

# Zooplankton production in temperate coastal waters: from individual to community level

Shin-ichi Uye (Hiroshima University)

**Inland Sea of Japan, or Seto Inland Sea**  
(Length: 500 km, width: 15~50 km, with 600 islands)

Human population:  
30 million

Productive fishing ground

Plankton production rates are high

# My first copepod works (1973~1977)

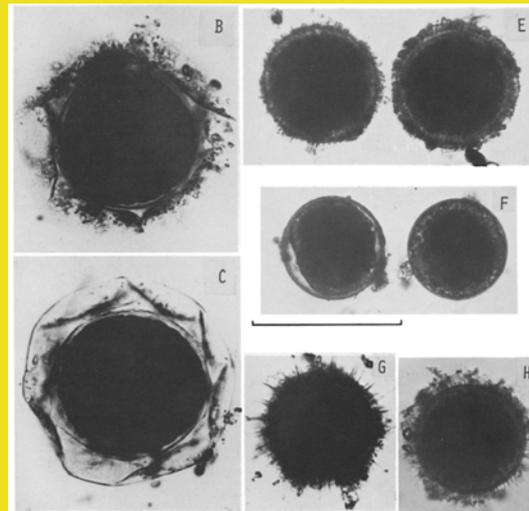

## Mass culture of copepods

*Pseudodiaptomus marinus*

## Resting eggs of copepods

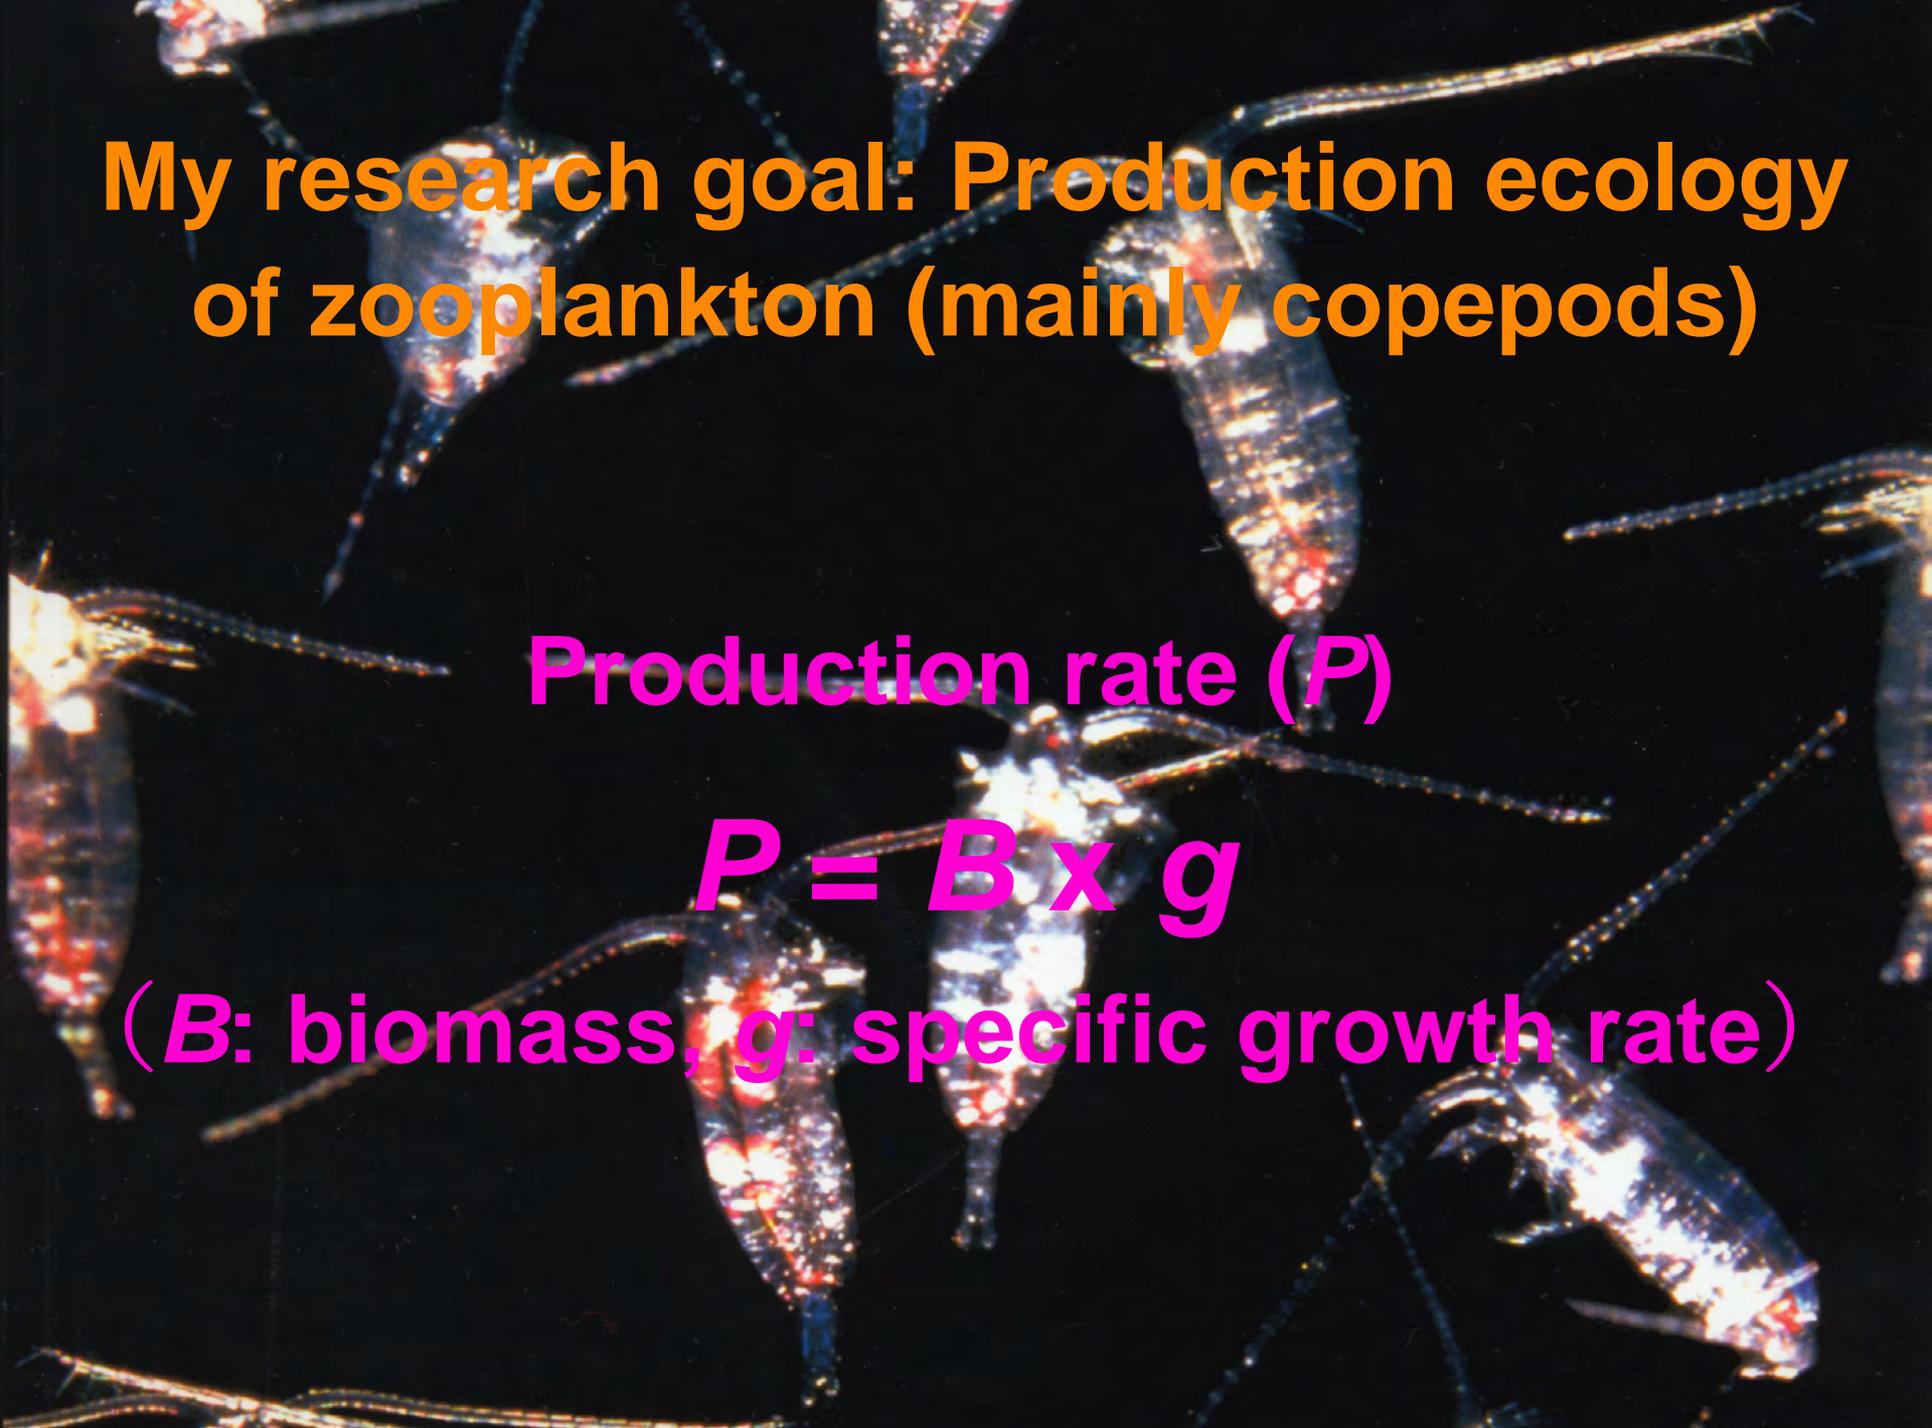

(Kasahara et al., 1974)

# Study abroad at Scripps Institution of Oceanography, UCSD (1974~1975)

## Getting more interested in zooplankton trophodynamics, because of Prof. M. M. Mullin

A microscopic image of several copepods, which are small crustaceans, against a dark background. The copepods are illuminated, showing their segmented bodies and appendages. The text is overlaid on the image.

**My research goal: Production ecology  
of zooplankton (mainly copepods)**

**Production rate ( $P$ )**

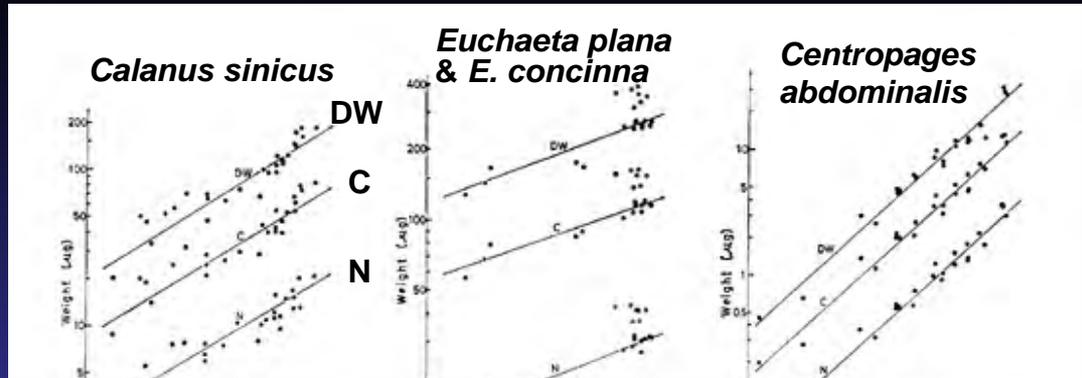

$$P = B \times g$$

**( $B$ : biomass,  $g$ : specific growth rate)**

# Zooplankton biomass

## L-C weight relationships

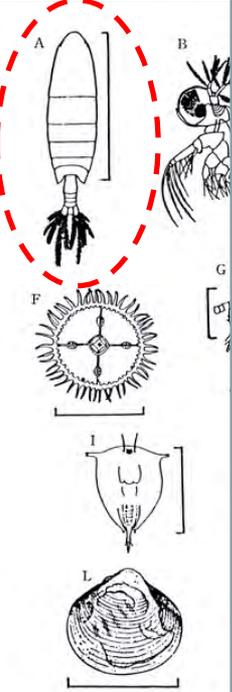

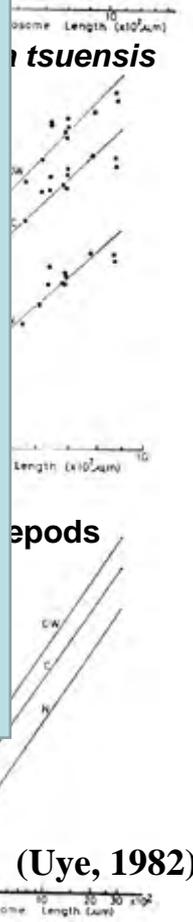

### Copepods

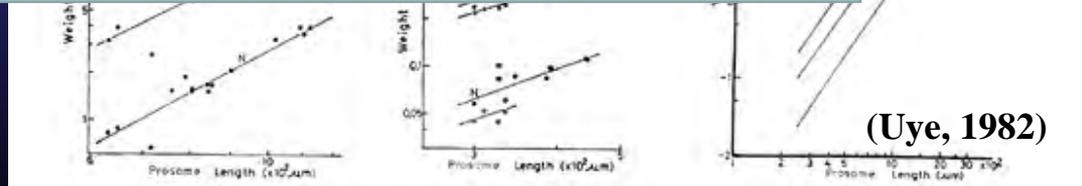

After PC became available, proper body lengths are measured by an image processor (Win-ROOF, Mitani), and automatically converted to individual carbon weights

