Amphorogyneae, a new tribe of Santalaceae
Santalales-Studies X

By

H. U. STAUFFER †

Untersuchung und Druck mit Unterstützung des Schweizerischen Nationalfonds zur
Förderung der wissenschaftlichen Forschung

with a map and 5 tables

The systematics of Santalaceae is provisional and not yet by any means clarified. Recently the subdivision of the family suggested by the Indian school (JOHRI and others *) is totally onesidedly based on embryological criteria and does not sufficiently consider the external morphology nor wood anatomy, pollen and chemistry. Also geographical criteria were ignored.

If I choose to make a new tribe in the family, it is because it is a unit which has many features clearly delineated from any other Santalaceae, and we gave a first indication of this in 1957 (STAUFFER and HÜRLIMANN In Vierteljahrsschr. Naturf. Ges Zurich 102 [1957] 337-349). Of special interest it was also claimed that stem parasitism only occurs in this tribe, existing nowhere else in the Santalaceae (with the sole exception being *Exocarpos Pullei* PILGER).

When drawing up a new subunit of the family the question of their rank is raised. I have formed a Subtribe the Tribe Santaleae Osyrideae. The new descriptive subunit corresponds in its value to Tribe Anthoboleae (STAUFFER, Revisio Anthobolearum, Aarau 1959); therefore I decided to likewise evaluate it as a Tribe. In the meantime I had the opportunity to study more exactly the monographic treatment of several of the genera of the former genus *Henslowia* (Mus. Lugd. Bat. 1 [1850] 242, non LOWE in DC. Prodr. 8 [1844] 288 nec WALL., Pl. As. Rar. 3 [1832] 13). On my research trip of 1963/64 it was possible for me to observe the relationships of seven genera in nature; besides I became acquainted with a further genus *Spirogardnera* (STAUFFER in Vierteljahrsschr. Naturf. Ges. Zürich 113 [1968] 305-309), which belongs within the same relationship group. Later with a revision of the overall system of the family it will become necessary to introduce subfamilies; then in such will the tribe Amphorogyneae find its place.

* Cf. MAHESHWARI and KAPIL in Phytomorphology 16 (1966) 244.

Provisionally I set up Tribe Amphorogyneae Tribus nova.
Type genus: *Amphorogyne* STAUFFER and HÜRLIMANN.

Morphological Characteristics of the Tribe:

Woody plants (with the exception of the parasitically reduced *Phacellaria*).
Sympodial branching
Phyllotaxy 2/5.
Inflorescences mostly racemose.
Flowers small to extremely small.
Tepals connected firmly to the receptacle, not articulated.
Stamens usually with 2 locules per theca, standing one above the other.
Poststaminal hairs usually present.
Ovary completely inferior.
Style short or missing.
Stigma lobes and ovules equal in number to the tepals and opposite them.
Placenta always rounded off above, not stalked, embedded closely in the tissue.
Epigynous disk present
Fruit a drupe.
Endocarp (and seeds) usually many sided structured.
Tepals, stamens, disk, style and stigmas lasting up to mature fruit stage.
Wood with diffuse vessel arrangement; vessels small, separate, wood parenchyma weakly apotracheal, diffusely distributed, rays heterogeneous.

In addition comes the restricted geographical distribution in tropical Asia and Australia (see the map) and the already mentioned stem parasitism.

Tendencies of the Tribe:

Tendency towards stem parasitism.
Tendency towards holoparasitism.
With increasing parasitism a tendency towards leaf reduction (general parasite tendency).
Tendency towards red coloration of the flowers (general Santalaceae tendency).
Tendency towards leaf reduction in arid Australia (general tendency).
Tendency towards host specificity (Fagaceae, Loranthaceae, Santalaceae as the usually preferred hosts)
With increasing parasitism a tendency towards unisexuality.

