after (iravier); d. dorsal thoracic bristle \(\times 80\); \(f\). thoracic hook \(\times 160\). S. melanostigma Schmarda: \(h\), anterior part. dorsal view (after Mclntorh);
\(i\), thoracic hook \(\times 170 ; k\), \(l\), shovel pick-axe setac quarte and front view \(\times 400 ; m, n\), thoracic bristles \(\times 120\).

Length: \(100-150 \mathrm{~mm}\).
Colour: in life, gills with violet brown stripes. Body greenish, thoracic tori lined with a violet or purple streak.

\section*{Occurrence: Port Blair, Andaman Islands.}

Distribution: Pacific Ocean, Japan, Malaysia; Andaman Islands; Atlantic Ocean, West Indies; Gulf of Guinea.

\section*{Genus SPIROGRAPHIS Viviani.}

Branchial lobes asymmetrical, one semi-circular, the other spirally coiled. Branchial filaments devoid of eyes and dorsal stylodes. Thoracic dorsal setae capillary, winged. Ventral thoracic tori with avicular uncini and pick-axe-shaped setac. Dorsal abdominal uncini avicular: ventral setae capillary, winged. A quadrilobate collar. Tube membranous coated with fine ooze and algae.
423. Spirographis spallanzanii Viviani. (Fig. 233, \(a-l\) ).

Spirographis spallanzanii, Fauvel, 1927, p. 309, fig. 105, a-h:
Johansson, 1927, p. 133 (Synonymy).
Spirographis tricyclia, Schmarda, 1861, p. 37, pl. XXIII, fig. 193.
Body cylindrical, abruptly tapering behind. Branchial lobes very unequal; one is circular and the other 2-6 times spirally coiled. Two short slender grooved palps.

Fig. 233.-Spirographis spallanzanii Viviani: \(a\), with branchial tuft expanded; b. \(\quad\), anterin region, dorsal and ventral view \(\times\) 응 (after Soulier): \(d\), e, thoracic dorsal bristles \(\times 185 ; f\), abdominal capillary bristle \(\times 185 ; \mathrm{g}, \mathrm{h}\), pick-axe setae \(\times 132\); \(i\), thoracic uncinus \(\times 185 ; k, l\), abdominal uncini \(\times 18\). .

Collar with two dorsal lobes and two ventral ones, thick and tumed down. Pygidium with two small rounded papillac. Tube tough, erect.

Length: \(\quad 200-300 \mathrm{~mm}\). by \(8-10 \mathrm{~mm}\).
Colour: very variable. Gills more or less streaked. Body brown.

Occurrence: Ceylon.
Distribution: Indo-China, Malay Archipelago; Indian Ocean, India; Atlantic Ocean, Mediterranean Sea.
F. 58

\section*{Genus DASYCHONE Sars.}

Body short. Both branchial lobes equal. Dorsal stylodes (appendages) on the branchial filaments, which also bear paired eye-spots. Subterminal eyes absent. A collar. Pickaxe-shaped setae absent. Abdominal dorsal uncini avicular and ventral setae winged.

Key to the species of Dasychone.

424. Dasychone cingulata Grube. (Fig. 931, f-h).

Dasychone cingulata, Willey, 1905, p. 308, pl. WII. figs. 170-173: Augener, 1914, p. 122 (Synonymy): Faucl, 19301, p. 1932, p. 236.

Branchiomma cingulata. Johausson. 1927, p. 61.
Branchial lobes equal, semi-circular, not spiral, Gillfilaments with paired dorsal, long and slender, stylodes and pairs of small eyes. Lateral eye-spots between dorsal and ventral rami.

Length: \(\quad 10-30 \mathrm{~mm}\). by \(2-3 \mathrm{~mm}\).
Colour: Body with scattered dark spots.
Occurrence: Burma coast, Mergui; Andaman Islands; Gulf of Mannar, Pamban.

Distribution: Pacific Occan; Indian Occan, Arabian Sea, Persian Gulf, Red Sea.
425. Dasychone serratibranchis Grube. (Fig. 294, i).

Dasychone serratibranchis, Grube, 1878, p. 262, pl. XIV, fig. 7: Ehlers, 1907, p. 28: Augener, 1926a, p. 257: Fauvel, 1939, p. 236.

Branchial lobes equal, semi-circular, not spiral. Dorsal stylodes short, appressed, appearing as sinall triangular serrations of the branchial filaments. A few paired branchial eye-spots. Body with lateral cye-spots.

Length: \(15-30 \mathrm{~mm}\). by 2-3 mm.
Colour: Gills with white, yellow and purple bands.
Occurrence: Mergui; Andaman Islands; Pamban.

Distribution: Philippine Islands, Indochina, NewZealand, Australia; India.

-ig. 234 - Rranchomma pacificum (Johansson): a. gill-tip, with cyes; b, thonacic hook \(\times 295\); r. pick-ave seta 6.60 ; d, thoracic bistle \(\times 99\), after Johansson). Br. intermedium Beddard: \(e\), top of gill. with cee after Beddard). Dasychome cingulata Gube: \(f\), phition of a gill's tadnole. with eyes and sylodes; \(g\), dorsal thoracic hivle: h. thonaci hook (after Willey). D. serratibranchus Grube: 1 , patt of a gill's radiole with stivlodes.

\section*{Genus BRANCHIOMMA Kölliker.}

\section*{Megalomma Johansson.}

Body elongated. Branchial lobes symmetrical, semicircular, not spiral. Banchial filaments destitute of dorsal stylodes. Subterminal compound eyes. A two- or four-lobed collar. Capillary setae winged. In the thorax avicular uncini and pickaxe-shaped setae. Tube coated with sand.

Key to the species of Branchiomma.
Collar low and very slanting. A double fold overlying the eyes near the tip of the gills .. intermedium

Beddard, p. 4.4.
Collar high, hardly slanting; tip
of the gills without any fold pacificum
(Johanswon). p. 44.
426. Branchiomma pacificum (Johansson). (Fig. 234, \(a-c\) ).
Megalomma pacifica, Johansson. 1927, p. 130, fig. 151.
Branchiomma pacificum. Fauvel, 1932, p. 237.
(?) Branchiomma quadrioculatum. Willey, 1905, p. 307, pl. VII, figs. 168-169.
(?) Branchiomma acrophthalmos Grube, Willey, 1905, p. 306, pl. VII, figs. 166-167.

Eight thoracic segments with short, elongated, narrowwinged dorsal setae, avicular uncini with a tather long base and pickaxe-shaped setae. Abdominal capillary setac slightly broader than in the thorax, but not paleac-like (in adult specimens; palcac-like in the very young). Collar hardly slanting: dorsal lobes rather low; ventral lobes higher with two lateral and a median deep notches. Subterminal eyes very large, encircling about half of the filament and appearing as double eyes.

Length: \(20-30 \mathrm{~mm}\). by 2 mm .
Occurrence: Moscos Islands, Burma; Ceylon (弓) .
Distribution: Gilbert Islands, Pacific Ocean; Moscos Islands, India (?).

