

TASI Scoring Document

This tool allows for the scoring of the TASI interview form, enabling a clinician to a) evaluate overall likelihood of ASD, and b) determine the presence or absence of *each* DSM-5 symptom.

Step 1: On the TASI interview form, calculate each box total by adding the items above each box. Each TASI item only contributes to one box value.

Step 2: Copy the box scores into corresponding squares on this form; calculate symptom-level totals.

Step 3: Add all symptom-level totals to calculate a total sum.

- Total sum \geq 7: ASD is likely
- Total sum $<$ 7: ASD is unlikely
