One of the most important aspects of home gardening is proper watering. Water is vital throughout a plant's life, but it matters most during its first days planted. If newly planted trees and shrubs are not watered, they will dry up and die. Until a plant has been in the ground for a few years, its root system is too shallow and it simply does not seek the moisture that the plant's needs.

Water all newly planted plants daily until fall, every other day after that. A depression at the base of the plant allows for water retention. Lawn sprinklers rarely give enough water to penetrate to the deep roots. **Very heavy clay soils require less watering** and lighter sandy soils will require extra water.

If you wish to create a wind break for your evergreens, use burlap and stake it around the plant in an "L" shape. **Do not wrap your plant.** The late winter sun is very warm and will cook your plant inside the burlap if it is wrapped.

In late fall, water all plants thoroughly before the ground freezes. It is best for plants to go into winter with a block of ice around their roots. This will allow the plant to have moisture around the roots as the ground thaws in spring.
