A SPECIAL DOG

Sled dogs are very strong and have unique endurance. They can work hard and stand low temperatures. They have powerful muscles and solid bones making them able to haul heavy loads, and they are resistant to injuries. Furthermore, they have strong teeth useful for defending themselves and for tearing food to pieces.

The fur is well suited for the climate in the Arctic. It has a soft, dense undercoat and a heavy outer layer. The dogs shed part of the undercoat in the spring with rising temperatures but regains it in autumn to stand the winter cold.

The sled dog is a rather big dog compared to other kinds of dogs. Full grown sled dogs normally weigh around 30-40 kg and are about 60 cm tall. Bitches are often smaller than male dogs.

But sled dogs may look very different. Some are big and sturdy, others small and lithe. The fur may have different colours from completely black or white to grey, brown, or yellow with spots which is the most common. Some sled dogs have longer and more curly hair than others. It differs what type of dog the sledge driver prefers.

Even though all kinds of dogs have something in common there is a wide difference between how dogs look like, and what they are capable of. The Greenland sled dog is especially qualified for life in the Arctic. It can handle cold and tough tasks. Through time the dogs who managed best, passed on their good abilities to their puppies. Furthermore, humans have taken care to keep the best puppies from good sled dogs. In this way humans and nature have selected the best dogs, and the sled dog type has acquired the special abilities it has today.

WHAT IS A DOG?

Dogs may look very different, but all dogs in the world are the same species and can have offspring with each other. Dogs that are alike and live in the same place, are often called a dog breed or dog type.