Zooplankton biomass determination became much more time saving

**LogC**  
**C: Carbon weight ( $\mu\text{g}$ )**  
**PL: Prosome length ( $\mu\text{m}$ )**

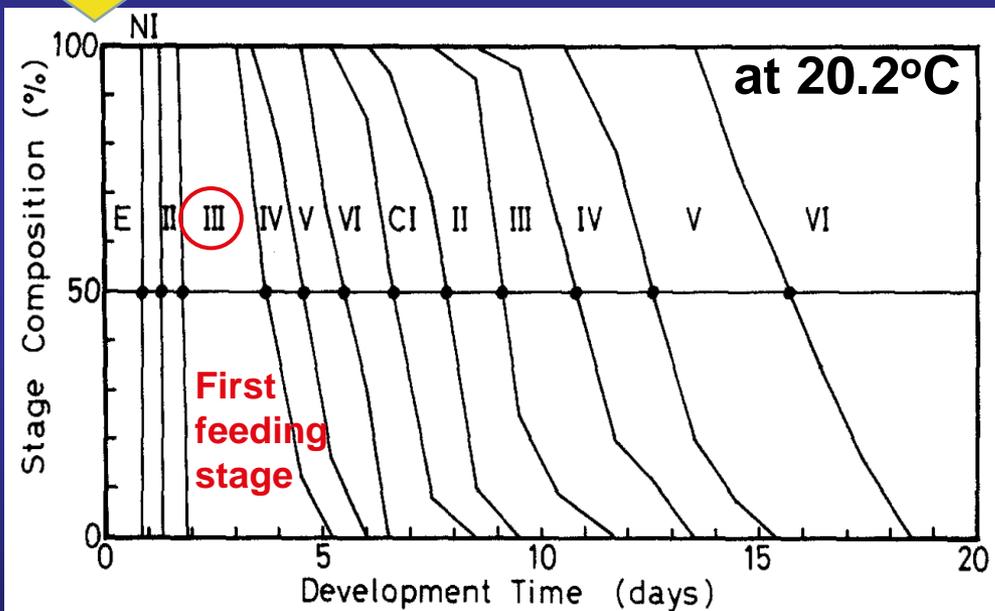

# Individual-based production rates

## Development times of *Calanus sinicus*

Culture in 2-L glass beakers

About 700 eggs

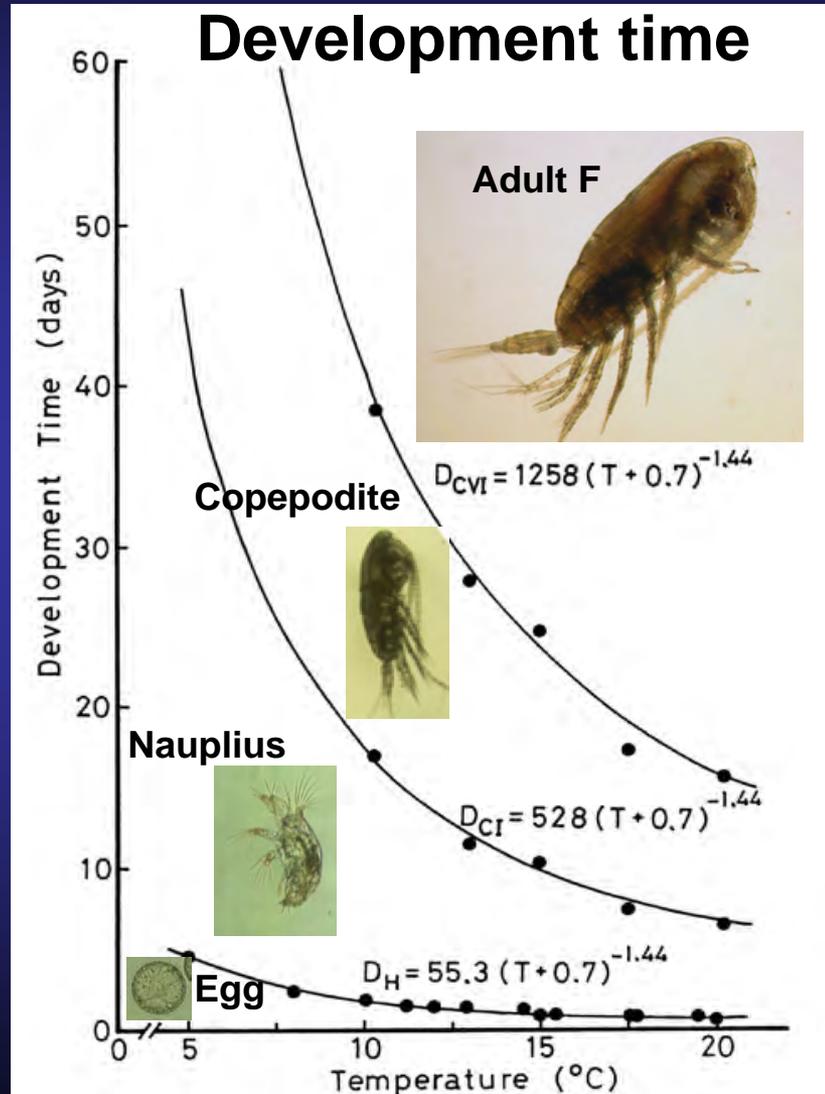

Subsampling of 8-48 specimens

*Thalassiosira weissflogii*

*Prorocentrum micans*

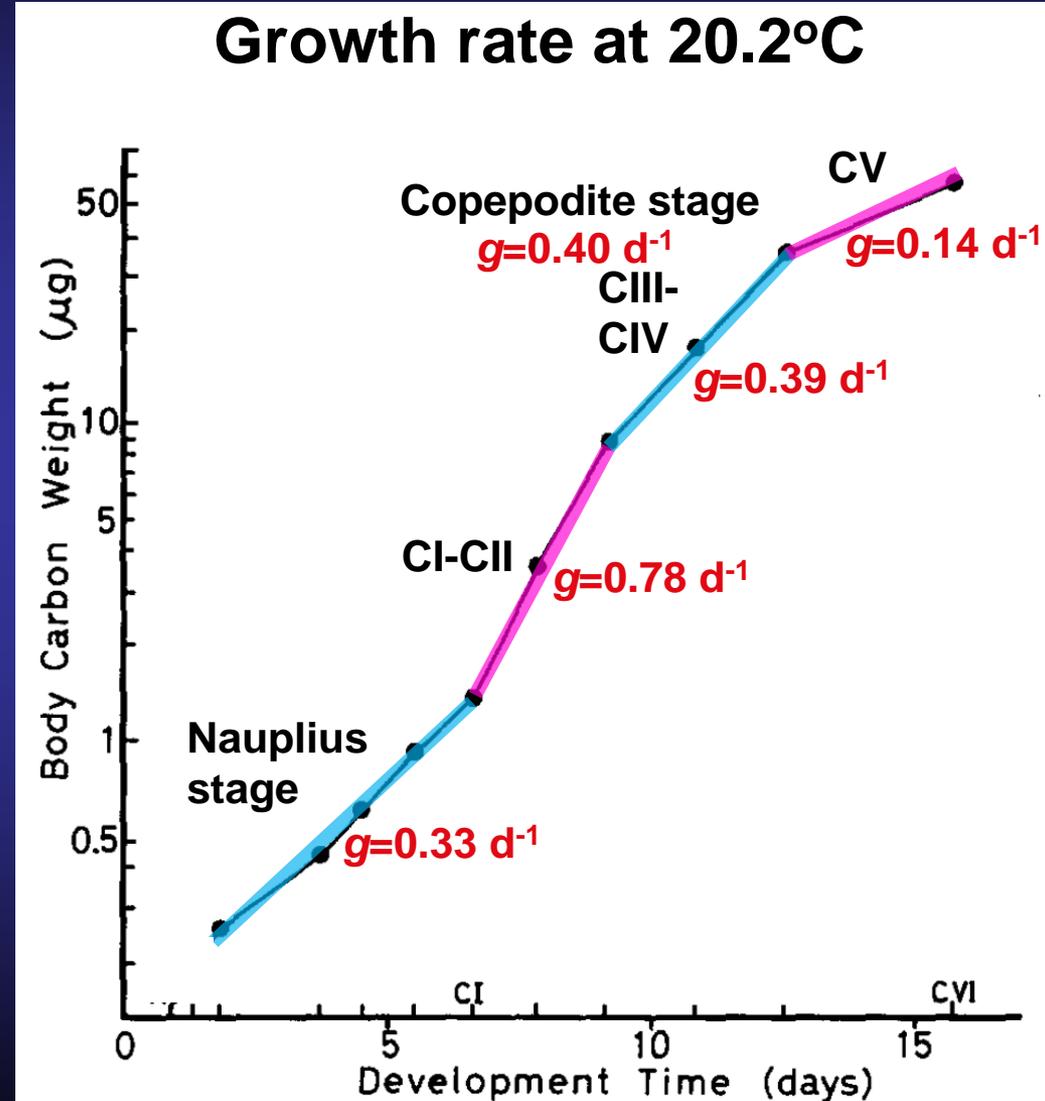

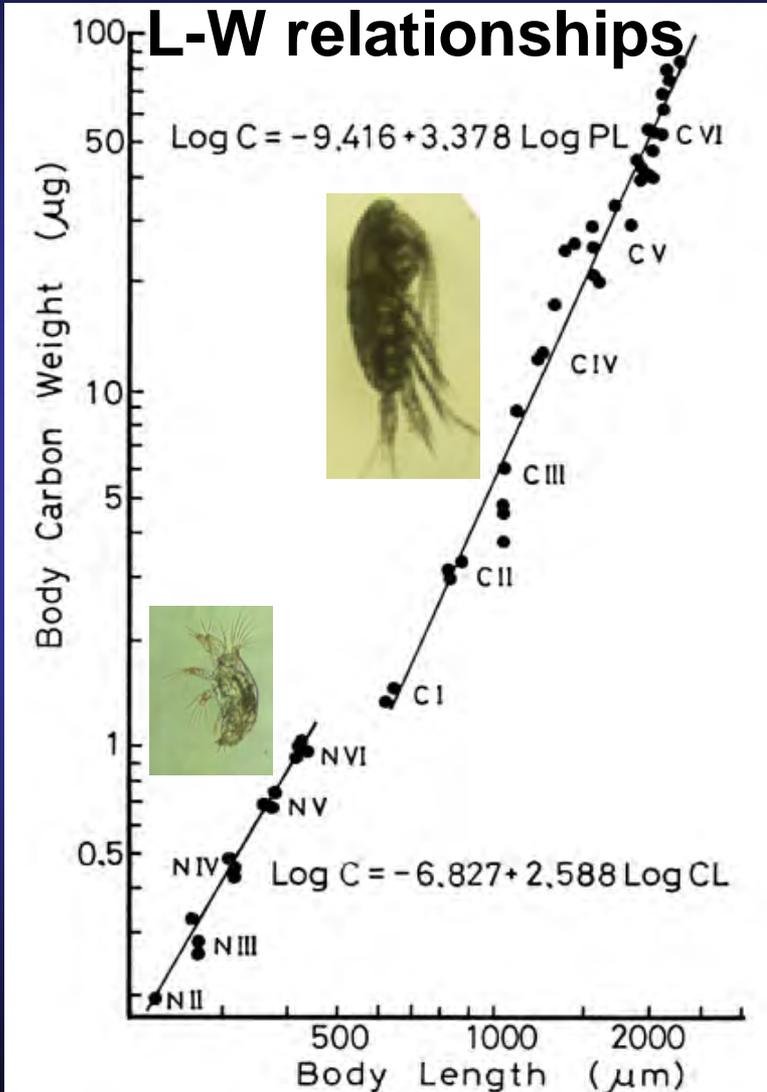

Concentration: >900  $\mu\text{g C L}^{-1}$

(Uye, 1988)

# Individual-based production rates

## Somatic growth rates of *Calanus sinicus*

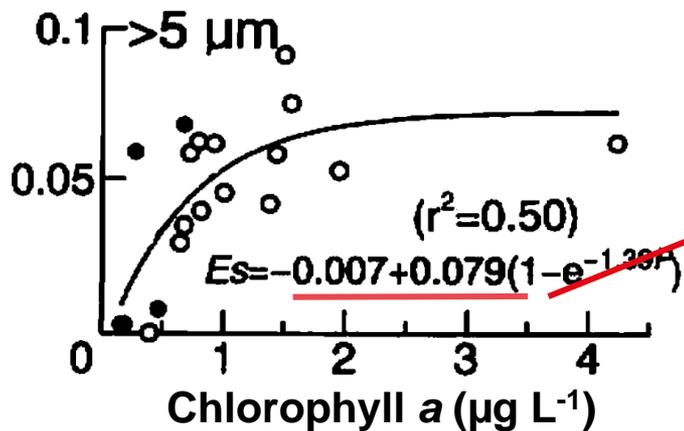

(Uye, 1988)

# Individual-based production rates

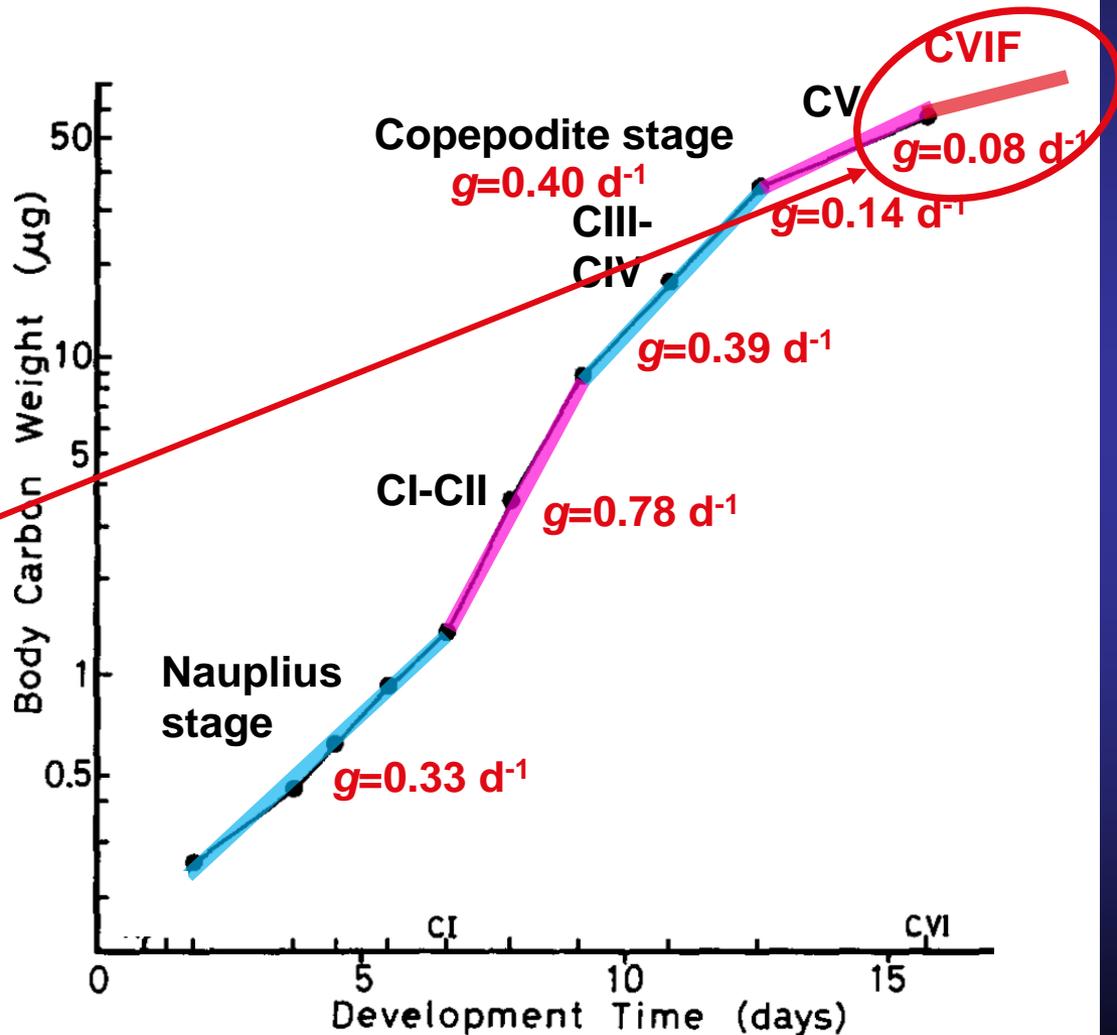

## Egg production rates of *Calanus sinicus*

*In situ* egg production rates in June  
(Temperature: 16.8-21.5°C)

(Uye and Murase, 1988)

