**ABSTRACT** – A new species of fruit bat in the genus *Thoopterus*, *T. suhaniahae*, is described from Sulawesi, Talaud and Wowoni Islands in Indonesia. The new species differs from *T. nigrescens* in having larger cranial, dental, mandibular, external measurements, and a wider calcar. In addition, the tail of the new species is absent or reduced to a rudiment, a quarter to a half of the under face of the uropatagium is sparsely furred and the urethral aperture of the glans penis lacks a conspicuous scale-like projection. The new species is sympatric with *T. nigrescens* and is known from elevations of 60–2,100 m above sea level.

**KEYWORDS:** taxonomy, morphology, *Thoopterus suhaniahae* sp. nov.

## INTRODUCTION

The fruit bat genus *Thoopterus* was proposed by Matschie (1899) as a subgenus of *Cynopterus*. Gray (1870) recognized *nigrescens* as a variety of *Cynopterus marginatus* (Geoffroy, 1810). Andersen (1912) recognized *Thoopterus* as a valid monotypic genus, based on the absence of a postorbital foramina, incisors complete, upper canine grooved, cheek teeth 4/5, P<sub>4</sub> and M<sub>1</sub> broad, quadrate with large surface, tail reduced to a rudiment, membranes attached on the second toe, fur much longer compared to *Cynopterus*, and grooved upper canines without cingulum cusps.

*Thoopterus nigrescens* has been recorded from Morotai in the North Moluccas (the type locality) and Sulawesi. Bergmans and Rozendaal (1988) and Suyanto *et al.* (1998) reported it occurring on the Sangihe Talaud Islands. Boeadi and Saim collected this species from Sula and Kabaena, Buton in 1991 and 2002, and from Wowoni Islands in 2005 which were then deposited in the Museum Zoologicum Bogoriense (MZB). Bergmans and Rozendaal (1988) reported that specimens from South-West Sulawesi (Bantimurung and Malino) were larger than that from northern Sulawesi and may represent a new taxon. *Thoopterus nigrescens* has previously been reported from sea level up to 1,780 m (Bergmans and Rozendaal 1988). During a 2000–2001 survey, however, we found *T. nigrescens* to be most common at even higher altitudes of Nokilalaki and Rorekatimbu-Lore Lindu National Park: 2,100 m and 2,200 m, respectively

(Maryanto and Yani 2001). To clarify the taxonomic status of these populations, this paper provides a morphological description of these high elevation populations of *Thoopterus* from Sulawesi and adjacent islands. We found compelling evidence to describe these populations as a new species of *Thoopterus*, here named *T. suhaniahae* sp. nov.

## MATERIALS AND METHODS

A total of 102 adult specimens of *Thoopterus* from Sulawesi, Buton, Sula, Talaud and Wowoni Islands were included in our morphometric analyses (see specimens examined and Figure 1). All cranial, dental, mandibular and external measurements are given in mm. Measurements used in this paper follow Kitchener *et al.* (1995) and Kitchener and Maharadatunkamsi (1991) and are as follows:

*Skull and dentition:* greatest skull length (GSL), interorbital breadth (IO), zygomatic breadth (ZB), rostrum length (RL), mastoid breadth (MB), braincase height (HB), mesopterygoid fossa width (MSF), palatal length (LOP), bulla length (BL), postorbital width (POW), braincase width (BW), dentary length (DL), height of ramus at angular process (RAP), C<sup>1</sup>-C<sup>1</sup> breadth (outside), M<sup>1</sup>-M<sup>1</sup>, M<sup>2</sup>-M<sup>2</sup>, P<sup>3</sup>-P<sup>3</sup>, P<sup>4</sup>-P<sup>4</sup> (alveoli, inside), C<sup>1</sup>-M<sup>2</sup> (crown length), C<sub>1</sub>-M<sub>2</sub> (crown length), M<sup>1</sup> crown length (M<sup>1</sup>L), M<sup>1</sup> crown width (M<sup>1</sup>W), M<sup>2</sup> crown length (M<sup>2</sup>L), M<sup>2</sup> crown width (M<sup>2</sup>W), P<sup>3</sup> crown length (P<sup>3</sup>L), P<sup>3</sup> crown width (P<sup>3</sup>W), P<sup>4</sup> crown length (P<sup>4</sup>L), P<sup>4</sup>

crown width ( $P^4W$ ).

