1. Introduction and Background

On 12 April 2017, the UK Government's Secretary of State for Transport announced the preferred route of Lower Thames Crossing (LTC). The route is primarily designed to ease congestion on the Dartford Crossing but will also accommodate projected increases in traffic levels in the region.

The Scheme is located between the A2 in Kent and the M25 in the London Borough of Havering, passing through the Borough of Thurrock in Essex for much of its length. The scheme will run underneath the River Thames in a tunnel and emerge on the northern side of the river at East Tilbury. A spur road will join the scheme from Tilbury Docks just north of the East Tilbury portal. The main route will pass north on an embankment in between Chadwell St Mary and Linford and turns to the north-west to join a new junction with the A13 to the west of Orsett. The route continues north on embankment from the A13 and then turns west to join the M25 in between North and South Ockendon.

The scheme's route requires detailed archaeological assessment. A scoping report (as part of the DCO process) appraised the potential implications of the scheme on archaeology, historic structures and historic landscapes. This report identified the need for detailed desk study and archaeological field investigations to inform the DCO application and define a robust mitigation strategy. Potential for direct impacts to a number of scheduled monuments and Grade II listed buildings have been identified in relation to the construction and operation of the scheme. The extent of potential impacts to the non-designated buried archaeological resource will be determined during the detailed assessment and evaluation programme.

A consultation exercise with Historic England before the preferred route announcement (PRA) outlined the potential issues regarding archaeology for the scheme. The

emphasis of their response was upon understanding the potential for unknown heritage assets (buried or near surface) and the risks involved in the scheme encountering them.

Preserved buried settlements, cemeteries, farming, drainage and industry from late prehistory to the post-Medieval period may lie in the buried environment along the route and these below-ground archaeological features will be adversely affected by the scheme. The River Thames gravel terraces are known for their abundance of buried archaeological remains, especially known from aerial photography. To research such remains, aerial reconnaissance has been employed in Essex since 1974. Annual reconnaissance surveys have been undertaken, which has led to the compilation of a large archive of oblique aerial photographs.

This project has used aerial investigation and mapping techniques to develop an efficient methodology to ensure the systematic examination of all the readily available aerial photographs and other remote sensing data such as lidar. The information gathered through this survey will contribute to a better understanding of the historic environment that will be impacted by the road development and its significance. This includes below-ground archaeological features and landscapes showing as earthworks, soilmarks and cropmarks dating from the later prehistoric period through to the twentieth century, including 20th century military structures that are visible, particularly on RAF photography from the 1940's.

The assessment has been undertaken in accordance with the guidelines set out in Historic England guidance on *Aerial Investigation and Mapping (Historic England 2012a and 2012b)*. Following the systematic assessment of available aerial photographs held at the Historic England Archive (HEA), ECC HER and those supplied

by Highways England, all visible archaeological features have been transcribed and the results will be used in the Cultural Heritage desk-based assessment and to facilitate a programme of trial trenching. A full methodology can be found in Appendix 1 and a full list of aerial photographic sources consulted for the project can be found in the Aerial Photographic Catalogue.

Plate 1 - Aerial photograph of the southern section of the Scheduled Monument at Grey Goose Farm (Site 14) (EX10/02/020 © Essex County Council)

2. Project Aims

The overall aim of this project was to complete aerial investigation and mapping work along the Essex section of the proposed Lower Thames Crossing and to identify and interpret the archaeological features (both upstanding and below-ground) visible on aerial photographs and remote sensed data such as Lidar.

The principle aims of this project were:

1. To examine all easily accessible aerial photographs and lidar data within the site boundary, plus a buffer study area, to identify archaeological features, both known and hitherto unknown. This study included those photographs already used in previous NMP surveys.
2. To accurately rectify relevant aerial photographs and georeference them;
3. To transcribe archaeological features from rectified and/or georeferenced aerial sources to NMP standards, and reproduce them in ArcGIS format;
4. To provide detailed accurate information to facilitate the placement of archaeological trial trenches to maximise the quality of information recovered;
5. To inform the LTC cultural heritage desk-based assessment;
6. To undertake detailed feature identification and typology;
7. To produce summary descriptions and interpretations of archaeological features to inform the desk based assessment. This information is included in the attributes of the aerial investigation and mapping GIS data.
8. Assess the potential and significance of each group of archaeological features identified.

Plate 2 - Aerial Photograph of the Scheduled Monument at South Ockendon Hall showing the medieval moated site and the Roman round barrow (Sites 10A and 10B) (EX16/03/098 © Essex County Council)

3. Project Area

The proposed road corridor for the new Lower Thames Crossing is approximately 20 km in length. However, this aerial investigation and mapping work only focussed on the Essex section of the new road scheme, from the Thames north to Junction 27 of the M25. A GIS shape file of the specific project area was supplied by the client. The study area is 34 sq. km in area and gives a buffer of the current proposed road corridor of between 80m and 1000m (Figure 1). Only historic assets visible within this area were recorded over the course of this project.

Geology

The geology and topography across the study area changes as the road corridor crosses the county from the Thames Estuary in the south and heads northwards across Thurrock towards the M25 (Figure 2). At the southern end of the road corridor the land slopes down towards the river and the Mucking and East Tilbury Marshes. In these low lying marsh areas on either side of the river the geology consists of Alluvium. North of the marshes as the topography rises, sands and gravels dominate the geology, which in turn influences the soils. The topography influences the geology with the Lambeth Group overlain by River Terrace deposits in many places on the highest ground. The soils over the sands and gravels are freely draining; consequently the retention of moisture is reduced and low rainfall during the growing season may result in cropmarks forming over below-ground features. The predominate geology of sands and gravels changes just north of the A13, with Head Deposits, Alluvium and River Terrace Deposits (Lynch Hill Gravel) overlying the London Clay Formation become prevalent. The clayey soils over this geology have impeded drainage, resulting in poorer cropmark development. A further area of alluvium in the Orsett Fen area has led to the development of clayey floodplain soils with naturally high groundwater. Alluvium deposits follow the route of the Mardyke and increase in width as it travels northwards. Along the entire road corridor there are many areas of quarrying and extraction of both clay and sand and gravels.

Plate 3 - Aerial photograph of Iron Age enclosure and associated boundary ditches (Site 41). Bands of different geology can be seen in the crop (EX11/04/066 © Essex County Council)

Gaps within cropmark record

There are gaps within the cropmark record within the project area. The northern section of the corridor has fewer features recorded, particularly to the north of the A13; this corresponds well with the changes in the geology from sands and gravels to alluvium and clay. The area around Orsett Fen which is located on the alluvium has very few features recorded and while this could be related to historic land use, the soils are not particularly conducive to cropmark formation. Other gaps in the cropmark record correspond with areas of disturbance (such as borrow pits and compounds associated with road construction) and quarrying. The absence of cropmarks is not always an indication of a lack of archaeological features but rather a result of either the soil-types or the agricultural regime not being conducive to cropmark formation.

4. Aerial Photography Sources

The sources of aerial photographs for this project included the Essex Historic Environment Record (HER), Essex County Council Vertical Collection, the Historic England Archive (HEA), Google Earth and Highways England vertical photography. A full list of all the images viewed within the project area can be found in the Aerial Photographic Catalogue.

A cover search of the HEA collections was completed using a 200m buffer of the project area. The records for 1545 vertical and 429 oblique images were returned. Arrangements were made to view these images in blocks of approximately 200-250 images at a time over the course of 3 months (time between visits to the archive was needed to allow HEA staff time to retrieve the large number of photographs).

All the photographic prints held within the HER were assessed in conjunction with the digital images (both oblique and verticals) held. Plate 4 is an example of a digital oblique images held within the HER. The Essex County Council vertical collection is entirely digital, with scanned prints from 1960 to 1990 and digital ortho-rectified images from 2000, 2010 and 2014. A limited number of hard copy prints of RAF verticals taken in 1946 are also held and were assessed. The HER holds a limited number of prints from the Cambridge University Collection of Aerial Photographs (CUCAP) and these were assessed along with the other prints; however the HER only holds approximately 18% of the prints that are actually within the CUCAP collection.

Images from Google Earth were assessed onscreen and images of visible archaeological features were saved and used for digitising. 8-10 sets of photographs were available, although there was not complete coverage of the project area for each set.

Additional vertical photography was taken on behalf of Highways England in the summer of 2018 and these ortho-rectified imaged were supplied by Highways England (Figure 3).

Highways England have access to other vertical photography that covers the project area and while access to this photography was requested no additional coverage was supplied.

Plate 4 - Aerial Photograph of the Scheduled site at Grey Goose Farm, showing the extensive multi-period features and pits (Site 13) (EX18/03/004 © Essex county Council)

5. Previous Work

Historic England's (formerly English Heritage) sponsored National Mapping Programme (NMP) has been completed in Essex (and also covered the edge of the London Borough of Havering) and an aerial photographic study was undertaken in Kent in 1986 was utilised for a cropmark classification project. The Kent survey produced 1:10,000 scale maps of cropmarks and annotated with written descriptions. However, a more recent aerial investigation and mapping project has been completed for the Hoo Peninsula Landscape project (Newsome et al., 2015). This completed landscape areas covered by the proposed route to modern aerial investigation and mapping (NMP) standards and added significant new features and improved the accuracy of mapping of features identified in the earlier Kent NMP.