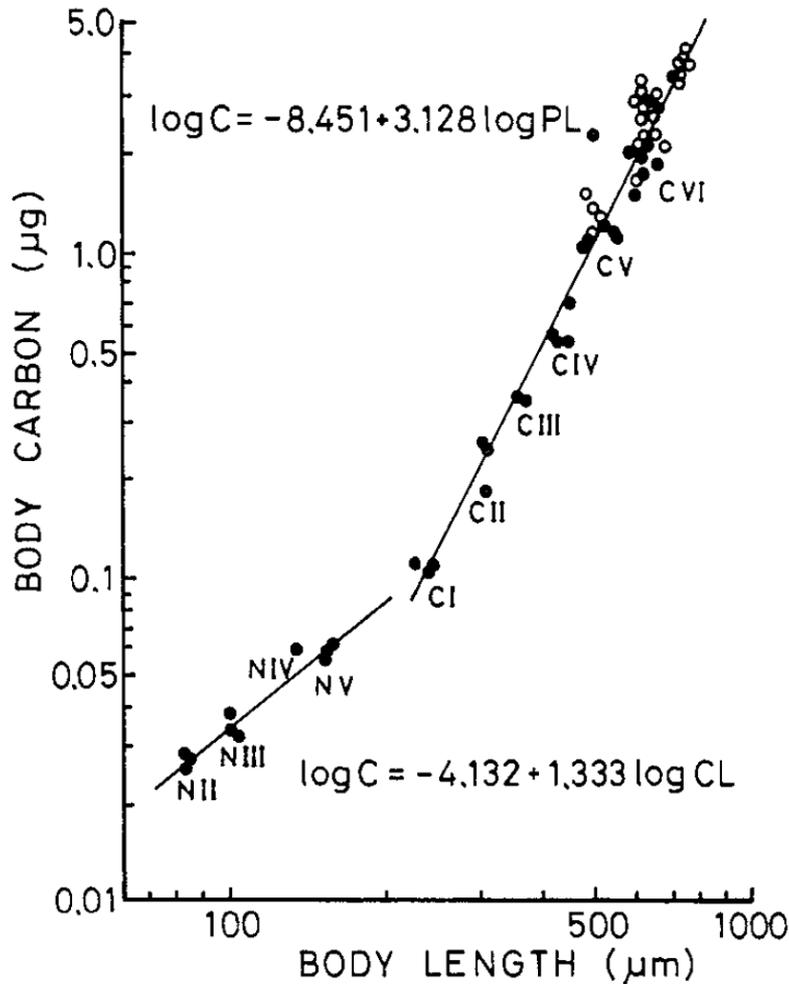

Growth rate at 20.2°C

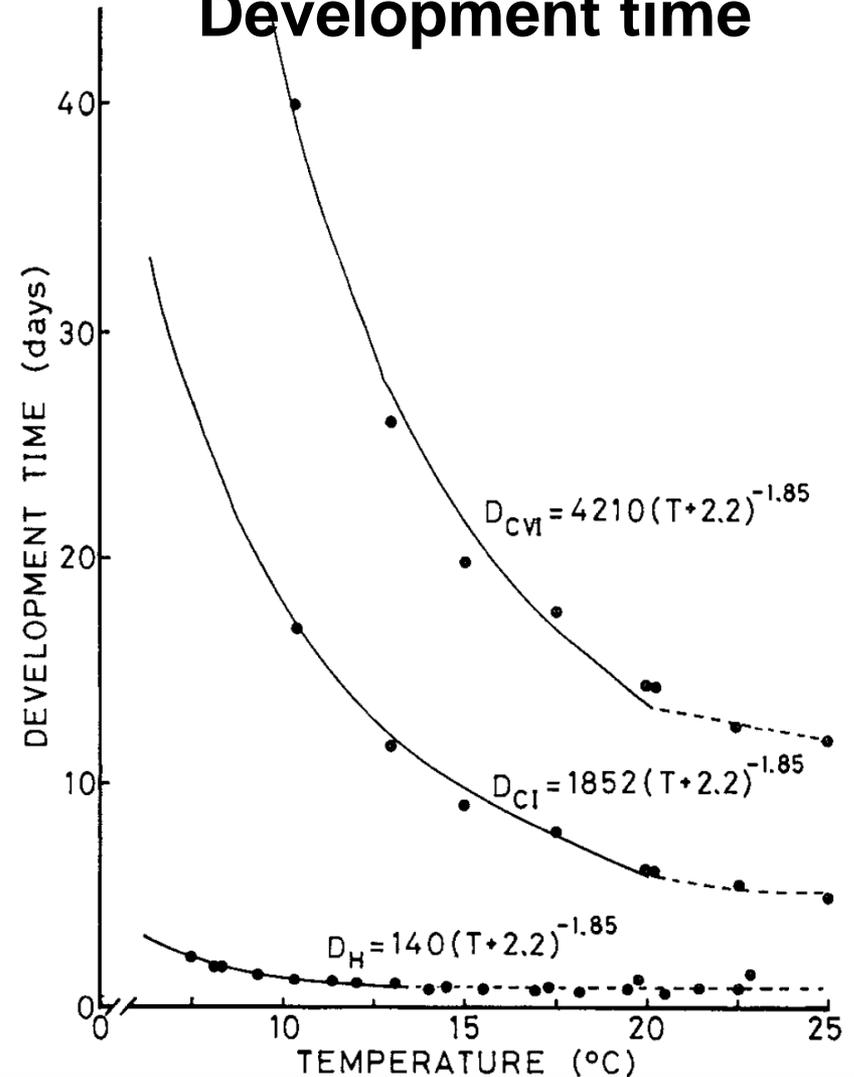

# Individual-based production rates

## Somatic growth rates of *Paracalanus* sp.

### L-W relationships

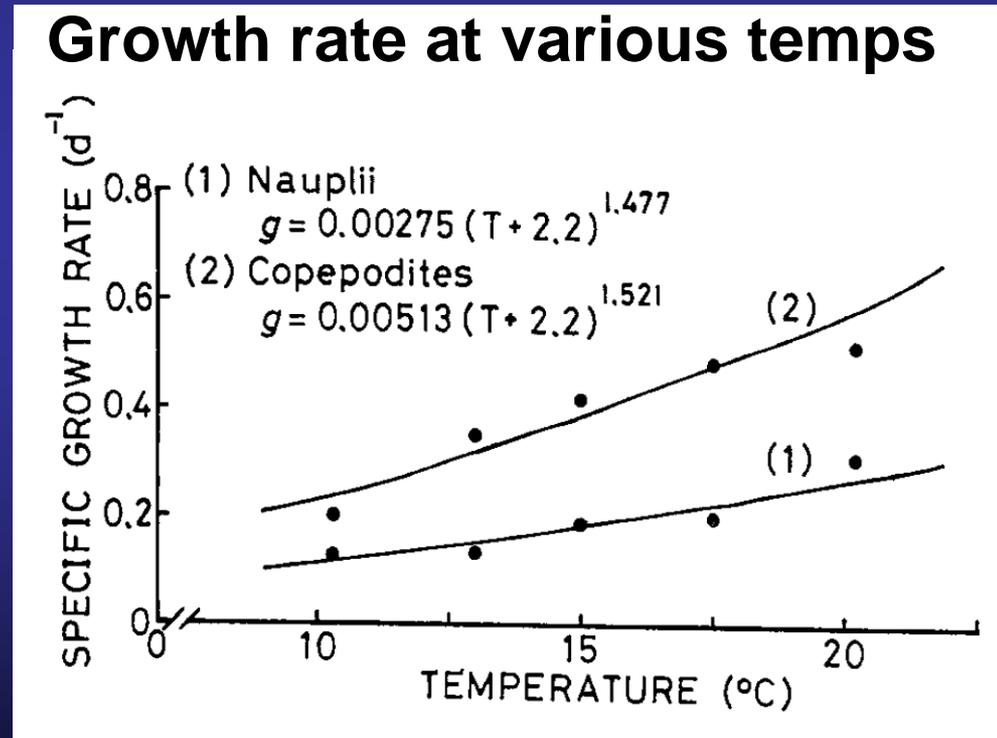

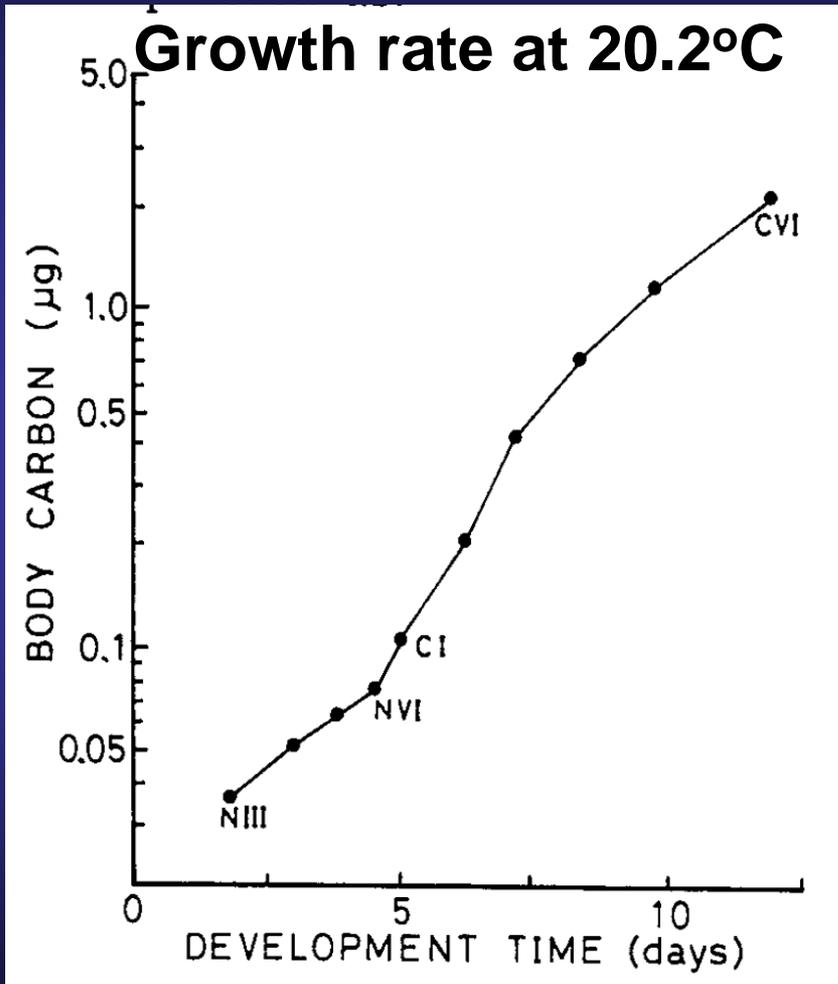

### Development time

# Individual-based production rates

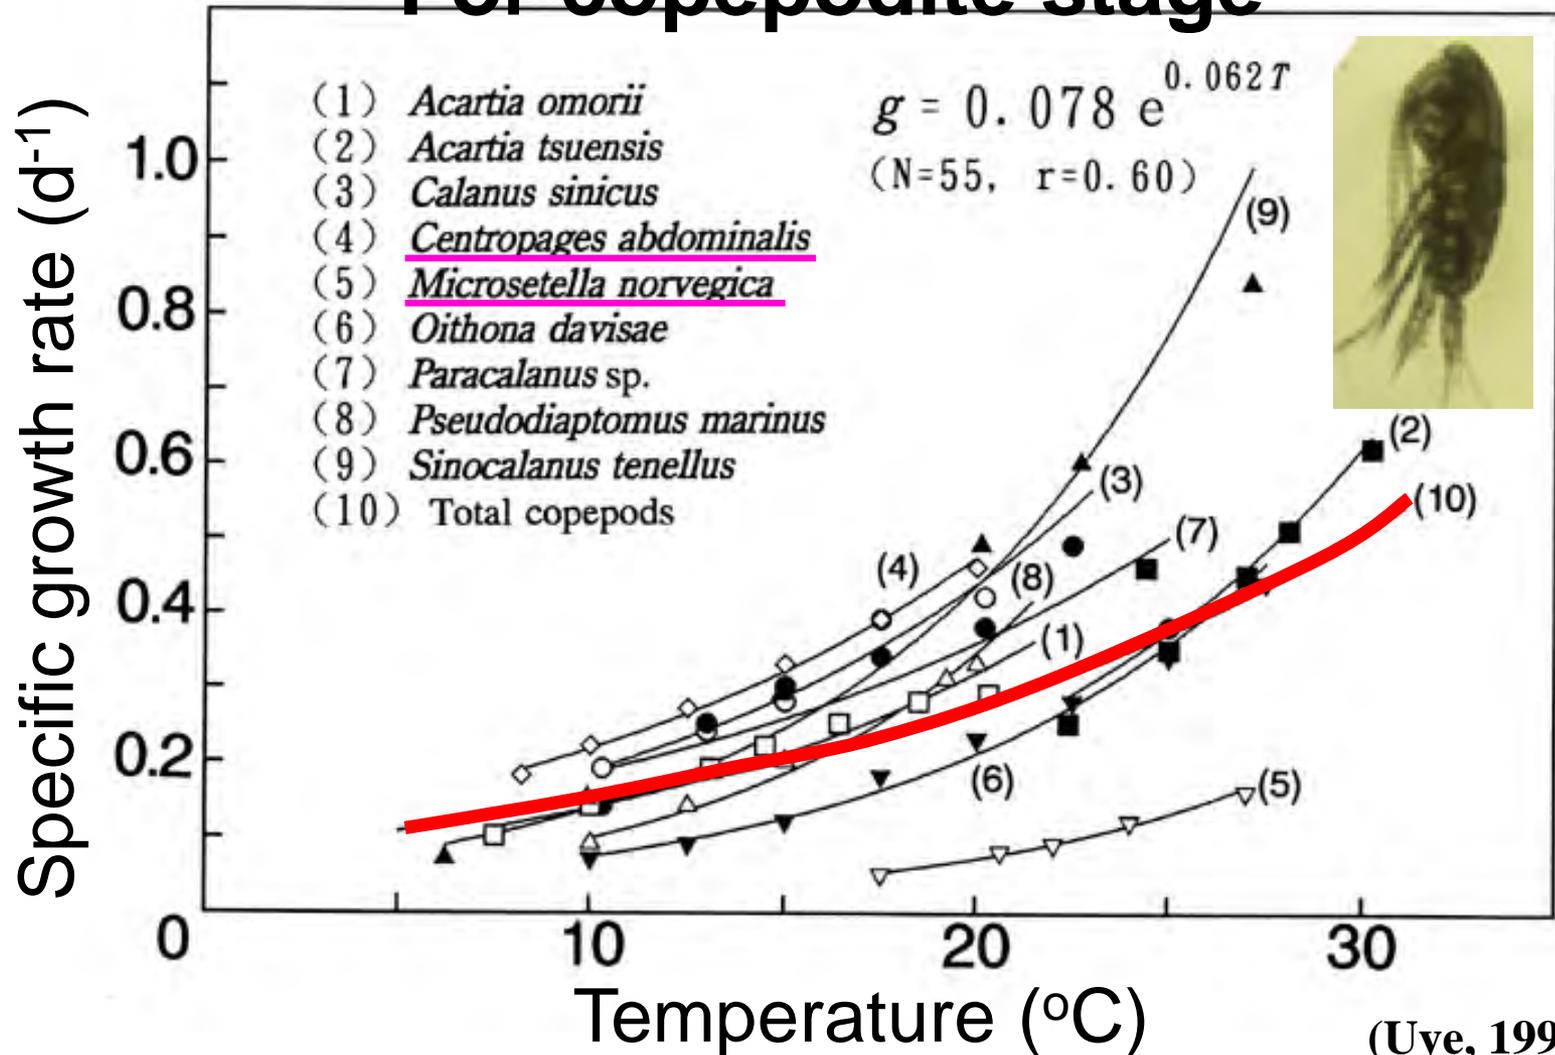

## Somatic growth rates of *Paracalanus* sp.

(Uye, 1991)

# Relationships between copepod specific growth rate and temperature

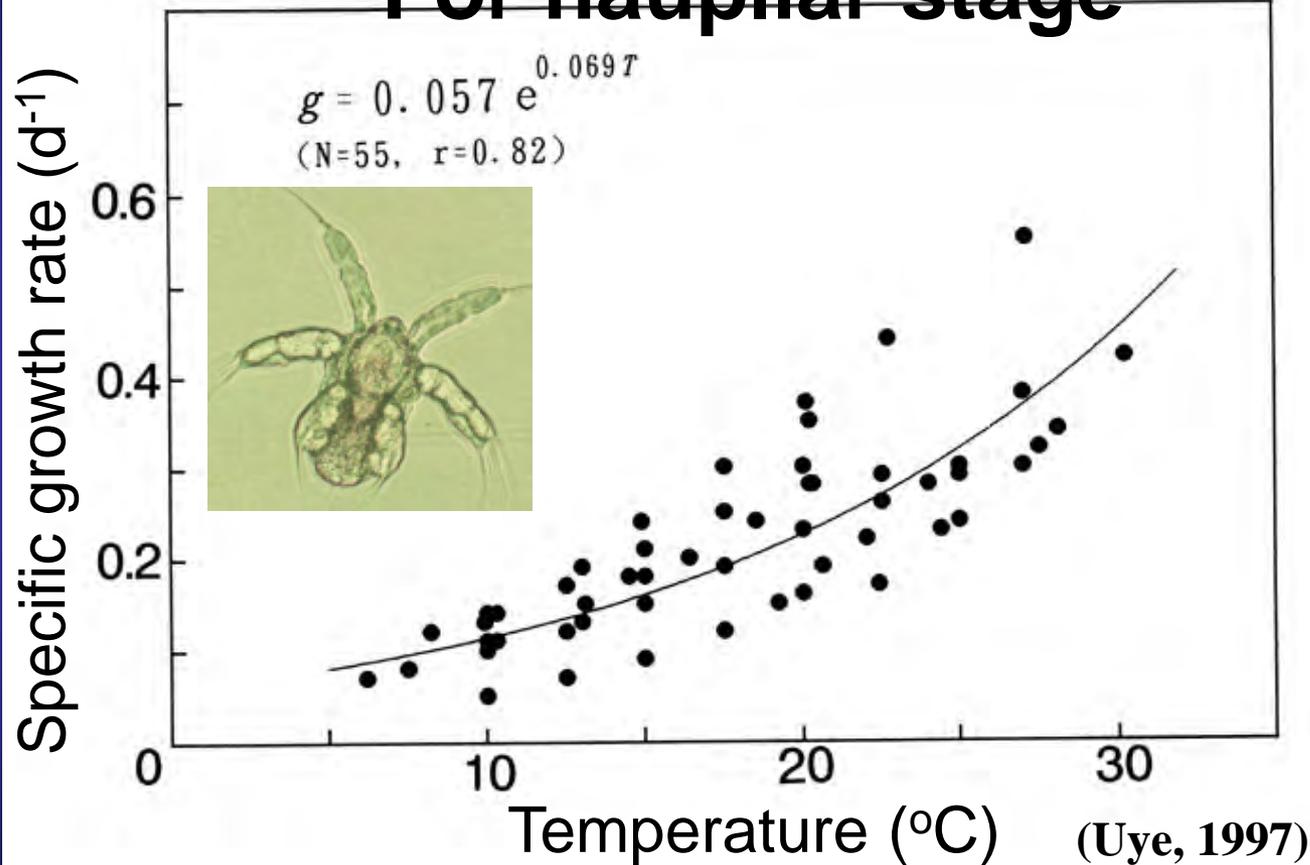

For copepodite stage

(Uye, 1997)

# Relationships between copepod specific growth rate and temperature

## For naupliar stage

## For adult F

Average growth rate of copepods from the Inland Sea of Japan:  
from  $0.1 d^{-1}$  in winter to  $0.5 d^{-1}$  in summer

# Population-based production rates

## Sampling site and methods

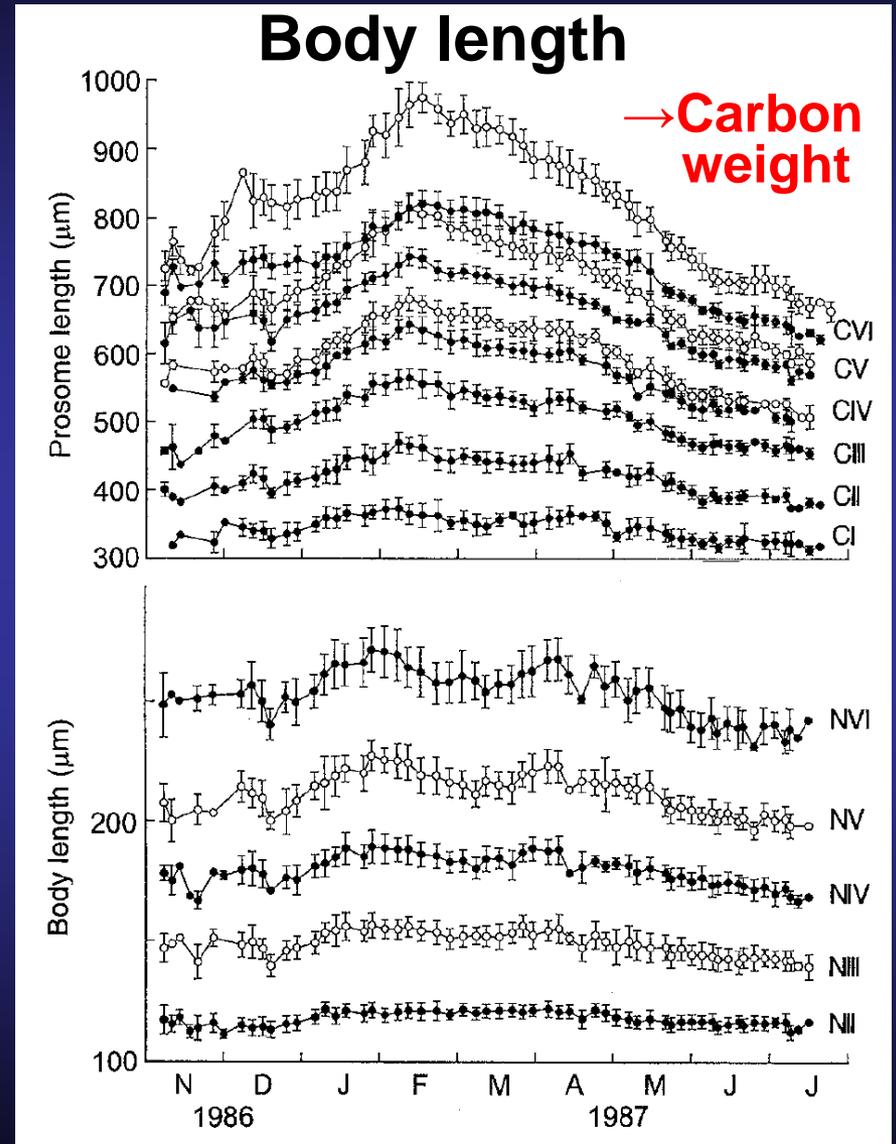

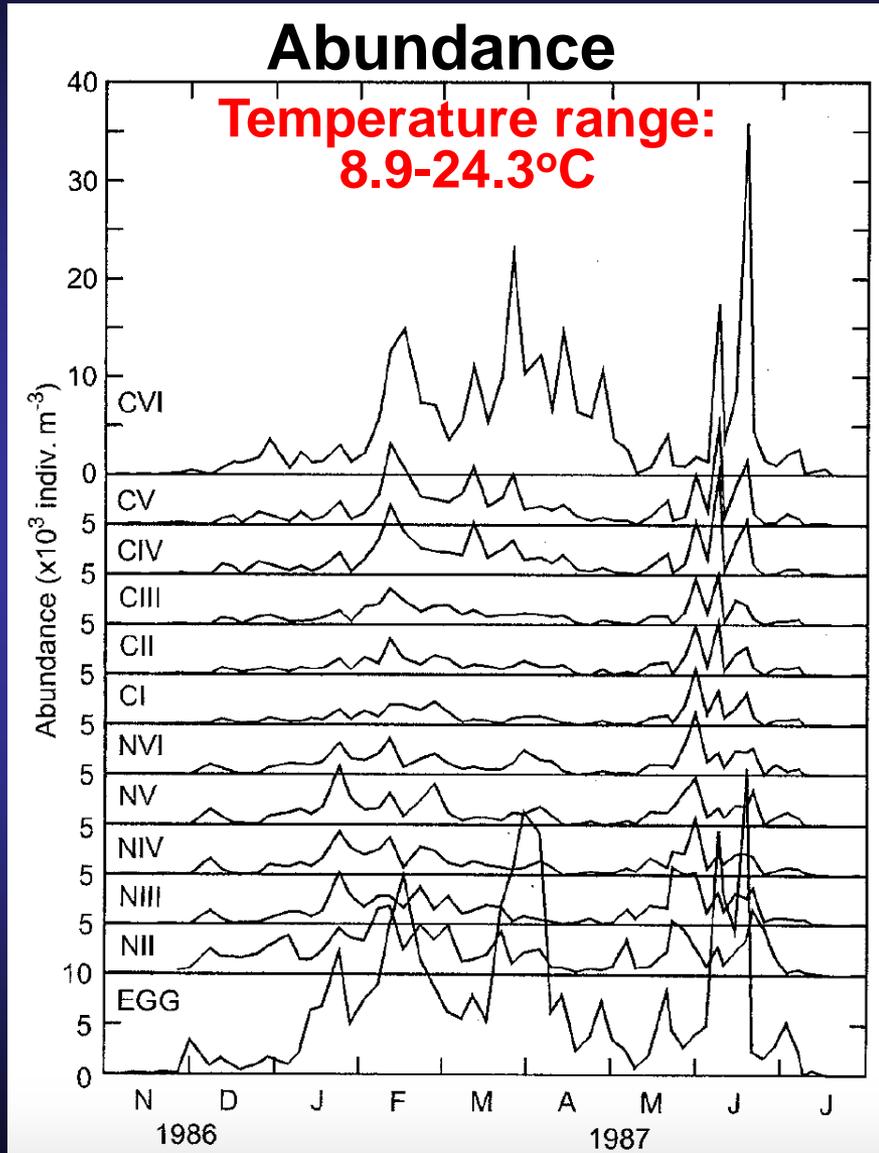

By oblique tows of a modified NORPAC net (mouth diameter: 45 cm, mesh opening: 62  $\mu\text{m}$ ) from the bottom (depth: 7-8 m) to the surface