*External:* forearm length (FA), head and body length (HBL), tail length (TAIL), ear length (EAR), tibia length (TIBIA), metacarpal 2 length (P2), metacarpal 2 phalanx 1 length (P2\_1), metacarpal 3 length (P3), metacarpal 3 phalanx 1 length (P3\_1), digit 4 phalanx 1 length (P4\_1), metacarpal 5 length (P5), metacarpal 5 phalanx 1 length (P5\_1). Adults were identified as those specimens with basioccipital and basisphenoid bones completely fused and epiphyseal swelling of metacarpal joints absent. Sexual dimorphism in skull and external characters was analyzed by a 2-way ANOVA. We tested for sexual dimorphism and morphological characters using canonical discriminant function analyses (DFA) of *Thoopterus* groups. Multiple analysis of variance (MANOVA) was run separately for craniodental and external characters. Colour terminology follows Kornerup and Wanscher (1984). Specimens discussed here are deposited in the Natural History Museum, London (BMNH) and the Museum Zoologicum Bogoriense, Cibinong Bogor (MZB).

## RESULTS

### UNIVARIATE STATISTICS

#### *Skull, dentary, dentition*

*Thoopterus suhaniahae* sp. nov. males are larger in most dimensions than females; respective measurements for males and females are as follows:

GSL 38.85 (37.21–40.55) v. 37.10 (35.82–38.28); ZB 25.12 (23.76–26.35) v. 23.93 (22.10–25.23); HB 12.77 (10.41–14.60) v. 12.78 (11.34–14.19); RL 9.54 (8.95–10.75) v. 9.20 (8.54–10.01); IO 8.71 (7.89–9.34) v. 8.24 (7.51–8.58);  $C^1-C^1$  8.06 (7.57–8.58) v. 7.68 (7.23–7.83); POW 7.62 (7.17–8.26) v. 7.51 (7.20–7.91); LOP 19.60 (18.37–20.92) v. 18.84 (18.10–20.03); MSF 4.59 (4.16–5.03) v. 4.64 (4.23–5.42); BL 3.03 (2.20–3.68) v. 3.00 (2.42–3.53); RAP 15.32 (13.63–17.01) v. 14.11 (13.12–14.95); DL 29.33 (28.03–31.06) v. 27.67 (25.58–28.91) (Table 1).

Cranial, dental, mandibular and external dimensions in *T. suhaniahae* sp. nov. are mostly larger than *T. nigrescens*. For example, measurements of female *T. suhaniahae* sp. nov. and *T. nigrescens* are respectively (mean, range in mm): GSL 37.10 (35.82–38.28) v. 34.29 (33.06–35.62), RL 9.20 (8.54–10.01) v. 8.39 (7.57–9.14), ZB relatively wide 23.93 (22.1–25.23) v. 21.67 (20.02–23.31), HB 12.78 (11.34–14.19) v. 11.65 (11.14–12.04); for males, the equivalent comparisons are GSL 38.85 (37.21–40.55) v. 35.33 (32.55–37.67), RL 9.54 (8.95–10.75) v. 8.65 (7.22–9.61), ZB 25.12 (23.76–26.35) v. 22.125 (19.39–23.71), HB 12.77 (10.41–14.60) v. 11.81 (10.88–12.50) (Table 1).

#### *External features*

In *T. suhaniahae* sp. nov., external measurements are larger in males than females, for example, HBL (in mm) 98.47 (89.35–109.67) v. 94.91 (86.02–101.11); ear length 17.79 (16.62–19.06) v. 17.64 (16.62–19.50); FA 78.36 (74.42–81.77) v. 76.44 (73.03–78.47); Tibia 32.26