The Essex NMP was carried out between 1993 and 2003 and this project also produced 1:10,000 scale maps, but unlike the Kent project, the Essex mapping project included both upstanding archaeological features (visible in the form of earthworks) and those below-ground archaeological features visible only as cropmarks and soil marks. The results of the Essex mapping were incorporated into the Essex HER at the time of the project. Within the current LTC project area over 250 archaeological features were mapped over the course of the Essex NMP; the majority of which had been recorded solely from aerial photographs.

Essex County Council has undertaken specialist archaeological aerial reconnaissance since the 1970's and has commissioned vertical photography of the county since the 1960's. All these aerial photographs have the potential to contain information of currently unknown above and below-ground archaeological features. While the LTC corridor project area was part of Essex NMP, the work was completed in 1995 and no photographic assessments have been completed on the ever-growing aerial photographic collections since.

In addition modern aerial investigation and mapping standards have been implemented which ensure increased accuracy and use a wider spectrum of sources, such as Lidar, as standard. The features recorded during the original NMP were mapped using manual rectification practices at a scale of 1:10,000. The accuracy of the transcription of each site is unknown and there were only limited records of which photographs were used for the process. It should also be noted that while the original NMP data can be viewed in a GIS the source data was not created in a digital format, but was hand drawn on 1:10,000 film sheets that have been subsequently scanned and geo-referenced; a process that can exacerbate inaccuracies.

One of the key priorities for this project was accuracy. Figure 4 shows an enclosure that was mapped for the original NMP in 1995 and the remapped feature (carried out for this project). This demonstrates the differences that can be present in some of the older mapping where only manual photographic rectification and 1:10,000 mapping was used.

A number of the features mapped for the original NMP could not be located on the aerial photographs assessed for this project and have not been digitally recorded. These features should not be dismissed although they have not been remapped. These features are likely to be on images that could not be assessed for this project, such as the CUCAP collection that is currently unavailable (other than those images held within the HER).

The original NMP emphasized the extensive number of below-ground archaeological features that could only be seen from the air. However, recent excavations have demonstrated that while archaeological cropmarks are crucial to the identification of sites, they rarely give a true indication of the number of archaeological features on a site. The archaeological cropmarks of a circular enclosure approximately 40m in diameter, some field boundaries and a possible incomplete sub-circular enclosure were

identified and recorded during the Essex NMP at Mill House Farm, Chadwell St. Mary (Plate 5) immediately to the west of the LTC corridor. However Plate 6 shows the excavation plan following work carried out ahead of gravel extraction (Archaeological Solutions 2017). This excavation identified an extensive archaeological landscape comprising in excess of 1000 features. The archaeology on the site ranged in date from the Palaeolithic to an extensive Saxon settlement. This excavated site at Mill House Farm is adjacent to two sites identified and recorded during this project (Sites 24 and 26).

Plate 5 - The archaeological cropmarks identified during the NMP at Mill House Farm, Chadwell St. Mary

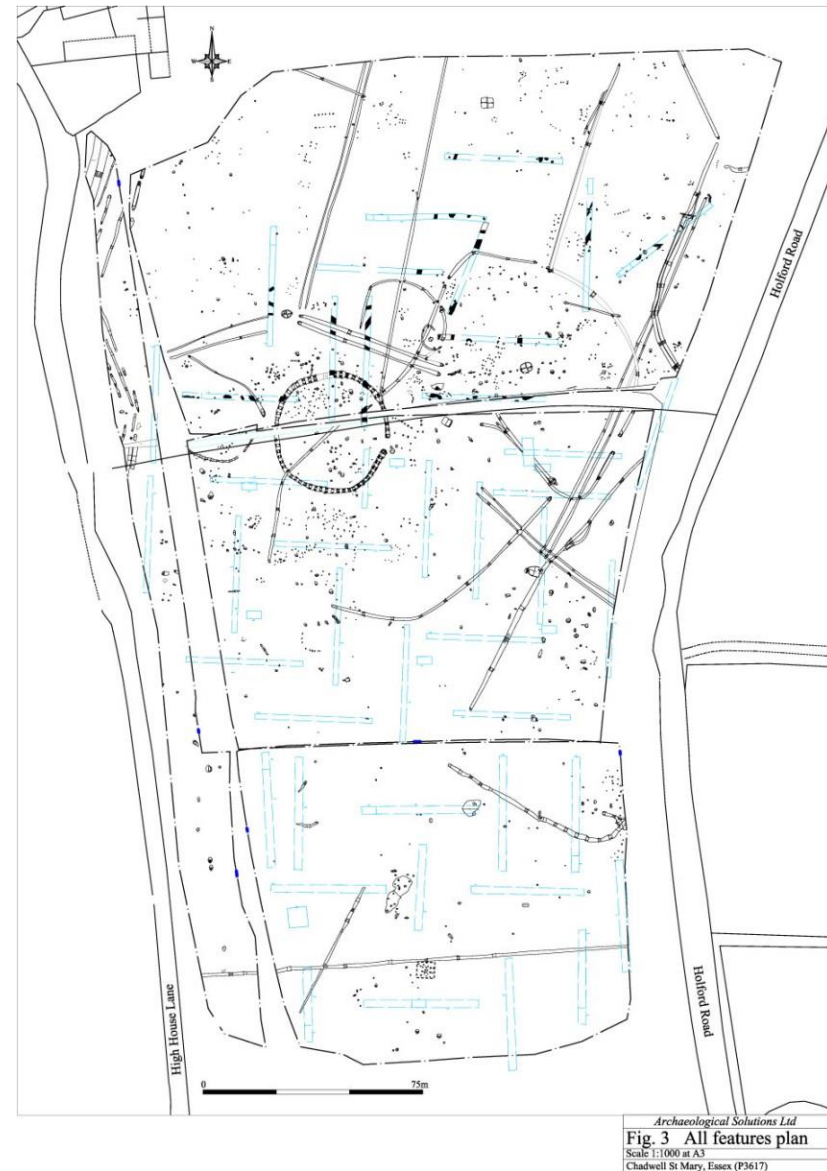

Plate 6 - Excavation plan of all features identified at Mill House Farm, Chadwell St. Mary (© Archaeological Solutions 2017, Figure 3)

6. Challenges

A number of challenges were faced during the aerial investigation and mapping carried out throughout this project. The aerial photography assessed for the project ranged in date from 1940 to 2018. During this time large scale and extensive landscape changes have occurred which, on occasion, hindered the rectification of the aerial photography. One of the largest changes in landscape was seen on the East Tilbury Marshes. RAF Photographs from the 1940s (Plate 8) show this area as managed grazing marsh, much as it had been in the later medieval period. However, by the 1960s reclamation and development was being carried out and this accelerated in the 1990s. Today the marshes have changed dramatically with very little of the grazing marsh left (Plate 9). This made the rectification of images for sites in this area problematic.

Similarly large infrastructure projects such as the construction of the A13, the A1089 and the M25 have ensured major changes to both the local road structure and field systems. Plate 7 shows the area around the A13 junction with the A1089 prior to its construction. This caused some issues with the identification of suitable control points on the aerial photographs to ensure the accurate rectification. A note has been made in the comments section of the GIS attribute table where it was felt there may be an accuracy issue.

Urban development, quarrying and changes to agricultural practices such as the removal of field boundaries has also had an effect, though not to the same extent as the large infrastructure projects.

The aerial photographs that have been assessed for this project have been a combination of hard copy prints held in the Essex HER and the Historic England Archive (HEA) and digital images. This means that the images are held in a number of geographic locations and in a number of formats and it has not been possible to view all

the images at the same time. The HEA images were assessed over the course of 3 months during 4 separate visits to the library. High quality images were taken of photographs that showed archaeological features and these were used to map features. However, this resulted in different images of the same site viewed at different times and when features were mapped from HEA images the photographs could no longer be viewed as stereo pairs or under magnification.

Plate 7 - Extract of vertical photograph taken in 1970 of the area around Grey Goose Farm (Site 13 & 14) prior to the construction of the A13 (HSL/UK/70/1083/4798)

Plate 9 - Extract from ECC vertical photography taken in 2010 of the East Tilbury Marshes showing the landscape changes that have occurred

7. Lidar

The Environment Agency (EA) Lidar data was a primary source for this mapping project. Lidar data was downloaded directly from Geomatics webpage [REDACTED] as ASCII data. The composite 1m DTM data was used (as downloaded in June 2018). An overall mosaic of the lidar data was created (split into north and south sections to make the data size more manageable and easier to process). A hill shade image was created using 3D Analyst in ArcMap. This hill shade composite image was assessed and examined alongside the available aerial photography. Where features of interest were found or additional investigation was needed multiple visualisations were produced using Relief Visualisation Toolbox (RVT) version 1.3. Various visualisations (including Slope Gradient, Simple Local Relief Model, Analytical hill shading and positive and negative openness) were then viewed in ArcGIS. Archaeological features visible as earthworks on the lidar were digitised from the visualisations created in RVT using standard mapping conventions.