High frequency: 3-7 day internals from 7 November 1986 to 8 November 1987

At nocturnal high tide (local time: 17:00-07:00)

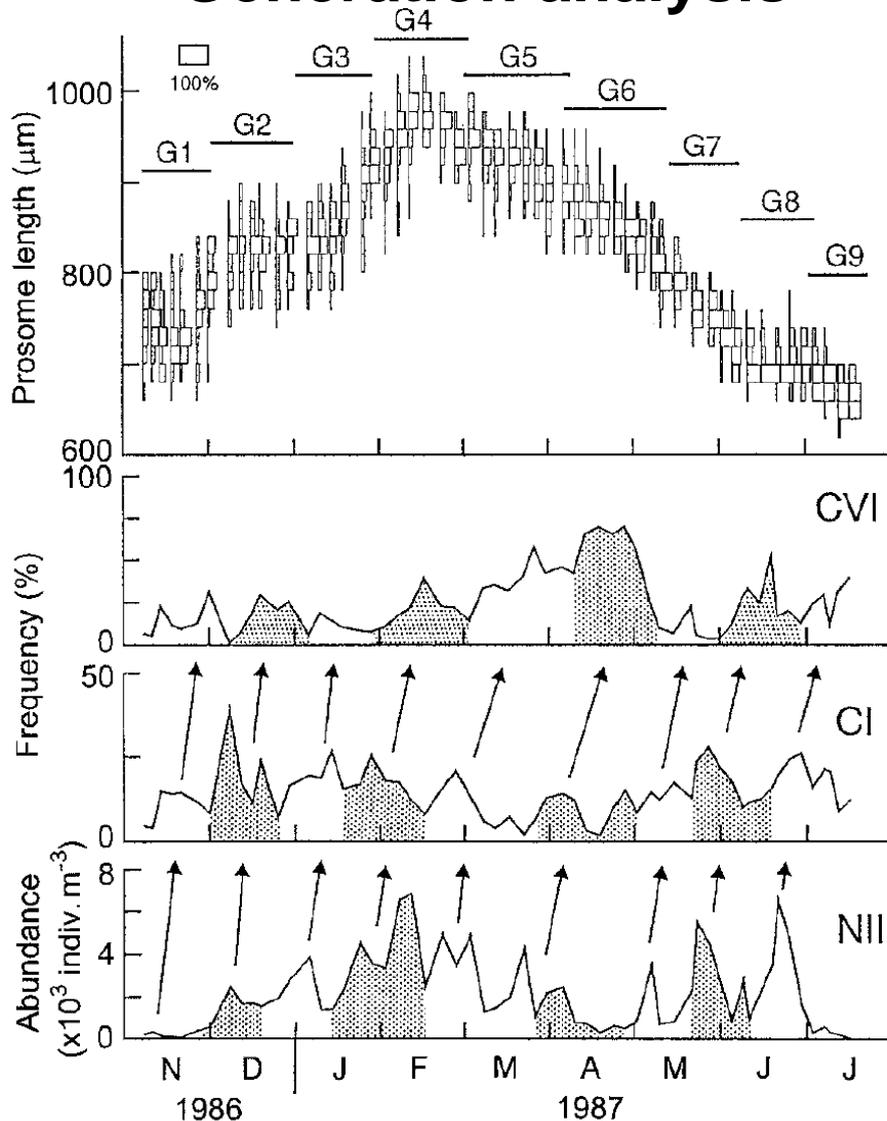

# Production rate of *Acartia omorii* population

(Liang and Uye, 1996)

# Production rate of *Acartia omorii* population

## Generation analysis

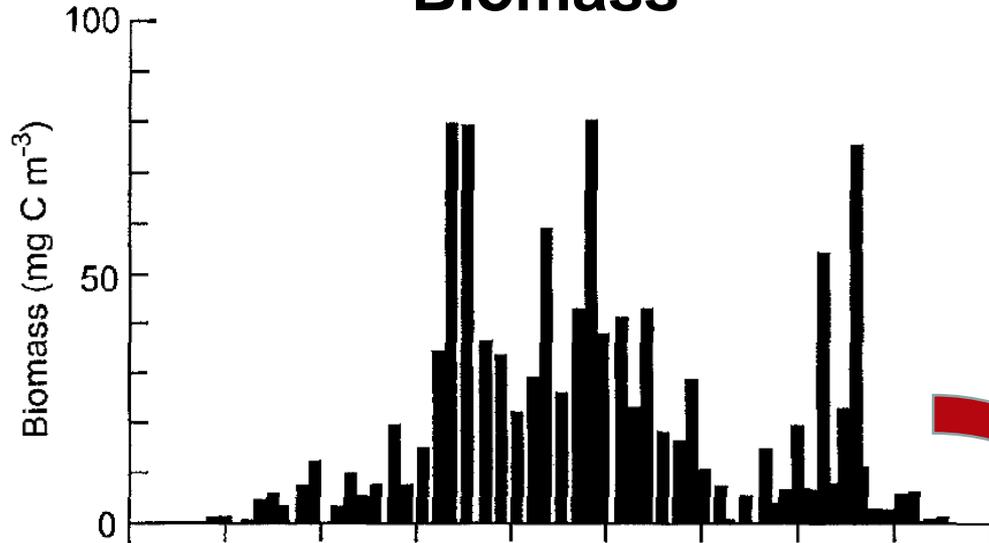

Genera- tion	Av. Temp. (°C)	Observed GT (d)	Predicted DT (d)
G2	14.3	<b>21</b>	<b>25.0</b>
G3	12.2	<b>25</b>	<b>31.4</b>
G4	9.9	<b>34</b>	<b>41.5</b>
G5	10.1	<b>38</b>	<b>40.0</b>
G6	12.8	<b>31</b>	<b>29.3</b>
G7	16.5	<b>20</b>	<b>20.2</b>
G8	20.5	<b>18</b>	<b>14.7</b>
G9	21.9	<b>18</b>	<b>14.7</b>

**Development times in  
Fukuyama Harbor** ≡  
**Development times in the  
culture experiments**

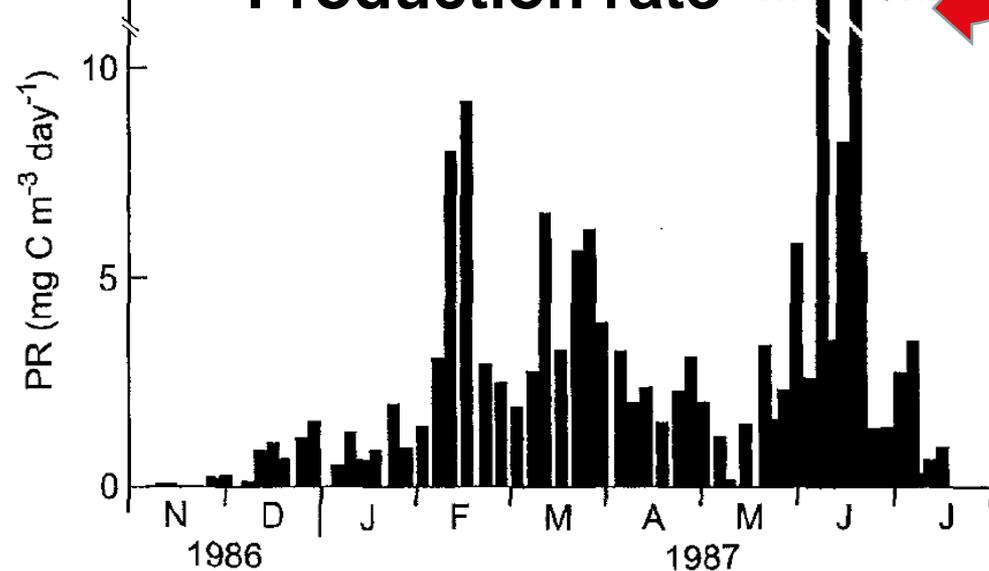

(Liang and Uye, 1996)

# Production rate of *Acartia omorii* population

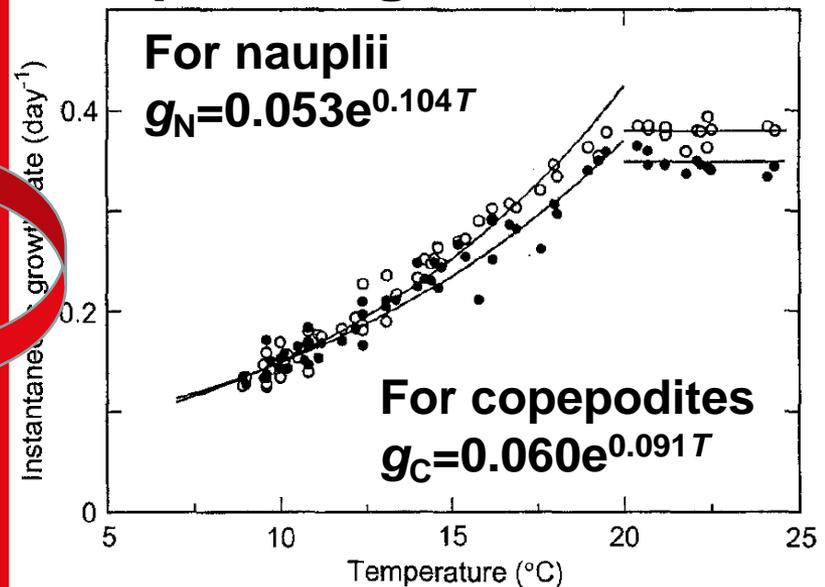

## Biomass

## Production rate

## Specific growth rates

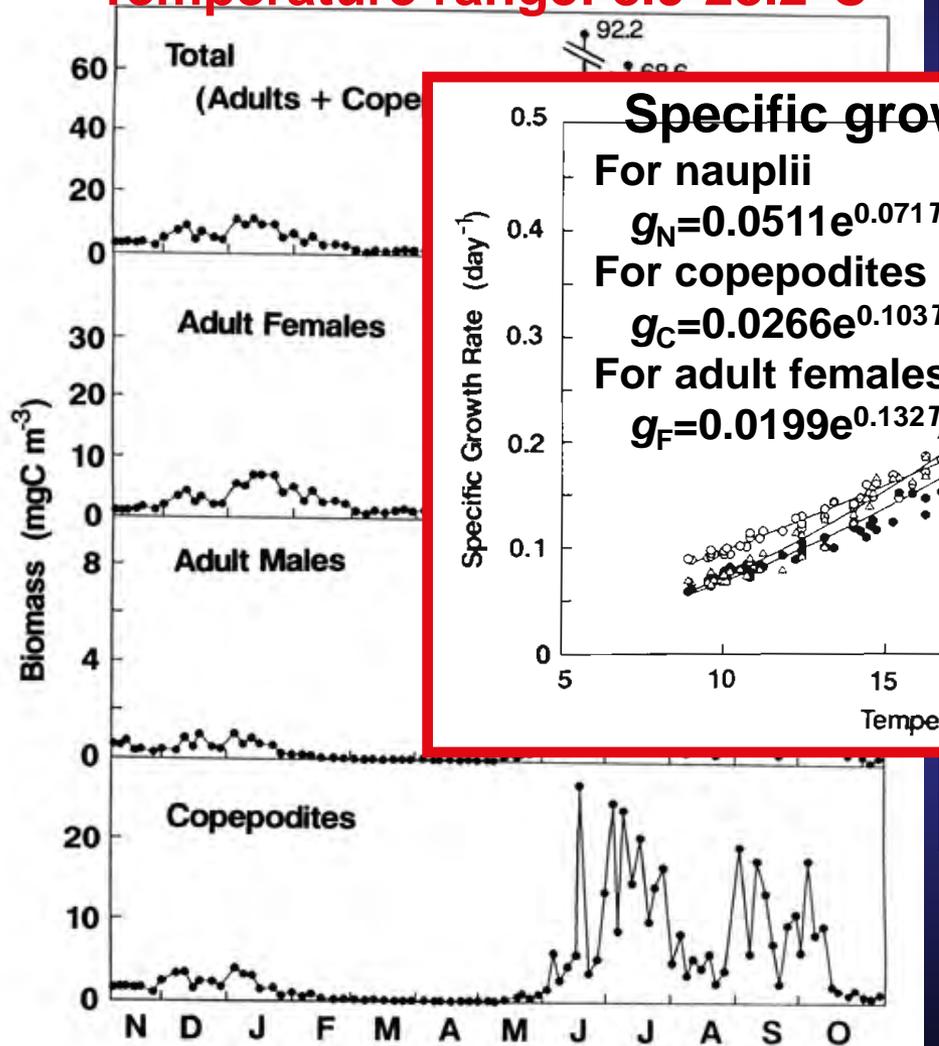

**Annual integrated  
production rate =  
749 mg C m<sup>-3</sup> yr<sup>-1</sup>**

(Liang and Uye, 1996)

