

Wednesday Walk in the Tinderries – 26 November 2008

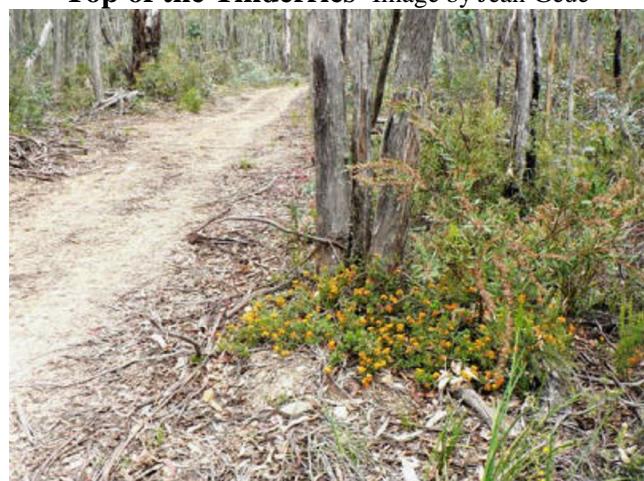

The Tinderry Mountains are south-east of Canberra. From the township of Michelago there is a very scenic drive across the range, initially through grassland then into wooded areas with large granite boulders. On the eastern side of the range towards the base, there is a walk on a fire trail to a swamp. All areas visited had an interesting array of plants. In the grassland, we saw the female *Dodonaea procumbens* full of fruit capsules but not much else; a spectacular display of *Astrotricha ledifolia* flowers on the roadside cutting during the final ascent; prolific flowering of *Prostanthera phylicifolia* and *Calytrix tetragona* on the first ridgeline; carpets of *Pratia* in the weather station swamp and a single spectacular *Podolobium alpestre* on the fire trail (new record). We were hoping to see another pea flowering, which previously we have not been able to identify but it was still a few weeks off flowering.