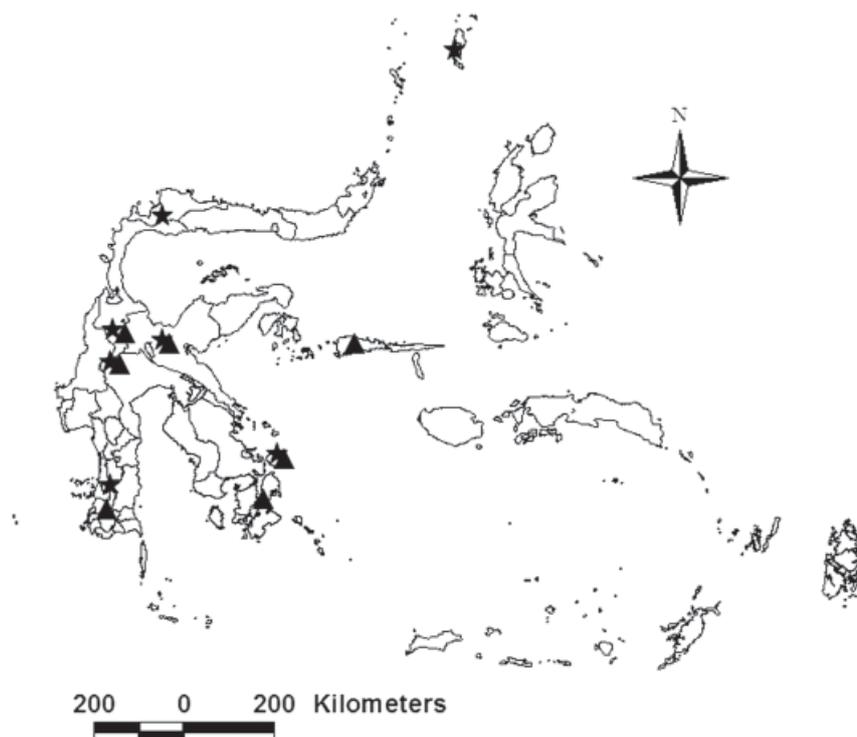

FIGURE 1 Collection localities of *Thoopterus* spp. used in this study, *T. nigrescens* (▲) and *T. suhaniahae* sp. nov. (★).

**TABLE 1** Measurements (mm) for skull includes dentary, dental and external characters (see Material and Methods section for explanation of character codes) of adult *Thoopterus* spp.

(30.49–34.11) Vs 31.47 (29.55–33.00); P2 38.03 (36.13–39.87) v. 37.22 (34.50–38.54); P2\_1 10.45 (9.50–11.57) v. 10.08 (9.58–10.66) (Table 1).

External measurements of *T. suhaniahae* sp. nov. are larger than *T. nigrescens* as follows: the female head and body length 94.91 (86.02–101.11) v. 89.69 (78.98–107.66), ear length 17.63 (16.62–19.50) v. 17.19 (14.26–19.24), forearm length 76.43 (73.03–78.47) v. 72.84 (67.88–77.32); the male head and body length 98.47 (89.35–109.67) v. 92.12 (78.55–105.12), ear length 17.79 (16.62–19.06) v. 17.74 (16.17–19.97), FA 78.36 (74.42–81.77) v. 74.25 (66.65–79.36).

Mean, standard deviation, minimum, maximum values and samples size for each species and different sexes are presented in Table 1 for cranial, dental, mandibular and external characters. MANOVA results (see Table 2 for details) indicate that nearly all characters differed significantly between the sexes. Characters that not were significantly influenced by sex ( $P > 0.05$ ) were: braincase height (HB), bulla length (BL), ramus angular process (RAP), upper first molar length ( $M^1L$ ), distance between upper first molars ( $M^1-M^1$ ), upper third premolars ( $P^3-P^3$ ), and upper fourth premolar ( $P^4-P^4$ ), ear length (EAR) and head and body length (HBL) (Table 2). All characters showed significant differences between *T. nigrescens* and *T. suhaniahae* sp. nov. at  $P < 0.001$ ; exceptions are MSF and ear length.

For most characters there were no significant interactions between sex and species (Table 2). Weak interactions between sex and species were found for interorbital width (IO), lower canine to second molar distance ( $C-M_2$ ) ( $P < 0.01$ ) and for condylobasal length (CBL), dentary length (DL), braincase width (BW) and mastoid breadth (MB) ( $P < 0.05$ ).

## MULTIVARIATE ANALYSES

DFA for 26 skull dental and dentary characters and 12 external characters were run separately. The DFA was run using a reduced set of five selected characters to reduce the effect of over fitting data. Five variables were selected to minimize Wilk's lambda. These subsets provided similar cluster values in discriminant function space as had been observed in the full set of 26 skull, dental and dentary characters. The DFA for males and females extracted a highly significant function that did not misclassify any individuals of *T. nigrescens* and *T. suhaniahae* sp. nov.