Remarks: Very close to B. vesiculosum (Montagu) from Europe and very likely conspecific.
427. Branchiomma intermedium Beddard. (Fig. 293, e).

Branchiomma intermedium, Beddard, 1887, p. 261, pl. XXI, figs. 4-7: Fauvel, 1932, p. 237.
Eight thoracic setigerous scgments with long and short, narrow-winged, dorsal setae, avicular uncini and pickaxe-shaped setac. Abdominal capillary setae hardly broader, not enlarged into paleac-like structures. Collar very low and slanting to the 3rd setigerous segment. Branchial lobes bornc on long stalks marked with a dark stripe. Gill filaments with a single subterminal cye. Towards the extremity there is a double fold, just overlying the eyc. Tube of considerable thickness, coated with mud and broken shells.

Length: 100 mm .
Colour: pale brown, gills darker.
Occurrence: Paway Island, Mergui Archipelago.
Distribution: Mcrgui Archipelago.

\section*{Genus SABELLASTARTE Krôyer.}

Branchial lobes symmetrical. Branchial filaments destitute of dorsal stylodes. Capillary setae winged, not paleae-like. In the thoras, only ventral avicular uncini; pickaxeshaped setae absent. In the abdominal region, dorsal avicular uncini and ventral capillary setae.
428. Sabellastarte indica Savigny. (Fig. 235, a-h).

Saliellastante indira, Augener, 1914, p. 115, pl. I, fig. 20 (Synon\my): Pluvot, 1930. p. 85. pl. 11, figs. 39-50: Fauvel, 1932, p. 238: Mono. 1931, p. 45.

Eurato notata, Willey, 1905, p. 310. pl. VII, figs. 174-175.
Eurato sancti-josephi, Gravier, 1903, p. 105, pl. VII, figs. 281-283.
Sabella pottaei, Quatrefages, 1865, p. 436.
(i) Sabella melanochlora, Schmarda, 1861.

Body lange, stout, dark. About 8 thoracic segments with dorsal capillary setae, all similar with a narrow wing, and ventral avicular uncini; pickaxe-shaped setae absent. Abdominal ventral setae with a broader wing. Collar well developed, with two dorsal lobes and a ventral lobe ending in two processes. Gill-filaments numerous and densely crowded, eyeless, and without dorsal stylodes. It differs from Sabella chiefly in the absence of pickaxe-shaped bristles in the ventral thoracic tori and by its wery numerous and thickly crowded gill-filaments, which look as though set in two concentric rows in contracted specimens. Tube membranous, coated with fine mud.

Length: \(90-120 \mathrm{~mm}\).
Colour: in spirit, dark-violet or grey with scattered dark spots.

Occurrence: Burma coast, Mergui, Akyab; Andaman Islands; Madras; Ceylon; Karachi.

Distribution: Japan, China Sea, Malayan Sea, New Caledonia, Australia; Indian Ocean, Red Sea; Tropical Atlantic Occan.

\section*{Genus LAONOME Malmgren.}

Branchial lobes symmetrical, semi-circular, not spiral. Branchial filaments without dorsal stylodes. No subterminal eyes. A four-lobed collar. In the thorax dorsal capillary setae of two kinds; ventral uncini, no pickaxeshaped setae. In the abdomen, dorsal avicular uncini and ventral capillary setae.
429. Laonome indica Southern. (Fig. 235, \((d-h)\).

Laonome indica, Southern, 1921, p. 652, pl. XXX, fig. 20.
Body slender. 6 thoracic segments with dorsal long, slender capillaries with narrow wing and long tapering

Fig. 235.-Sabellastarte indica Savigny: a, antetior patt. domal view. enlarged; \(b\), collar, ventral view; \(c\), thotaric hooh \(; 190\) (after Pruvot). Lannome indica Southem: d. collar segment, ventral view \(\%\) : 6 ; \(e\), hook from the 2 nd segment \(\times 8(0)\); \(f\), h(x)k from the 8th scgment \(\times 8(0) ; g\), spatulate thoracte bristles \(\times 560)\);
\(h\), capillary bristle from the 8th segment \(\times 600\) (after Southern).
tips and setae with spatulate tips terminating in a long fine point. Uncini with a stout rounded base and 4-5 rows of teeth above the main fang. In the abdomen, dorsal uncini, differing very slightly from those of the thorax, with rounded base more obliquc, and ventral capillary
setae with short and broad wings and a long and slender tip. The gills are unconnected by a membranc. There are two short palps and two ventral lobes projecting forwards and ending in a pointed tip. No eyes observed. Tube unknown.

Length: 28 mm . by 2 mm .
Occurrence: Chilka Lake.

\section*{Genus HYPSICOMUS Grube.}

Body long and slender, Branchial lobes symmetrical. Gill-filaments with rows of eyes. Dorsal stylodes absent. A collar. Capillary setac of the first thoracic segment set in a slanting row. Thoracic dorsal setac of two kinds: (1) capillary, and (2) paleae-like. Ventral avicular unrini and pickaxe-shaped sctac. In the abdomen, dorsal avicular uncini and ventral capillary setac and paleae.
430. Hypsicomus phaeotaenia (Schmarda). (Fig. 236, al).

Hypricomus phacotnenin. Gravier, 1908, p. 84, pl. VI, figs. \(255-\) 259: Fauvel, 1927a. p. 312, fig. 108 (Sinonvmy); 1932, p. 238: Willey, 1905, p. 307.
Hypsicomus pigmentatu; Gravier, 1908, p. 81, pl. VI, figs. 252254.

Sabella phacotaenia, Schmarda, 1861, p. 35, pl. XXII, fig. 188.
Sabella fusco tarniata, Crube, 1874, p. 3es.
Branchial lobes borne on a long stalk. Gill-filaments bearing on their rachis two longitudinal rows of simple eye-spots, single, or in more or less numerous groups. Collar low and straight, entire or nothed. Short setae of the first setigerous segment set in a sigmoid, slanting row. Paleac spoon-shaped with a rounded winged end, with, or without, a sharp tip; and capillary setae. In the abdomen, dorsal avicular uncini and ventral capillary setae with broader paleae. Tube membranous, transparent.

Length: \(40-60 \mathrm{~mm}\).
Colour: Very variable; body dark with pale feet and tori. Gills banded with yellow, brown, red or violet.

Occurrencr: Mergui; Nankauri Harbour, Nicobar Islands; Great Coco Island; Ceylon; Gulf of Mannar, Pamban, Kilakarai; Maldive Archipelago.

Distribution: Japan, China Sea, New Caledonia, IndoChina, Malay Archipelago, Australia, Indian Ocean, Persian Gulf, Red Sea; Atlantic Ocean.

Fig. 236.-Hypsicomus phaeotaenia (Schmarda): a, (after Schmaida); \(b\), anterior part, dorsal view ; \(c\), middle pant of a gill-filament iaftet Gravier) ; \(d, e\), bristles from the first segment, fromt and stele view; \(f\), thoracic winged seta \(\times 230\) : g, thoracic palea \(\times 230\); \(h\), abdominal palea \(\times 230\); \(i\), pick-axe seta; \(k\), thoracic hook \(\times 230 ; l\), abdominal capillary bristle \(\times 460\).