Regular Key to the Genera of Amorphogyneae

(for *Dendrotrophe*, *Dendromyza*, *Cladomyza*, *Dufrenoya*, fruits are necessary)

1. Leaves well-developed, pinnately nerved, ± whorled 9. *Amphorogyne*
Leaves reduced to scales or usually then alternate and bent nerved 2
2. Stigma lobes and ovules 2-3, flowers bisexual or pseudo-bisexual 10. *Daenikera*
Stigma lobes and ovules (4-) 5 (-6), flowers bisexual or unisexual 3
3. Root parasites with small, reduced to scales, mostly deciduous leaves without clear leaf veins 4
Stem parasites; if root parasitic, then usually with bent nerved leaves 6
4. Three or more bracts under each flower 1. *Choretrum*
Only a single bract under each flower 5
5. Inflorescence a simply racemose 3. *Leptomeria*
Inflorescence a few-flowered cluster or a compound spike 2. *Spirogardnera*
6. All flowers reduced to triangular scales at the most 1.5 mm long 7
At least some of the leaves with developed lamina of at least 3 mm in length 8
7. Axes short, straight, without secondary haustoria 8. *Phacellaria*
Axes twining, with secondary haustoria 5. *Dendromyza*
8. Stem parasite, only attached to the host axis by a primary haustorium (*Viscum album*-Type) 11
Stem parasite with secondary haustoria on its axes, or root parasite 9
9. Terrestrial or epiphytic root parasite, rarely a stem parasite 4. *Dendrotrophe*
Stem parasite with secondary haustoria on its axes 10
10. Endocarp and seed with a round cross section 5. *Dendromyza*
Endocarp and seed with a star-shaped cross section, or basally divided into lobes
..... 8. *Cladomyza*
11. Surface of the endocarp and seeds generally with lobes 4. *Dendrotrophe*
Endocarp smooth, seed surface lobed basally or basally and apically 12
12. Seed with basal lobes 6. *Cladomyza*
Seed with basal and apical lobes 7. *Dufrenoya*

Remarks on Parasitism, the Distribution and the Taxonomy of the Genera

1. *Choretrum* R. BR.

Terrestrial hemiparasites of 40 cm or small trees of 5 m height. About host specificity nothing is known. Limited to the Australian mainland including Kangaroo Island, where an endemic variety exists. The genus requires revision. 7 species and a variety: *Ch. Candollei* F. V. MÜLL. (100 to 500 cm high) – *Ch. chrysanthum* F. V. MÜLL. (220 cm high) – *Ch. glomeratum* R. BR. (160-200 cm hoch) - *Ch. lateriflorum* R. BR. (to 350 cm high, to 7 cm Ø) – *Ch. pauciflorum* A. DC. (40 cm high) – *Ch. Pritzelii* DIELS (170-200 cm high) – *Ch. spicatum* F. V. MÜLL. (to 100 cm high) – *Ch. spicatum* F. V. MÜLL. varietas (150 bis 200 cm hoch).

2. *Spirogardnera* STAUFFER

Terrestrial hemiparasite with completely local occurrence in southwest Australia (Perth: Wannamal). Monotypical genus (see Zeitschrift J 13 [1968] 305). 1 species: *Sp. rubescens* STAUFFER (160 cm high).

3. *Leptomeria* R. BR.

Terrestrial root parasites, shrublet from 30 cm to small trees of 3 m height. About host specificity nothing is known. Australian mainland and Tasmania as well as some smaller barrier islands to the west and the east of Australia. The genus very much requires a taxonomic revision. About 16 species: *L. acida* R. BR. (300 cm high, 7 cm Ø) – *L. aphylla* R. BR. (120-200 cm high) – *L. Billardieri* R. BR. – *L. Cunninghamii* MIQ. – *L. Dielsiana* PILGER – *L. empetriformis* MIQ. (30 cm high) – *L. ericoides* MIQ. – *L. laxa* MIQ. – *L. obovata* MIQ. – *L. pauciflora* R. BR. (180 cm high) – *L. Preissiana* A. DC. (ca. 120 cm hoch) – *L. scrobiculata* R. BR. (80-150 cm high) – *L. spinosa* A. DC. (40- or 70 cm high) – *L. squarrulosa* R. BR. (100 cm high).