The DFA of male specimens contrasted *T. suhaniahae* sp. nov. from Sulawesi, Wowoni and Talaud Islands with *T. nigrescens* collected from Sulawesi, Sula, Wowoni and Buton Island. The five skull and external character for male selected to minimize Wilk's lambda (Kitchener *et al.* 1995) are  $M^1W$ , IO, POW, POZ,  $M^1-M^1$  and P3, P2\_1, P5, P3\_1, HBL. The analyses of female specimens contrasted *T. suhaniahae* sp. nov. from Sulawesi and second, *T. nigrescens* collected from Sulawesi, Buton, Sula,

Wowoni Islands. The five skull and external characters selected to minimize Wilk's lambda female are  $C^1-C^1$ , GSL, HB, MSF,  $M^1L$  and P3, P5, P2\_1, FA, HBL.

The separate DFA for males and females extracted the highly significant function (Function 1) and classified 100% individuals correctly to species. Variables loading most heavy ( $> 0.5$ ) on these functions were POW, P3, P5, P3\_1, P2\_1 (males) and  $C^1-C^1$ , P3, P5, HBL (females).

## SYSTEMATICS

### Family Pteropodidae

#### Genus *Thoopterus* Matschie, 1899

#### TYPE SPECIES

*Cynopterus marginatus* var. *nigrescens* Gray, 1870.

#### DIAGNOSIS

Postorbital foramina absent; incisors complete, upper canine grooved, cheek teeth 4/5,  $P_4$  and  $M_1$  broad, quadrate with large surface and grooved upper canines without cingulum cusps; tail reduced to a rudiment, membranes from second toe with longer fur.

#### *Thoopterus nigrescens* (Gray, 1870)

Figures 2, 3

#### MATERIAL EXAMINED

##### *Holotype*

**Indonesia: North Moluccas:** ♀ skin and skull, Morotai, A.R. Wallace (BMNH 62.10.21.6).

##### DIAGNOSIS

No postorbital foramina, incisors 2/2-2/2, upper canine grooved, cheek teeth 4/5,  $P_4$  and  $M_2$  extremely broad, quadrate, with large surface cusps, and the inner ridge quite obsolete. Tail rudimentary, membranes from second toe' (Andersen 1912).

#### DESCRIPTION

Description follows Andersen (1912): fur much longer than in *Cynopterus*, back warm prout's brown, under fur pale drab grey, head similar but slightly darker, nape neck paler, under parts from chin to interfemoral, hair brown, slightly shaded with a warmer brown on flanks and sides of breast and belly, the metacarpal and phalanges dark brown. Rostrum unmodified; premaxillae slender, tapering above in simple contact interiorly; row of upper incisors in sharp profile of rostrum (one canine covering the other) partly hidden between canines. Front of orbits above back of  $P^4$ , maxillary tooth row not extending beyond ventral margin of orbit. Sagittal crest fully developed, but low.

#### DISTRIBUTION

Sulawesi, Talaud, Sula, Buton, Wowoni, Morotai

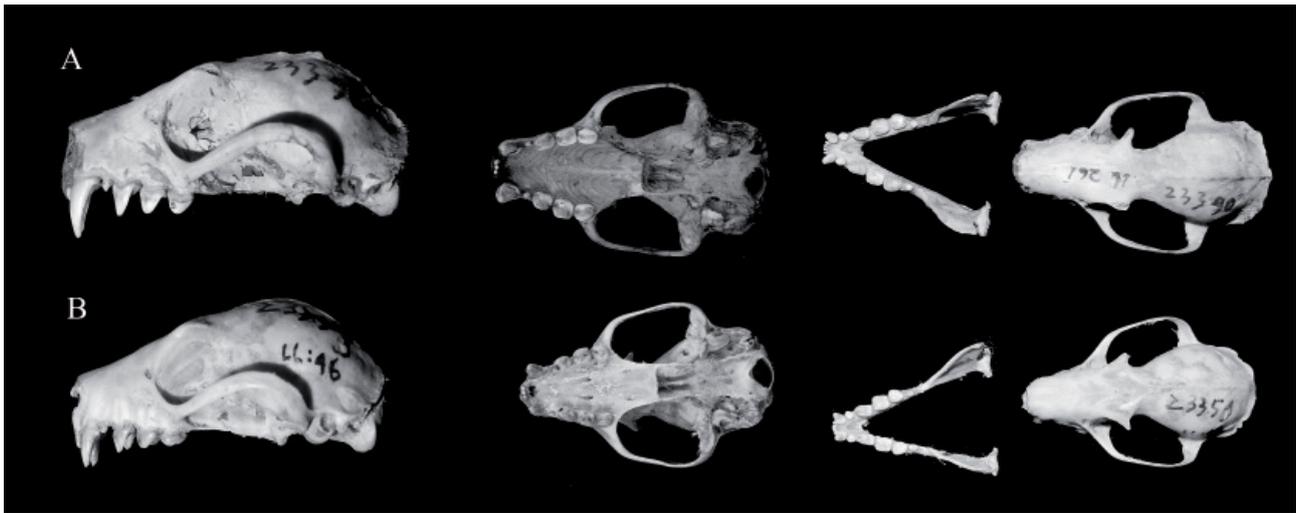

FIGURE 2 Photograph of the skulls of *Thoopterus suhaniahae* (a) and *T. nigrescens* (b), showing the lower mandible and cranium in dorsal, ventral and lateral views.

