---

This treatment is composed of the following taxa: *Aldina*, *Aldina discolor*, *Aldina heterophylla*, *Aldina kunhardtiana*, *Aldina latifolia*, *Aldina microphylla*, *Aldina occidentalis*, *Aldina polyphylla*.

## HOW TO CITE

Ramos, G., Cardoso, D.B.O.S. 2020. *Aldina* in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB78502>.

## DESCRIPTION

**Tree**, frequently buttressed. **Leaves** up to 11 odd-pinnate, often 1–3-foliolate when nearer the inflorescences, exstipulate; petioles and rachis sometimes darkening; leaflets opposite to subopposite, mostly coriaceous, sometimes chartaceous, base rounded to cordate, a subtle sometimes dense white wax coat on the lower surface, venation brochidromous. **Inflorescences** terminal or axillary, racemose or paniculate-racemose, densely covered by minute appressed golden to rusty hairs; bracts and bracteoles minute. **Flower** bisexual, actinomorphic (radially symmetrical), fragrant; calyx glabrous in the inner surface, entire in bud, opening about halfway in 2–4 recurved, irregular segments; petals (3)4–6, imbricate in the bud, white to yellowish, glabrous, oblong, obovate and oblanceolate, usually concave to cuculate with folding impressions from stamens at the tips; stamens numerous, mostly ca. 60, rarely around 36, glabrous, white, free, commonly with a sheath at the base of ca. 3 mm long, the anthers large, uniform, narrowly oblong to linear, opening lengthwise by slits; gynoecium arising from the bottom of hypanthium cup, sessile or more often borne on a distinct stipe, swollen-articulate at junction with the somewhat oblong ovary; ovary 1–3 (non-Brazilian species), 2–5 ovulate, covered by yellowish, golden appressed hairs; style glabrous, subulate, straight or usually hooked; stigma punctiform. **Fruit** drupoid legume, ca. 5–9 cm long, 4–6 cm diameter, tardily dehiscent, thick, spongy when adapted to water floatation, globose to subglobose, glabrous to tomentose, and 1-seeded.

## COMMENTS

*Aldina* is a Neotropical genus with 18 species distributed in the Amazon region. In Brazil, the genus is represented by 7 species distributed in a variety of habitats such as seasonally flooded forests (*igapós*), white sand forests (*campinas* and *campinarans*) and high altitude montains. *Aldina* is closely related to *Andira* and *Hymenolobium*, comprising the *Andira* clade.

## Life Form

Tree

## Substrate

Terrestrial

## DISTRIBUTION

Native, Not endemic to Brazil

## Phytogeographic Domains

Amazon Rainforest

**Vegetation Types**

Amazonian Campinarana, Terra Firme Forest, Inundated Forest (Várzea), Ombrophylous Forest (Tropical Rain Forest), Rock outcrop vegetation

**Geographic Distribution**Confirmed occurrences

North (Amazonas, Rondônia)

Possible occurrences

Northeast (Bahia)