The EA lidar coverage was not complete for the entire project area. Figure 5 shows the extent of the coverage, with an area between the north of Chadwell St Mary and to the west of East Tilbury having no available lidar coverage.

While a full 0.25m Lidar survey of the road corridor was carried out in 2018 on behalf of Highways England, the cloud point data was unavailable for use within this project. A georeferenced mosaic of the DSM from this lidar survey was made available (Figure 6), but because the data was a surface model rather than a terrain model no additional archaeological information could be gained from the data.

The lidar that was available did allow a site (Site 1) that was located within a woodland to be identified and recorded, and overall 16 features were mapped using lidar (in conjunction with the aerial photographs).

8. Results

Below is a table of the results of this project. Each site has a summary description of the features recorded and where possible a suggested date and function. A guide to the archaeological potential and archaeological significance of each site has been given as Low, Medium, High or Very High (where these fields have been left blank no features were mapped in this site area and an explanation of why no features were mapped is given in the description). The location of each site can be seen in Figure 7 and a GIS shape file containing this information has been supplied. Figure 8 and Figure 9 show the archaeological potential and archaeological significance along the entire project area within Essex, based on the aerial investigation and mapping work.

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
1	16279		Codham Hall wood reported in the HER as containing possible earthwork banks, and ditches. The banks and ditches are visible from the Lidar.	Medium	Low
2	16278		Hobbs Hole, HER record suggested that possible earthworks related to a dam, fish pond and mill. The site is currently tree covered and the lidar did not indicate any features to map		
3	19106		Franks Manor is recorded in the HER as a Medieval manor. The current house is surrounded by a moated enclosure which is visible on several recent aerial photographs and the earthworks can be traced on the Lidar. However, examination of all the available aerial photographs has shown that the moat does not originally appear to have been a complete circuit. Photography from the 1940s to 1970s shows the moat to be located to the south of the house and may represent an earlier settlement area. The moat may have been extended in the early 1990s as a photograph from 1995 shows the water filled ditches with very few surrounding trees and clean ditch edges. Despite this extensive work the site is still a medieval manor site.	Medium	High
4	6763		North Ockendon Hall Moated site: the T-shaped moat is visible on both aerial photographs and lidar. The water filled ditches are between 21 and 30m wide. Currently the southern water filled ditch has a land bridge which separates it was the northern ditch. There is evidence from the historic photographs that this land bridge was not originally in place. There was also photographic evidence for minor re-shaping of parts of the moat.	Medium	Medium

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
5A	5099		Cropmarks of a sub-rectangular enclosure 69m by 29m, which is wider at the northern end and has entrances at the north west and south east corners. A small ring ditch, which probably represents a ploughed-levelled round barrow, is located to the north (both likely to be prehistoric). Two further ring-ditches overlaying one another are located to the north. Some pits are scatter around the site. A possible trackway is visible at the west end of the enclosure (potentially medieval as lines up with existing trackway). Elsewhere across the site several field boundaries are also visible.	High	Medium
5B	5099		Cropmarks of several field boundaries are visible, though the majority are not visible on the 1 st edition OS mapping they are probably still Late Medieval in origin.	Low	Low
6	47725		Cropmarks of a ring ditch which probably represents a ploughed-levelled Bronze Age round barrow. A curved ditch which may represent an incomplete enclosure is located to the north-west.	Medium	Medium
7A	5108, 14659		A square enclosure with no visible internal features, several ditches and pits. Potential prehistoric	Medium	Medium
7B	5108, 14659		Cropmarks of a complete ring ditch and an incomplete one which probably represent ploughed-levelled Bronze Age round barrows. The ring-ditches are surrounded by several pits.	Medium	Medium
7C	5108, 14659		Cropmarks of former field boundaries, visible on the 1 st edition OS mapping of the 1880s are also visible	Low	Low
8	5096		Cropmarks of a possible prehistoric sub-circular enclosure with no visible internal features. A pipeline crosses through the enclosure (which has caused breaks in the ditch circuit). A section of the ditch is masked by geology. Ditches (possible field boundaries) are also visible to the north of the enclosure.	Medium	Medium
9	5100, 5271		Cropmarks of a probable prehistoric trackway is visible for around 600m. There are groups of pits also visible in the vicinity. The cropmarks of a possible incomplete rectangular enclosure of an unknown date are also visible. This site lies in proximity to the scheduled Roman barrow and medieval moated site at South Ockendon Hall (Site 10)	Medium	High

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
10A	5135	1019106	Earthworks of a Scheduled round barrow, investigated in 1957 showing that the barrow is Roman in date. The mound is surrounded by a dry shallow ditch. The lidar was used to map the barrow as the tree coverage reduced the visibility of the features (Figure 10 and Plate 2)	Very High	Very high
10B	1863	1002155	Earthworks of a Scheduled Medieval moated. The moat is a large, irregular, quadrilateral moat that is water-filled. (Figure 10 and Plate 2)	Very high	Very high
11	5263		Cropmarks of two sub-rectangular wide ditched enclosures which are probably medieval moated sites. The enclosures are joined by a ditch with a smaller rectangular enclosure.	High	Medium
12	47054		Extensive former field boundaries forming a former field system, many of these features are visible on the 1 st edition OS mapping of the 1880s	Low	Low
13	5237, 5243, 5244, 5238, 5245	1002134	Grey Goose Farm Scheduled Monument consisting of extensive dense multiple period cropmark complex (Figure 11 and Plate 1, Plate 4). While the A13 bisects this complex the extensive cropmarks are visible on both sides of the road. The main concentration of enclosures, ring-ditches which probably represent ploughed-level Bronze Age round barrows and prehistoric round houses, trackways and field systems is located to the north of the site and is bisected by Stifford Clays Road. The archaeological features overlay and bisect each other in this area demonstrating that the site is multi-period. Across the entire site is an extremely dense pattern of pits of varying size and shape (ranging from 1m in diameter to 8m). Many of these pits are located around the visible enclosures as well as forming lines and boundaries. One feature shows a curving line of pits alternating with a length of ditch. In places the concentration of pits is so dense they cannot be identified as individual pits. Some of the pits are elongated in shape and could represent Saxon <i>grubenhous</i> or sunken floored buildings (SFB). This cropmark complex has parallels with Mucking which is located 4.5km to the south-east and was found to be predominately Bonze Age to Saxon when it was excavated. There is the potential for features surviving beneath the slip roads. The evidence for archaeological cropmarks on these sites goes beyond the extent of the Scheduled area.	Very High	Very High
14	5237, 5243, 5244, 5238, 5245				

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
15	5237, 5243, 5244, 5238, 5245	1002134	<p>Note: This lies outside the project area for the aerial investigation and mapping but is identified within the land requirement map provided. This therefore has not been mapped but does contain considerable cropmarks</p> <p>Part of the Scheduled Grey Goose Farm cropmark complex which consists extensive pits, enclosures, trackways and ring-ditches. This part of the cropmark complex is outside the project corridor and the features were not mapped, however this area remains extremely significant and has very high archaeological potential.</p>	Very High	Very High
16	5191		Extensive cropmark complex consisting of a probable Roman field system, trackways and associated settlement, Iron Age settlement enclosures and possible Bronze Age round barrows. There are multiple pits, both isolated and within groups across the site. The cropmark complex continues to the north and east, but this area was outside the project area	Very High	Very High
17A	5158, 5159, 5162, 5163	1009286	Scheduled Orsett Neolithic Causewayed Enclosure, identified as a cropmark (Figure 12). The enclosure lies at the southern edge of a remnant of the 30m Thames Terrace. It consists of three irregularly concentric circuits of interrupted ditches. The two outer circuits conform with each other in terms of their layout; not so the inner one. Behind the middle ditch was the faint line of a palisade slot or trench. Gaps in it matched with gaps in the ditch circuit. There was no sign of the outer ditch circuit to the south and east and the innermost circuit appears open on the south. A small area of the site was excavated in 1975 to assess its nature and state of preservation. The site also has evidence for Iron age occupation and within the southern half of the inner circuit of the causewayed enclosure the cropmarks of 5 ring ditches which proved to be Saxon in date during the excavation. To the south west of the scheduled is a further complex group of cropmarks indicative of prehistoric settlements with enclosures containing internal features. Within the wider landscape there are pits and ditches around the causewayed enclosure which may date from the prehistoric through to the medieval period. (Buckley and Hedges 1978)	Very High	Very High
17b			Sequence of cropmark field boundaries to the north and west of the Scheduled Monument of multi period date. The archaeological cropmarks in the northern part of the site have been quarried.	Low	Low