Island.

***Thoopterus suhaniahae* sp. nov.**

Figures 2, 3, 6

**MATERIAL EXAMINED**

*Holotype*

**Indonesia: Central Sulawesi:** MZB 23390: ♀, LL 261, Lore Lindu National Park, Watumeta (1°23'57"S, 120°18'07"E, 1125 m), collected on 26 July 2000 by I. Maryanto and M. Yani.

*Paratypes*

**Indonesia:** 12 ♀: MZB 23360, MZB 23363, MZB 23365, MZB 23369, MZB 23372, MZB 23374, MZB 23383, MZB 23384, MZB 23386, MZB 23387, MZB 23376, MZB 23478 (see Appendix 1); 24 ♂: MZB 13378, MZB 15326, MZB 15329, MZB 17812, MZB 23361, MZB 23364, MZB 23367, MZB 23368, MZB 23370, MZB 23371, MZB 23373, MZB 23377, MZB 23378, MZB 23379, MZB 23380, MZB 23381, MZB 23382, MZB 23385, MZB 23389, MZB 23391, MZB 23392, MZB 23393, MZB 27725, MZB 27726 (localities details see Appendix 1).

**DIAGNOSIS**

*Thoopterus suhaniahae* sp. nov. is diagnosed by cranial, dental, and external characters and by combinations of these (see discriminant function analysis and univariate plots, Figures 4, 5). Compared to *T. nigrescens*, metacarpal 3 of *T. suhaniahae* sp. nov. is longer relative to metacarpal 4 phalanx 1; ZB is wider relative to skull length in *T. suhaniahae* sp. nov. and palatal length is longer relative to postorbital width than *T. nigrescens* (Figure 5).

