

Wednesday Walk – Tinderries Trip – 2 December 2009

The Tinderries Mountains are south-east of Canberra. From the township of Michelago there is a very scenic drive across the range, initially through grassland then into wooded areas with large granite boulders. On the eastern side of the range towards the base, there is a walk on a fire trail to a swamp. We made several stops on the drive to the top of the range – first at the grassland to check on *Dodonaea procumbens*. The female plants had fruit capsules and there was a good display of grasses. Part way up the range we stopped for a good display of *Astrotricha ledifolia*. At the top of the range we explored the granite boulders on both sides of the road and also the roadside. There were good displays of *Gompholobium huegelii*, *Prostanthera phylicifolia*, *Grevillea oxyantha* ssp. *oxyantha* and *Calytrix tetragona*. The rare *Acacia costiniana* had good seed production and an interesting find was *Olearia tenuifolia* in flower. At the swamp with the small meteorological station we found *Diuris monticola*, *Pratia pedunculata*, *Brachyscome decipiens*, *B. scapigera* and *Senecio pinnatifolius* var. *alpinus* all flowering. The one large plant of *Podolobium alpestre* on the fire trail was flowering well as was the tall pea that is yet to be identified. The swamp was dry but there were some flowers – *Wahlenbergia ceracea*, *Hakea microcarpa*, *Callistemon pallidus*, *Baloskion australe* and a prostrate *Epacris* sp.