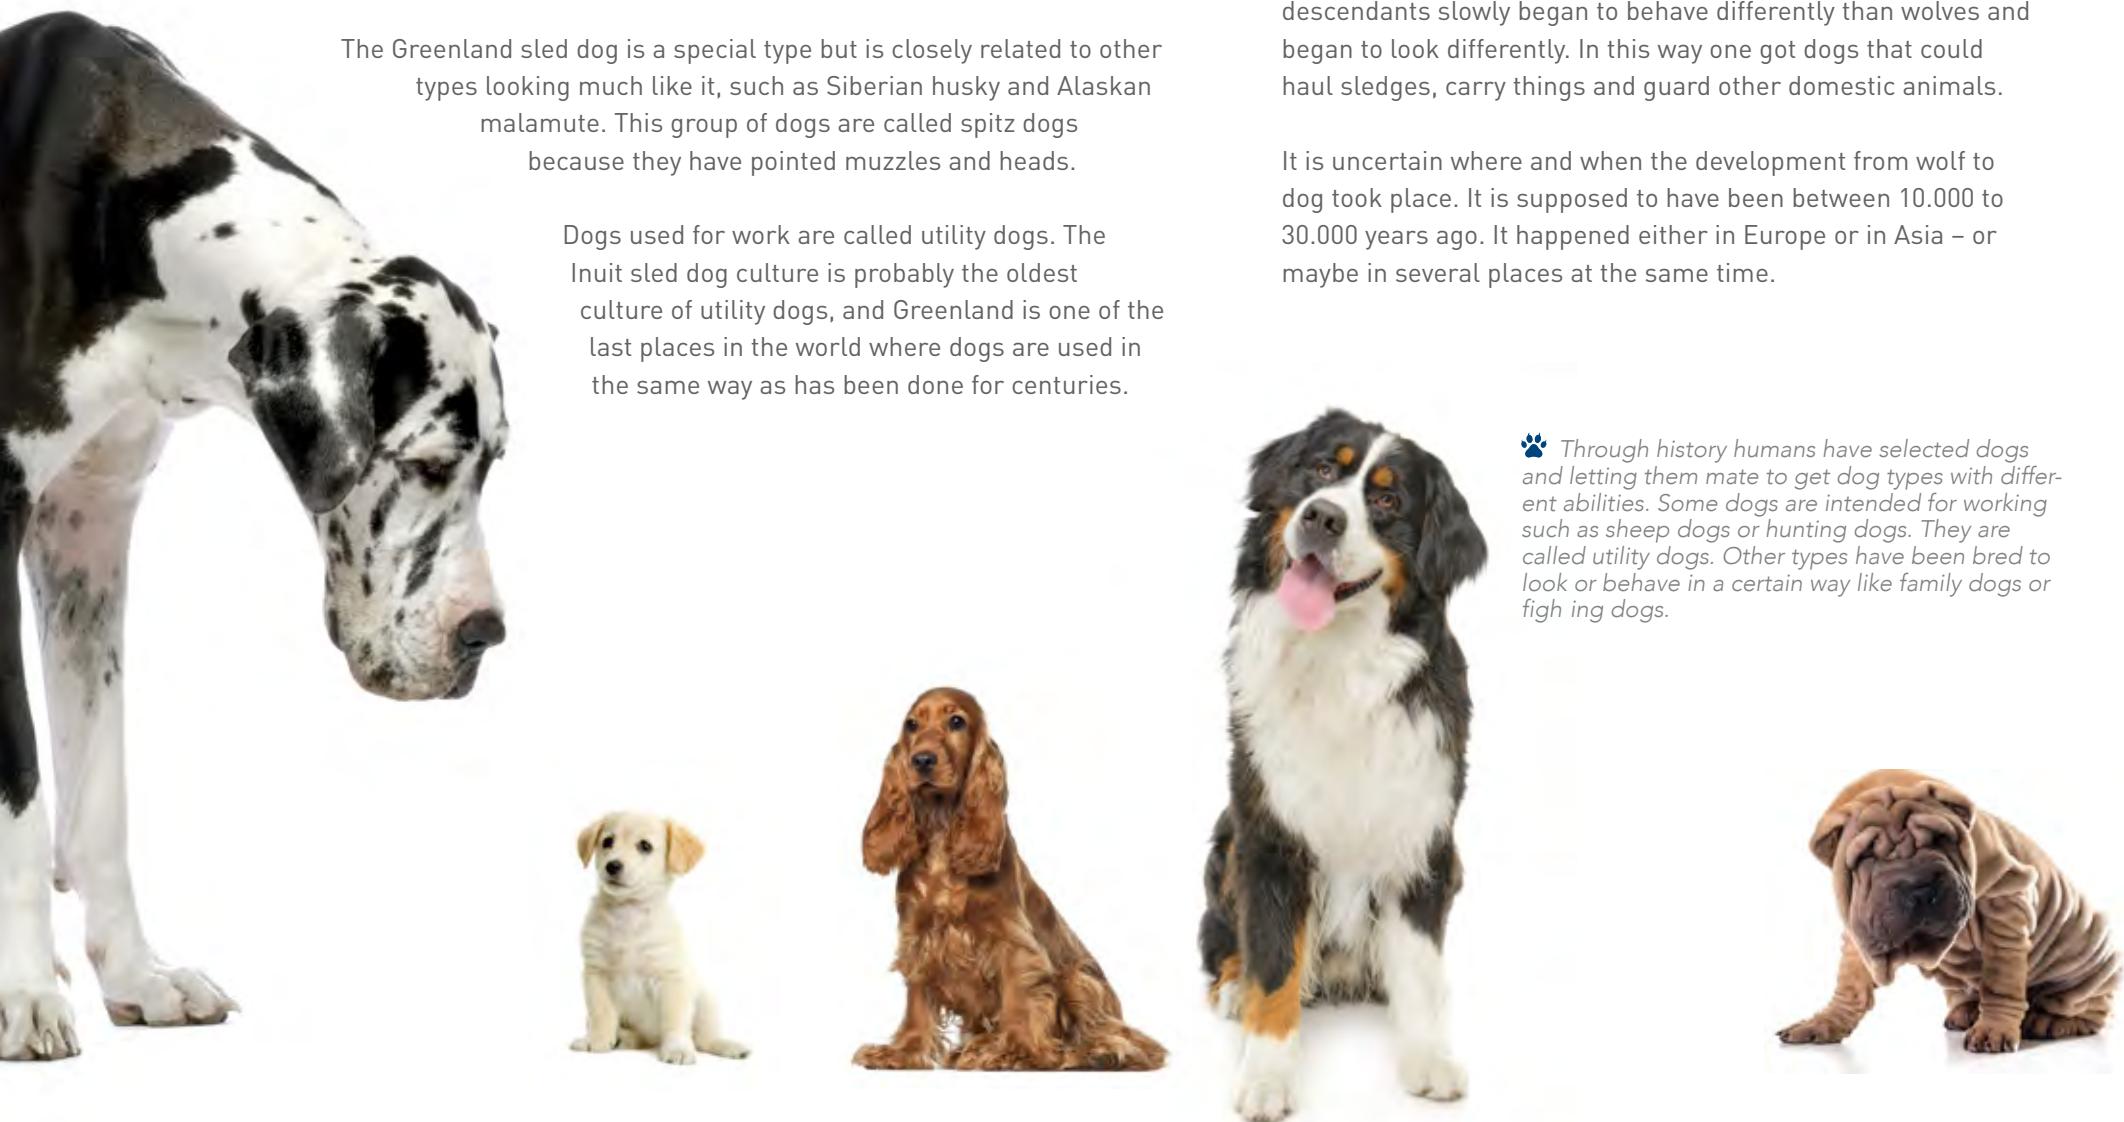

The Greenland sled dog is a special type but is closely related to other types looking much like it, such as Siberian husky and Alaskan malamute. This group of dogs are called spitz dogs because they have pointed muzzles and heads.

Dogs used for work are called utility dogs. The Inuit sled dog culture is probably the oldest culture of utility dogs, and Greenland is one of the last places in the world where dogs are used in the same way as has been done for centuries.

Dogs are closely related to wolves and in fact come from a kind of wolf that no longer exists. In the Stone Age humans may have tamed wolf cubs, and after a long period of time their descendants slowly began to behave differently than wolves and began to look differently. In this way one got dogs that could haul sledges, carry things and guard other domestic animals.

It is uncertain where and when the development from wolf to dog took place. It is supposed to have been between 10.000 to 30.000 years ago. It happened either in Europe or in Asia – or maybe in several places at the same time.

🐾 Through history humans have selected dogs and letting them mate to get dog types with different abilities. Some dogs are intended for working such as sheep dogs or hunting dogs. They are called utility dogs. Other types have been bred to look or behave in a certain way like family dogs or fighting dogs.

GENEALOGI OF THE SLED DOG

Research has shown that the Greenland sled dog is genetically unique, and that it is one of the oldest dog types in the world. The Greenland sled dog is closely related to other sled dog types in the Arctic. This kind of dogs probably emerged in Siberia around 10.000 years ago.

It is possible to gain knowledge of the relationships and development of the sled dogs by examining their genes. Researchers have taken samples of genes from sled dogs several places in Greenland and also samples from old dog furs and dog bones in museums. In that way you can compare genes from modern dogs with dogs that lived long ago. Sled dogs have also been compared to wolves and other modern dog types.

Today there is a law protecting the Greenland sled dog from being mixed with other dog types. But through history expeditions, whalers and merchant ships have brought other kinds of dogs who probably mated with sled dogs. There are many stories too about sled dogs and wolves having puppies together. Even though there has been crossbreeding through history with wolves and other dogs, the researchers have not been able to see clear traces of mixing with wolves and other dogs in the genes of Greenland sled dogs.

The reason why sled dog genes do not show mixing with other dogs or wolves may be that the sled dog is so special and well adjusted to life as a utility dog in Greenland. Crossbreeds with other

kinds of dogs or wolves would not have great chances of surviving. Only sled dogs with the best qualities have survived, had puppies and thus passed on their own genes.

Research in modern sled dogs show that there are some genetic differences between dogs in eastern and western Greenland. This is due to the fact that Eastern Greenland used to be very isolated so not many other sled dogs arrived there.

Many think that sled dogs look like wolves. But sled dogs are heavier and bigger than wolves, and their skull is more solid. The dog's tail is normally curled up over the back, while the wolf's tail is hanging down. Dogs also have other colours in their fur than wolves.

THE SLED DOG AT WORK

With the dog sledge you can travel to hunting and fishing places far away. Most common is catching seals, whales, and walrus, hunting polar bears, musk ox and reindeer and fishing for Greenland halibut and other fish from the sea ice. The sledge can be used for transporting the catch and to carry equipment such as hunting gear and kayaks.

The dogs can be used for hunting too. They can scent the prey, and some can even smell their way to the breathing holes of seals in the ice. During a hunt the dogs can be used to encircle prey like polar bears and musk ox.