\section*{Genus POTAMILLA Malmgren.}

Branchial lobes symmetrical. Gill-filaments with or without eyes, without dorsal stylodes. Setae of the first setigerous segment in a tuft. Dorsal thoracic setae of two kinds: capillary and paleae; ventral uncini and pickaxcshaped setae. In the abdomen, dorsal avicular uncini and ventral winged setae. Tube horny.

Key to the species of Potamilla.

Potamilla oligophthalmos, Augener, 1914, p. 109.
A number of gill-filaments bearing one to \(4-7\) dorsal cyes set in a longitudinal row. Collar well developed, with four lobes. Stuaight, narrow winged, dorsal setac and paddle-shaped paleac with a slender tip. Abdominal setac with unequal wings and a very long and slender tip.

Length: \(10-40 \mathrm{~mm}\).
Ocrurrence: Gull of Mamar, Krusadai Island; Koweit Larbour, Persian Gulf.

Distribution: Indochina, Malay Archipelago, AustraLia (?); India, Persian Gulf, Red Sea.
432. Potamilla leptochaeta Southern. (Fig. 238, a-f).

Potamilla leptochatla. Southern, 1921, p. 651, pl. XXXI, fig. 28: lawed, 1939, p. 239; 1939, p. 26.
Thoracic segments few, 6-7. 8-11 gill-filaments destitute of cyes. Collar sloping backwards, deeply notched and bilobed icntrally. Thoracic and abdominal capillary setae with elongate narrow wings and very long filiform lips. Thoracic spatulate setae have pear-shaped blades with finely pointed tips. Pickaxc-shaped setae with long slender tips. Tube membranous, coated with mud and sand.

Length: \(10-40 \mathrm{~mm}\).
Occurrence: Chingrighatta near Calcutta; Vizagapatam. A brackish water species.

Distribution: Malay Archipclago; India.
433. Potamilla ceylonica Augener. (Fig. 237, \(a-g\) ).

Potamıla ccylonica. Augener, 1926, p. 470: Fauvel, 1930a, p. 61, fig. 17.
Branchial fan with 7-10 gill-filaments ending in a long slender naked tip. They are without eye-spots. Collar very slanting, broadly gaping on the back and with two flattened, reflected, acute ventral flaps. Palps broad
and laciniate. Thoracic segments very numerous (15-23 or more). Dorsal thoracic setae of two kinds; (1) winged capillaries and (2) oboval oar-shaped palcac with a long and slender tip. Avicular uncini with a long manubrium,

Fig. 237.-Potamilla ceylonica Augener: a, thoracic aumular uminus \(\times 400 ; b\), abdominal uncinus \(\times 400 ; c\), thoracic oar-hhaped palca \(\times 400\); \(d\), thoracic capillary bristle \(\times 400\) : \(f, f\), pich axc setac \(\times 400 ; \mathrm{g}\), abdominal spatulate seta \(\times 400\).
and pickaxe-shaped setac, having a long fine point. Dorsal abdominal uncini avicular, and ventral spatulate setae with unequal wings and a long, slender tip.

Length: \(\mathbf{3 0} \mathrm{mm}\).
Colour: Dark yellowish-grey.
Occurrence: Gulf of Mannar, Krusadai and Shingle Islands; Trincomalee.

\section*{Genus JASMINEIRA Langerhans.}

Branchial lobes symmetrical, semi-circular, not spiral. Branchial filaments destitute of eyes and dorsal stylodes. Otocysts present. A collar. Thoracic segments with capillary setae of two kinds: (1) limbate, (2) spatulate. Avicular uncini. Pickaxe-shaped setae absent. Dorsal
abdominal uncini avicular; ventral setae winged, slender, often geniculate. Tube membranous, transitory.
434. Jasmineira caducibranchiata Willey. (Fig. 238,

Jasmineira caducibranchiata, Willey, 1905, p. 312, pl. VII, fig. 178-179.

Body tapering posteriorly. 8 thoracic segments with dorsal capillary setac and a single row of rostrate uncini with long manubrium. Dorsal abdominal uncini avicu-

Fig. 238.-Potamilla leptochacta Southem: a, shont capillary seta from an anterior abdominal segment \(\times 840 ; b\), spatulate seta from the 6th thoracic scgment \(\times 810: c\). pick-axe seta \(\times 840 ; d\), abdominal hook \(\times 840\); c. thoracic hook \(\times 840\); \(f\). tip of a gill (after Southern). P. ehlerst Gravier: g, thoracic hook; \(h\), pickaxe sela; 1, thoracic palca (after Gravier). lar. Collar rounded, slightly projecting forwards below, with a median notch dividing the two low rounded lobes and a shallow impression on each side of the notch. About a dozen radioles on each branchial filament. In-
side the gill-crown a pair of broad, pinkish laciniac, and below these a group of about 6 slender tentacular cirri attached to the lower ends of the gill-carriers.

Length: 22 mm . by 1.5 mm .
Occurrence: East side of Cheval Paar, Ceylon.

\section*{Genus MANAYUNKIA Leidy.}

\section*{Haplobranchus Bourne.}

Body very small. Branchial lobes symmetrical, branchial filaments simple, unbranched. Two palps. A collar. Ventral scutes absent. Dorsal thoracic setae. Uncini with a long stalk; pickaxe-shaped setae absent. Abdominal uncini elongated; ventral capillary setae.
435. Manayunkia spongicola Southern. (Fig. 238, \(k, l\) ).

Manayunkia spongicola, Southern, 1921, p. 653, pl. XXXI, Hg. 29.

Body cylindrical. 8 thoracic segments with dotsal capillary setae with short, flattened, blades and long slender tips. Ventral hooks stout, with thee teeth above themain lang. In the three abdominal segments \(1-2\) capillary setac with very slight flattening of the blade and no wings; 9-11 dorsal hooks, rather small, with clongate shafts and numerous fine long teeth in several 10 as at one end. The gills consists of about 18-20 slender unbranched filaments on each side. Two clavate palps. Head conical in front, bearing two black eycs. 1 piominent collar, with an entire convex border ventrally. No otocysts. Pygidium spatulate, or pear-shaped, bearing two black eyes. Tube membranous, covered with flocculent mud.

Length: 1.5 to 3 mm .
Occurrence: Chilka Lake, brackish water. Tubes cmbedded in the sponge Laxosuberites lacustris Annandale, or amongst Algae.

Remarks: The presence of eyes on the pygidium and a more developed collar are the principal features differentiating this species from M. aestuarina Bourne.

\section*{Family SERPULIDAE Burmeister.}

Body divided into two regions: (1) thoracic, consisting of a few segments bearing dorsal and capillary setae and ventral uncinigerous tori; (2) abdominal, which is much longer, and has dorsal uncinigerous tori and ven-
tral capillary setac. Ventral glandular shields divided by a longitudinal shallow groove. First segment with a more or less developed collar. A thoracic membrane. Gills forming a funnel surrounding the mouth and composed of two semi-cincular or spiral lobes bearing a number of filaments or radioles with two rows of barbules. Usually an operculum. 'Tubes calcarcous.