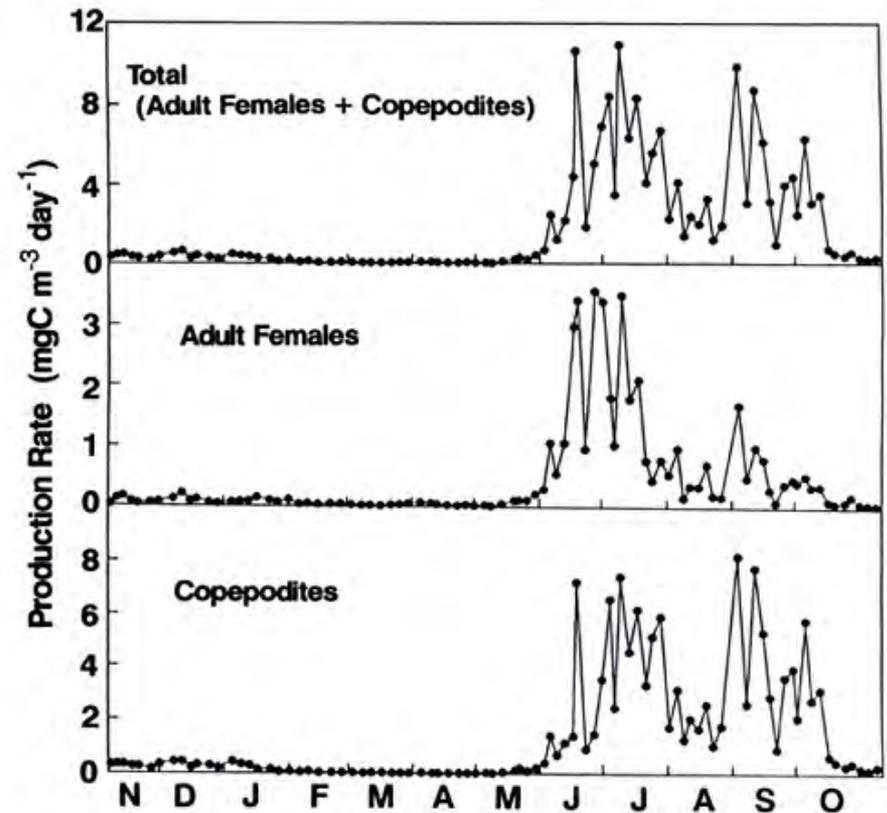

# Production rate of *Oithona davisae* population

## Biomass

Temperature range: 8.9-28.2°C

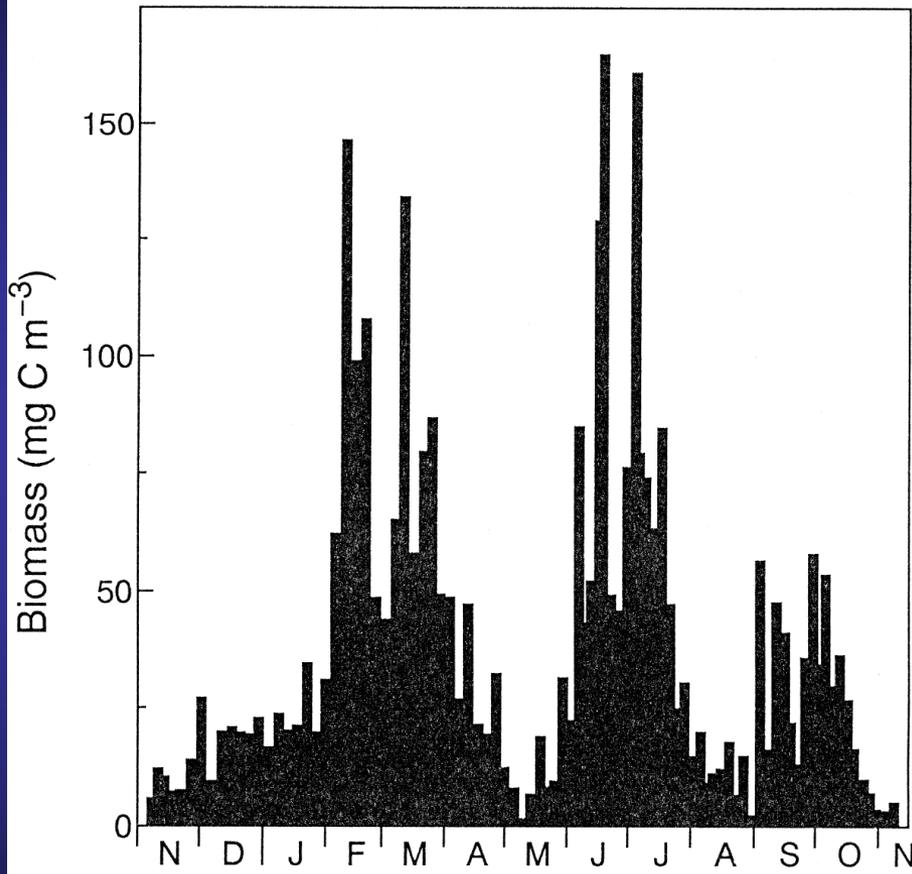

## Production rate

**Annual production rate = 650 mg C m<sup>-3</sup> yr<sup>-1</sup>**

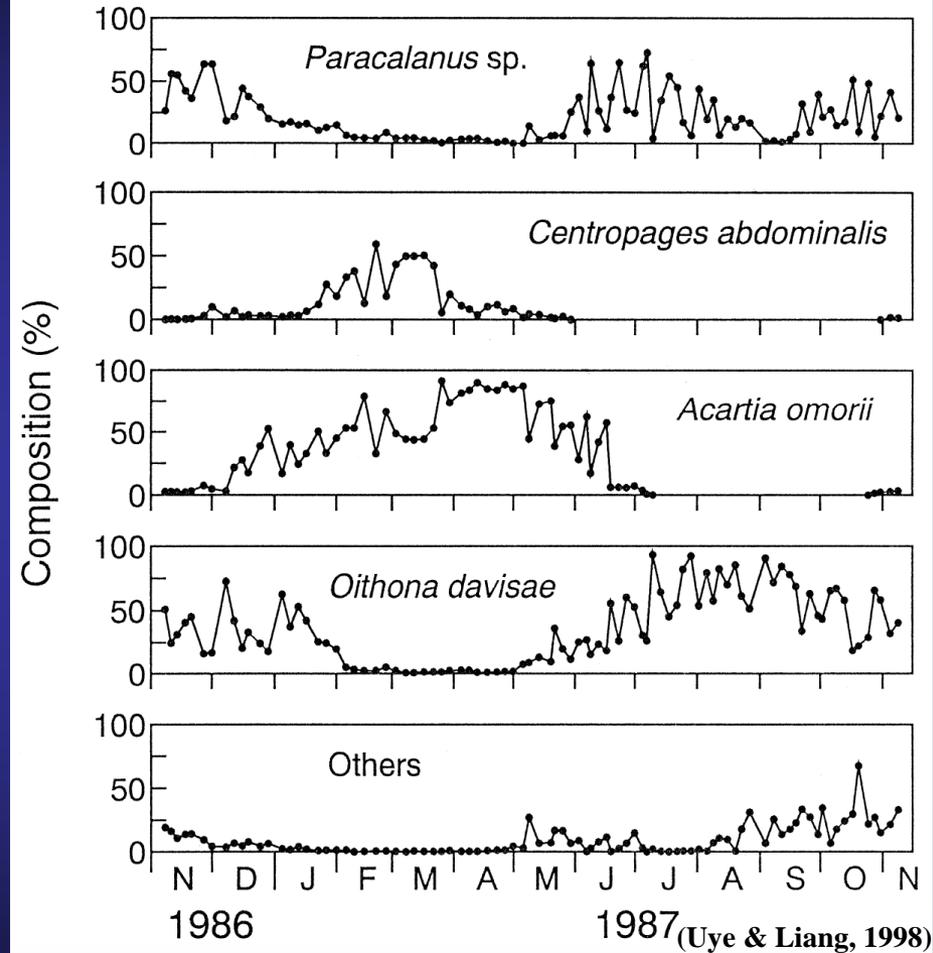

# Copepod community-based production rates

## Total copepod biomass

Annual mean biomass = 39.1 mg C m<sup>-3</sup>  
28.0 g C m<sup>-3</sup> in Narragansett Bay,  
33.2 g C m<sup>-3</sup> in Long Island Estuary,  
21.5 g C m<sup>-3</sup> in New Port River Estuary

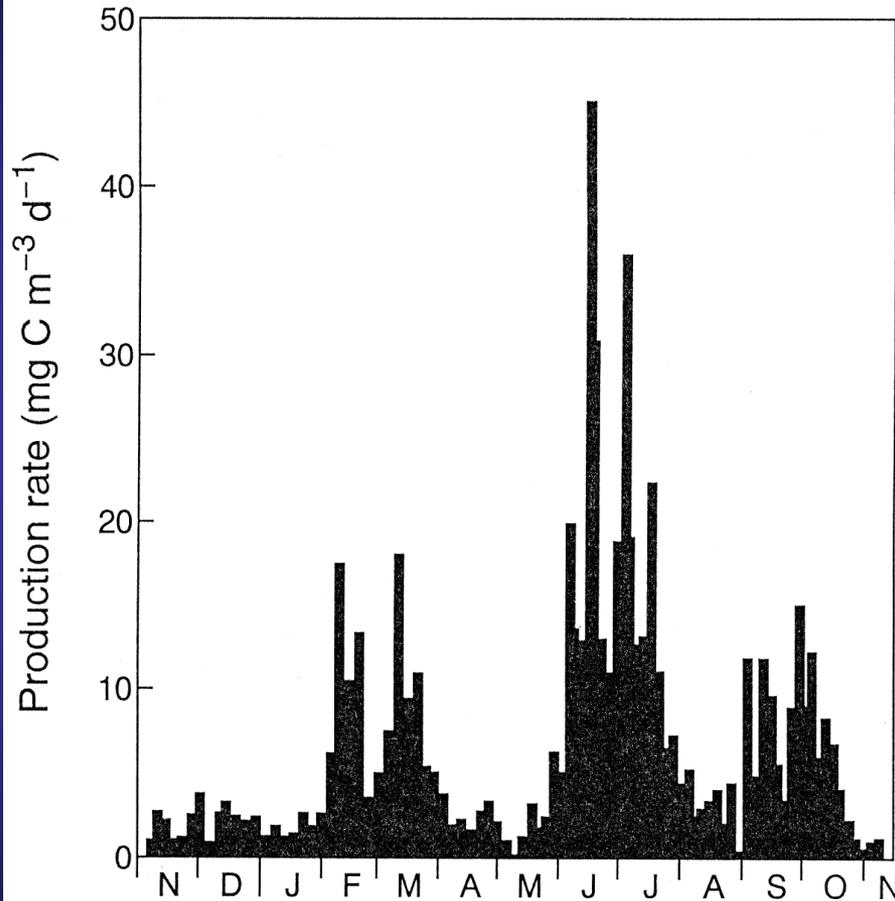

## Taxonomic composition

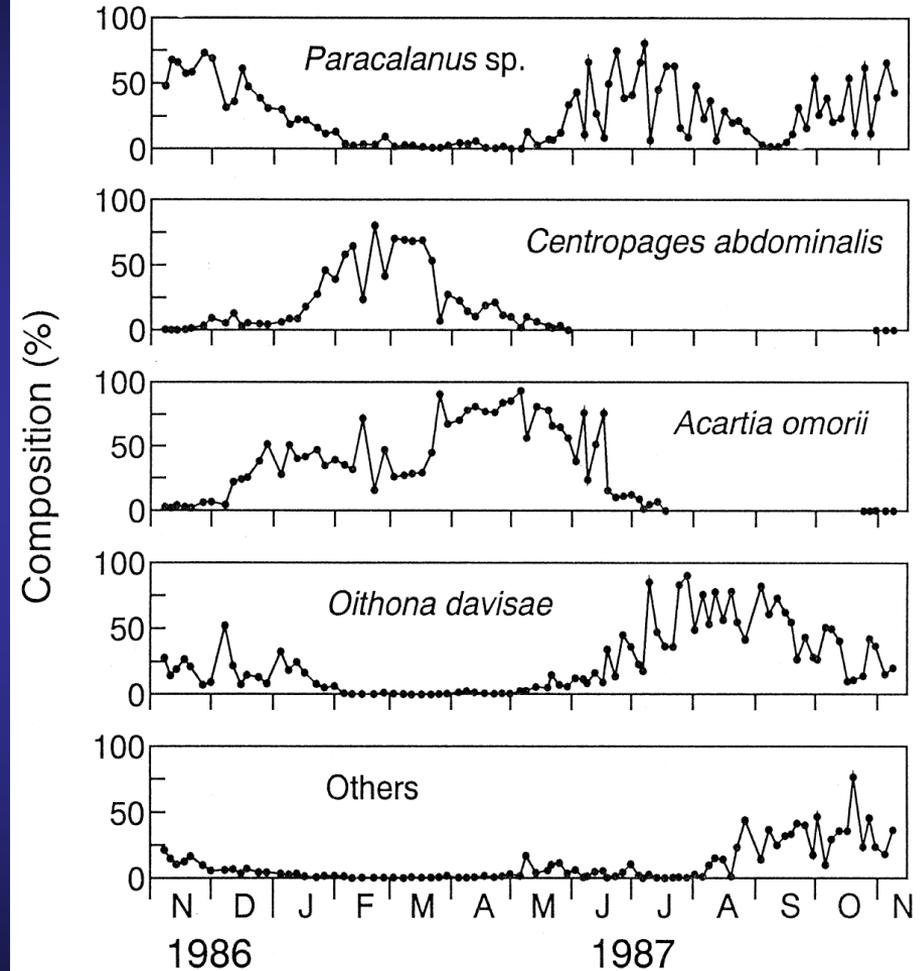

Others: *Acartia erythroa*, *A. pacifica*,  
*Centropages tenuiremis*, *Parvocalanus*  
*crassirostris*, *Pseudodiaptomus marinus*,  
*Tortanus forcipatus*, and *T. gracilis*

# Production rate of copepod community

## Total copepod production rate

## Taxonomic composition

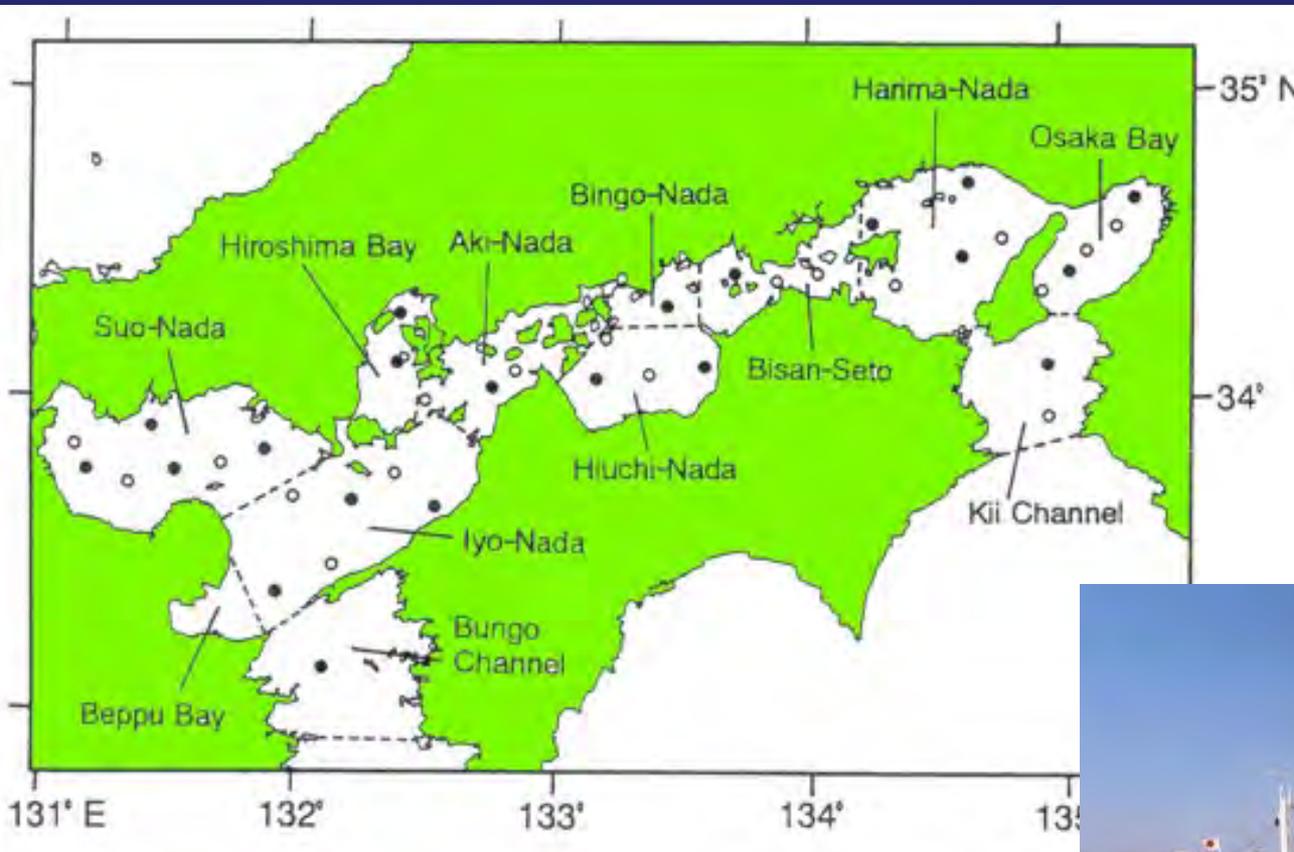

**Annual integrated production rate =  
 $2.5 \text{ g C m}^{-3} \text{ yr}^{-1}$  or  $18.4 \text{ g C m}^{-2} \text{ yr}^{-1}$**

(Uye & Liang, 1998)

# Zooplankton community-based production rates

Research cruise in October 1993, January, April, and June 1994, in the Inland Sea of Japan

1. General oceanographic surveys at 39 st
2. Phytoplankton primary production at 21 st
3. Zooplankton production at 21 st

Divided into 10 regions (bay, Nada, Seto, and channel)

Hiroshima University R/V "Toyoshio Maru"

# Microzooplankton biomass and production rate

## Specific growth rate

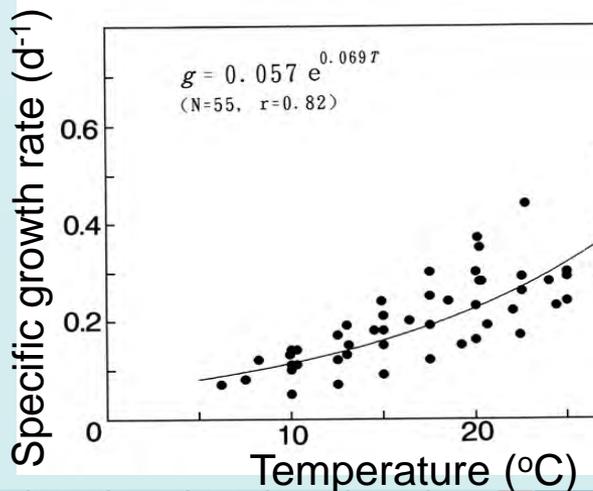

Ciliates:  $ln g = 0.1438 T - 0.0011 V$

$T$ : temperature (°C)