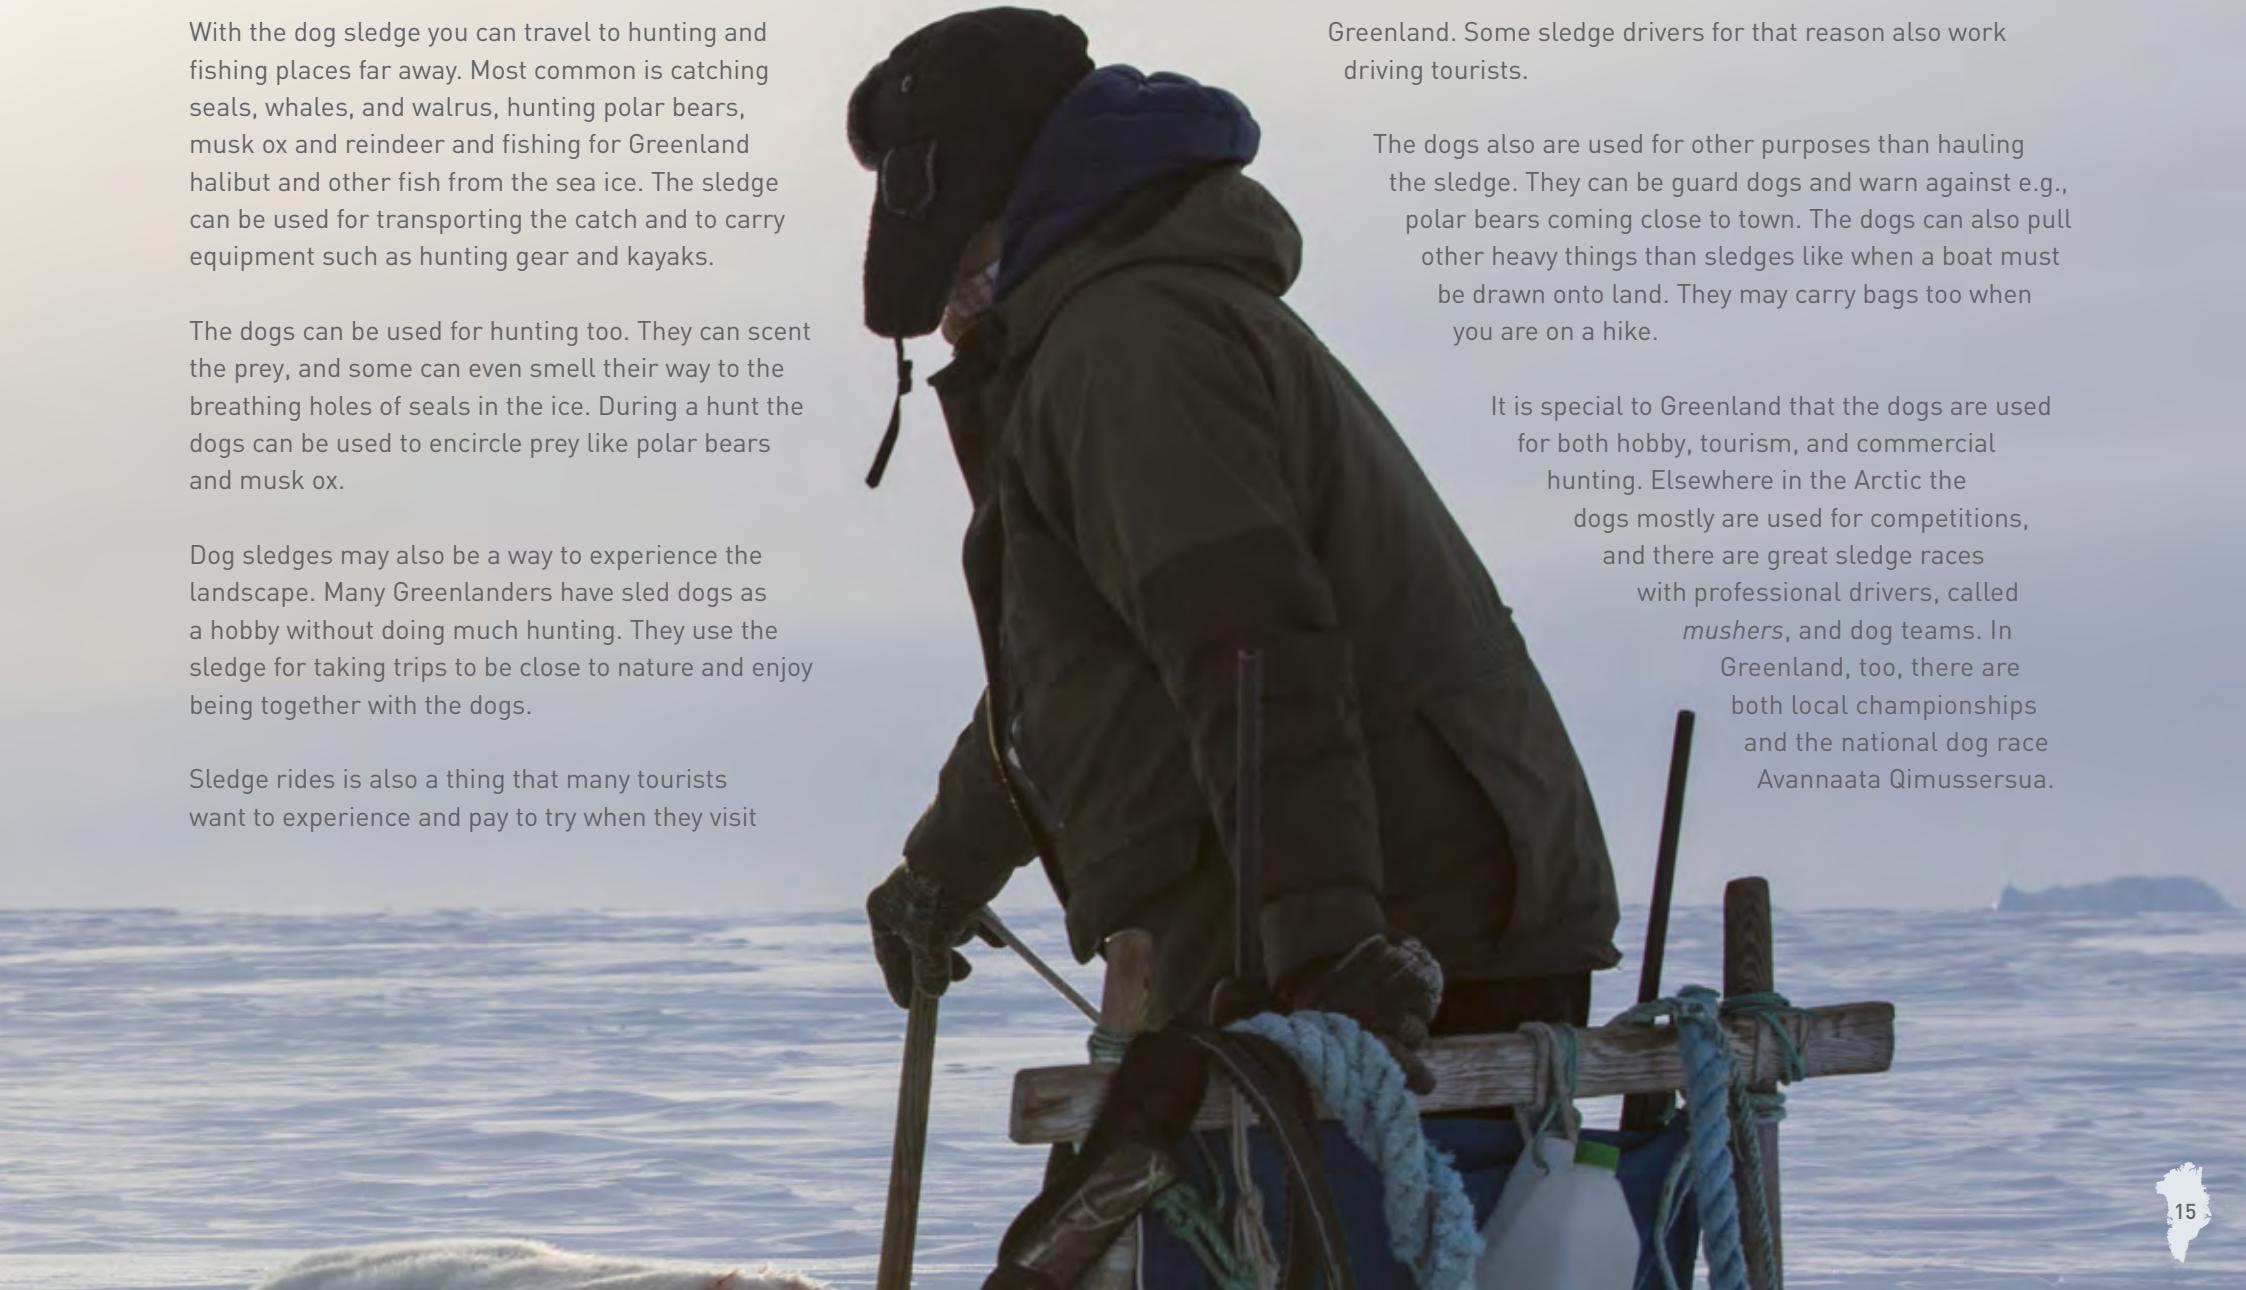

Dog sledges may also be a way to experience the landscape. Many Greenlanders have sled dogs as a hobby without doing much hunting. They use the sledge for taking trips to be close to nature and enjoy being together with the dogs.

Sledge rides is also a thing that many tourists want to experience and pay to try when they visit

Greenland. Some sledge drivers for that reason also work driving tourists.

The dogs also are used for other purposes than hauling the sledge. They can be guard dogs and warn against e.g., polar bears coming close to town. The dogs can also pull other heavy things than sledges like when a boat must be drawn onto land. They may carry bags too when you are on a hike.

It is special to Greenland that the dogs are used for both hobby, tourism, and commercial hunting. Elsewhere in the Arctic the dogs mostly are used for competitions, and there are great sledge races with professional drivers, called *mushers*, and dog teams. In Greenland, too, there are both local championships and the national dog race Avannaata Qimussersua.

When a puppy is born it is quite small, but it grows with about one kilo a week. When it is around one month old and weighs approximately 4 kg, it can start eating ordinary food – until then it sucks by its mother.

There may be many puppies in a litter, and sometimes you get rid of the weakest and the smallest that do not thrive well. Puppies and their mother usually have a dog yard and a kennel to themselves while the puppies are small. Puppies

may run loose but can be in danger of other dogs who may attack and eat them.

When the puppy is 4 months old, it can eat as much as a grown dog. It varies a lot what food the dogs get – dry feed, fish, seal or whale.

All sled dogs must be kept in chains when they are more than 6 months old. Their chain is so long that they can move around and at the same time get out of reach from other dogs, if they want to. In some towns and settlements all dogs are kept in one dog lot, in other places they are chained near their owner's home.

When the puppies are six months old you may start bringing them along on trips and letting them run as much as they can. Later you begin training them to haul the sledge, but they are first fully grown and able to haul like adult dogs when they are more than 1½ years old.

Sled dogs that are healthy and taken good care of, may become more than ten years old, but most of them do not live that long. Being a sled dog can be a rough life, and they can get hurt during drives or fighting with other dogs. It may become necessary to put away the dog if it is too old, becomes ill or injured, or if it is too vicious and has bitten other dogs or humans.

BEHAVIOUR AND LANGUAGE

Some people think that sled dogs look and behave like wolves. It is true that the sled dog looks more like a wolf than e.g., a poodle does, and groups of sled dogs may remind one of packs of wolves, but the sled dog is not more closely related to wolves than all other dogs are.

One thing that makes sled dogs remind one of wolves is their sounds. They seldom bark, but have many other different howling and yapping sounds, and when sled dogs howl it may resemble the howling of wolves.