ApomatusPhilippi.No operculum .. .. Prntula
Risso, p. 471.

\section*{Genus SERPULA Linnaeus.}

Collar setae bayonet-shaped, with two conical piocesses at the base of the blade. Operculum funncl-shaped, with numerous radii ending in serrations along the margin. Uncini with only few stout tecth. Thoracic setae winged, abdominal setae trumpet-shaped.
436. Serpula vermicularis linnaeus. (Fig. 299, \(a-q\) ).

Serpula vermicularis, Pixell, 1913, p. 71: Fauvel, 1927a, p. 351, fig. 120 (Synonymy): 1932, p. 241.
Collar setae with two large, conical, blunt processes at the base. Uncini with 4-7 teeth, the lower one more stout and blunt. Collar trilobed. Operculum concave, with numerous radii, symmetrical. Tube variable, cylin-
drical, wrinkled, with 5-7 longitudinal ridges, smooth or serrated or echinulate, rather bell-shaped at the mouth; more or less crooked and gencrally of a red or pink colour, more rarely white.

If ig 239.--Serpula vermiculatis Linn. a, side view \(\times 2.5\); \(b\), tube, natural size; \(c\), \(d\), section of the tube; \(e, f\), operculum; \(g\), false operculum: \(h\). thotacic bristle \(\times 105 ; i\), bristle from the first setugerous segment (collar bristle) \(\times 105 ; k\), young collar bristle with denticles at the base of the prongs \(\times 105 ; l\), capillary seta from the collar \(\times 105 ; m\), abdominal bristle \(\times 350\); \(n, o\), thoracic uncini \(\times 350 ; p\), abdominal uncinus \(\times 350\); \(q\), another form of uncinus \(\times 350\).

Length: \(50-70 \mathrm{~mm}\). by 5-6 mm.
Colour: in life very variable. Operculum with radiating red and white streaks.

Occurrence: Moscos Islands, Burma; Orissa Coast, Madras Coast; Persian Gulf.

Distribution: Magellan; Indian Ocean, Kerguelen, Persian Gulf, Red Sea; Atlantic Ocean, Mediterranean Sea.

\section*{var. granulosa Marenzeller.}

Serpula granulosa, Marenzeller, 1884, p. 215: Willey, 1905, p. 316, pl. VII, figs. 186, 186 A .
" Operculum shallowly concave, with 46-52 rays which project as denticulations at the margin. The
grooves which separate the rays do not all reach to the centre of the disc; they are superficial indications of dissepiments which project vertically with a free inner border into the substance of the operculum. Minute tubercles are sparsely distributed on the concave opercular disc. Tube round, subcristate to cristate." (Willey)

Occurrence: South-west Cheval Paar, Ccylon.
Distribution: Japan; Ceylon.

\section*{var. watsoni Willey.}

Serpula watsoni, Willey. 1905, p. 317. pl. ViI. fig. 187; pl. Vill. fig. 6.
Characterised by the great length of the ampulla of the operculum, which is about twice the length of that portion of the style which rises above the collar. Thecollar is cutire below, divided on cach side by a lateral notch.

Occurrence: Trincomalee.

\section*{Genus HYDROIDES Gunnerus.}

\section*{Eupomatus Philippi.}

Collar setac bayonet-shaped, with two conical processes at the base of the blade. Uncini with a few coarse teeth, the lower one larger than the others. Thoracic setae winged, abdominal setae trumpet-shaped. Opersulum funnel-shaped with a crown of horny spines arising from the centre.

Key to the species of Hydroides.

Eupomatus elegans, Haswell, 1883b, p. 633, pl. XII, fig. 1.
Radii of the operculum forming rounded lobes on the edge of the funnel, spines of the central crown equal, with several sharp lateral processes. Tubes white, cylindrical, faintly wrinkled and more or less erect or spirally coiled.

Length: 15-30 mm. by \(1-2 \mathrm{~mm}\).
Occurrence: Madras.
Distribution: Indian Ocean, Persian Gulf, Red Sea; Atlantic Ocean, Mediterranean Sea.
440. Hydroides Iunulifera (Claparède). (Fig. 241, h).

Hydroides lunulifera, Fauvel, 1927a, p. 358. fig. 122, p-s; 1932, p. 242: Potts, 1928, p. 701.

Eupomatus lunulifera, Clapartecde, 1868, p. 441, pl. XXXI, fig. 3.
Radii of the operculum forming sharp lobes on the edge of the funnel, spines of the central crown equal with flattened half-moon or anchor-shaped tips. Tubes slender, white, cylindrical, more or less coiled.

Length: \(12-30 \mathrm{~mm}\). by \(1-3 \mathrm{~mm}\).
Occurrence: Madras.
Distribution: Madras; Suez Canal; Mediterranean Sca.
441. Hydroides heteroceros (Grube). (Fig. 241, c).

Hydroides heteroceros, Fauvel, 1911, p. 428: Pixell, 1913, p. 75. pl. VIII, fig. 2.
Hydroides uncinata (non Philippi), Gravier, 1908, p. 114, pl. VIII, 286-287.
Eupomatus heteroceros, Gıube, 1868, p. 639, pl. ViI, fig. 8: Willey, 1905, p. 313.
Radii of the operculum with a terminal knob. Seven spines in the central crown, bent at the tip and with

Fig. 241.-Hydroides operculum: a. H. homoceros (Pixell) \(\times 24\); \(b\), \(H\). exaltatus (Marenzeller) \(\times 11 ; c, H\). heteroceros (Grube) \(\times 12\) (after Pixell); \(d, c, H\). albiceps (Ehrenberg), dorsal and side view (after Willey) ; f. lateral hooks, the seventh is much larger, bent, alpenstockshaped and destitute of lateral processes. Tubes thick, flattened on side of attachment, often coiled, marked by faint longitudinal lines, aperture circular.

Length: about 40 mm . by 4 mm .
Colour: Body dull yellowish; gills dark crimson at the base, light yellow distally.

Occurrence: Ceylon; Koweit Harbour.
Distribution: India, Persian Gulf, Red Sea, Zanzibar, 442. Hydroides monoceros Gravier. (Fig. 911, g).

Hydroides monoceros, Glavier, 1908, p. 115. pl. V'Il. hg. 288: Pixell, 1913, p. 76: Fauvel, 1923, p. 48; 1930a, 1. 63.

The lower funnel of the operculm is oral and slanting, has teeth with enlarged extremitios. The asymmetrical central crown has 6 very small spines and bears a very large one with a lateral triangular hook on each side and a strong curved terminal tip. Tubes thick, more of less curved, with longitudinal and transverse ridges.

Length: about 15 mm .
Occurrence: Rameswaran, Gulf of Mannar.
Distribution: Gambier Islands; India, Red Sca, Zanzibar.

Remarks: Closely allied to H. minax (Grube).
443. Hydroides minax (Grube). (Fig. 211, f).