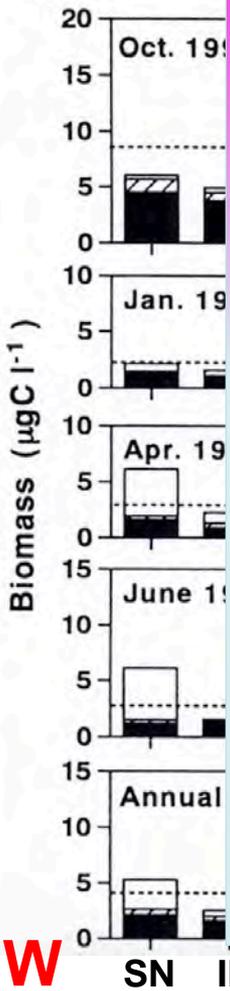

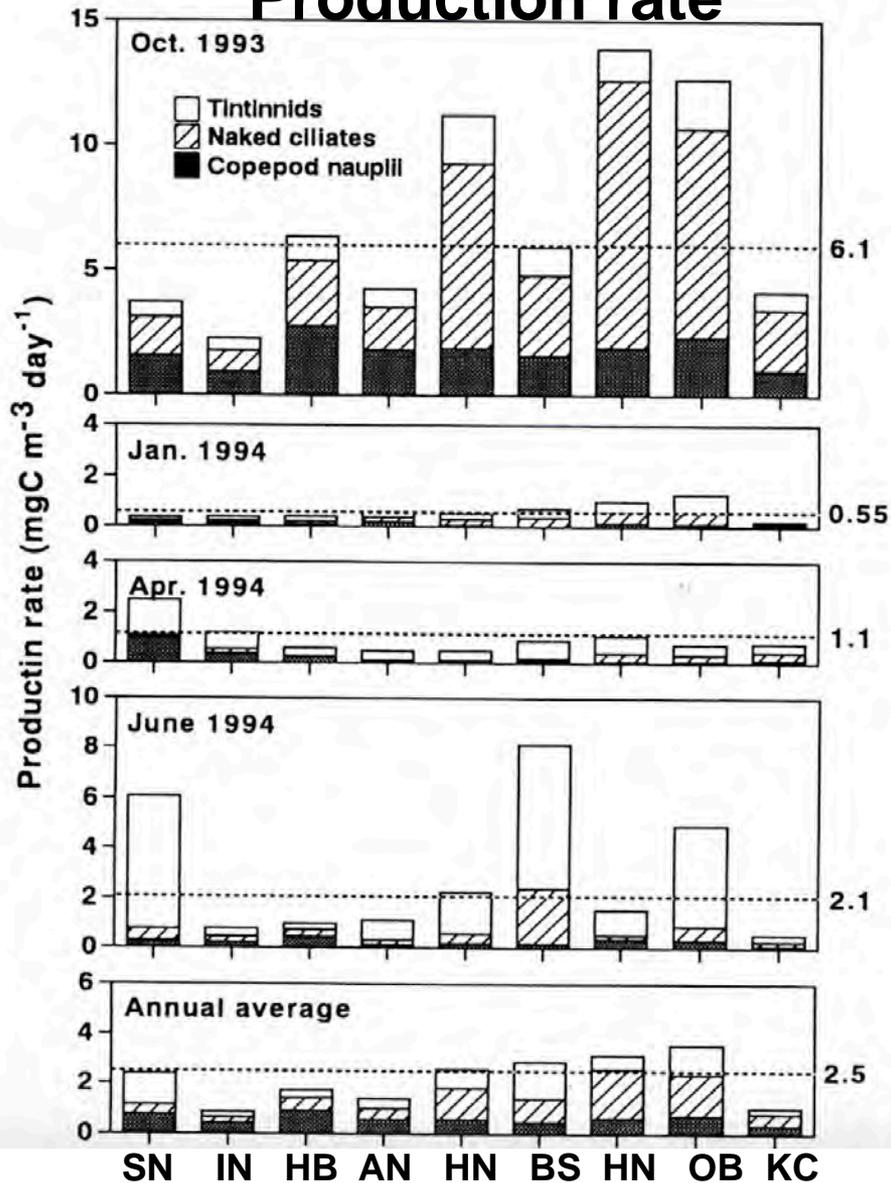

$V$ : cell volume ( $\mu m^3$ )

(Murray 1984)

Copepod nauplii:  $g = 0.0001 T^2 + 0.0011 T - 0.0001 V$

## Production rate

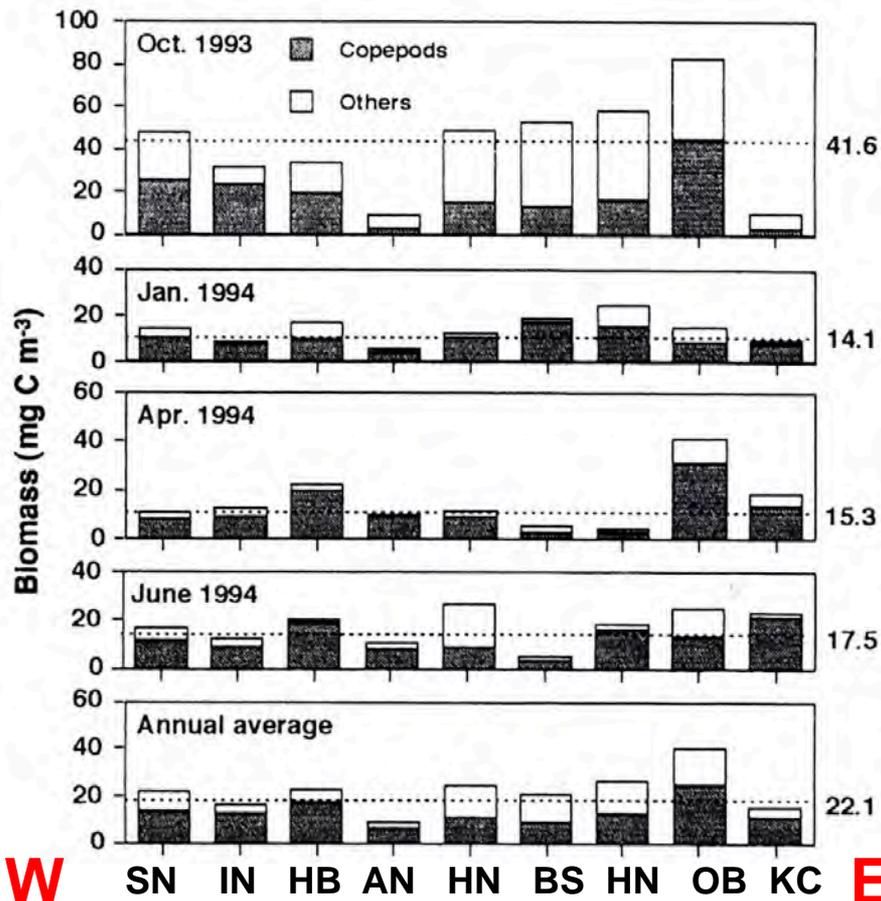

W

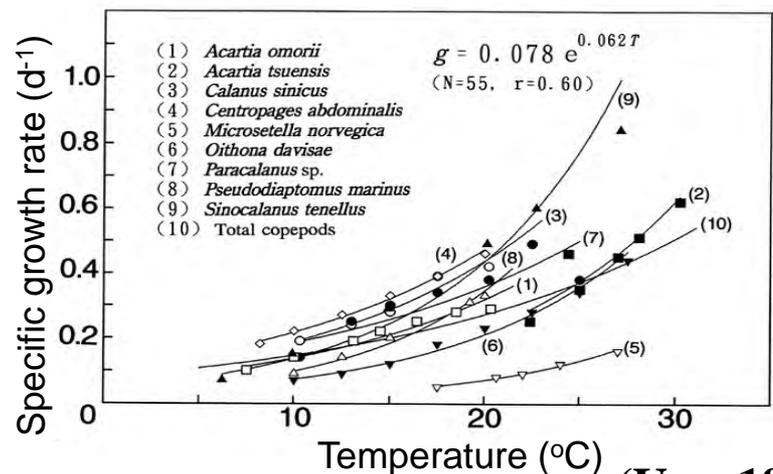

E

# Net-zooplankton biomass and production rate

## Biomass

## Specific growth rate (g) Copepods

(Uye, 1997)

## Larvaceans

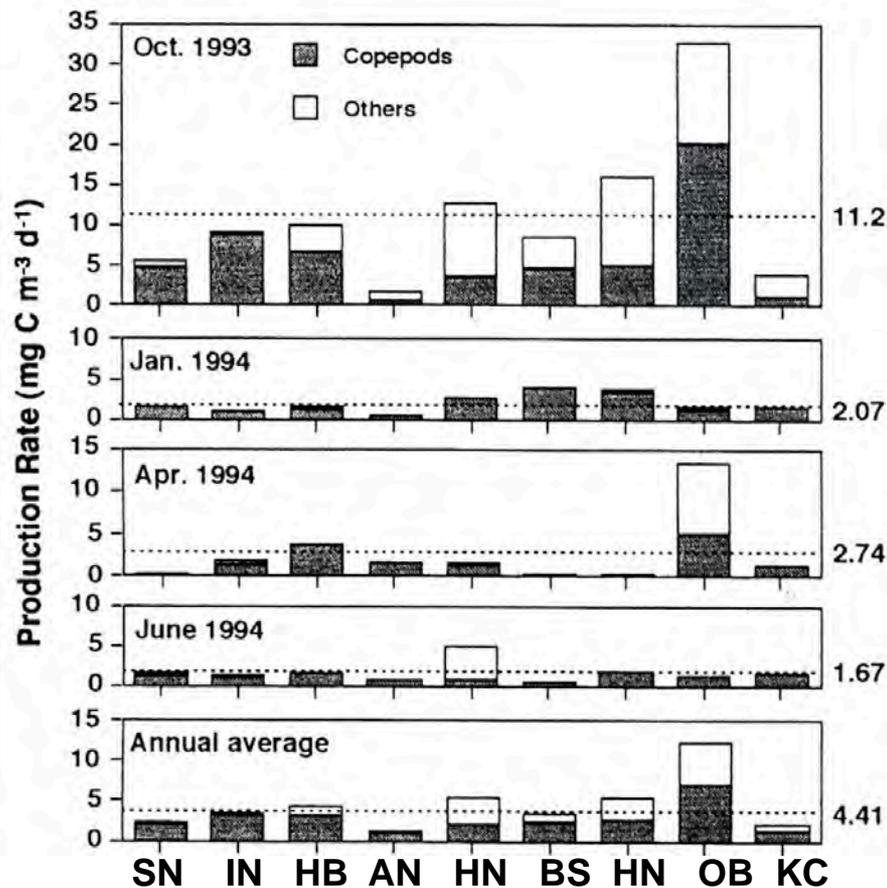

$$g = 0.077 e^{0.13T} \text{ (Uye \& Ichino, 1995)}$$

Other taxa (Cnidarians, polychaetes, cladocerans, malacostracans, chaetognaths, thaliaceans, and benthos larvae)