Sled dogs can behave in ways that seem “wild” compared to dogs who are pets or family dogs. That is because sled dogs are raised and trained to be utility dogs, and that is a very different life than that of dogs who are pets and live closely together with humans. Sled dogs spend much more time with other dogs than a family dog does. For that reason, their behaviour is different. People not used to being close to sled dogs, may misinterpret their behaviour and see it as wild or aggressive because they do not act affectionately or calmly like a family dog normally does.

It happens that the dogs fight. That is why their chains must be so long that a dog can always escape to safety from other dogs. Before the laws about chaining of sled dogs accidents did happen

now and then when small children were bitten and killed by loose sled dogs.

Luckily this happens very rarely now. But sled dogs are big and strong animals, and they can be violent in their behaviour. They will defend themselves when feeling threatened, and they will protect their food or their puppies.

You have to know the signs of the dog to appreciate if it is feeling threatened or is threatening you. If a

dog shows its teeth, goes down on its knees and flattens its ears, it is signalling that it is angry or scared, and may attack. A dog that is wagging its tail, laying down on its back or jumping around, is often a happy and friendly dog. But because sled dogs are strong animals with sharp teeth, you have to be absolutely certain that you know the dog and understand its signals before coming close to it or touching it. You should never approach a loose sled dog or a sled dog that you do not know well.

THE THULE CULTURE

The Greenland sled dog culture is about 800 years old. The oldest finds of sledge parts together with dog bones have been made in Siberia and are approximately 9.000 years old. The archaeological finds thus suggest that the dog sledge technology arose in Siberia and spread eastward to the rest of the Arctic.

About 800 years ago Greenland gradually was populated by Inuit with new and effective means of transport and tools. The archaeological remains from the first Inuit are called the Thule culture. Inuit came from Canada and Alaska where they have left even older archaeological finds. Inuit came with umiaks (woman's boats), kayaks and with sledges hauled by dogs. This gave great advantages when hunting and transporting families and things from settlement to settlement.

Many people in modern Greenland have forefathers and foremothers among the immigrants 800 years ago. There have been made many archaeological finds of dog sledges from the settlements of the Thule culture in Greenland. Sledge parts as well as joints made from bone used for the dogs' harnesses and traces have been found. On old dog bones from the Thule culture, you see that they probably have been kept as sled dogs. The bones have marks from work and blows, and on some skulls it looks like the dog has had the teeth knocked out – maybe to prevent it from gnawing over the traces.

The oldest dog bones in Greenland come from the Saqqaq culture that existed in Greenland 4.500-2.500 years ago. Scratches in the bones indicates that they sometimes may have been slaughtered so that their meat and skin could be used. They may have been used mostly for carrying things and for hunting, but no traces have been found of sledges. The earliest sledge finds come from the subsequent period called the Dorset culture. There are only few traces of dogs so the sledges may have been pulled by humans. Certain traces of dog sledges in Greenland are first seen with the immigration of Inuit in the 13th century.