Hydroides minax, Fauvel, 1939, p. 361.
Serpula minax, Grube, 1878, p. 269, pl. XX, fig. 5.
Eupomatus minax, Willey, 1905, p. 314.
Radii of the inferior part of the operculum numerous, with a small terminal knob. Central crown symmetrical, with 6 short pointed spines bent outwards, the 7 th , much larger, is erect, with a stout recurved hook, bent inwards and with two lateral accessory hooks. Tube sound, showing coarse growth rings.

Occurrence: Ceylon.
Distribution: Philippine Islands, Annam; Ccylon.
444. Hydroides albiceps (Ehrenberg). (Fig. 241, d, e).

Eupomatus albiceps, Grube, 1969, p. 520: Willey, 1905, p. 312. pl. VII, figs. 180-181.
Marginal tecth of the opercular funnel blunt. Central crown with 7-8 nearly crect, slightly curved virgulac and a laterally compressed, ovate, lamina dorsalis, the latter being a direct continuation of the columella and bearing a pair of broad dorso-lateral hamuli. Thoracic uncini with about 7-9 teeth. Tube quadrilatcral, winding round a tube of Chaetoplerus ramosus.

Length: 7 mm .
Occurrence: Ceylon, Cheval Paar.
445. Hydroides exaltatus (Marenzeller). (Fig. 241, b).

Eupomatus exaltatus. Marenzeller, 1884, p. 217, pl. IV, fig. 3: Willey, 1905, p. 312, pl. VII, fig. 182; Pixcll, 1913, p. 77.
" The inner funnel of the operculum is raised on a thont column and has \(8-9\) strong book-like spines, without secondary processes, except at the base; the dorsal one is twice as large as the others and bends suddenly at a right angle over the top of them." (Pixell).

Length: about 20 mm .
Colow: Body dull green.
Occurrence: Ceylon.
Distribution: Japan; India, Red Sca, Zanzibar.
var. vesiculosus Fauvel. (Fig. 2.10, i).
Hydroides exaltatus, var. uersiculosus, Fauscl. 1919. p. 342. fig. 1;
1929, p. 40; 1939. p. 30: Monro, 1937, p. 316.
A large hollow vesicle takes the place of the great unpaired hook. It is a connecting link between II. exaltatus (Marenzeller) and II. albiceps (Ehrenberg).

Occurrence: Gambier Islands, Java; Zanzibar.

\section*{Genus POMATOLEIOS Pixell.}
- Collar setae and eye-spots absent. Uncini with fairly mumerous teeth, the most anterior being larger and bouged underneath. Abdominal setae trumpet-shaped with one side produced into a long spine. Operculum Hat with winged pedicle. Tube with a flap over the ertrance." (Pixell)

\section*{446. Pomatoleios crosslandi Pixell.}

Pomatoleios crosslandi, l'ixell, 1913, p. 85, pl. IX, fig. 10.
-. All thoracic setae simple striated blades. Uncini with 10 or 11 teeth in both thorax and abdomen. Branchiae with very high inter-branchial membrane and long bare terminal filaments." (Pixell)

Remarks: The operculum of the Madras specimen is tipped with a hollow calcareous cup destitute of spines. The pedicle has thick lateral wings with straight edges.

Neither Pixell nor I were able to detect any collar setae. The flap of the tube, mentioned by Crossland, has not been observed again.

Length: 4-14 mm.
Occurrence: Madras.
Distribution: Madras; Red Sea.
Remarks: Differs only from Pomatoceros caeruleus in the absence of collar setae, flat operculum and flap of the tube.

\section*{Genus SPIROBRANCHUS Blainville.}
" Operculum with a calcareous plate generally bearing a group of branched spines. Pedicle with broad lateral wings. Collar setae bayonet-shaped and covered with fine hair-like processes. Abdominal setac tumpet-shaped, the edges compressed and toothed and produced at one place into a long fine point. Uncini with numerous tecth, the lower one larger and hollowed out underneath like a gouge. Uncinigerous tori of the two sides widely separated ventrally in front, and gradually approaching onc another towards the end of the thorax, thus leaving a triangular depression" (Pixell).

Key to the species of Spirobranchus.
1. Operculum without processes .. maldinensis Pixell, p. 464

Operculum with processes .. 2

Cymospira gaymardi, Quatrefages, 1865, p. 339, pl. 16 bis fig. 13.
Pomatoceropsis coutierei, Gravier. 1908, p. 125. pl. VIII, fig. 294. 299.

Opercular plate with two antler-like processes, which sometimes, however, branch close to their base. Abdo. men about 11 times as long as its greatest breadth with numerous (200-300) segments. (Pixcll)

There is a considerable range of variation to be found in the operculum whose antlers may be more or less developed and branched; but too often they are broken. The tube is pink, but generally more or less imbedded in the corals.

Fig. 942 - Spirobunchus piganteus (Pallas): a, bristles from the first sctigerous segment \(\times 240\); \(b\), ventral abdominal trumpet-shaped bristle ン240; \(c\), thotacic hook \(\times 240\); \(d\), lower tooth of a thoracic hexh \(>395^{\prime}\); \(c\). \(f\), g, several hinds of operculum (after Giube and Quatrefages). Spir fousseaumei (Gravier); h, operculum dftel (iravies): Spir. maldtrensis Pixell: i. operculum (atter lixell). lermiliopess glandigerus Gravier: \(k\). operculum (after Gravier).

Length: \(100-120 \mathrm{~mm}\). by \(6-7 \mathrm{~mm}\).
Colour: Body yellow, with a deep blue thoracic membrane. The gills are blue at the base and with white, blue and pink stripes.

Occurrence: Nankauri Harbour, Nicobar Islands; Great Coco Island; Ceylon.

Distribution: Intertropical areas of Pacific, Indian and Atlantic Occans, especially in coral reefs.
448. Spirobranchus jousseaumei (Gravier). (Fig. 242, h). Spirobranchus jouscaumei. Potts, 1928, p. 701: Fauvel, 1932, p. 244.

Pomatoceropsis jousscaumei, Gıavicr, 1908, p. 130, pl. VIII, figs. 292-293.
Opercular plate with several distinct, much branched processes. Pedicle winged. Tube with several wavy ridges.

Length: 30 mm .
Colour: Gills of a decp violet-blue colour.
Occurrence: Palan Biddang.
Distribution: Palan Biddang; Red Sea, Sucı Canal.

\section*{449. Spirobranchus maldivensis Pixell. (Fig. 242, i).}

Spirobranchus maldivensis, Pixell, 1913. p. 84, pl. IN, fig. 9: Fauvel, 1932, p. 245: Monro, 1937, p. 918.
"Operculum a thick calcareons plate, without processes, supported by a tall pedicle with thin lateral wings. Collar setae with a short, wide, fincly striated, fin-like process at the base of the narrow anterior blade. Branchiae about 32 pairs with numerous long pinnae except at their distal ends, which are bate and filamentous. Thoracic uncini have about 15 teeth in addition to the large gouge-shaped one, and the abdominal 18. Abdominal setae narrow compressed trumpets, with onc side produced into a long process." (Pixell). Tube with one or three coarsely serrated ridges.

Length: \(\quad 20-30 \mathrm{~mm}\).
Occurrence: Off Cape Negrais, Burma, 40 fms.: Gulf of Oman.