**IDENTIFICATION KEY**

1. Leaflets glabrous or glabrescent to tomentose with erect to appressed hairs on the lower face; mature flower buds 1–2.5 cm long, erect in the inflorescence axes; stamens ca. 60, commonly enveloping the gynoecium ..... 2
1. Leaflets glabrous on both faces; mature flower buds 0.5–2 cm long, globose to obovoid, erect or bent in the inflorescence axes; stamens 36–60, enveloping the gynoecium or disperse ..... 6
2. Leaflets oblong, densely tomentose with erect to decumbent rusty hairs on the lower face over a flacking white wax coat, secondary veins prominent below inflorescence with velvety rusty hairs; fruit globose with appressed brown hairs ..... *A. kunhardtiana*
2. Leaflets broadly ovoid to narrowly oblong, white wax coat absent or attached to the surface; inflorescence pale yellow to pale green before drying; stamens coiling around the gynoecium or spread around it; fruit with spongy mesocarp if species from igapó forests ..... 3
3. Leaflets oblong-ovoid, glabrous to glabrescent with appressed white hairs on the lower face, white wax coat absent; inflorescence pale yellow; fruit with spongy mesocarp ..... *A. latifolia*
3. Leaflets broadly ovoid to narrow oblong, lower face of leaflets with white to pale golden appressed hairs, wax coat in an even layer; mature flower buds globoid to obovoid; barochoric fruit with fibrous mesocarp ..... 4
4. Leaves 5–9(11)-foliolate; leaflets 5.5–16 × 1.5–4.5 cm, narrowly oblong-lanceolate tomentose to glabrescent with appressed pale grey hairs and uniform white wax coat below; mature flower buds obovate; stipe 1 cm long ..... *A. polypylla*
4. Leaves (1–3)5(7)-foliolate; leaflets 7–19(23) × 4–11 broadly oblong pubescent with minute white to golden-brown appressed hairs; mature flower buds globose or obovate; stipe 1–10 mm long ..... 5
5. Leaves (1–3)5(7)-foliolate; indumentum with appressed white to golden hairs and a homogeneous white wax coat underneath; mature flower buds 1–2 cm long, oblong; stipe 0.5–10 mm long ..... *A. discolor*
5. Leaves 3–7-foliolate; indumentum with white to brownish hairs collapsed after drying, erect when living and a fine layer of wax; mature flower buds 0.8–1.5 long, globose; stipe ca. 1 mm long ..... *A. occidentalis*
6. Mature flower buds 0.5–1 cm long, globose, bent in the inflorescence axes; stipe 5–25 mm long, style 2–6 mm long; stamens 30–60 ..... *A. heterophylla*
6. Mature flower buds 1–2 cm long, obovoid, erect in the inflorescence axes; stipe 2.4 cm long, stamens never less than 37 spread around gynoecium ..... *A. microphylla*

# *Aldina discolor* Spruce ex Benth.

## Has as synonym

heterotypic *Aldina stergiosii* M.Yu.Gontsch. & Yakovlev

## DESCRIPTION

**Root:** nodule absent; **sapopema** present. **Stem:** exudate red present. **Leaf:** leaf compound; **phyllotaxy** alternate; **leaflet** subopposite; **leaflet indumentum** present; **size of the leaflet** 1.5 to 2 cm long; **number of the leaflet** 1 - 5. **Inflorescence:** **indumentum** rusty sericeous; **inflorescence type** terminal or axillary raceme. **Flower:** symmetry floral actinomorphic; **calyx** entire at the flower-bud; **stamen** 60; **flower size** 1.5 to 2.0. **Fruit:** **drupe** not woody; **hair** present. **Seed:** **number seed** 2.

## ADDITIONAL DESCRIPTION

**Tree:** up to 25 m high, commonly with buttresses; banches, petioles, pulvinus and inflorescences covered with appressed hairs, these frequently pale yellow in situ, rusty after drying. **Leaves:** (1–3) 5 (7)-pinnate, 18–34 cm long, unifoliolate leaves 15 cm long; leaflets 7–19(–23) × 4–11 cm, blade charthaceous to coriaceous, ovate to oblong-ovate, rounded at the base, sometimes subcordate, apex varying from rounded to shortly acute, tip obtuse to acute, upper face glabrous, lower face glaucous, pubescent to glabrescent with appressed white to pale golden hairs, frequently with a tesselate layer of wax, more visible after drying. **Venation:** nearly obscure on the upper face, prominent below. **Inflorescence:** 9–22 (–35) cm long, axillary or terminal racemes, less frequently panicles, generally lax, occasionally branched, covered by short appressed white to rusty golden hairs; flower buds obovoid, 0.8–2 cm long. **Flowers:** 1.5–3 cm long; calix 1–2 cm long, splitting into two to three recurved lobes after anthesis; petals 5, narrowly oblong or oblanceolate with a hooded tip; stamens numerous, 1–2.5 cm long; stipe 0.3–1 cm long, terete; ovary oblong, joint with the stipe, covered by appressed pale golden hairs; style 0.3–1 cm long, subulate, sometimes recurved at the tip. **Fruit:** 2.5–6.5 × 1.5–4.5 diam., globose, glabrescent, 1–4 seeded.