THE SIGNIFICANCE OF THE SLED DOG

QIMMEQARFIT // DISTRIBUTION OF THE SLED DOG

Inuit who immigrated to Greenland about 800 years ago, can be considered forefathers and foremothers of many of the people living in Greenland today. The sled dog and the dog sledge were essential to the immigration of Inuit and to their life, and thus the dog sledge technology has contributed to creating Greenlandic society of today.

Sled dogs and dog sledges have been of enormous importance for people's possibility to travel, to settle and survive in Greenlandic nature with its wide distances and a rough, shifting climate. The dogs have been means of transport, partners in hunting and fishing, and a source of fur, food, security and company. The dog sledge, the kayak and umiak also have been the basis making it possible to settle in new areas and still keep in contact with friends and family in other settlements.

The use of the dog sledge and the dogs have been different from place to place and is part of local traditions for e.g.,

hunting of polar bears, fishing and catching seal. The dog sledge also was central to the development in the Thule area at the beginning of the 20th century, when the trading post gave access to wood. This made it possible to build long sledges, and the fur trade made it affordable to keep many dogs – tradition arose for big sledges and big dog teams for the long hunting travels. In both northern and eastern Greenland, the dog is important in traditional hunting, and especially in the hunt for polar bears where the dog both helps tracking and encircling the bear and by hauling it home on the sledge.

The dog sledge in former times had and today still has a unique significance for Greenlanders' relationship with nature. The cooperation between dogs, humans and dog sledge technology gives access to explore, use and experience the landscape. You might say that the dog sledge has contributed to creating a special bond between humans and nature in Greenland.

POLAR EXPEDITIONS

During the 19th century many western countries began sending expeditions to both the Arctic and Antarctica to map the areas. Many expeditions were undertaken by ship, but if you wanted to reach the North Pole or the South Pole travelling by land was necessary.

Many of the first expeditions were undertaken on foot with men themselves hauling sledges with equipment and food. With contact to the Thule area and knowledge about the Greenlandic and northern American dog sledge culture polar explorers in the late 19th century started using dog sledges. The knowledge about Inuit's use of sled dogs and equipment gave new possibilities and became crucial to the exploration of the Arctic and Antarctica.

On an expedition in 1910-12 a Norwegian expedition lead by Roald Amundsen by using skis, Greenland

dogs and dog sledges as the first reached the South Pole. The dogs not only hauled sledges with equipment but also served as food for humans and the remaining dogs during the journey.

Since the 19th century there have been many expeditions in Greenland, and here dog sledges were indispensable for travelling by land. Many expedition members learnt from the knowledge of Inuit about travelling in the Arctic concerning clothing, food and dog sledges, and Inuit took part in many of the expeditions.

Knud Rasmussen was especially important for the exploration of Greenland and for spreading information about the Greenlandic culture and nature in the rest of the word. Knud Rasmussen

learnt to drive a dog sledge as a kid in Ilulissat and used dogs on his expeditions. He organized several great expeditions out of the trade post he founded in Thule. They are called the Thule expeditions.

The longest trip was "The Great Sledge Journey". It took place from 1921 to 1925 and went from Greenland through North America to Siberia.

Sled dogs today are still indispensable to the sledge patrol Sirius in northeastern Greenland. Every winter groups of soldiers from Sirius travel through the area with dog sledges to watch and secure presence there.

A MYTH ABOUT THE SLED DOG

On Knud Rasmussen's travels he wrote down many of Inuit's stories. Many of them have been told from person to person through hundreds of years, and often they are about how the world came into existence, and how to understand it. This kind of stories is called myths.

This myth about the first dogs were told by the woman Arnâluk from Thule to Knud Rasmussen when he was there in 1916-18. The myth describes the creation of the earth and humans, and how humans began to have children.

The next thing that happens to humans is: "Now that they had become many, they wanted dogs. And a man with a dog harness in his hand goes out and starts stamping in the ground yelling 'Hok-hok-hok!'. Then dogs jumped out of mounds, small mounds; and they shaked themselves thoroughly because they were covered with sand. This is how humans got dogs."

This myth shows how important dogs were for those who recounted the story. Dogs were the first thing humans wanted after they had been created and had children. And before daylight, sun, moon and death came into existence in the world.

A sledge consists of runners on which the sledge slides, of cross boards for the load to rest on, and a stanchion at the back of the sledge. The shape of the Greenlandic sledge has not changed much through time, but size, materials and details depend on what the sledge will be used for. It is important that the sledge is solidly constructed, and that it slides well making it easy to pull.

In former times it was difficult to obtain big pieces of wood for the sledges. You could only get it from driftwood and shipwrecks. But sledges could also be made out of whalebone, antlers or smaller pieces of wood tied together. With time it became easier to get wood for sledges, and today almost every sledge in Greenland is made of wood.

THE SLEDGE

Dog sledges usually are between 2 and 5 m long and about 1 m wide. But the shape and size of the sledge depends on what the sledge will be used for, and how the landscape and the weather is. The sea ice at Thule makes it possible to drive with long sledges while the sledges in Eastern Greenland often are short because they must be able to go through deep and loose snow.

In Western Greenland too the sledges are not as long as in Thule because you drive on land with an uneven surface.

There are also other local differences. The tip of the runners called the brush bow, have varying shapes and are joined differently. How the cross boards are tied to the runners, also differs.

Many details of the sledges have been developed through centuries to make the driving easier. Under the runners there has to be a sole that slides easily against the ice. Today metal or plastic is used, and previously baleens or bones from whales were used. Another method was to make an "ice sole" by smearing wet mud on the runners so that they became smooth when the mud froze.

There are different ways to brake the sledge. You can throw loops of rope around the runners so that they will not slide so fast, or you can have a brake behind the stanchion that can be stepped down into the surface.

Formerly you built your own sledge, and many still do today. But now it is possible to buy ready-made sledges. The materials have changed too. Today rope is used for lashings – in the past lines made of sealskin were used.

In Greenland it is usual to harness the dogs to the sledge in a fan shape where each dog has a long trace attached to the sledge. Often the traces are of equal length but in some places one dog is given a little longer trace than the others so it may take the lead. Driving in snow it can be useful to have traces of different length so that the dogs may open the way for each other. In Alaska and Canada, the dogs often are harnessed together two by two in a row.

Before attaching the dog to the sledge with the trace, it is put in a harness. This harness goes around the back, chest and front legs, so it fits well, and the dog can use its strength to pull without the harness getting too tight or hurting. On the sledge is a rope called the snood. Between the snood and the dog's harness are the traces that attach the dog to the sledge. There are many things to keep track of when the dogs are being harnessed. The various ropes and the manner they are joined makes it possible to harness or unharness one dog at a time – or to release the dogs from the sledge all at once if necessary.