Distribution: Burma; Maldive Archipelago, Arabian Coast, Gulf of Oman.

Genus POMATOSTEGUS Schmarda.
Collar setae bayonet-shaped and covered with hairlike processes. Operculum with a slanting calcareous plate or several horny discs united by a central vertical column. Opercular pedicle with lateral wings. Abdominal setae trumpet-shaped or Salmacina-like.

Key to the species of Pomalostegus.
Operculum with a slanting plate. Abdominal setac trumpet-shapcd
Operculum with horny discs. Abdominal setae Solmacina-like stellatus Abildgaard, p. 465.
450. Pomatostegus stellatus Abildgaard. (Fig. 248, a).

Pomatostegus stcllatus, Gravier, 1908, p. 133: Pixell, 1913, p. 79: Johansson, 1918, p. 10, fig. 10-11: Fauvel, 1932, p. 246.
Pomatostegus actinoceros, Willcy, 1905, p. 314, pl. VIII, figs. 34 : Augencr, 1914, p. 152.
Operculum with several horny denticulated dises piled up very close and strung on a hollow pillar with rows of star-like diverging spines and a circle of spincs under each plate. Pedicle flat, with broad smooth wings. A high collar. Abdominal setae sickle-shaped (Salmacina setac).

Occurrence: Malacca Straits: Andaman Islands, Gulf of Mannar, Krusadai, Pamban, Ceylon, West Coast of India.

Distrubution: Pacific, Indian and Atlantic Oceans.

\section*{451. Pomatostegus polytrema Philippi. (Fig. 245, \(l-q\) ).}

Pomatostegus polyticma, Rioja, 1917, p. 87, fig. 25: Fauvel, 1927a.
Operculum a membranous vesicle shaped as an inverted cone capped with a calcarcous plate which may be level, convex or bluntly conical, smooth, or bearing 1,2 or 3, more or less developed prongs very variable in shape. Abdominal setae trumpet-shaped. Tube with characteristic alveoles and perforations.

Distribution: Atlantic Ocean, Mediterranean Sea. var. indica Fauvel. (Fig. 206, \(h, i\) ).
Pomatostegus polytrema var. indica, Fauvel, 1930a, p. 64, fig. 15, \(h-i\).
L. ower bladder of the operculum capped with a rigid cone, somewhat arched and bearing a number of small spines on its concave side.

Occurrence: Gulf of Mannar, Krusadai lsland.

\section*{Genus VERMILIOPSIS Saint-Joseph.}

Vermilia pro parte.
"Collan setae simple blades. Uncini with fairly numerous teeth, the most anterior are larger and blunter than the rest. Abdominal setae geniculatc. Some thoracic setac are bladed sickles (setac of Apomatus), thus differing from the genus l'ermilia with ordinary bladed setac only. Operculum with a horny somewhat cylindrical or conical (ap" (Pixell).

Vermilia pygidialis, Willey, 1905, p. 318, pl. VII, figs. 194-190.
Branchiae with ocelli and elongated, often with much swollen ends free from pinnae. Operculum with a conical (sometimes truncated) chitinous cap. Uncini with

Fig. 243.-Vermiliopsis pygidialis (Willey): a, anterior region, dorsal view, enlarged; \(b\), thoracic hook (after Willey). \(V\). aranthophora Augener : \(c\), anterior part, dorsal view \(\times 14\); d, operculum \(\times 23\); e, tube, aperture somewhat damaged \(\times 2\) (after Augener).

13-14 teeth. Terminal dorsal gland generally present as an oval purplish-crimson cushion, with long hair-like setae on the obtuse last segments. Tube coiled, with 45 low longitudinal keels.

Length: about 20 mm .

Colour: Gills tipped with pink.
Occurrence: Ceylon.
Distribution: India, Maldive Archipelago, Suez, Zanzibar.
453. Vermiliopsis acanthophora Augener. (Fig. 243, cc).

V'ermiliopsis acanthophora, Augener, 1914, p. 155, pl. I, figs. 2124; Fauvel, 1930a, p. 63; Monro, 1937, p. 318.
The flat, smooth, wingless pedicle of the operculum bears a white hemisphere capped with a yellow cone, without chitinous partitions, ending in a horn-like hook. The thoracic segments bear Apomatus setac. Tube with traces of successive peristomes.

Length: 20 mm .
Occurrence: Gulf of Mannar, Krusadai Island.
Distribution: Galapagos Islands, Australia, Gambier Island; India, Gulf of Oman, Arabian Coast.
454. Vermiliopsis glandigerus Gravier. (Fig. 242, k).

Iermihopsts glandigerus, Gravier, 1908, p. 121, pl. VIII, figs. 290-291.
Vermiliopsu glandigera. Augener, 1918, p. 602: Fauvel, 1930a, p. 63: Monro, 1937, p. 918.

The wrinkled pedicle of the operculum bears a white opaque hemisphere, with a yellow horny cone, short or clongate, divided by 3-4 partitions and sometimes slightly hollowed at the tip in a small cup. Thoracic segments with Apomatus setae. Tube wrinkled, with 4-5 longitudinal keels and more or less conspicuous transverse peristomial ridges.
l.ength: \(\quad 15-20 \mathrm{~mm}\).

Occurrence: Gulf of Mannar, Krusadai and Shingle Islands, Rameswaram.

Distribution: Panama; India, Arabian Sea, Red Sea, Madagascar; Atlantic Occan, West Africa, Gulf of Guinea.

\section*{Genus OMPHALOPOMOPSIS Saint-Joseph.}

Operculum chitinous or horny, concave or funnelshaped. Thoracic membrane very short. Setae of the first seginent (collar setae) acicular, or geniculate. Thoracic setac winged capillaries and Apomatus setae. Abdominal setae geniculate and long slender capillaries. Uncini pectiniform, with lower tooth larger but not gouge-like.
455. Onphalopomopsis langerhansi (Marenzeller). (Fig 94, \(a-h\) ).
Omphatopomopsis langerhansi, Fauvel, 1930a, p. 65, fig. 18.
Omphalopoma langerhansi, Marenzeller, 1884, p. 219, pl. IV, fig. 6.
Operculum with a yellow rounded plate slightly depressed, saucer-like, with a single stout spike arising nearly in the centre. It is borne on a huge thick pedicle, nearly as broad as the terminal plate. bulging in the middle and with edges thinned into lateral smooth wings, without any processes. Gills short, thick, crowded into dense semi-circular clusters, in-rolled, but not spiralls

Fig. 214.-Omphalofomops, langerhansi (Marenzeller): a, anterior pat and operculum, dos sal view \(\times 4: h\), anterior region, ventral view A4; \(r\), abdommal uncinus, 40 NO ; d, thotacic uncinus \(\times 4(0)\); \(e\), apomatus seta from the last thoracic segment \(\times 150: \mathrm{f}\), thoracic winged capillary bristle \(\times 150 ; \mathrm{g}\), abstominal geniculate bristle \(\times 4(0) ; h\), collar seta from the Ist segment \(\times 300\).
coiled. The collar, widely open dorsally, has an irregular serrated edge but no distinct flaps. Thoracic membrane very short. 7 thoracic segments. Collar setae minutely spinose. Other thoracic setae winged and accompanicd by Apomatus setae in the last thoracic segments. Thoracic tori very long, nearly meeting in the middle
of the ventral side. Abdominal setae somewhat geniculate and serrated. Abdominal tori very long, with pectiniform uncini whose lower tooth is larger, but not gougelike.