## COMMENTS

This species is widely distributed over the Amazon basin in white-sand forests of Brazil (Amazonas), Venezuela, and Colombia.

# *Aldina heterophylla* Spruce ex Benth.

## DESCRIPTION

**Root:** nodule absent; sapopema absent. **Stem:** exudate red present. **Leaf:** leaf compound; phylotaxy alternate; leaflet subopposite/opposite; leaflet indumentum absent; size of the leaflet 0.5 to 1 ( 2 ) cm long; number of the leaflet 1 - 5. **Inflorescence:** indumentum rusty sericeous/whitish sericeous; inflorescence type terminal or axillary panicle. **Flower:** symmetry floral actinomorphic; calyx entire at the flower-bud; stamen 35; flower size up to 1.5 cm. **Fruit:** drupe not woody; hair absent. **Seed:** number seed 1.

## ADDITIONAL DESCRIPTION

**Tree** up to 25(–40) m tall. All parts glabrous except the inflorescence. **Leaves** 5.5– 22 cm long, unifoliolate leaves 6.5–15 cm long, 1–3(5)-foliolate; leaflets 5–11(–14) × 3–8.5 cm commonly naviculate in situ, ovate, oblong-lanceolate, coriaceous, base rounded, apex acuminate, glabrous on both surfaces; venation inconspicuous on both faces, except for the midvein below. **Inflorescence** 7–21 cm long, terminal panicles, occasionally axillary, densely covered with appressed pale-yellow to ferruginous hairs. **Flowers** 1.5–2 cm long; mature buds 0.5– 1 cm, globose, attached in the inflorescence in a bent position; calyx ca. 1 cm long, splitting into three to four lobes; petals, oblanceolate with the apex cuculate; stamens 36, not involving the gynoecium; stipe 5 mm long jointed with the ovary, style ca. 2 mm long, straight, subulate, glabrous. **Fruit** 1.5–3 × 2.3–3 cm diam., globose, glabrescent, green, drying dark brown to black, occasionally slightly wrinkled; suture line swollen, 1 seeded.

## COMMENTS

This species is endemic to Brazil and has been known only from the white-sand forests of Manaus, Presidente Figueiredo and surrounding areas in the state of Amazonas.

## DESCRIPTION

**Root:** nodule absent; sapopema absent. **Stem:** exudate red present. **Leaf:** leaf compound; phylotaxy alternate; leaflet subopposite/opposite; leaflet indumentum present; size of the leaflet 0.5 to 1 ( 2 ) cm long; number of the leaflet 1 - 5. **Inflorescence:** indumentum rusty sericeous; inflorescence type terminal or axillary panicle. **Flower:** symmetry floral actinomorphic; calyx entire at the flower-bud; stamen 60; flower size bigger than 3.0/2.0 to 3.0 cm/1.5 to 2.0/up to 1.5 cm. **Fruit:** drupe not woody; hair present. **Seed:** number seed 1.

## ADDITIONAL DESCRIPTION

**Tree** up to 25 m tall. All parts except upper leaf surface fuscous-velvety. **Leaves** 17–42 cm long, mostly 5–9 (–13)-foliolate. **Leaflets** 5–23 × 3–10 cm, alternate to subalternate, ovate, oblong-elliptic, coriaceous, base rounded, apex rounded, glaucous to yellowish below densely covered with greenish to ferruginous hairs, erect to slightly decumbent; venation: midvein, secondary and tertiary veins conspicuous below. **Inflorescence** 9–36 cm long, terminal panicles, occasionally axillary, densely covered with appressed velvety rusty hairs. **Flowers** 2–2.5 cm long; mature buds 1–1.8 (–2.5) cm long, obovate; calyx 1–2 cm long, entire at the bud, splitting into 2–3 recurved lobes; petals 5 white, oblanceolate with the apex cuculate; stamens usually grouped and slightly coiled before pollination, anthers cream; ovary ca. 4–8 × 4 mm, oblong, densely covered with appressed golden-brown hairs; stipe ca. 5–10 mm long jointed with the ovary, the style 6–10 mm long commonly recurved, subulate, glabrous, the stigma simple. **Fruit** 4.5–8.5 × 2.5–7 diam., globose with a median suture, appressed pubescent with dark-brown hairs.