These parts can be linked with snaphooks. Formerly joints made of bone or points were used. The traces are made of rope and the harness of leather, nylon or cloth straps. Formerly the harness was made from sealskin cut in strips and sewn together.

When the dogs pull the sledge, they run in and out and change places. This entangles the traces forcing the driver to halt and disentangle so that the dogs may move freely again.

How many dogs are in a team varies. For small sledges and short trips 2-3 dogs are sufficient while long and heavy Thule sledges require up to 20 dogs. A sledge of medium size for hunting or tourist rides usually has a team of 8-12 dogs.

In a dog team the dogs have different relations to each other. There may be one or more dogs that are lead dogs. The lead dogs are often good dogs that react quickly and unerringly to the orders of the driver. They will be harnessed in front of the team with the longest traces. Besides the lead dog usually there are also two wheel dogs, a male and a female. The wheel dogs are the strongest dogs in the team – not necessarily the smartest. The driver cannot choose who is wheel dog in a pack of dogs, because that is decided by the dogs themselves.

Like humans dogs have different personalities. Some dogs are quiet and shy and keep to themselves, others are very active and like to make noise and fight. Sledge drivers put together their dog teams so that it will consist of dogs with different characteristics.

The dog owner watches which puppies are well suited to the others and then trains them to pull the sledge and be part of the team. Dogs that have grown too old or do not fit in with the others are replaced. New dogs are put in to become part of the team and learn from the other dogs.

It is crucial that the sledge driver and the dog team understand each other. The dogs and the driver should know each other so well that the driver can control the dogs and that they obey her. This applies both when the dogs are at home, and when they are fed or harnessed – but especially on the sledge trip.

Sled dogs can be very eager when they are about to go on a trip, and they howl and whine showing this. That happens too when they are fed. The dogs also with their body language can show how they feel. If the driver knows the dogs well, she understands their signals about what they hear and smell in their surroundings, and what mood they are in. In this way communication takes place between the dogs and the driver.

The dogs like to run and go on a trip, and the driver does not need force or blows to make them pull. The driver uses certain sounds or words to control the dogs. Examples can be iju or ili for turning left or right, or ai to stop, and assut for pulling extra hard. Most drivers have their own personal shouts and sounds that their dog team learns to know and obey.

The whip is used for signalling to the dogs and not for lashing. The whip can be used to show in what direction the dogs shall run and to encourage them or get their attention. A skilful and experienced dog driver who knows the team well, hardly has to give any signals because the dogs understand her body language, small sounds and movements that well.

When you keep dogs, you are responsible for taking care of them and making sure that they are healthy and doing well. The dogs need a lot of food to be able to work pulling a sledge and keep warm in the cold arctic climate. In summertime the dogs need food to recover after the injuries of winter and to shed old and grow new fur.

Even though the dogs may stay at a dog lot far from your house, you have to look after them every day. This is necessary to make sure that they are well and have not been entangled in their chains or fallen ill.

Bitches with puppies need extra care. They must have more food than usual and a kennel where they and their puppies can seek shelter and be safe. The puppies need patting to get used to humans.

You also are responsible for your dogs not bothering people or scaring them. That is why dogs must be kept in chains, and you must have them under control. If the dogs are aggressive or bite people, they must be put down.

In Greenland there is legislation about how sled dogs must be treated. The rules among other

TAKING CARE OF SLED DOGS

things state that dogs must have a dry place to sleep, that they should get enough food and fresh water every day, and that they must be vaccinated against infectious diseases.

Dogs can infect each other with diseases, and sometimes this can be serious and result in death of the dogs. Especially puppies can become very ill. For that reason, it is required that dogs must be vaccinated against certain diseases. A vaccine means that the dog cannot get the disease it has been vaccinated against, and neither can it infect other dogs.

ENERGY AND FOOD

Sled dogs can eat almost anything and are also able to work hard even if they do not get much to eat. But when you keep dogs, it is important to ensure that the dogs get enough food, and food that is well suited for the dogs.

The food must give the dogs energy and vitamins. But what the dog needs varies. The dog needs more energy if it has to work hard, or when it is

very cold. A bitch needs three times more food when she has puppies.

The dogs' food formerly depended on what could be obtained by hunting and fishing. Today the dogs still primarily get fish and seal, but it is also usual to feed with ready-made dog food that can be bought. It varies how much energy is found in different kinds of feed. There is much energy in fat

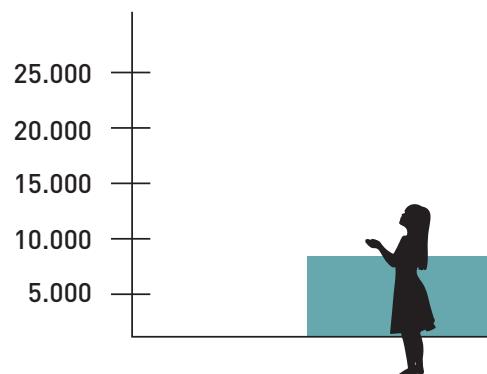

food like seal blubber, but not very much in lean food like Greenland cod.

If the dog does not get enough food, or only gets food without sufficient energy, it cannot work hard and may become skinny and ill. It is important too that the dogs have water to drink.

Nerisat orsumik, proteininik (neqi) kulhydratinillu (kinersaatit sukkullu) akui nukissaqartitsisupput. Nerisassat nukissamik akui kilojoule (kj) atorlugu uutortarneqartarput. Nerisarisat nukissamik akui timip atugaanut naleqqutuusariaqarput.

Energy comes from the food's contents of fat, proteins (meat) and carbohydrates (starch and sugar). Energy content in food is measured using kilojoule (kJ). You need varying amounts of kilojoule depending on how old you are, how much you move about, and on your sex. The energy you get from your food, should equal the energy used by the body.

ON A SLEDGE RIDE

Riding with a dog sledge is something special. Both as dog driver and as a passenger on the sledge you are very attentive to the dogs, and you experience the landscape and the trip with all your senses.

The sledge does not make much sound, but you can hear the runners against the surface. Other sounds are the breathing of the dogs, the driver's orders and creaking from the sledge. Out in the landscape you can see far, but at the same time you have to watch out for obstacles ahead of the sledge, and you must pay attention to the behaviour of the dogs.

The dogs often are used to driving the same route to hunting cabins, fishing places or certain tourist trips, and usually they will be able to find their way home on their own when they are on a trip.

Often the air is cold and fresh, and smells become very distinct. Often you can smell the dogs farting while they are running.

At times the driver runs alongside the sledge to steer it or to keep warm. Sitting on the sledge you can feel jolts when driving over bumps, and sometimes you have to hold on tight not to slide off when the sledge is swinging or tipping. You can get very cold sitting still on the sledge. It is important to wear clothing that is warm and windproof when you are sitting still, and that is good to move in if you are running alongside the sledge.