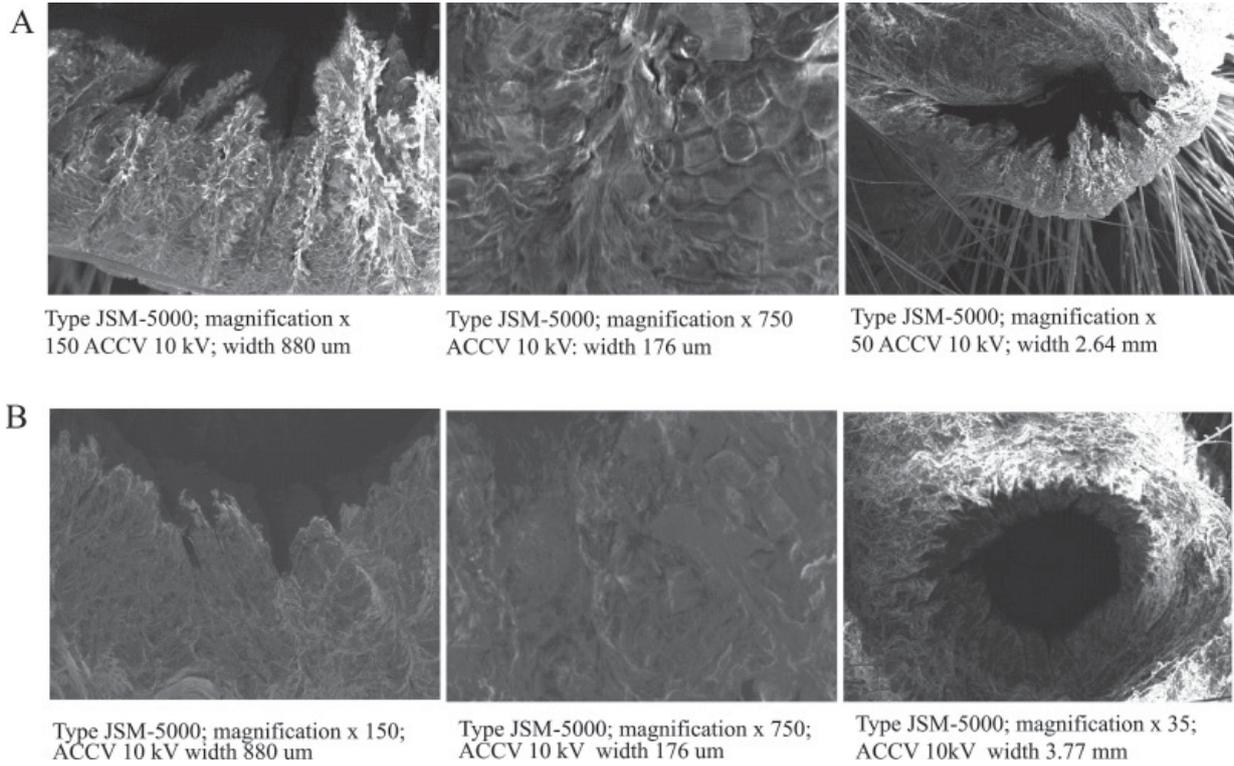

**DESCRIPTION**

*Skull, dentary, dentition.* Compared with *T. nigrescens* cranium of *T. suhaniahae* sp. nov., is broader and has a shorter rostrum. There are no postorbital foramina in either taxon. The mandible is more robust underneath the mandibular tooth row. In *T. suhaniahae* sp. nov. the second upper incisors are slightly shorter than first upper incisors. There is a broad and deep vertical groove on the antero-medial surface of the upper canine. The canine and second incisors are separated by auricle diastema.  $P_1$  is more massive than  $P^1$ ;  $M_2$  nearly the same size as  $P_1$ ;  $M^1$  smaller than  $M_1$ ;  $P_4$  heavier than  $M_1$ ; and  $P^4$  smaller than  $P_4$ .

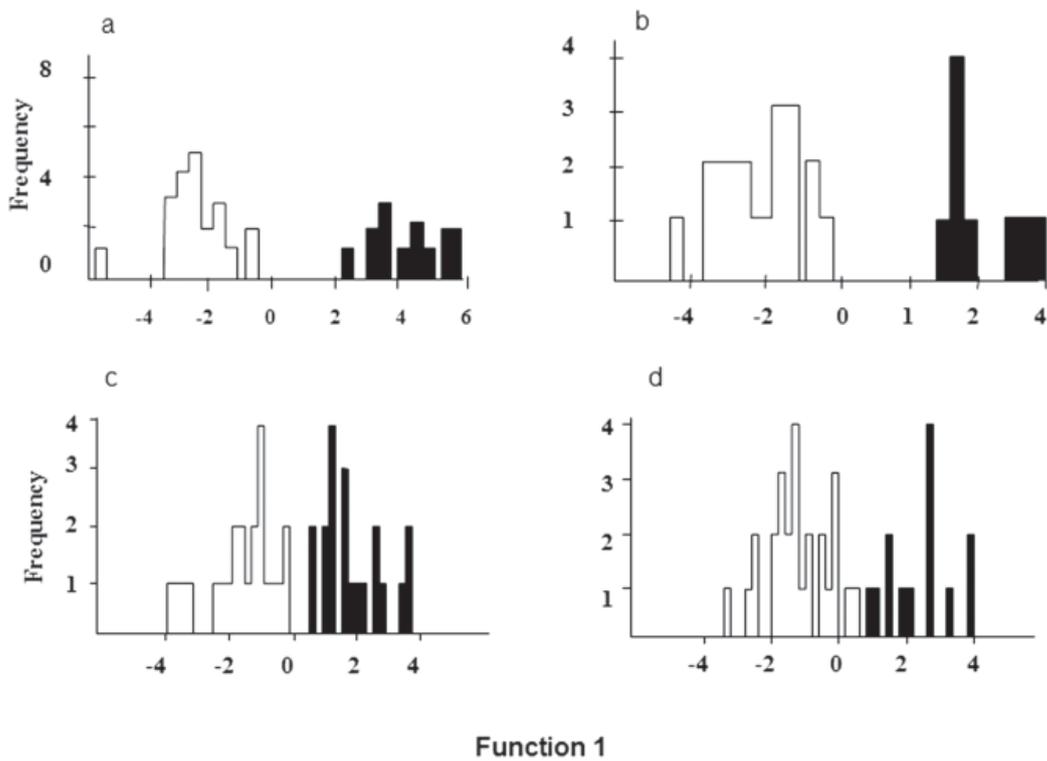

*External characters.* Tail absent or reduced to a rudiment but usually more conspicuous than in *T. nigrescens*. Other external characters are as described for *T. nigrescens* by Andersen (1912), except for the interfemoral membranes which differ in having a quarter to half of the under face of the uropatagium sparsely furred and the calcar wider in *T. suhaniahae* sp. nov. is 10–11 mm (measured from tibia) v. 7–8 mm in *T. nigrescens*.