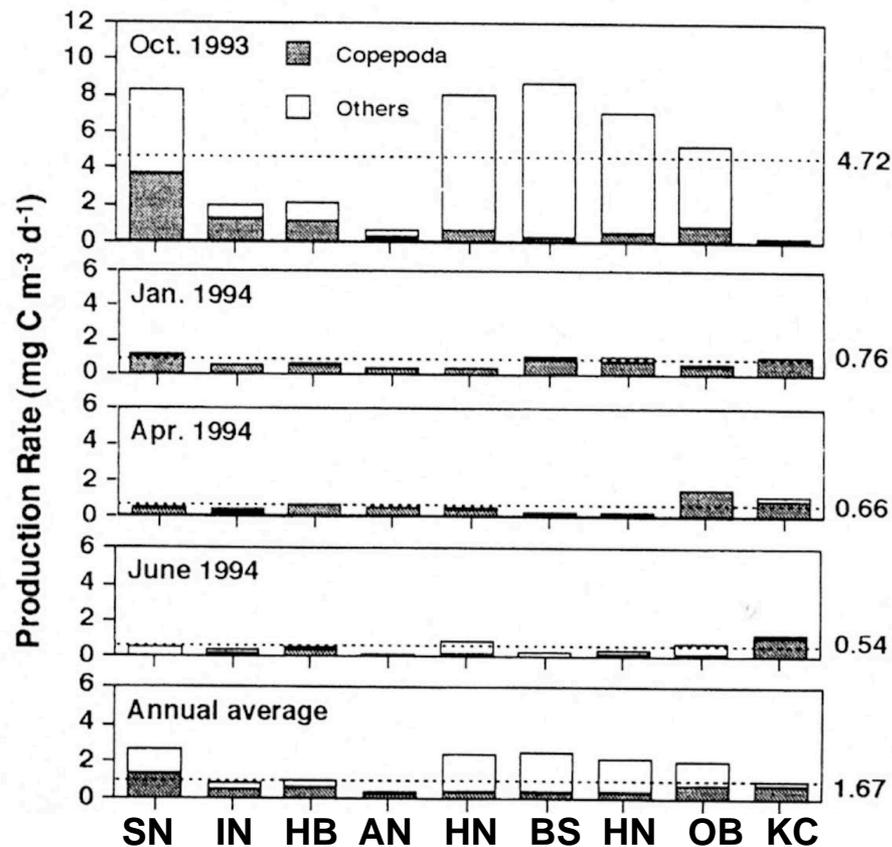

**Ikeda-Motoda's physiological method**  
(Ikeda & Motoda, 1978)

# Net-zooplankton secondary and tertiary production rate

## Secondary production rate

## Tertiary production rate

### Herbivores:

Appendicularians, benthos larvae, cladocerans, herbivorous copepods, thaliaceans

### Omnivores:

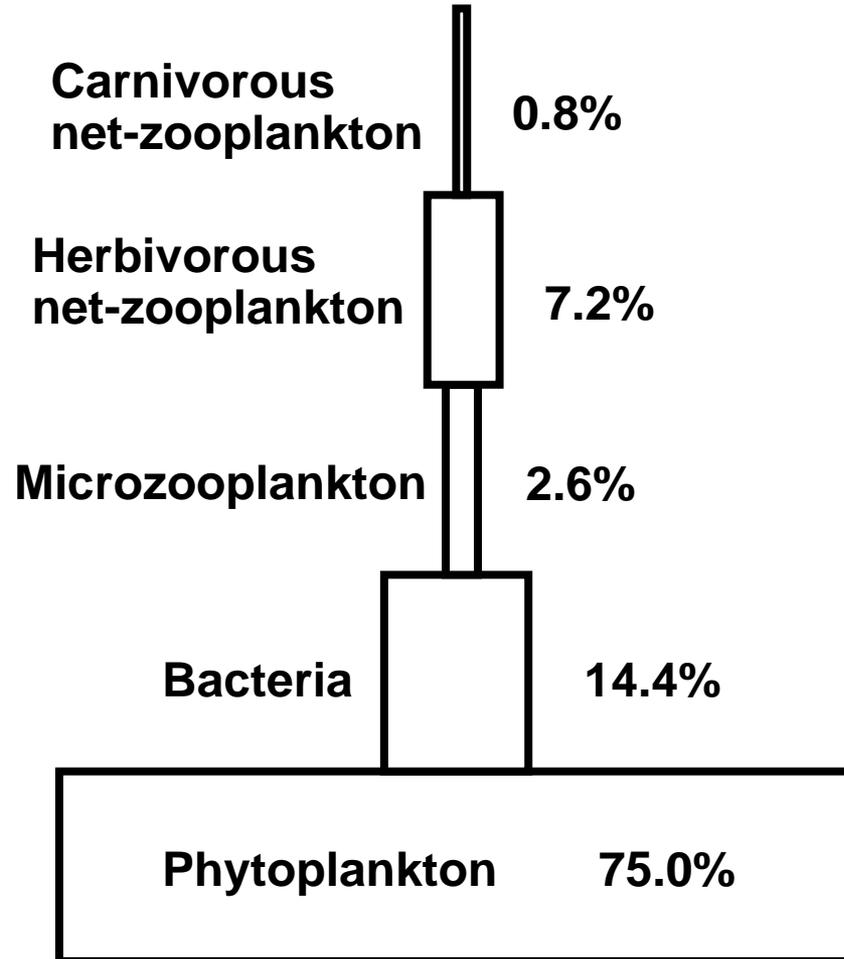

Copepods (*Acartia*, *Centropages*, *Oithona*, *Temora*), Malacostracans

### Carnivores:

Chaetognaths, cnidarians, carnivorous copepods, fish larvae

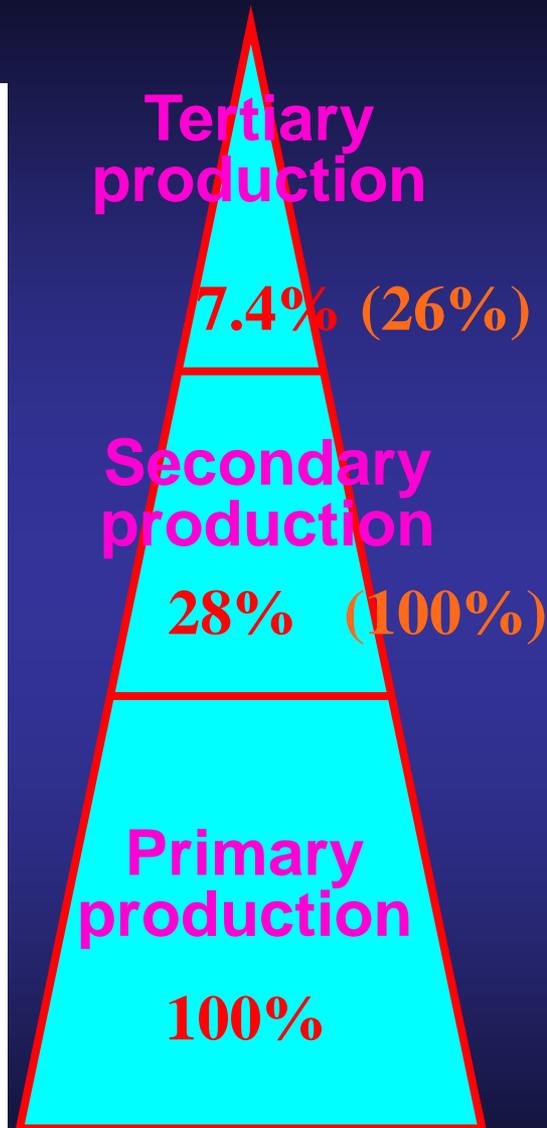

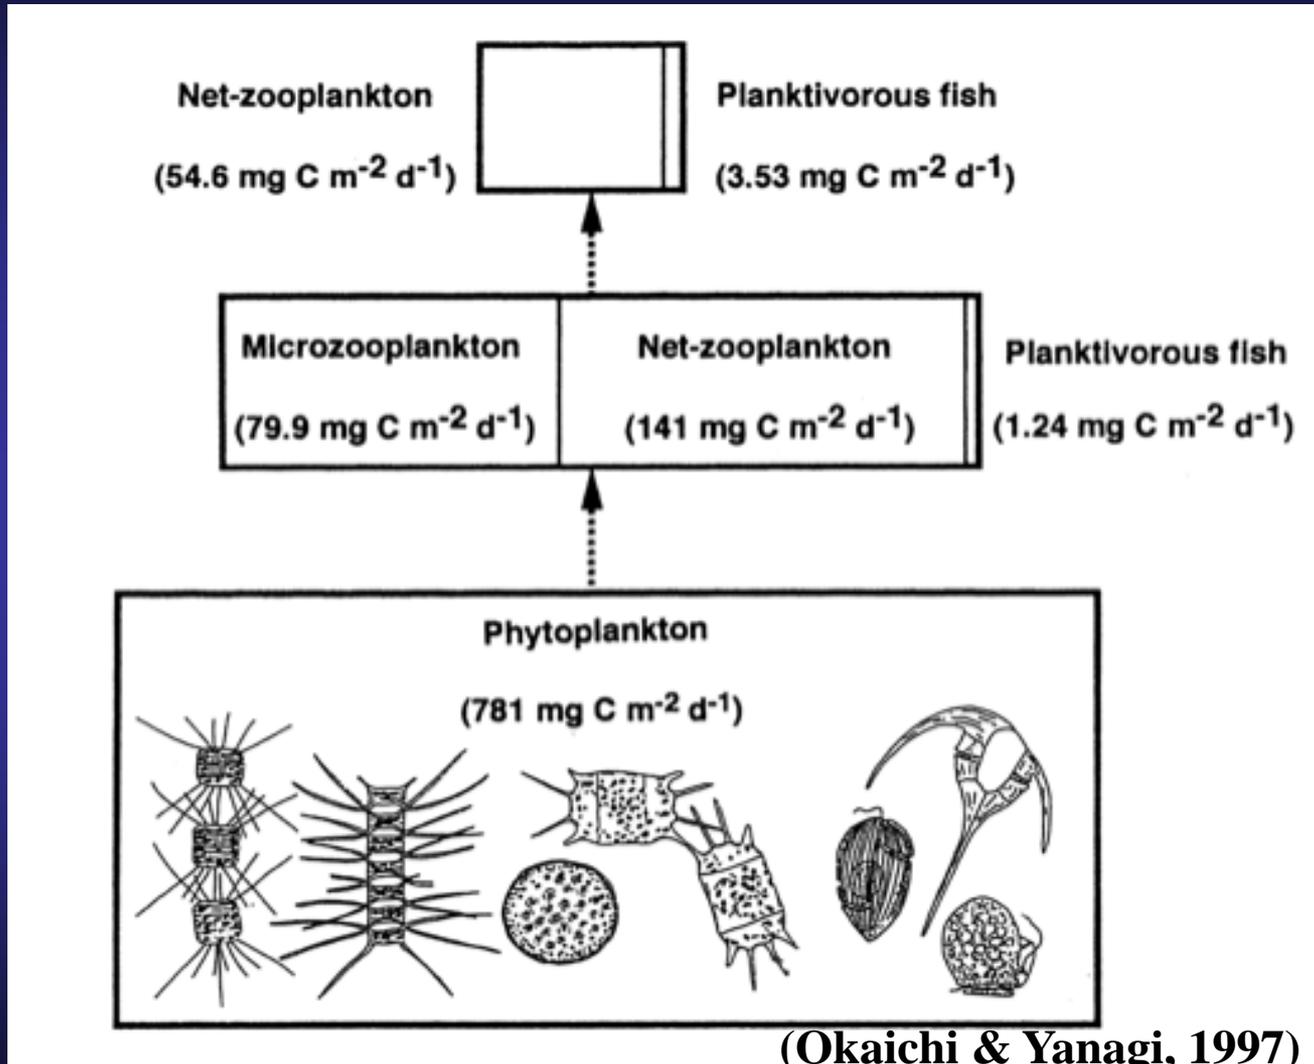

# Food chain structure of the Inland Sea of Japan

Total plankton biomass: 4,998 mg C m<sup>-2</sup>

(Redrawn from Okaichi & Yanagi, 1997)

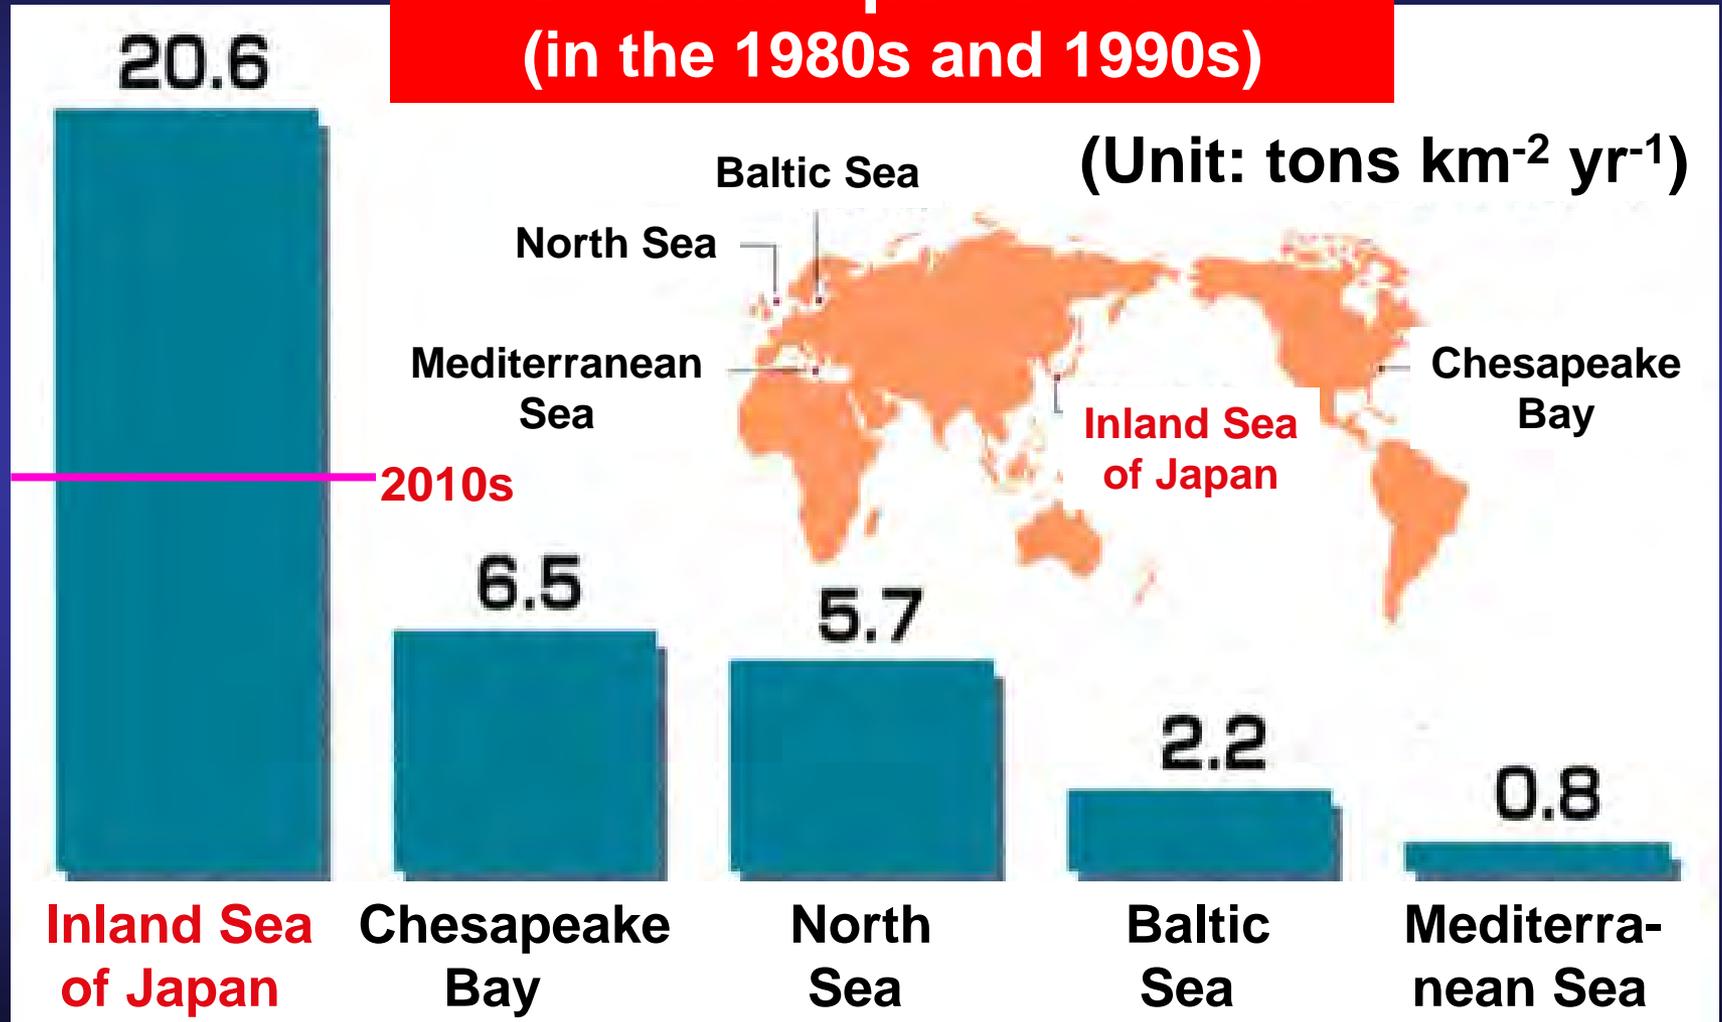

# Food chain structure of the Inland Sea of Japan

High transfer efficiency between trophic levels

# Productive fishing ground

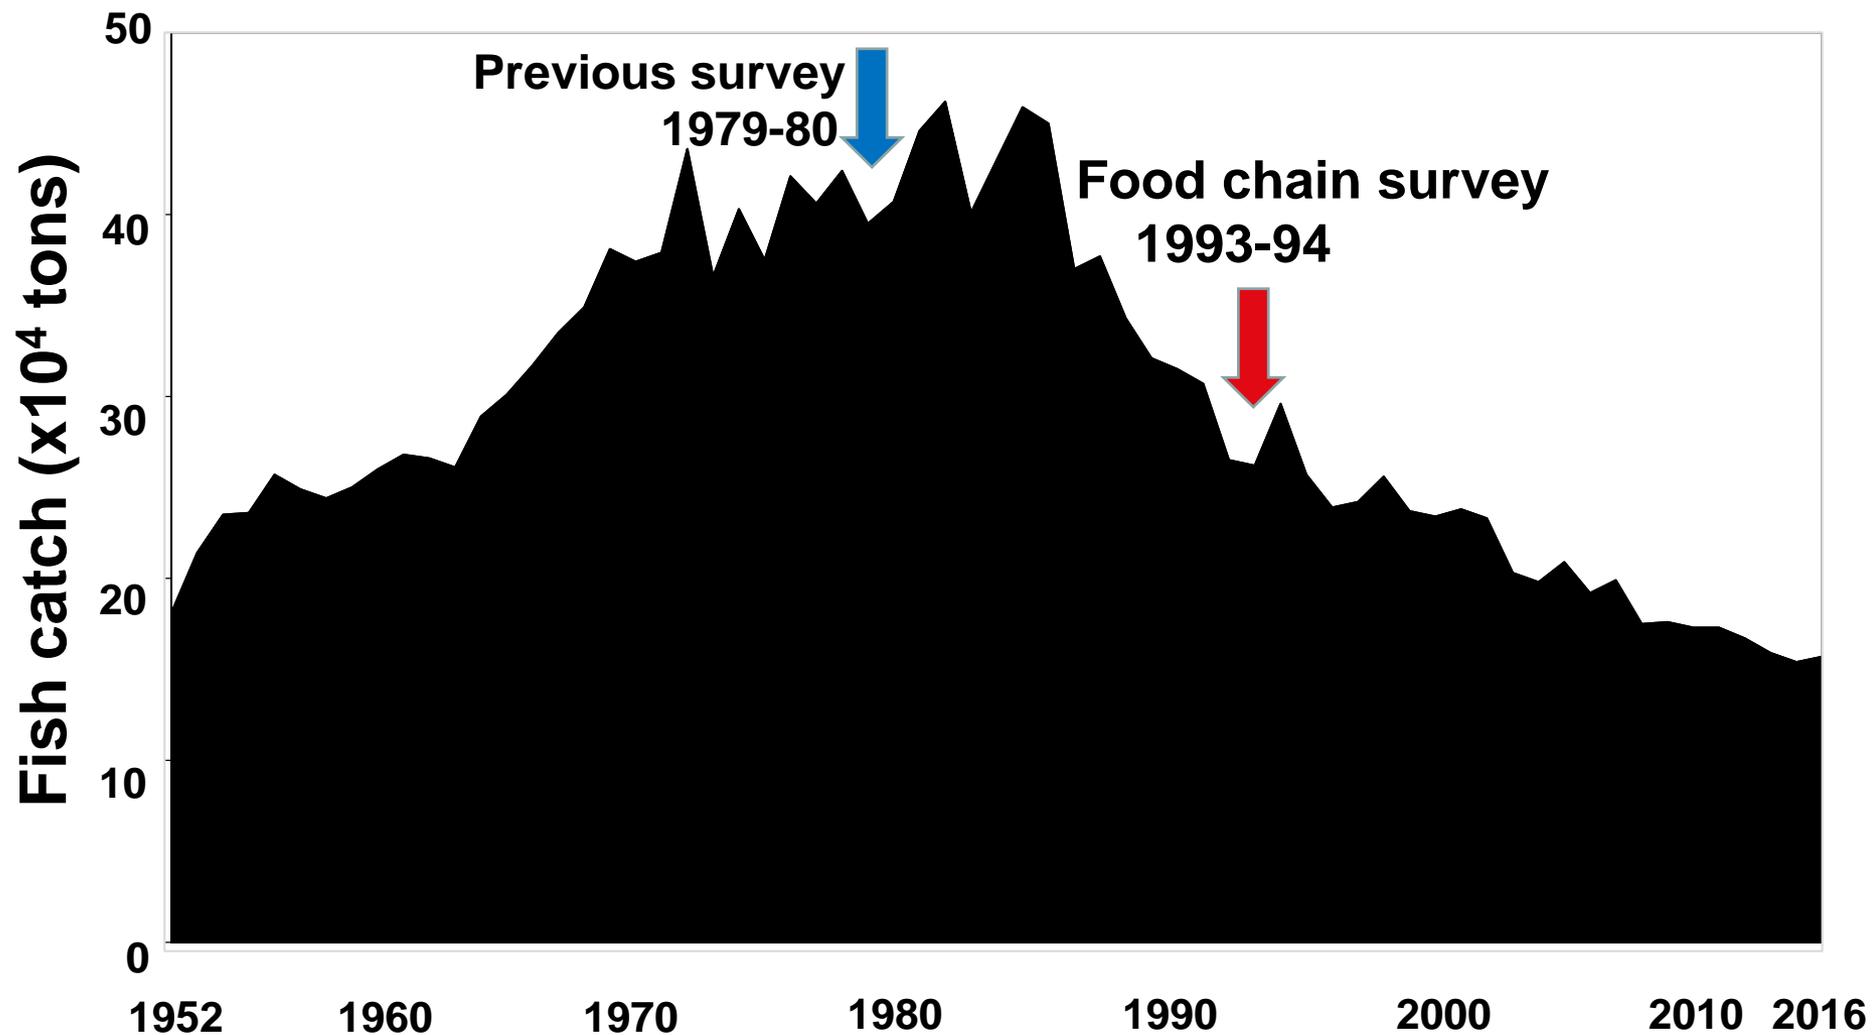

**Fish Catch per Unit Area**  
(in the 1980s and 1990s)

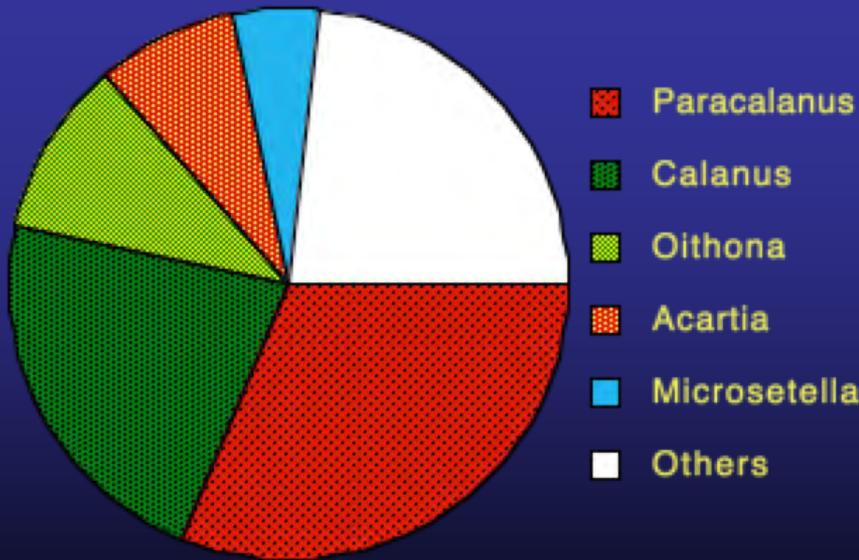

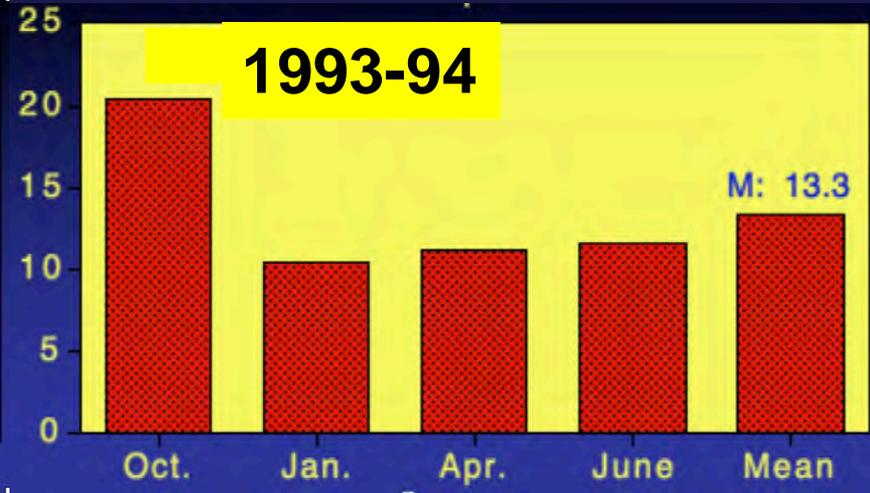

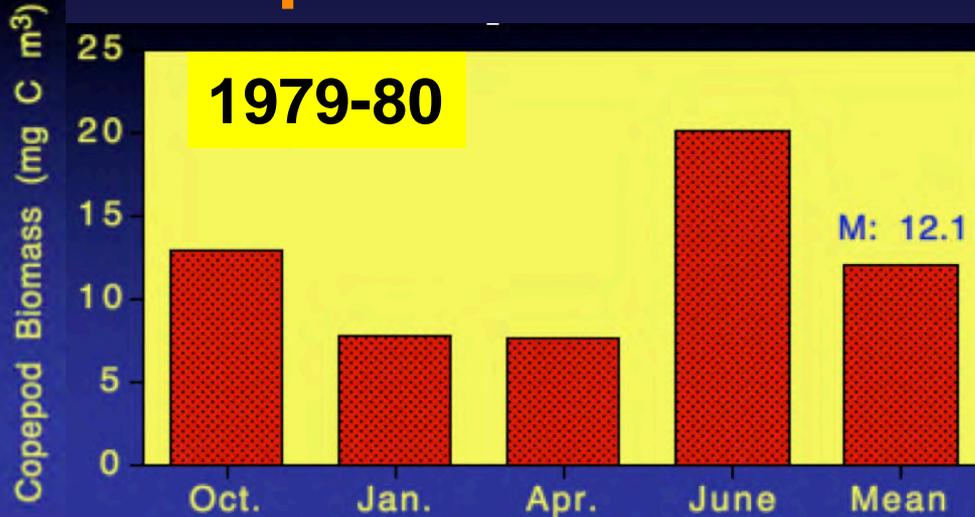

(Modified from Takeoka, 1997)