If the snow is deep, the sledge is heavy, and you are driving uphill, the going may get very slow, and you may have to get off the sledge to make the pulling easier for the dogs. If the surface is fine, and the dogs are fresh, the sledge can drive very fast, and you can feel the wind in your hair, and it may tickle in your stomach when the going gets really fast.

CHANGES AND CHALLENGES

Sled dogs are often seen as typically Greenlandic. But although many people in Greenland have tried riding a sledge or know someone who has dogs, very few in fact keep sled dogs. Most Greenlanders live in areas where there are no sled dogs.

Only in the area from Sisimiut and further north and in Eastern Greenland there are sled dogs. It is forbidden to bring other kinds of dogs to places where sled dogs are kept, as well as it is forbidden to take sled dogs outside the sled dog areas. These rules are intended to protect the dogs against infections and to prevent interbreeding with other dog types.

There were around 10,000 sled dogs in Greenland in 2019, and the number has been declining through the last decades. Fewer people live exclusively by hunting and fishing where dogs are necessary to survive. Climate changes have caused a shortening of the periods of the year when you can drive on sea ice, and the catch yield is changing.

When you cannot provide your own and the dogs' food solely by hunting and fishing, it may be expensive to keep dogs because you have to buy ready-made dog food. In places where the dogs are required to be kept in a dog lot outside of town it may become troublesome to have dogs and take care of and look after them every day. This may cause fewer people to keep sled dogs, and some exchange their dog team for a snowmobile.

Sled dogs have traditionally been used for hunting and fishing and for travels. Today some people keep dogs as a hobby because they like being with the dogs and experiencing nature with a dog sledge. Other drivers undertake rides with tourists who would like to try riding on a dog sledge. Dog sledge races and other competitions are popular too.

In this way the dog sledge culture is changing, and the way sled dogs are used, develops over time when society and surroundings change.

Assigiinngitsorpassuarnik qimussertartoqarsinnaavoq. Filmini pingasuni; Piniartoq, Sukkanniunneq kiisalu Ingerlatitseqqinneq, sooq qimussertarnermik kulturip pingaaruteqarneranik namminnerlu sooq qimussertarnerlutik kalaallit pingasut oqaluttuarput.

There are many ways to be a sledge driver. In the three films The Hunter (Piniartoq), The Race (Sukkanniunneq) and Passing it on (Ingerlatitseqqinneq) you meet three different Greenlanders telling about why the sled dog culture is important, and about why they drive a dog sledge.

THE SLED DOG AS A SYMBOL

Both in Greenland and outside of Greenland many regard the sled dog as typically Greenlandic.

Sled dogs are associated with both the historical Inuit culture and with stories about expeditions and scientific exploration of the Arctic. Dog sledges are something many see when thinking of Greenland – even if they might not know much about the dog sledge culture.

The sled dog and the dog sledge in this way stand as a symbol of Greenland, much like polar bears, whales, kayaks, inland ice and glaciers do.

Many tourists visiting Greenland are eager to see sled dogs and experience riding on a dog sledge. And in Greenland there exists a pride of the living and unique sled dog culture, even among people who have no dogs or ever tried riding a dog sledge. The dogs and the sledge create a bond between humans and nature – and create a connection between the history of Greenland and the present. The sledge and the dogs are part of the cultural heritage that many would like to preserve and pass on to the future.

HOW DO WE KNOW? – ARCHAEOLOGY AND HISTORY

When did the use of sled dogs in Greenland begin? What did sledges look like in the past? Where did the dogs and the sledges come from? How did the sled dog culture evolve?

If you want to know something about history, you need sources. Sources may be texts, pictures or artefacts from the past.

You may use many different sources if you want to know how sled dogs and dog sledges were used in Greenland in the past. The oldest written sources come from Europeans who arrived in Greenland and wrote diaries and letters about how the Inuit were living. This kind of sources is at most a few centuries old. If you want to know something about the oldest dog sledge culture, you have to use other kinds of sources like archaeological finds and DNA.

Archaeology is a science finding and analysing artefacts from the past. They are called

Attat ukiut 1200-1800-neersut tuttut saarnginik ilallit itsarnisarsiuut assaavigaaq, Aasivissuit, 1978.

Archaeologists excavating a dunghill with reindeer bones from around 1200-1800, Aasivissuit, 1978.

archaeological finds because the archaeologists often find them in the ground. Finds can be pieces of sledges or tools of stone, wood or bone. It may also be animal bones or figurines. Archaeologists are experts in finding, comparing and analysing things from the past to obtain knowledge about the life and culture of humans.

Archaeology uses methods from many other sciences when analysing the finds. Biological knowledge is necessary when you examine old bones and other remains of animals. In this way you can identify which animals the bones came from, and how they died. In the Arctic the remains of animals, humans and plants are well preserved in the ground because of the cold. That is why DNA as well may be preserved in the archaeological material that genetic researchers can examine.

It is important to be able to date the archaeological finds correctly to understand the development through time. Scientific analyses are used to achieve a precise dating. Archaeologists are also able to see what is oldest and youngest when excavating a settlement.

Using archaeological finds you can obtain a lot of knowledge about sledges and sled dogs in the past. But still there are many things that are not known. Archaeological finds can tell us a lot about technology and way of life, but not much about how people thought and behaved. Historians use written sources to obtain knowledge about history. And they can use myths and stories that have been recounted through many years and later been written down. Another science is ethnology that studies living cultures and people. Ethnologists too collect artefacts, stories and traditions that may make us wiser about the development of cultures. With these kinds of sources, you can obtain knowledge about thoughts, traditions and relationships between humans and between humans and their animals.

All the time new sources are found, and with that new knowledge acquired. The way archaeologists and historians understand their sources may change too under the influence of their own time. Today the history of Greenland is understood and interpreted quite differently than a hundred years ago.

HOW DO WE KNOW? – GENEALOGY

Where do the first sled dogs come from?
How are dogs and wolves related to each other?
And is the Greenland sled dog something quite special?

If you want to know when the first dogs emerged, and where the sled dog comes from, written and archaeological sources are not sufficient. You have to use scientific investigations.

The science called genetics, examines the genes of living beings. The genes are found in DNA that are those parts of the cell containing all kind of information about how you look, and how the body works. DNA and genes are called hereditary material because it is inherited from both of your parents. This goes for humans, dogs and other animals.

DNA is passed on from generation to generation, but it changes slightly over a long period of time. These differences can yield knowledge about the relationship between different kinds of animals, and when those different animals emerged. By examining DNA from many different sled dogs, the scientist can compare and see differences

and similarities in DNA from dogs living in different places. Also, the scientists can compare with DNA obtained from archaeological finds of skin and bones, and with DNA from other kinds of dogs and from wolves.