## COMMENTS

This species is distributed in terra-firme forests of Amazonas in Brazil, Venezuela and occasionally in non-inundated areas near river banks of Colombia.

# *Aldina microphylla* M.Yu.Gontsch. & Yakovlev

## DESCRIPTION

**Root:** nodule absent; sapopema absent. **Stem:** exudate red present. **Leaf:** leaf compound; phylotaxy alternate; leaflet opposite; leaflet indumentum absent; size of the leaflet 1.5 to 2 cm long; number of the leaflet 1 - 5. **Inflorescence:** indumentum golden; inflorescence type terminal or axillary panicle/terminal or axillary raceme. **Flower:** symmetry floral actinomorphic; calyx entire at the flower-bud; stamen 60; flower size 1.5 to 2.0. **Fruit:** drupe not woody; hair absent. **Seed:** number seed 1.

## ADDITIONAL DESCRIPTION

Spreading trees up to 8 m tall. Leaves 8–12 cm long, (1)3–5-foliate; leaflets 3.5–6.5 × 2–4.5 cm, coriaceous, glabrous on both faces, ovate, oblong-ovate, base rounded to cuneate, apex acuminate to subacute; venation inconspicuous except for the midvein below. Inflorescence 11–23 cm long, terminal racemes and panicles, densely covered with appressed hairs. Flowers 1–2 cm long; mature buds 1–2 cm long, obovate; calyx 1–1.5cm long entire at the bud, splitting into 3–4 unequal reflexed parts; petals ca. 1.5 × 0.8 cm, 4–5, oblong; stamens ca. 1.5 cm long; gynophore 2.4 cm long, densely covered with appressed golden-brown hairs jointed with the ovary; ovary 0.5–0.9 × 0.5–0.6 cm, oblong-elliptic, pubescent to glabrescent, style 3–6 mm long, glabrous. Fruit unknown.

## COMMENTS

*Aldina microphylla* is known to be distributed in high altitudes slopes of the Serra do Aracá in the state of Amazonas.

## ADDITIONAL DESCRIPTION

**Tree** up to 20 m tall. All vegetative parts glabrous except for the lower leaflet surface. **Leaves** mostly 12–36 cm long, 5–7 (9–11)-foliolate; leaflets 5.5–16 × 1.5–4.5 cm, oblanceolate to lanceolate, coriaceous, base rounded, apex long acuminate, the upper surface glabrous, nitid, the lower surface glaucous with hairs; venation subobscure above, midrib conspicuous below. **Inflorescence** 12–24 (–28) cm long, terminal racemes and panicles, densely appressed-puberulent. **Flowers** 1.5–3 × 1–2.5 cm; calyx ca 1.8 cm long entire at the bud, split into two or three recurved parts; mature buds ca. 1–2 cm long, obovate; petals 4–5, oblong with the apex cuculate; stamens cream; ovary about 7 × 3 mm, oblong-ovate, 5-ovulate; style about 8 mm long, glabrous, uncinated at tip; stipe 1 cm long jointed with the ovary. **Fruit** unknown.

## COMMENTS

This species is endemic to Brazil and has been collected in the vicinities of São Gabriel da Cachoeira and Santa Isabel do Rio Negro in the state of Amazonas.

### Life Form

Tree

### Substrate

Terrestrial

## DISTRIBUTION

Native, Is endemic from Brazil

### Phytogeographic Domains

Amazon Rainforest

### Vegetation Types

Terra Firme Forest, Ombrophylous Forest (Tropical Rain Forest)

### Geographic Distribution

#### Confirmed occurrences

North (Amazonas)