*Pelage.* The dorsum of *T. suhaniahae* sp. nov. is brown, under fur grayish brown, and head, forehead, forearm and rump darker brown. The under parts from chest to abdomen are brownish gray, from chin to interfemoral brown, and the flanks and sides of breast and belly are slightly shaded with a warmer brown. The ear and membranes are unmarked; the metacarpals and phalanges are dark brown. The dorsal fur of both *T. suhaniahae* sp. nov. and *T. nigrescens* is 10–13 mm long.

*Glans penis.* Seen under a scanning electron microscope, the urethral aperture of the glans penis of *T. suhaniahae* sp. nov. lacks the conspicuous scale-like projection seen in *T. nigrescens* (Figure 3).

**FIGURE 3** Scanning electron microscope photograph of glans penis morphology of *Thoopterus nigrescens* (a) and *T. suhaniahae* sp. nov. (b).

**FIGURE 4** Dendrograms of discriminant function values for male and female between *Thoopterus nigrescens* (white) and *T. suhaniahae* sp. nov. (black) (a), male skull characters; (b), female skull characters; (c), male external characters; and (d) female external characters.

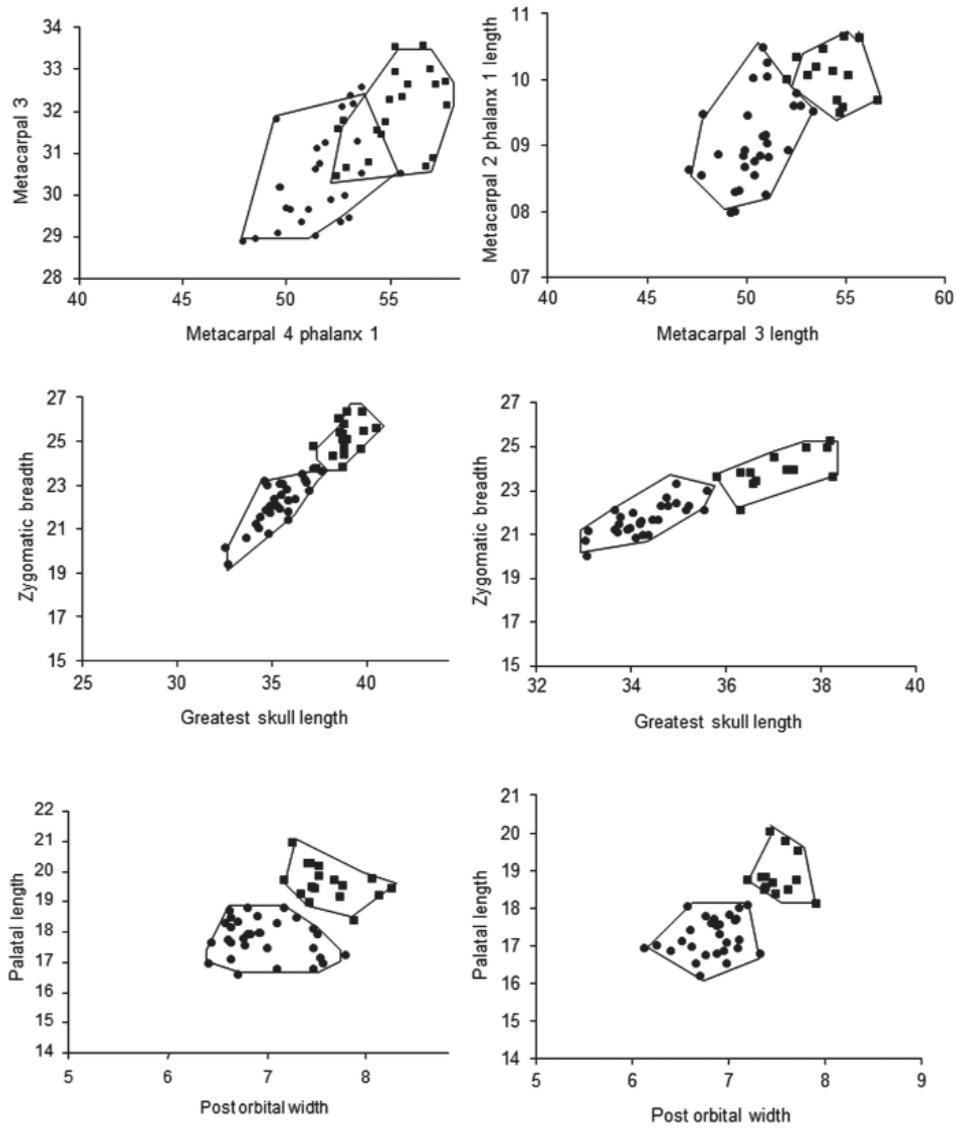

FIGURE 5 Univariate plots of palatal length and postorbital width, and greatest skull length and zygomatic breadth, metacarpal 3 and metacarpal 4 phalanx1 (in mm) of male and female *Thoopterus nigrescens* (●) and *T. suhaniahae* sp. nov. (■).

**HABITAT**

*Thoopterus suhaniahae* sp. nov. is common in Central Sulawesi at elevations of 600–1,000 m. Specimens were also captured at 1,930 m at Rorekatimbu, Lore Lindu National Park, Central Sulawesi, and at 60 m asl at Wowoni Island. *Thoopterus suhaniahae* sp. nov. has been collected sympatrically with *T. nigrescens*, *Rousettus celebensis*, *Cynopterus luzoniensis*, *Cynopterus minutus* (a new record for Sulawesi), *Chironax melanocephalus* and *Macroglossus minimus*. The species was collected from Maros, South Sulawesi; Bakiriang-Batu, South-West Sulawesi; Dako Mountain-Toli-Toli, Central Sulawesi; Talaud Island, North Sulawesi, and Wowoni Island, South-East Sulawesi and South-West Sulawesi.

**DISTRIBUTION**

Known from Sulawesi, Talaud and Wowoni Islands, Indonesia.

**ETYMOLOGY**

For Suhaniah (wife of Mohamad Yani), who passed away on 31 March 2000 while her husband studied in Lore Lindu National Park.