Using chemical analyses and computers the scientists can try to figure out when the first dogs developed from wolves, and when and where the different dogs of the world emerged. They can also investigate whether dogs have interbred with each other or with wolves in the course of time.

If different groups have interbred with each other, it can be seen in the DNA, and this is called "mixing". If a certain type or group of dogs show no genetic signs of having been mixed with others, you say that it has been "genetically isolated".

To make these calculations the researchers need DNA from many dogs. The samples can be taken from skin or bone of dead animals or with a cotton bud from the mouth of a living dog. The last couple of years many samples have been taken and much research been done on genes from both the Greenland sled dog and other dog types.

*Qimmiq qanianit vatpindimik ilisimatuum
misissugassaminnik pissarsipput.*

*Researchers taking samples from the dog's mouth
with a cotton bud.*

The methods of research develop quickly and depends on how many and how good samples you have. For that reason, the genetic knowledge about the sled dog's origin and development changes all the time, and new knowledge will surely emerge in the future.

HOW DO WE KNOW? – HEALTH

How are sled dogs capable of handling the extreme conditions in the Arctic? Which food is best for enabling the dogs to endure the tough work of hauling the sledge? Which diseases can strike the sled dogs, and how are they prevented?

If you want to know something about the health and characteristics of the sled dog, you have to be well acquainted with dogs and examine them with scientific methods. Research into the health and diseases of animals is called veterinary science.

Through the many hundreds of years when sledge dogs have been used in Greenland, knowledge and traditions have been accumulated concerning how to take care of, feed and treat the dogs. The way dogs are kept today is based on both this kind of knowledge and on scientific and medical examinations of the sled dogs, their anatomy and their diseases.

To preserve the dog population and the hunting profession vets have been very interested in investigating infectious and dangerous dog diseases like canine distemper and rabies. For more than 100 years it has been attempted to register and prevent these kinds of diseases by legislating on dog districts and by introducing

vaccination. Vets examine both live and dead dogs to diagnose these diseases. Historical sources may be used to understand how diseases in the past spread from area to area..

Researchers are not just interested in diseases of the sled dogs. They also would like to understand the special characteristics of the sled dog, and particularly how the dog is adjusted to life in the Arctic and manages the tough work as a sled dog. To understand this, you need knowledge of live dogs, their energy consumption, anatomy, circulation, digestion and temperature regulation. This knowledge can be obtained partly by examining the anatomy of live dogs, e.g., their size, weight, teeth and muscle mass, partly by means of blood samples, faeces samples and DNA tests. The physiology of the dog has been investigated too. This has been done by making measurements on dogs in motion to compare the energy consumption, temperature and breathing while pulling the sledge, and while resting.

Climate changes and pollution have posed new challenges for sled dogs. Environmental poisons which the dogs receive by being fed with seals, whales and fish, may affect the health of the dogs. Climate changes may also introduce new parasites

or alter the environment and the temperatures that the dogs are adjusted to. To obtain this kind of knowledge you have to examine the dogs and take samples for examination in the laboratory.

There are not many vets in Greenland, and there are still many aspects of the health and diseases of sled dogs that have not been subject to research. To obtain more knowledge and ensure a healthy and sustainable dog population in Greenland it is necessary and important to secure a good collaboration between dog owners, local health authorities and scientists.

Researchers can obtain knowledge about the dog sledge culture by visiting and interviewing sledge drivers. Here Manumina Lund Jensen has been invited to a training session of dogs in Ilulissat.

HOW DO WE KNOW? – THE SLED DOG TODAY

How many sled dogs are there in Greenland today? What are they used for? What relationship do you have with the dogs? And is the dog sled culture changing?

If you want to understand the Greenland sled dog culture, and how it has changed to what it is today, you may use many different methods.

The development in the number of sled dogs can be viewed in statistics based on counting the dogs at regular intervals. Statistics Greenland has figures from the latest decades online, making it possible to see how the number of dogs has developed. When using statistics and comparing numbers from different years it is important to look into how these figures were composed. Do the numbers include both adult dogs and puppies? Does it differ how dogs have been counted in different areas?

It may be difficult to obtain a general view of what sled dogs are used for in Greenland today. Here you have to find sources from media, articles,

debates, research results, and look into statistics for occupations like hunting and tourism. You have to compare and combine the knowledge obtained from different areas to put together an overall picture.

Many researchers and authorities use questionnaires. This can be forms that people are asked to fill in, or that you fill in by interviewing people. The Internet and other modern technology have made it much easier to send out and receive answers to questionnaires, which can be made online and shared with many people.

You may also obtain knowledge of both the changes of the dog sled culture and its significance in modern Greenland through interviews. Cultural researchers engaged in fieldwork can experience and observe how dogs are used. And by talking to many people and being part of their everyday life, researchers can acquire knowledge of how culture changes. Some researchers have been living together with sledge drivers and interviewed them, and in this way

learned more about how dogs are used today, and what relationship you have to them.

Hunters themselves also have collected and communicated important knowledge of how their sledge routes and hunting have changed with the climate changes. When the population contributes to research by gathering or registering data it is called Citizen Science.

Research into contemporary society and culture is not one specific science, but uses many different methods from e.g., history, ethnology and statistics. And new technology for communicating with people and gathering facts and attitudes may eventually result in new and different knowledge.

ABOUT THE BOOK

The aim of the book *Qimmeq – The Greenland Sled Dog* is to make knowledge about the Greenland sled dog and sled dog culture accessible to children and young people in Greenland. The book may be read as an ordinary children's non-fiction book or be used as a basis for teaching in school by means of the associated educational material. Qimmeq is published as part of the research and dissemination project *Qimmeq – The Greenland Sled Dog* that was initiated in 2017. This project is a collaboration between researchers at Ilisimatusarfik and the University of Copenhagen with involvement of many other collaborators in Greenland as well as in Denmark. During the project a number of researchers have investigated the genetics, origin and health of the Greenland sled dog and the dog sled culture as a historical and live cultural heritage. The project comprises an exhibition and a number of documentary films and photo shoots that combined with the research of the project have contributed to this book.

The five documentaries can be seen at <https://qimmeq.ku.dk/>

The project *Qimmeq – The Greenland Sled Dog* has received support from Velux Fonden, Aage og Johanne Louis-Hansens Fond and Beckett-fonden, and the production of the children's non-fiction book also was supported by Den grønlandske fond.

QIMMEQ – THE GREENLAND SLED DOG

The Greenland sled dog is something quite special. It can endure cold and hard work, and it is one of the oldest dog types in the world. The dogs and the dog sledge have throughout centuries been an important part of Greenland's culture and history – and they still play an important role.

In this book you can read about the Greenland sled dog and sled dog culture and learn more about the sled dog, where they come from, what they are used for, and about what the sled dogs have meant to Greenland.