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
18	14550		Cropmarks of ring-ditches which probably represent ploughed-level Bronze Age Round barrows and a series of pits which range in size and shape. The largest round barrow is located to the south of the site and is 18m in diameter. While the pits remain undated they could represent unenclosed settlement evidence.	High	Medium
19A	5226		Cropmarks of an incomplete later prehistoric enclosure and several ditches. The concentration of cropmark features continues to the north, but the features are outside the project corridor and have not been mapped. Some features in this area were mapped for the original Essex NMP, but were not visible on the available aerial photographs used in this project. These additional features should not be dismissed despite not being mapped as it is possible they were visible on CUCAP images that were not available.	Medium	Medium
19B	21491		A military camp was located to the north of this area (outside the project area) and on a 1944 aerial photograph it can be seen that a temporary camp with groups of bell tents extended onto the golf course and across the area covered by the cropmarks in Site 19A. This area was used as a embarkation camp and extensive features are visible but were not mapped for this project	Low	Low
20	5235		Cropmarks of a rectilinear enclosure with rounded corners and several internal divisions, a trackway is located adjacent to the enclosure to the south (Figure 13). The enclosure is potentially Roman in date and represents some form of settlement site. The enclosure is surrounded by extensive groups of pits which range in size and shape, which could represent surrounding settlement. There is an additional smaller rectangular enclosure located to the north-east which may also be Roman in date. A small elongated enclosure is located on the north-west side of the main enclosure which has been interpreted as a probable long mortuary enclosure of prehistoric date (Figure 14), which would potentially make it of national importance.	Very High	Very High
21	5262, 5180		This site consists of the cropmarks of extensive groups of pits across a wide area of an unknown date and function, along with the cropmarks of a possible ring-ditch which may represent a ploughed-out round barrow. Elsewhere in the site are several ditches which could represent former field boundaries.	Medium	Low

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
22	1801		Cropmarks of a large Iron Age rectilinear enclosure with a funnel entrance to the north-west and at least two internal round houses. Trial trenching across the enclosure showed that it was Iron Age in date. A single ring-ditch which represents a ploughed out round barrow is visible to the north-east (Elston 2013)	Medium	High
23	5213		Cropmarks of a ring-ditch probably represents a ploughed out round barrow. Also visible are extensive pits, including a line of large sub-circular pits (up to 17m in diameter). These could represent adhoc extraction pits. The site also contains several ditches of an unknown date and function. This area potential is a continuation of the Scheduled Monument cropmark complex (Sites 13 and 14).	High	High
24A	1769		This is a large site that has concentrations of archaeological features in some areas with apparent 'blank' areas elsewhere. In the north of the site a small ring-ditch which probably represents a round barrow is visible, along with some short sections of ditch (of an unknown date and function). There are also two bands of pits of varying size and shape crossing this site. A further cluster of pits and a round barrow are visible on the west side of the site.	Medium	Low
24B	1769		There is an extensive complex of pits and ditches of potential Bronze Age date as this site forms an extension of the complex Bronze Age site at Mill House excavated immediately to the south (Archaeological Solutions 2017).	High	Medium
25	1767		Cropmarks of a possible double ditched, but incomplete rectangular enclosure that is probably later prehistoric in date and could represent a settlement enclosure. This lies in relatively close proximity to the extensive excavations at Mucking and may be related.	High	High
26	1753		Complex of cropmarks at Mill House Farm north of Muckingford Road (Figure 15). The site consists of rectilinear enclosures and ditch alignments, multiple linear features, ring ditches, pennanular ditches and pits. A Large circular enclosure with an east facing entrance can be seen at the centre of the cropmark complex. This enclosure is similar to one excavated at a site to the west and was found to be Bronze Age in date. A further large circular enclosure has been truncated by the modern road, but this is similar in size. The site is likely to be a multi-period settlement site with Bronze Age, Iron Age and Roman enclosures and possible Saxon pits. This site is comparable to Mucking (located 1.5km to the north), and the scheduled Monument at Baker Street to the north.	Very High	Very High

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
27	17125 (part)		Cropmarks of extensive former field boundaries forming part of a field system with trackways, many of these features are visible on the 1 st edition OS mapping of the 1880s but may have much earlier origins	Low	Low
28	GLHER		Small circular depression visible on lidar; a soilmark of the site is visible on Google Earth. Possible former pond though nothing was marked on the OS mapping. No features were mapped and the site is now a solar park.	Negligible	Low
29	GLHER		Cropmarks of former field boundaries visible on the 1 st edition OS mapping of the 1880s	Low	Low
30	GLHER		Cropmarks of former field boundaries and a possible incomplete enclosure of a possible late medieval date. There is also evidence for an extraction pit.	Low	Low
31	New		Cropmarks of extensive former field boundaries forming a lost field system, many of these features are visible on the 1 st edition OS mapping of the 1880s	Low	Low
32	New		Cropmarks of a trackway which is probably a continuation of the Iron Age track/funnel associated the enclosure to the south-east (Site 22). There are also a large group of small pits of an unknown date	Medium	Low
33	14558		This area is dominated by the levelled earthworks of WWII anti-glider ditches, but there are also the remains of former salt marsh creeks, one with a possible enclosure associated with it and may form a former salt making site of Roman date. The majority of the site is likely to be of low sensitivity, however, if salt making is identified this could increase significantly.	Medium	Low
34	14559		Cropmarks of former field boundaries that are visible on the 1 st edition OS mapping of the 1880s and are overlaid by WWII anti-glider ditches	Low	Low
35	14559 (anti-glider ditches)		Low level earthworks across this site that are visible on both vertical photography and lidar represent creeks formed in former salt marsh. These earthworks survive because the land is part of Walton Common. It is possible that there is survival of archaeological remains, particularly salt making sites, on the edge of these creeks. Anti-glider ditches were constructed across the area and these features were mapped. (Figure 16)	Low	medium

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
36	14559 (anti-glider ditches)		Low level earthworks across this site that are visible on both vertical photography and lidar represent creeks formed in former salt marsh. These earthworks survive because the land is part of Parsonage Common. It is possible that there is survival of archaeological remains, particularly salt making sites, on the edge of these creeks. Anti-glider ditches were constructed across the area and these features were mapped.	Low	medium
37	New		Cropmarks of former field boundaries forming a field system, these features are visible on the 1 st edition OS mapping of the 1880s but may have earlier origins	Low	Low
38	47726		Cropmarks of extensive former field and wood boundaries, many of these features are visible on the 1 st edition OS mapping of the 1880s but may have earlier origins	Medium	Low
39	1817		Cropmarks of an enclosure and associated trackway of probable Iron Age date. There are pits both within the enclosure and nearby. A possible ring-ditch is also visible on several photographs but may be of a more modern date.	Medium	Medium
40A	1747		Cropmarks of a concentric ring-ditch which represents a Bronze Age round barrow. There is also evidence for dispersed pits to the south.	High	Medium
40B	1747		There is cropmark evidence for short sections of ditch across the site. A small square enclosure of unknown date and function is also visible.	Low	Low
41A	1736		Cropmarks of a rectangular enclosure with internal pits and ditches of Iron Age date. A ring-ditch that has been recut/replaced is located outside the enclosure; this may represent a round-house. There are pits both within the enclosure and nearby. (Plate 3)	High	Medium
41B	1736		Cropmarks of long ditches which may represent prehistoric boundaries are also visible in the vicinity	Low	Low
42	1754		Cropmark of a linear ditch with right angle. This cropmark could represent an incomplete rectangular cropmark enclosure of unknown date and function.	Low	Low
43	1821		Cropmarks of possible incomplete enclosures, potential trackway and a fragmented field system of unknown date.	Medium	Low
44	1820		Cropmarks of probable late-medieval field boundaries and pits of an unknown date.	Low	Low

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
45	1755		Cropmarks of a ploughed-level wind mill with central cross-trees, a field system and cropmark enclosures are also visible.	Medium	Low
46	9082	1012185	Scheduled Anti-aircraft Battery at Bowaters Farm. The monument includes 8 concrete emplacements in 2 groups, with their connecting roads and vehicle parks, magazine, and command post. The earlier group comprises 4 octagonal emplacements measuring some 16 metres across. Earthen banks protect the outer sides of the 2 enclosures. Ammunition lockers and a rectangular magazine building some 12 metres long survive, as does a larger building which formed the command post. This group housed 4.5 inch guns from mid-1940 to 1944. To the east lies the 2nd group of four emplacements comprising a concrete lined deep circular pit some 16 metres across, with an adjoining sunken engine room. A gun turret originally capped the pit and housed a 5.25 inch gun which superseded the 4.5 inch guns in 1944 and continued in use until after the war. Photographs from 1940 show that the layout of the original emplacement was changed prior to September 1940 and other photographs from 1953 show guns still in place. Many of the buildings still survive outside the scheduled area.	High	Very High
47	1823	1013880	Scheduled East Tilbury Battery for 6 guns, built 1889-1890. Proposed in 1887 to strengthen the Thames defences, as it was less conspicuous than Coalhouse Fort located to the south. Living casemates were below the 10" battery. Cookhouse, stores, offices etc. were on the inland side of a sunken way behind the work. The earthworks were visible on lidar.	Very High	Very High
48	1760	1013943	Coalhouse Fort (Scheduled Monument). The site consists of a series of fortifications dating back to the time of Henry VIII, which consist of a series of structures, surrounded by a water filled moat.	Very High	Very High
49	5261		Cropmarks of a multi-period site consisting of a truncated field system, possibly medieval in origin overlaying a section of trackway that could be prehistoric which in turn overlays a possible ploughed-level Bronze Age round barrow. The site also has numerous pits of varying size and shape, which could demonstrate settlement. The site is located to the east of the Scheduled Monument of Grey Goose Farm and is potentially a continuation of it.	High	High