# Deterioration of productive ecosystem

## Decrease in fish catch after the 1980s

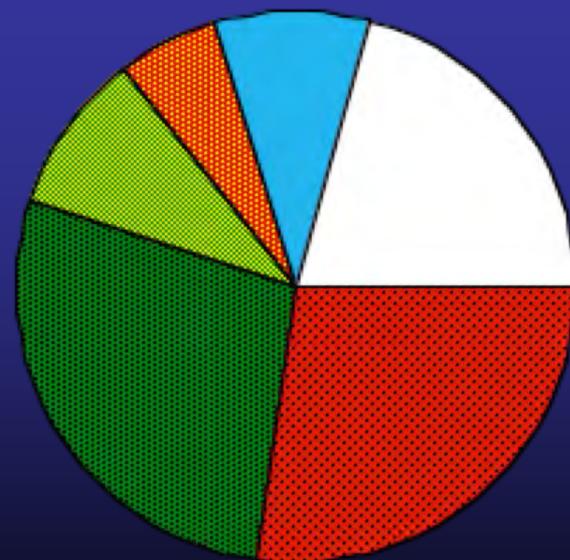

# Comparison of copepod biomass and taxonomic composition between 1979-80 and 1993-94

1979-80

(Uye et al., 1986)

1993-94

(Uye & Shimazu, 1997)

# Jellyfish trends in the Inland Sea of Japan

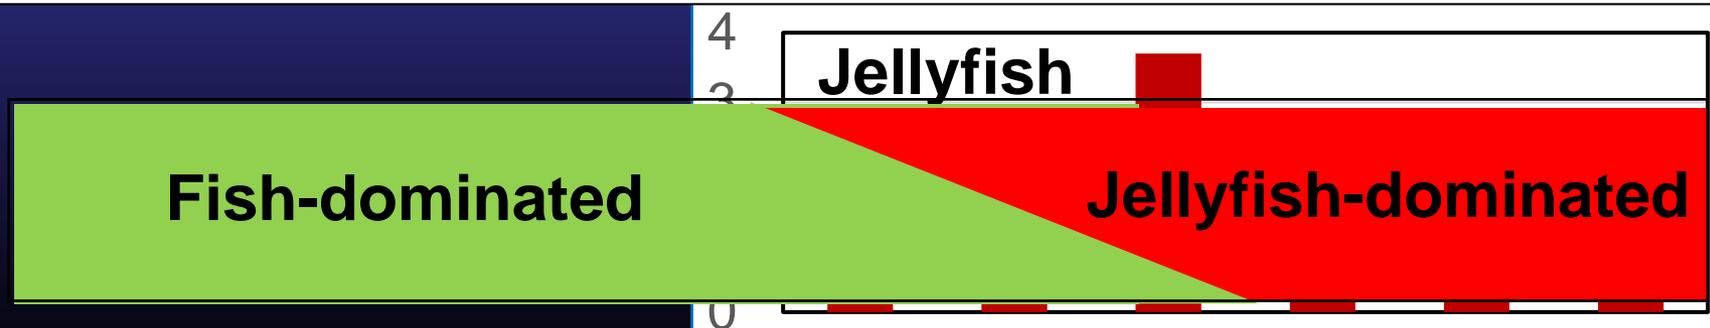

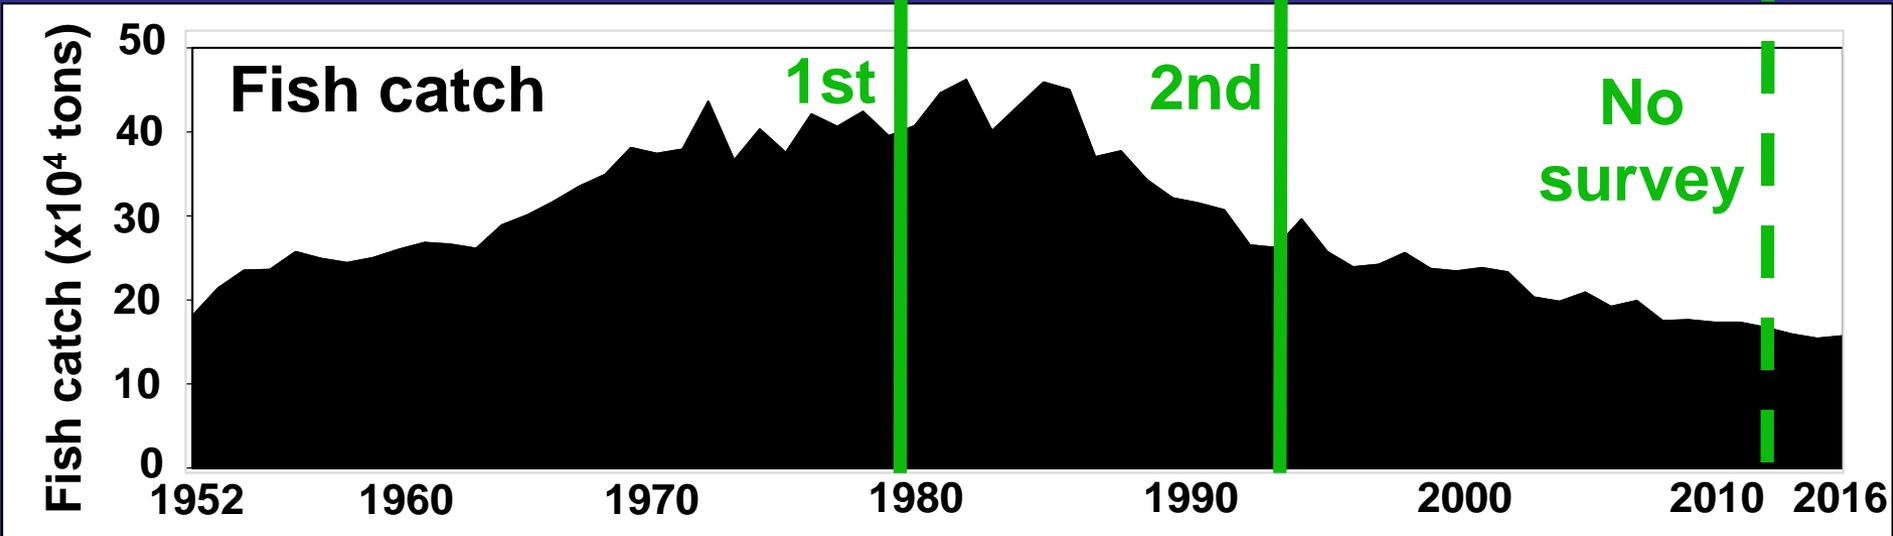

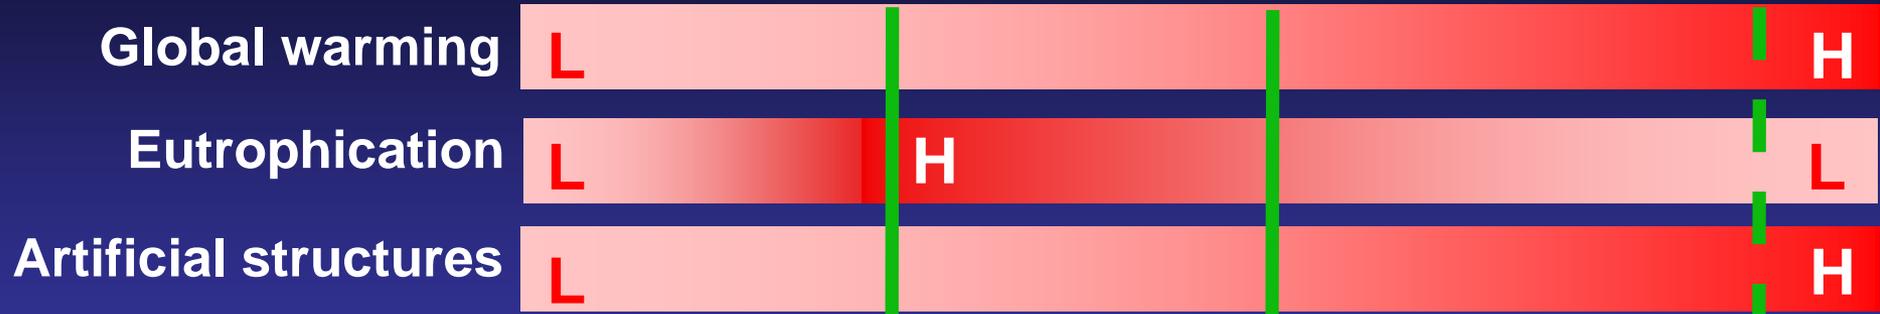

Since the 1990s, many fishermen claimed that jellyfish aggregations damage their fisheries, and in 2000 a unprecedentedly large population outbreak of *Aurelia coerulea* occurred in the western Inland Sea of Japan

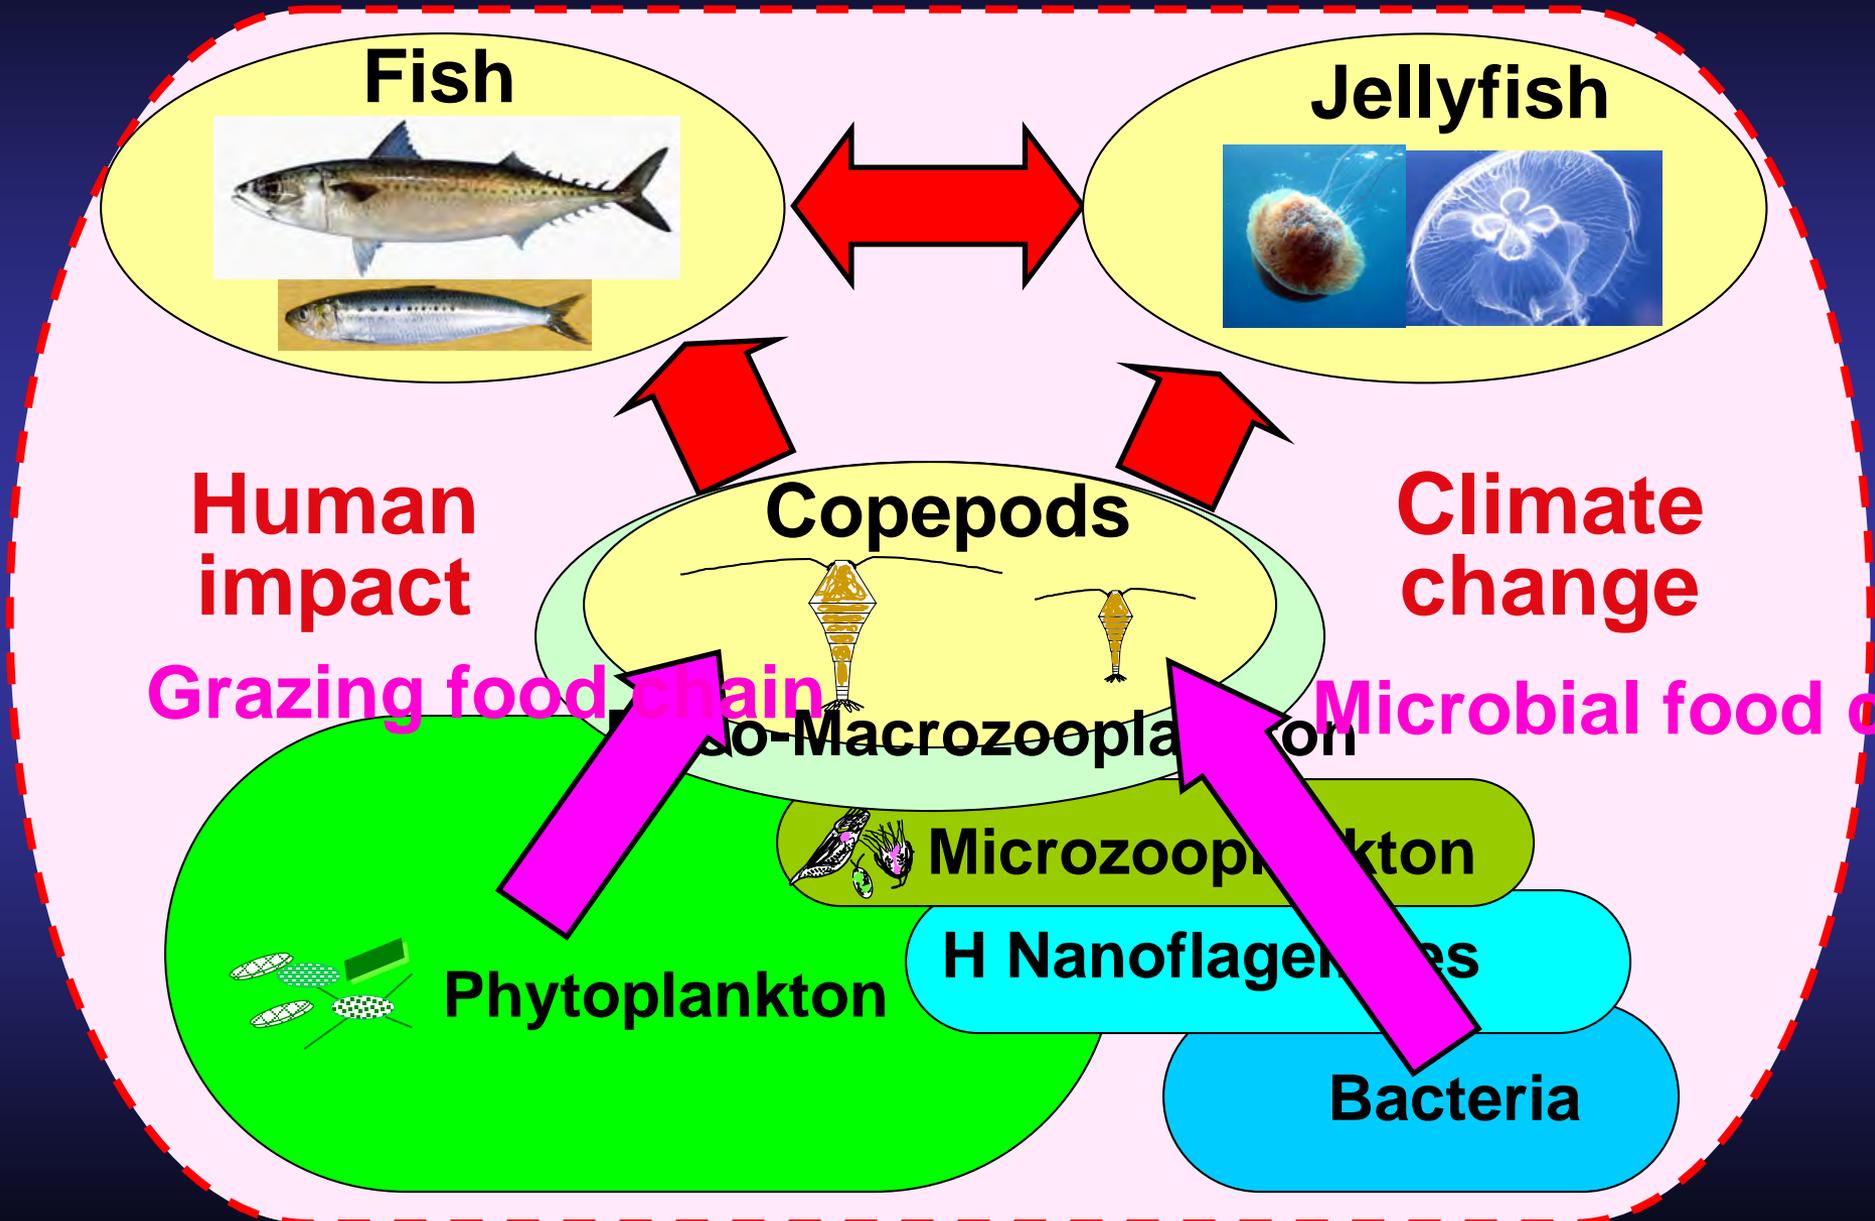

*Aurelia  
coerulea*  
medusae

# Environmental changes in the Inland Sea of Japan leading to jellyfish-dominated ecosystem

# Trophic structure in marine coastal waters

# Conclusion

1. The Inland Sea of Japan, a former productive fishing ground, shows a typical example of ecosystem deteriorated by human impacts.
2. To understand the effects of human impacts, it is necessary to clarify the energy flux through whole trophic processes up to fish.
3. Zooplankton production is a key process.
4. Individual-based specific growth rates are always the foundation for the population-based and community-based production estimates.
5. Needs accumulation of their growth rate data.