**REMARKS**

The new species of *Thoopterus* is a medium-sized fruit bat in Sulawesi and small adjacent island groups. From our observations, it is one of the most abundant bats which widely distributed on Sulawesi from 60–2,100 m asl.

Geographically sympatric to *T. suhaniahae* sp. nov., *T. nigrescens* is found in primary, secondary, cacao and coffee plantation forest, whereas *T. suhaniahae* sp. nov. is more common in primary forest at middle and low land altitudes.

The discovery of a second species of *Thoopterus* endemic to Sulawesi and adjacent islands provides further evidence that Sulawesi is a ‘hot spot’ of pteropodid evolution (Maryanto and Yani 2003). The majority of distribution of the new species such as *Rousettus linduensis* and *R. bidens* were known from Central Sulawesi which appears to emphasize once more the complex geological history of the island as a composition of parts with different origins (Maryanto and Yani 2003).

Unfortunately, ongoing large scale hunting and trapping of fruit bats in the north and parts of Central Sulawesi and elsewhere, seriously endangers the survival of this species as well as other fruit bats on these islands.

## ACKNOWLEDGMENTS

We were indebted to Duncan Neville, The Nature Conservancy Program Manager at Palu, and Darrell Kitchener, TNC Director of Conservation, for their organization of the mammal survey on Lore Lindu National Park; we also thank Edward Polard, Program Manager for conservation at TNC Palu branch. We gratefully acknowledge the support of Ir. Banjar Yulianto Laban MSc, the Director of Lore Lindu National Park, who provided us with great assistance in the field.

Thanks are extended to our field assistants Mohamad Annas, Hariyanto and Thius Jacson, who assisted in developing the trapping procedures. Expedition costs were met by a grant to The Nature Conservancy Indonesia program from the USAID /NRM2 (Nature for Resource Management 2) program, Jakarta, Indonesia.

Finally, we are indebted to D.J. Kitchener, Chris Watts, Kristofer Helgen (Smithsonian Museum), R.A. How (Western Australian Museum) for their constructive comments on an earlier version of this paper, Endang Purwaningsih from Museum Zoologicum Bogoriense for scanning electron microscopy, Ir. Koestoto Subekti, Boedi and A. Saim for study of their specimens from Wowoni and Buton Islands.