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
50	1766		Cropmarks of a multi-period site consisting of a short section of trackway that could be prehistoric, a small rectangular enclosure of probable Iron Age to Roman date and a possible ploughed-level Bronze Age round barrow. The site also has numerous pits of varying size and shape, which could demonstrate settlement. The site is just outside the project area and no features were mapped, but the site remains important and has high potential for archaeology.		
51	NEW		Cropmarks of a probable field system, some of the field boundaries are visible on 1 st edition OS mapping of the 1880s, but other boundaries that contribute to the field system are not visible; the field system may have much earlier origins. An incomplete rectangular enclosure, 54m by 36m of an unknown date and function is also visible.	Low	Low
52	NEW		Extensive former field boundaries forming a lost field system, these features are visible on the 1 st edition OS mapping of the 1880s. Photographs from the 1940s show the location of buildings related to Thrifts and Abrahams a farm visible on the 1 st edition OS mapping which may have much earlier origins.	Medium	Medium
53	NEW		Cropmark of a linear ditch with right angle at eastern end. This cropmark could represent an incomplete rectangular cropmark enclosure of unknown date and function.	Low	Low
54	NEW		An enclosure elongated enclosure that crosses the marsh, possibly associated with WWII activity in the area. Not visible on later photographs	Low	Low
55	N/A		Agricultural marks, nothing mapped		
56	14572		Cropmarks of an enclosure with an annex thought to be Iron Age to Roman in date. The cropmarks are visible on RAF vertical photography from 1946, unfortunately the site is now damaged and under residential development.	Negligible	Low
57	1859		Cropmarks of Orsett Cock settlement enclosure of Iron Age to Roman date. The site was excavated prior to the construction of the A13.	Low	High

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
58	NEW		Earthworks consisting of ditches on either side of central tracks, one of which is visible for over 1.5 km. Five of these droveways are visible running in a north-south direction across the former salt marsh (Figure 17). Some of the droveways end by opening out into areas of marsh confined by ditches and all lead from farms (such as Gravel Pit Farm) or settlements (Like Low Street) via green lanes that appear to still be in existence in places, often defined by parallel ditches. These droveways were probably used to take animals down to the marshes for grazing or to allow access to the marshes for salt making and probably date to the medieval period or earlier. While the southern end of the droveways are no longer visible on the earliest available aerial photography (modern exploitation of the marsh for use as landfill and for Tilbury Power Station had begun in the 1940s), quays and salt making sites may still survive on the coast.	Medium	High
59	NEW		Cropmarks of a possible ring ditch were faintly visible on a single 1940s aerial photograph; however the mark is not thought to be archaeological in origin (possible agricultural mark) and was therefore not mapped.	Negligible	Low
60	NEW		Continuation on the north side of the railway of the earthworks consisting of a ditch on either side of a central track to form a droveway from the settlements on the ridge above the marsh (Site 58).	Medium	High
61	NEW		A possible earthwork enclosure that uses creeks on the salt marsh. The site is visible with shallow water filled ditches 5 days after the 1953 flood. Could be a salt making site. Site now covered by landfill site.	Medium	Low
62	NEW		Cropmarks of a former field boundary visible on the 1 st edition OS mapping of the 1880s. No sign of the potential red hills identified from geophysics.	Low	Low
63	1759	1013943	Coalhouse Fort quick fire battery, which is part of the Scheduled Coalhouse Fort site. A small earthen emplacement for four 6-pounder quick firing guns was constructed just behind the river wall south of the main fort in 1893. Today the site still has an earth bank with concrete structures in the centre. The emplacement is surrounded by a narrow water-filled ditch	Very High	Very High
64	NEW		Earthworks of a small field or drainage system visible on aerial photographs from the 1940. The ditches were visible as earthworks, but have since been destroyed by the construction of a pond and drainage system.	Negligible	Low

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
65			WWII anti-glider ditches were visible as earthworks on the 1940s aerial photographs and as levelled earthworks on the later photography. To the north of the anti-glider ditches was a series of field boundaries, ring-ditches and an enclosure, that were all located just outside the project area and were therefore not mapped. The entire site has now been destroyed by quarrying.	Negligible	Low
66			Earthworks of a series of short field boundaries of a probable post-medieval date that have subsequently been levelled.	Low	Low
67	NEW		Cropmarks of a possible square enclosure and a larger, but incomplete rectangular enclosure, both of an unknown date and function. No internal features or entrances were visible on the available photography.	Low	Low
68	NEW		Cropmarks of a possible ring-ditch, that may represent a ploughed-level Bronze Age round barrow. The ring-ditch is not clearly visible on several photographs and may only be a geological mark.	Medium	Low
69	14641		Cropmarks of two possible incomplete rectangular enclosures that could be prehistoric settlement enclosures. Around 30 pits of varying shapes and sizes are located within the enclosures and in the immediate vicinity. Lies immediately to the south east of Scheduled Monument at Grey Goose Farm.	High	High
70	5236		Cropmarks of two intersecting field boundaries are visible, of possible medieval to post-medieval date. The site also has extensive pits of varying shape and size. Some of these pits form lines and small groups. It is possible these relate to the Grey Goose Farm scheduled monument	Medium	Low
71	1750		This site is located between Sites 26 and 73 and shows the continuation of the cropmarks of a possible field system and pits (evidence for prehistoric settlement). It also lies immediately adjacent the excavated site at Mill House farm which contained extensive Bronze Age occupation.	High	High
72	14643		Cropmarks of a continuation of the Roman field system located to the east (Site 16). A ring-ditch which may represent a ploughed-level Bronze Age round barrow is also visible as well as an irregular enclosure which potentially forms an extension of the late Iron Age/Roman complex to the east. .	High	Medium
73	1750		Cropmarks of a possible incomplete rectangular enclosure, field boundaries and a series of small pits which appear to continue from Site 24 to the west.	Medium	Medium

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
74	14559		Extensive WWII anti-glider ditches were visible as earthworks on the 1940s aerial photographs and as levelled earthworks on the later photography. Many of the anti-glider ditches were constructed with a single central ditch with material from the ditch left in piles alongside. The anti-glider ditches across the salt marsh made use of the existing drainage channels and creeks	Low	Medium
75	14559		Extensive WWII anti-glider ditches were visible as earthworks on the 1940s aerial photographs and as levelled earthworks on the later photography. The anti-glider ditches across the salt marsh made use of the existing drainage channels and creeks	Low	Medium
76	NEW		Site of Castle Farm which is marked on 1st edition OS mapping from the 1880s, but may have much earlier origins. Photographs from the 1940s and 1950s show the location of buildings related to the farm. The site is now under a small copse of trees.	Medium	Medium
77	N/A		Cropmarks of a possible ring ditch were visible on a single aerial photograph, however the mark is not thought to be archaeological in origin (possible agricultural mark) and was therefore not mapped.	Negligible	Low
78	N/A		Cropmarks of possible ditches were visible on a single aerial photograph, however the mark is not thought to be archaeological in origin (possible agricultural mark) and was therefore not mapped.	Negligible	Low
79	5287		Cropmarks of two parallel, but widely spaced ditches which probably represent former field boundaries and a possible incomplete rectangular enclosure of unknown date and function.	Low	Low
80	NEW		Cropmarks of former field boundaries of a possible late medieval date and two rectangular enclosures. The northern enclosure is incomplete, but has wide ditches and could be a small medieval moated site. The southern enclosure is 63m by 43m with narrow ditches and is of an unknown date and function. Neither enclosure has any internal features visible on the available aerial photography.	Medium	Medium
81	NEW		Cropmarks of a possible incomplete circular enclosure of an unknown date. The cropmark is truncated by trees	Low	Low
82	NEW		Cropmarks of a possible ring-ditch 32m in diameter. Located to the north of the Grey Goose Farm Scheduled Site.	Low	Medium

9. Conclusions

The results of the aerial investigation and mapping will support the Cultural Heritage chapter of the DCO application, providing an accurate location for the known below-ground archaeological features and will facilitate the accurate location of trial trenches for the field assessment.

The archaeological cropmarks from around the Thames Estuary are of particular significance for the understanding of many periods. The corridor of the Lower Thames Crossing bisects one of Britain's key archaeological landscapes cutting across the core of the Greater Thames Estuary (Williams and Brown 1999, Essex County Council *et al* 2010). The large scale multi-period excavations undertaken at Mucking, situated to the east of the project area, gives an indication of the extent and complexity of the heritage issues faced by the scheme and this is supported by the cropmark evidence.