Length: 35 mm . by 5 mm .
Colour: pedicle of the operculum variegated with dark spots. Gills tinged with violet-brown.

Occurrence: Gulf of Mannar, Rameswaram.
Distribution: Japan; India.

\section*{Genus POMATOCEROS Philippi.}

Operculum with a calcareous plate very variable, flat or conical, smooth or spinose, borne on a winged pedicle.

( \(P\). coeruleus Schmarda is very likely but a mere colour variety of \(r\). triqueter Linn.). Pomatostegus polytrema Philippi:
l. opetculum. enlarged: \(m\), \(n\), tube with section \(\times 2\);
o, collar bristle \(\times 315\); p. q, thoracic bristles \(\times 315\);
\(r\). Apomatus seta from the last thoracic segment \(\times 515\); s. abdominal trumpet-shaped bristle \(\times \$ 15 ; 7\), u, uncini, front and side view \(\times \$ 15\).

A high collar. Collar setae very finc, short and few. Other thoracic setae winged capillaries. Abdominal setae compressed, trumpet-shaped with a long lateral point.

Uncini pectiniform with lower tooth larger and gougelike. Tube triangular in section, incrusting the support.
456. Pomatoceros caeruleus (Schmarda). (Fig. 245, a-k).

Pomatoceros caeruleus Ehlers, 1907, p. 30: Fauvel, 1930a, p. 67.
Pomatoceros strigiceps, Ehlers, 1904, p. 67, pl. IX, figs. 11-19.
Gills, collar and thorax bright indigo-blue. Otherwise hardly distinct from \(P\). triqueter Linnaeus. Operculum probably variable, tube less regularly triangular, often coloured blue inside.

Length: 15-25 mm.
Occurrence: Ennur Backwater, Madras Harbour.
Distribution: New Zealand, Australia; Indian Ocean.
Genus DITRUPA Berkeley.
Operculum an inverted cone with a horny plate. Pedicle smooth, wingless. A collar. Collar setae absent. Thoracic setae capillaries and winged setac. Abdominal setae capillary. Uncini pectiniform, with numerous teeth, the lower one gouged. Tube calcarcous, free, open at both ends, Dentalium-like.

\section*{457. Ditrupa arietina O. F. Müller. (Fig. 246, \(a-g\) ).}

Ditrupa arietına, Saint-Joscph, 1898, p. 443. pl. XXill, hg. 24… 254: Yauvel, 1927a, p. 374, fig. 128, a-g; 1932, p. 247.

Operculum vesicular, opercular plate horny, thick, brown, flat or convex, often encrusted. Tube smooth, elephant tusk-shaped, curved and tapering, narrowed at the mouth, white or with brown rings; made of two calcareous layers, the inner opaque white, the outer translucent.

Length: \(10-20 \mathrm{~mm}\). by \(1-2 \mathrm{~mm}\). Tube, 25-40 mm. by \(2-3 \mathrm{~mm}\).

Occurrence: Andaman Sea, 785 fms.
Distribution: Philippine Islands; Andaman Sca, Red Sca; Atlantic Ocean, Mediterranean Sea.
var. monilifera Fauvel. (Fig. 246, \(h\) ).
Ditrupa arietma var. monilifera, Fauvel, 1932, p. 247, pl. IX,
fig. 12. fig. 12.

The tubes show a number of more or less regular annular enlargements, giving them a moniliform appearance.

Fig 246.-Ditrupa arietina O. F. Müller: a, ventral view \(\times 4 ; b\), operculum \(\times\). \(: ~ c\), tube natural site; \(d\), thoracic bristle \(\times 220\); \(c\), abdominal bristle \(\times 100: f, g\) hooks, front and side view \(\times 400\); h, var. monilifera tube \(\times 2\).

Occurrence: Andaman Sea, 378 fms.
Distribution: Kei Islands; Andaman Sea.

\section*{Genus PROTULA Risso.}

Operculum absent. Collar setae simple tapered blades; thoracic setae winged capillaries and Apomatus setae; abdominal setae cither sickle-shaped or bayonet shaped. Uncini bicuspid, with very numerous, very fine teeth and a long basal spine. Tube white, cylindrical, nearly smooth, often partly crect.
458. Protula tubularia (Montagu). (Fig. 247, a-i).

Protula tubularia, Fauvel, 1927a, p. 382, fig. 130.
Protulopsis palliata, Willey, 1905, p. 316, pl. VIII, figs. 183185.

Abdominal setae sickle-shaped. Collar trilobed. A very large thoracic membranc. Gills woolly. Branchial filaments with red eye-spots at the back. Tube white. nearly smooth, coiled at the base, then erect.

Fig. 247.-PProtula tubularia iMontagu): a, with Hs tule: fafter (guttrefages) ; \(b\), anterior region, vential view (after Rioja); \(r\), branchial funnel, fiom above, gills cut off ; \(d\). anterior pant, side nirw \(\times 3.5\); e. thotacic winged bristle \(\times .132\) : f, Apomatus seta \(\cdot 132\); \(g\), abdominal bristle; \(h, i\), abdominal briste before and after treatment with weak potash solution, curve inverted \(\times 220 ; k, l\), uncini \(\times 350\). Pr. intestinum (Lamarck): \(m\), anterior part, ventral view (after Rioja).

Length: \(20-50 \mathrm{~mm}\). by \(3-8 \mathrm{~mm}\).
Colour: Body red or orange, gills with white and red or orange streaks.

Occurrence: Ceylon.
Distribution: Japan, Australia, Malay Archipelago: Indian Ocean, Persian Gulf; Atlantic Ocean, Mediterranean Sea.

\section*{Genus FICOPOMATUS Southern.}
" Modified setac present on the first thoracic segment, having blades provided with very stout teeth. Beneath the blades is a transverse row of more than two teeth. Uncini with relatively few teeth, the lowest of which is in the form of an elongate bifd spinc. Ventral abdominal setac geniculate. Operculum fig-shaped, without any outgrow'ths" (Southern).
459. Ficopomatus macrodon Southern. (Fig. 248, c-l).