The proposed road corridor crosses a range of geology and land forms including the coastal marshes, gravel terraces, clay lowlands and river/stream valleys. The aerial survey forms an essential element in the delivery of an integrated investigation of the landscape as a whole; the results of the survey could influence the methodology and extent of subsequent evaluation. The results of the survey also provide a detailed record of previous field systems and other man-made landscape features, including the coastal grazing marshes and quarrying, and these could feed into the development of an overall landscape assessment and should influence future enhancement and mitigation design for the scheme.

Within the coastal marshes a range of aerial cropmarks and earthworks were visible. These include the Second World War defence systems deployed across the former grazing marsh to hinder aerial invasion. Similarly the extent of the scheduled WWII anti-aircraft batteries situated on the marshland can be identified. Natural features such as

former creeks within the marshland are also visible, as well as features associated with the reclamation of the marshes such as counter-walls. This information is important in helping to define the heritage on the marsh, and could be integrated with other work such as landscape assessments of the LTC to inform design processes such as development of new landscapes.

The interface between the marshland and the gravel terraces is known to be a favoured location for human activity and settlement, and consequently this area is archaeologically highly sensitive from the early prehistoric period through to the post-medieval period. The results of the aerial photography should be integrated with both the deposit models across the marshes and the trial trenching on the gravel slopes. The aerial investigation and mapping will facilitate the targeting of trial trenches to maximise the information from the evaluation trenching. This survey also facilitates an understanding of the overall landscape and provides an indication of the settlement pattern over time. This will facilitate a better understanding of both the separate heritage assets and also how the overall landscape is related and developed through time.

The aerial photography has shown how the Scheduled Monument comprising the Neolithic causewayed enclosure at Orsett (which also contains an Anglo Saxon cemetery), will be impacted by the LTC.

One of the important features identified by the aerial survey is the Long Mortuary enclosure which lies in the centre of the road corridor about 1km west-south-west of the Scheduled Orsett Causewayed Enclosure. Most other known long mortuary enclosures within Essex are protected as Scheduled Monuments and as such this could be regarded as of national importance. This monument, if confirmed to be of Neolithic date,

would form part of a Neolithic landscape with the Causewayed enclosure (Hedges and Buckley 1978, 221).

The aerial assessment shows that the gravel terraces in Thurrock are important to our understanding of the later Bronze Age in Britain and has the potential to inform the regional research frameworks. The Mucking excavations located to the east of the LTC with its Middle Bronze Age field system and two 'Springfield Type' enclosures (Evans et al 2016) and the similar 'Springfield Type' enclosure west of Orsett (Ingle and Saunders, 2011, 83) lies close to the route of the LTC and provide an indication of the complexity of the archaeological deposits likely to be encountered on the route. It is inevitable that the archaeological fieldwork in advance of construction will reveal a range of archaeological sites of this period; the recent excavation at Mill House Chadwell St Mary (Archaeological Solutions 2017) provides an example of what may be expected (Plate 6).

Probable Late Iron Age and Roman occupation is identified from the aerial survey across much of the gravel terraces and in some of the clay areas. Extensive cropmarks east of Orsett have been interpreted as a large Late Iron Age/Roman settlement; these will be affected by the link road running north from the A13. The investigation of these complexes, together with others elsewhere, such as the rectilinear enclosures adjacent to the Chadwell St Mary Long Mortuary enclosure will enhance our understanding of Iron Age and Roman settlement patterns (e.g. Evans et al 2016, 479-525; Medlycott and Atkinson 2012).

Saxon settlement and cemeteries are difficult to identify from aerial photographs although it is known from excavations at Mucking (Hamerow 1993; Hirst and Clark, 2009; Rippon, 2012, 105), Orsett, Orsett Cock, (Carter 1998) and Mill House (Archaeological Solutions 2017) that Early Saxon settlement and burial is widespread in the area. Many of the irregular pit-like features identified from the aerial survey have the potential to be of this date. Considering their widespread distribution across the survey

area if these do prove to be of Saxon date they will be highly significant and potentially change the present understanding of the occupation of the gravel terraces at this period.

The area crossed by the LTC has been at the forefront of study of the origin and development of field systems especially in regard to change and continuity from the Roman through to the medieval periods down to the present day (e.g. Rippon 1991; Hunter 2003). The aerial rectification in association with the trial trenching will define the date and significance of the field systems.

The aerial photography has defined a cluster of defensive structures overtime, a number of which are Scheduled Monuments, such as, Tilbury and Coalhouse forts and their associated gun batteries along with anti-aircraft installations. These are a remarkably complete set of monuments illustrating the development of the defence of the northern bank of the Thames estuary and approaches to London. Each is of considerable importance, but their group value makes them particularly significant. The aerial photographic assessment has brought together information on this complex of defences which should be used to inform the regional research agendas into the future.

Although there are less cropmarks on the claylands in the northern area of the LTC scheme, the aerial survey has been important in locating new sites and identifying surviving earthworks such as moated enclosures. Earlier field-systems have also been identified on the claylands. The results of the aerial survey will be used to target the trial trenching to assess for previously unknown archaeological remains which are likely to survive in this area.

There are extensive areas of cropmarks within the LTC corridor, but it should be noted that even where dense cropmarks are known, they will only represent a fraction of the archaeological features actually present.

Title: Lower Thames Crossing: Aerial Investigation and Mapping

Furthermore, the absence of cropmarks is by no means likely to be an indication of a lack of archaeological features but rather a result of either the soil-types or the agricultural regime not being conducive to crop-mark formation (Ingle and Saunders, 2011, 81).

The aerial survey has therefore provided an indication of the extent and complexity of the archaeological landscape traversed by the LTC and this will support the evaluation phase of the archaeological assessment.

Appendix 1: Methodology for Mapping

The following sections identify the archaeological scope of the project, the aerial photographic sources consulted and the methodology used for transcription. Aerial investigation and mapping typically records all archaeological features visible on aerial photographs and other airborne remotely sensed data such as Lidar dating from the Neolithic up to the 20th Century. The following lists the classes of monuments that were within the scope of this project, though not all feature types were recorded:

Archaeological Scope

Plough-levelled features and earthworks: All cropmarks and soilmarks that represent below-ground features of archaeological origin have been recorded. All earthwork sites visible on aerial photographs and Lidar were recorded. Earthworks that were no longer extant on the most recent photography were mapped and recorded as 'levelled earthworks' in the GIS attributes (see Section A1.3 below for further information regarding GIS attributes).

Post-medieval field boundaries: Former field boundaries and field systems that were marked on the 1st edition OS mapping (c. 1880s) were mapped where they were visible in conjunction with other archaeological features (and these field boundaries were mapped in a different GIS layer) to ensure the former field boundaries were identified correctly and not misinterpreted (e.g. in areas with complex archaeological features). Where former field boundaries that were on the 1st Edition OS mapping were visible in isolation (with no other archaeological features to be mapped) they were not mapped. All other field boundaries and field systems not marked on the OS mapping were recorded.

Twentieth-century Military remains: Military buildings and structures were recorded and mapped according to their form (e.g. military buildings or pillboxes were recorded as structures; airfields were recorded as extent of feature). Military features and structures mapped included anti-glider ditches and anti-aircraft batteries.

Ridge and Furrow: All remains of medieval and post-medieval ridge and furrow were recorded using a standard convention to indicate the extent of area covered by the ridge and furrow, with arrows to indicate the direction of the furrows.

Buildings and structures: Foundations of buildings and structures which appeared as ruined stonework, earthworks, cropmarks, soilmarks or parchmarks were recorded. Only buildings relating to military or industrial sites were mapped as 'structures' or defined by an 'extent of area' as appropriate, other standing buildings (e.g. with roofs) and structures were not plotted.

Parks and Gardens: Earthworks and levelled landscape features associated with historic parks and gardens were recorded but features associated with 20th-century parks and gardens were not included.

Water meadows and drainage: Areas of water meadow were mapped using bank and ditch mapping conventions. While extensive areas of drainage were not routinely mapped, drainage channels were included where the features were associated with other identified archaeological features (such as moats or water meadows).

Natural Features: Geological and geomorphological features were not mapped, although these natural features were noted in the record and within the attributes of

Title: Lower Thames Crossing: Aerial Investigation and Mapping

other mapped features where their presence would help to define the limits of archaeological features or if they could be misinterpreted.

Transport: Transport features such as canals or railways were not mapped as these features are adequately recorded elsewhere such as on historic OS mapping. Smaller features such as trackways and pathways were assessed and mapped if appropriate (for example, some historic pathways were visible on the aerial photographs were identified on the 1st edition OS mapping and these features were mapped when they were visible with other archaeological features, in a similar way to the post-medieval field boundaries).

Sources of Aerial photographs

All readily available aerial photographs were consulted during the project. Table A1 shows the main sources for the photographs that were reviewed for the project.

Source	Type of photography
Historic England Archive (HEA)	Vertical and oblique
Essex County Council HER	Oblique and vertical
Cambridge University Collection of Aerial Photographs (CUCAP)	Oblique and vertical images that are held within the HER or HEA. The CUCAP library is currently not accessible, therefore not all images could be viewed
Lower Thames Crossing (Highways Agency)	Ortho-photography from summer 2018
Google Earth	Verticals (from up to 8 different years)

Table A1 - Sources and types of aerial photography consulted for this project

A cover search of the HEA collection of the project area was carried out at the beginning of the project and was carried out again in September 2018 following an amendment to the project area. This cover search listed all the photographs recorded in the collections, along with additional information such as the date of photography, easting and northing of the photographs' central point, film detail (black and white or colour print for example) and copyright information.

The HEA photographic collection was assessed in Swindon and high quality photographs of the images were taken with a hand-held camera within the Public Search Room. While this allows a rapid assessment of the available photography it does mean that all the aerial photographs of a specific site cannot be viewed at the same time.

Vertical Photography

The main vertical collection for this project came from the HEA, with additional coverage from online sources such as Google Earth and ECC vertical collections (Table A1). The HEA cover search identified 3484 vertical prints using a 1km buffer. This buffer was reduced to 200m to ensure the number of images was manageable within the project timescales. 1545 vertical prints were available to view in Swindon. Essex County Council holds a vertical collection which ranged in date from 1960 to 2014. The ECC verticals from 2000, 2010 and 2014 were available as digital ortho-photographs with the pre-2000 photographs available as high quality scanned images (not georeferenced).

A narrow corridor of digital vertical images was supplied by the Highways England Lower Thames Crossing Team. These images did not cover the complete study area, but had been taken in July 2018 and contained some excellent archaeological cropmark information.

Vertical photography from Google Earth and Bing Maps was assessed; both these sources of photography are high resolution, with good clarity, are accessible and easy to assess. Up to eight sets of photographs of the project area were available on Google Earth. The available photography on Google Earth ranges in date from 2000 to 2017.

Oblique Photography

The main sources of oblique aerial photography were the HEA and the Essex HER. The HEA cover search contained records for 429 specialist oblique photographs (both hard copy and digital images). 345 images were available to view for this assessment.

Oblique photography from the Essex HER consisted of hard copy prints of some of the HEA photography, along with hardcopy ECC photography and digital images taken between 2009 and 2018.

The CUCAP library in Cambridge was not consulted as it is currently closed, however, both the HEA and Essex HER contained CUCAP images, which were assessed.

Lidar

Lidar data was downloaded directly from Geomatics webpage (www.geomatics-group.co.uk) as ASCII data. The composite 1m DTM data was used (as downloaded in June 2018). An overall mosaic of the lidar data was created (split into north and south sections to make the data size more manageable and easier to

process). A hill shade image was created in ArcMap. This hill shade composite image was assessed and examined alongside the available aerial photography. Where features of interest were found or additional investigation was needed multiple visualisations were produced using Relief Visualisation Toolbox (RVT) version 1.3. Various visualisations (including Slope Gradient, Simple Local Relief Model, Analytical hill shading and positive and negative openness) were then viewed in ArcGIS. Archaeological features visible as earthworks on the lidar were digitised from the visualisations created in RVT using standard mapping conventions.

Transcription and GIS

The results of the mapping were produced entirely in a digital format. ESRI's ArcMap 10.4 was used. As all the aerial photographs were assessed and archaeological features were identified a GIS polygon was created to identify the extent of the visible features and each area was given a site number (information such as description of features visible, existing HER number (if applicable) and photograph reference number were recorded in the attribute table). This system of numbered polygons allowed hardcopy and digital images of the same site to be collated, while mapping was tracked and suitable images of each site were recorded.

The oblique and vertical photographs to be used for transcription were either scanned (if the original was a hard copy held within the HER) or the digital image identified (from either the HER images or the photographs taken in Swindon). The images were rectified using AirPhoto (a programme for the rectification of perspective distortion in aerial photographs, enabling archaeological features to be directly mapped from the rectified image). Control information (points such as the corner of a building or field boundary identifiable on the OS maps and the aerial photograph) was derived from OS MasterMap or the digital ortho-photography available and a digital terrain model (created from digital contour data)

was used to compensate for distortion due to slope and terrain. The rectified aerial photographs were imported into the GIS and could be viewed in conjunction with other geographic information such as geology, soil information and historic OS mapping (see Section A1.1.1 for other available layers).

Archaeological features were digitally transcribed in ArcMap using conventions and guidance from the 'Standards for National Mapping Programme projects on transcription (English Heritage, 2012, 22-23) in a compatible format of the existing digital Essex NMP. The transcription was carried out using two GIS layers (polygons and polylines) within an ESRI Personal Geodatabase. The geodatabase made use of 'domains' (the attribute domain is the set of values permitted in the attribute); this allowed rules on the editing of data to be imposed. These rules allowed 'coded values' or set text to be used that ensured consistent categories of attributes could be recorded through a pick-list system throughout the project (for example, for the attribute 'Feature Type' either – DITCH, BANK, EXTENT OF AREA, STRUCTURE, RIDGE AND FURROW and LARGE CUT FEATURE could be chosen from a list to best describe the feature that had been mapped).

The majority of the features identified during the project were digitised as polygons, while former field boundaries marked on the 1st edition OS mapping were digitised in a polyline layer (for further information regarding the mapping of field boundaries please see Archaeological Scope in Section A1). The mapping conventions used for the project (and in the illustrations throughout this report, unless otherwise stated) are shown in Table A1.

Feature Type	Layer Format	Colour	Description
DITCH	Polygon and Polyline	Green	Used for all negative features seen as cropmarks and earthworks, e.g. ditches or pits. Only features digitised in the polyline layer were field boundaries marked on the 1 st Edition OS mapping
BANK	Polygon	Red	Used for upstanding earthwork, earthworks that were visible on earlier photographs that had since been levelled or compacted surfaces such as roads/trackways
EXTENT OF AREA	Polygon	Dashed outer line, no fill	Used to depict the extent of large areas features such as airfields or searchlight emplacements
STRUCTURE	Polygon	Grey	Used to outline structures such as pillboxes, Nissen huts or military tents
RIDGE AND FURROW	Polygon	Purple with purple arrow	Used to depict the area of ridge and furrow with an arrow showing direction of furrows
LARGE CUT FEATURES	Polygon		Used to depict large areas of quarrying

Table A2 - Mapping conventions used in the GIS for this project

A1.1.1 Other data

During the assessment and transcription of photographs several other digital sources were also consulted (Table A3).

Data type	Source	Format
HER monuments	ECC	GIS shape files
HER Event	ECC	GIS shape files
Essex HER	ECC	HBSMR database
Scheduled Monuments	HE	GIS Shape file
Previous/surrounding NMP data	ECC	Georeferenced TIFF images
Quarry data showing disused, existing and proposed quarry & mineral extraction areas	ECC	GIS Shape files
Geology/Soil maps	ECC/BGS/Cranford University	GIS Shape files and data from www.bgs.ac.uk/ www.landis.org.uk/soilscapes
Historic Mapping (OS 1 st – 4 th Edition 25 Inch)	ECC	Georeferenced Tiff's

3. Cambridge University Collection for Aerial Photography

The Cambridge University Collection of Aerial Photographs (CUCAP) was not accessed directly. Below is a cover search for the project area completed using the online map search facility (<https://www.cambridgeairphotos.com/map/>). The catalogue has been marked with the photography that is held within the HER and the hardcopy photography could be viewed. Only a small proportion of the CUCAP collection could be viewed (18% of the total collection was available). It is likely that there is additional archaeological information on the photographs that are not currently accessible.

1. Introduction and Background

On 12 April 2017, the UK Government's Secretary of State for Transport announced the preferred route of Lower Thames Crossing (LTC). The Scheme is located between the A2 in Kent and the M25 in the London Borough of Havering, passing through the Borough of Thurrock in Essex for much of its length. The scheme will run underneath the River Thames in a tunnel and emerge on the northern side of the river at East Tilbury. The main route will pass north on an embankment in between Chadwell St Mary and Linford and turns to the north-west to join a new junction with the A13 to the west of Orsett. The route continues north on embankment from the A13 and then turns west to join the M25 in between North and South Ockendon.

In September 2018 a project was undertaken using aerial investigation and mapping techniques to develop an efficient methodology to ensure the systematic examination of all the readily available aerial photographs and other remote sensing data such as lidar. The information gathered through this survey contributed to a better understanding of the historic environment and its significance. This includes above and below-ground archaeological features and landscapes showing as earthworks, soilmarks and cropmarks dating from the later prehistoric period through to the twentieth century, including 20th century military structures.

The first phase of the project was completed in March 2019 and extensive archaeological remains were recorded along the development corridor in Essex. The results of this work can be found in the final report (Saunders, 2019). However, further aerial investigation and mapping work in an area around the town of Orsett was commissioned in March 2020 (Figure 1); the results of which are included in this report. This area covers 178 hectares and includes two scheduled monuments.