Ficopomatus macrodon, Southern, 1921, p. 655, pl. XXX, fig. 27. \(a-m\); Fauvel, 1932, p. 248.
Operculum solt, vesicular, fig-shaped, flat or convex at the tip, without any outgrowths: stem rather flattened. Branchial filaments 13-17 in number, bearing 18-20 pairs of babbules. 7 thoracic setigerous segments. Collar

Fig, 248.-Pomalostcqus strllatus Abildgaard: a antetion end with operculum, dorsal view (after Willey). Spirorbis fomammorus Moore: b, operculum filled with cags. front view (atter Moore). Ficoponatus macrodon Southern ; \(c\). front view of the aperture of an attacher tube; \(d\), openculum, sude view \(\times 32\); \(e\), modified seta from the first setigeroms segment \(\times 400 ; f\), thoracic capillary bristle \(\times 400 ; \mathrm{g}\), simple capillary seta from the first segment \(\times 400\) : \(h, i\), thoracic hook, front and side view \(\times 640: k\), abdominal hook \(\times 640 ; 1\), ientral abdominal bristle \(\times 440\) (after Southern).
F. 62
high. Free margin of the thoracic membrane entirc. Collar setae of two kinds: (1) stout setae with a series of very coarse teeth diminishing in size towards the smooth tip, beneath these teeth for some distance the shaft is smooth and this is followed by a transverse row of teeth; and (2) slender setae with finely tapering tips and minutely hispid edges. Thoracic setac capillary, flattened. Abdominal setac geniculate. Tube frce or erect, circular in section, with a single dorsal ridge, or squarish with threc dorsal ridges.

Length: \(8-10 \mathrm{~mm}\). by \(0.5-0.75 \mathrm{~mm}\).
Colour: Traces of blue pigment bands on the gills and thorax.

Occurrence: Taléh-Sap, Gulf of Siam; Sunderbans, Ennur Backwater, Madras Coast, Cochin Backwater, Chepparam.

\section*{Genus MERCIERELLA Fauvel.}

Operculum non-calcareous, vesicular, crowned with concentric rows of simple horny spines. Opercular pedicle smooth, wingless. Branchial filaments without eyes. Interbranchial membrane absent. Collar entire. A thoracic membrane. A pair of palps. Lowest tooth of the uncini stout and gouged. Collar setae with two rows of sharp teeth. Dorsal thoracic setac winged. Abdominal setae geniculate. Tube circular in section.
460. Mercierella enigmatica Fauvel. (Fig. 249, a-o).

Mercierella enigmatica, Fauvel, 1923d, p. 124, fig. 1; 1927a, p. 360, fig. 123; 1932, p. 249: Monro, 1924, 155, fig. a-e: Rioja, 1924, p. 160, figs. 1-30, pl. V, figs. 1-3.
Seven thoracic segments. Branchial filaments stout, short, with a naked tip variable in length. Interbranchial membrane absent. Operculum somewhat fig-shaped, bearing concentric rows of simple, horny, sharp, blackish spines. Pedicle stout, thick, smooth, subtriangular in section, wingless, with a shallow dorsal groove. Two finger-shaped palps. Collar tall, erect, or turned down, without lateral notches, edges entire; it is continuous with the thoracic membrane which is very broad and terminates in a back flap. Collar setae of two kinds: (1) slender filiform capillaries, and (2) strongly serrated sctae with two longitudinal rows of teeth; a few transverse rows at the base and without an intervening smooth part of the shaft. Other dorsal thoracic setae straight, or faintly bent, smooth or very finely hispid. Uncini with a single
row of 5-7 teeth, the lowest of which is larger and gouged. Abdominal uncini more triangular, with more numerous teeth. Abdominal setae long, geniculate, serrated. Pygidium conical, with two rounded knobs. Tube calcareous, whitish, thin, cylindrical, wrinkled and bellshaped at the entrance, the successive peristomes forming collars all along. It is coiled at the base, then erect.

Fig. 249.-Mercierella enigmatical Fauve : a, tube \(\times 2.6\); \(b\), side view \(\times 9 ; c, d\), operculum, front and side view \(\times 13\); \(e\), operculan spines \(\times 52 ; f\), section of the opercular stalk ; \(g, h\), modified bristle of the first setigerous segment, side and front view \(\times 516 ; i\), capillary bristle from the first setigerous segment \(\times 344 ; k\), thoracic bristle \(\times 344 ; m, n\), thoracic uncini, front and side view \(\times 516\); o, abdominal uncini \(\times 516\).

Usually lives in brackish but sometimes in nearly fresh water; very rarely in pure seawater.

Length: 6-25 mm. by \(1-2 \mathrm{~mm}\).
Colour: Operculum chestnut, with a white or yellow ring. Gills greenish with brown spots. In spirit, abdomen uncoloured, thoracic tori chestnut, gills ringed with chestnut and chalky white.

Occurrence: Ennur Backwater, on oyster shells.
Distribution: Malay Archipelago, Australia; India; Atlantic Ocean (France, Morocco, Uruguay), Mediter-
ranean Sea, Adriatic Sca, English Channel. In canals, estuaries and on ships' bottoms.

\section*{Genus SALMACINA Claparède.}

Operculum absent. Branchiae few; more or less enlarged at the tip. Prostomium rounded, with two eycs. A collar. Collar setae notched, with a broad fin-like expansion at the base of the blade. Other thoracic setae

Fig. 250.-Filograma implexa Berkeley: \(a\), operculum; b, collar bristle \(\times 500\). Salmacing dysteri (Huxley): \(c\), ventral view, enlarged ; d, tip of a gill-radiolle \(\times 40\); \(e\), collar bristle \(\times 500 ; f\), thoracic bristle \(\times 500\) ) \(g\), abdominal bristle \(\times 500 ; h\), posterior abdominal bristle \(\times 500 ; i\), hook \(\times 500 ; k\), clustered tubes, natural size.
capillary, limbate, and sickle-shaped setae. Abdominal setae geniculate and serrated. Uncini pectiniform, with the lower tooth larger. Calcarcous tubes, very small and slender, crowded in aggregate fenestrated masses. Hermaphrodite. Schiziparous.

\section*{461. Salmacina dysteri Huxley. (Fig. 250, c-k).}

Salmacina dysteri, Fauvel, 1927a, p. 377, fig. 129, e-k; 1930a, p. 67.

Branchial filaments with spatulate enlargements at the tips. The triangular wing of the collar setae with numerous, more or less fine, teeth. Tubes forming large, white, colonial masses.

Length: 4-7 mm.
Colour: Orange or red. Gills pale or reddish at the base.

Occurrence: Gulf of Mannar, Krusadai Island, Rameswaram; Madras Harbour.

Distribution: Pacific, Indian and Atlantic Oceans.

\section*{Genus SPIRORBIS Daudin.}

Body asymmetrical. Thoracic segments less than five. Opercular peduncle without pinnules. Tubes spirally coiled, dextral or sinistral.
462. Spirorbis foraminosus Moore. (Fig. 248, b).

Spirorbis foraminosus, Augener, 1926b, p. 472; Fauvel, 1990a, p. 68; 1932, p. 247.

Collar setae smooth, without fin-like extensions, accompanied by a few capillary setae. Abdominal setae with large falciform serrated blades. Operculum cylindrical, transparent, dotted, and crowned with a rim, with longitudinal grated plates. Three thoracic segments. Tube dextral, keeled, wrinkled, more or less pitted with alveoli.

Occurrence: Nankauri Harbour, Nicobar Islands; Gulf of Mannar, Krusadai Island, Rameswaram Beach.

Distribution: Pacific Ocean; Nicobar Islands, Ceylon.