The same methodology and aerial photographic sources have been employed for the assessment around Orsett as were used in the first phase and a full methodology statement can be found in the final report (Saunders 2019). This current assessment has been undertaken in accordance with the guidelines set out in Historic England guidance on *Aerial Investigation and Mapping (Historic England 2012a and 2012b)*. Following the systematic assessment of available aerial photographs and Lidar held at the Historic England Archive (HEA), ECC HER, Environment Agency and those supplied by Highways England, all visible archaeological features have been transcribed and recorded.

This report should be read in conjunction with the main report produced in February 2019.

Gaps within cropmark record

As with the first phase of mapping along the main road corridor there are gaps within the cropmark record in the project area. The west side of the area has fewer archaeological features recorded; this corresponds well with the changes in the geology. The absence of cropmarks is not always an indication of a lack of archaeological features but rather a result of either the soil-types or the agricultural regime not being conducive to cropmark formation

2. Aerial Photography and Lidar Sources

The sources of aerial photographs for this project are the same as Phase 1 and included the Essex Historic Environment Record (HER), Essex County Council Vertical Collection, the Historic England Archive (HEA), Google Earth and vertical photography supplied by Aerial Photography for Great Britain (APGB).

A cover search of the HEA collections was completed in February 2020 using a 100m buffer of the project area. The records for 90 vertical and 36 oblique images were returned. Arrangements were made to view these images at the Historic England Archive in Swindon in March 2020.

All the photographic prints held within the HER were assessed in conjunction with the digital images (both oblique and verticals) held. The Essex County Council vertical collection is entirely digital, with scanned prints from 1960 to 1990 and digital ortho-rectified images from 2000, 2010 and 2014. The HER holds a limited number of prints from the Cambridge University Collection of Aerial Photographs (CUCAP) and these were assessed along with the other prints; however, the HER only holds a small number of the prints that are actually within the CUCAP collection.

Images from Google Earth (Plate 2) were assessed onscreen and images of visible archaeological features were saved and used for digitising. 8-10 sets of photographs were available, although there was not complete coverage of the project area for each set.

The Environment Agency (EA) Lidar data was a primary source for this mapping project. Lidar data was downloaded directly from their webpage (<https://environment.maps.arcgis.com/>) as ASCII data. The composite 1m DTM and 50cm DSM data was used (as downloaded in March 2020). An overall mosaic of the lidar data was created and multiple visualisations were produced using Relief Visualisation Toolbox (RVT) version 1.3. Various visualisations (including hill shade, Slope Gradient, Simple Local Relief Model, Analytical hill shading and

positive and negative openness) were then viewed in ArcGIS. Archaeological features visible as earthworks on the lidar were digitised from the visualisations created in RVT using standard mapping conventions.

Plate 2 – Site 16 As seen on 2018 Google Earth Imagery (© Google Earth)

3. Results

Below is a table of the results of this project. This is a continuation of the table used in the final report of the first phase of work (Saunders, 2019, 15). Each site has a summary description of the features recorded and where possible a suggested date and function. A guide to the archaeological potential and archaeological significance of each site has been given as Low, Medium, High or Very High. The location of each site can be seen in Figure 2.

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
16	5191		Extensive cropmark complex consisting of a probable Roman field system, trackways and associated settlement, Iron Age settlement enclosures and possible Bronze Age round barrows (Figure 3). There are multiple pits, both isolated and within groups across the site. The cropmark complex continues to the south and was mapped in phase one. The trackway, mapped in Phase 1, continues into the northern section of site and forms a central feature. Adjacent to this trackway there are at least two settlement enclosures of a probable Iron Age date, one with evidence for a round house within the ditch and a trackway leading to the entrance of the enclosure. A series of conjoined enclosures with internal pits and a possible round house is also visible. There are several isolated ring ditches which probably represent ploughed-level Bronze Age Round barrows and a group of three round barrows which may represent a barrow cemetery. The spread of pits continues in this northern area and some of the pits are rectangular	Very High	Very High
83	1855	1002196	Extensive earthworks consisting Bishop Bonner's Palace medieval ringwork and bailey (Figure 4, Plate 1). The scheduled monument comprises a circular enclosure (60m diameter), surrounded by a ditch. To the north is an oblong bailey enclosed by a well-defined ditch, on the northern side of which defences are strengthened by a second ditch. The work is said to be the site of a palace of the Bishops of London, who held the <i>vill</i> of Orsett from the late Saxon period onwards. To the west, is a large oblong fishpond, known as The Decoy, which is linked to the ringwork by an extensive network of water and drainage channels (Figure 5). It is not Scheduled but appears to have formed part of the overall complex as many of the surviving water channels interconnect with the ringwork and bailey. To the south of The Decoy is a further pond and interconnecting channels, all of which appear to be part of the overall complex.	Very High	Very High
84	14640		Former field boundaries forming part of a field system visible on the 1 st edition OS mapping of the 1880's	Low	Low

Site Number	HER Number	Scheduled Monument Number	Description of site and features mapped	Potential	Significance
85	5212	10009287	<p>Hill House Scheduled Monument consisting of extensive multi-period cropmarks, including a Springfield style enclosure, settlement enclosure, series of conjoined enclosures, possible round houses and pits (Figure 6). The Springfield style enclosure includes an external ditch, enclosing an area of c.65m in diameter, with an entrance on the eastern side. Springfield style enclosures are roughly circular enclosures, typically found on a hilltop or spur and dating to the Middle/Late Bronze Age, with some occupied into the Early Iron Age. Their function appears to be domestic and such sites will yield archaeological and environmental information about the lifestyle of the communities living in them.</p> <p>Overlying the Springfield style enclosure is an enclosed domestic settlement and associated field system. Within the field system are at least four roughly rectangular compounds which vary in size, most of which are believed to represent stock paddocks and pens or distinct areas for cultivation and industrial purposes, probably Iron Age to Roman in date. In an internal enclosure in the north-west corner of the complex are the remains of two circular buildings. These are visible on aerial photographs as cropmark ring ditches 14m in diameter along with cropmarks representing pits and other features. Within the square enclosure to the east of the Springfield Style enclosure, there is evidence of a ring ditch which probably represents a round house, which had not been previously identified (marked A, Figure 6).</p> <p>The importance of the Springfield style enclosure south of Hill House is enhanced by its association with this Iron Age settlement enclosure complex and the site represents a sequence of domestic development from the Late Bronze Age to the Late Iron Age/Roman period.</p> <p>The cropmarks visible on the aerial photographs at this site go well beyond the Scheduled area. To the north of the main concentration of archaeological features is a newly identified ring ditch which may represent a ploughed-level round barrow (B, Figure 6) as well as a series of field boundaries, partial round barrows and small enclosures.</p>	Very High	Very High

4. Conclusions

As with the previous project the results of the aerial investigation and mapping will support the Cultural Heritage chapter of the DCO application, providing an accurate location for the known below-ground archaeological features and will facilitate the accurate location of trial trenches for the field assessment.

The work has highlighted the extent and complexity of both the Scheduled monuments that were within the project area, including newly recorded features and survival of earthworks. The completion of the mapping of the probable Late Iron Age and Roman settlement to the east of Orsett has ensured this extensive settlement site is now better understood.

The recording and mapping of the Scheduled Springfield style enclosure and Iron Age settlement to the south of Hill House has highlighted the importance of this site as it demonstrates a sequence of domestic development from the Late Bronze Age to the Late Iron Age and Roman period. A recent review of this Scheduled Monument also states that the site also forms part of a much larger historic landscape identified from aerial photographic evidence, which stretches from Grays in the west across to Mucking in the east comprising one of the largest complexes of cropmarks in the county. These cropmarks form a multi-period complex dating from the Neolithic through to the medieval period (Medlycott, 2019). However, the mapping has also highlighted that the Scheduled Area does not cover all of the most significant below-ground archaeology.

Bishop Bonner's Palace and the surrounding fishponds and water channel network is of national importance archaeologically and historically, as the ringwork is one of only eleven ringworks in Essex and is particularly well preserved. A recent review of this Scheduled Monument stated that the immediate setting of this site is largely unchanged, and the integrity of the setting makes a major positive contribution to the setting and

significance of the heritage asset (Medlycott, 2019). The mapping of the visible and upstanding features has enabled this monument to be viewed in its landscape context as well as allowing more of the surrounding significant features to be better understood.

While no features have been specifically identified as Saxon within this project area, a number of pits of varying size and shape have been recorded. Saxon settlement and cemeteries are difficult to identify from aerial photographs although it is known from excavations at Mucking (Hamerow 1993; Hirst and Clark, 2009; Rippon, 2012, 105), Orsett, Orsett Cock, (Carter 1998) and Mill House (Archaeological Solutions 2017) that Early Saxon settlement and burial is widespread in the area. As with the previous survey many irregular pit-like features have been identified from the aerial survey and they have the potential to be of this date.

There are extensive areas of cropmarks within the LTC corridor, but it should be noted that even where dense cropmarks are known, they will only represent a fraction of the archaeological features actually present. Furthermore, the absence of cropmarks is by no means likely to be an indication of a lack of archaeological features but rather a result of either the soil-types or the agricultural regime not being conducive to crop-mark formation (Ingle and Saunders, 2011, 81).