4. *Dendrotrophe* MIQ.

Upright or climbing terrestrial root parasites, upright epiphytic root parasites or stem parasites of the *Viscum album* type. *D. varians* is the most widely distributed species in the Tribe; its area is from north Australia to deep into the Asian mainland. The stem parasitic species occur only in New Guinea. 4 species: *D. amorpha* STAUFFER – *D. buxifolia* (BL.) MIQ. – *D. umbellata* (BL.) MIQ. - *D. varians* (BL.) MIQ. (5 m high, then overhanging).

5. *Dendromyza* DANSER

Climbing stem parasites with secondary haustoria. About host specificity nothing is known. A variety, *D. Reinwardtiana* var. *aphylla* STAUFFER, whose leaves are reduced to tiny scales, shows a tendency of the genus towards holoparasitism; it is host specific on Loranthaceae. *D. Reinwardtiana* is widely very common, from lower India to the islands, which are barriers to New Guinea in the west, the center of development of the genus is New Guinea. 7 species: *D. crassiolia* GIBBS STAUFFER comb. nova – *D. cucullata* (DANSER) STAUFFER combo nova – *D. intricata* (DANSER) STAUFFER comb. nova – *D. Ledermannii* (PILGER) STAUFFER combo nova – *D. puberula* STAUFFER – *D. Reinwardtiana* (BL.) DANSER – *D. volubilis* STAUFFER.

6. *Cladomyza* DANSER

Climbing stem parasites with secondary haustoria or stem parasites of the *Viscum album* type. About host specificity nothing is known. Center in New Guinea, where the genus is richly differentiated. Its area reaches up to the Philippines, northeast Borneo and up to the Solomon islands. About 20 species: *Cl. acrosclera* DANSER – *Cl. acutata* (PILGER)

DANSER – *Cl. angustifolia* STAUFFER sp. nov. – *Cl. -cuneata* DANSER (with var. *grandifolia* STAUFFER) – *Cl. dendromyzoides* STAUFFER – *Cl. densa* STAUFFER sp. nov. – *Cl. dubia* STAUFFER – *Cl. erecta* DANSER – *Cl. gracilis* DANSER – *Cl. kaniensis* (PILGER) DANSER – *Cl. Ledermannii* DANSER – *Cl. microphylla* (LAUTERB.) DANSER – *Cl. nivalis* (RIDLEY) DANSER – *Cl. pachydisca* DANSER – *Cl. stellata* STAUFFER sp. nov. – *Cl. trinervia* STAUFFER sp. nov. – *Cl. uncinata* DANSER.

7. *Dufrenoya* CHATIN (Synonym *Hylomyza* DANSER)

Stem parasite of the *Viscum album* type. Predominantly on Fagaceae. Center of development of the genus is Myanmar. As mountain plants it is distributed to Borneo and Java. 14 species: *D. aurantiaca* STAUFFER sp. nov.– *D. Collettii* (GAMBLE) STAUFFER comb. nova – *D. euryphylla* (DANSER) STAUFFER comb. nova – *D. granulata* (HOOK f. et TH.) STAUFFER comb. nova – *D. longicuneata* STAUFFER sp. nov. – *D. oresitropha* (DANSER) STAUFFER combo nova – *D. papillosa* STAUFFER sp. nov. – *D. platyphylla* (SPRENG) STAUFFER comb. nova – *D. Poilanei* STAUFFER sp. nov. – *D. pruinosa* STAUFFER sp. nov. – *D. robusta* STAUFFER. sp. nov. – *D. sessilis* (CRAIB) STAUFFER comb. nova – *D. sphaerocarpa* (DANSER) STAUFFER comb. nova.

8. *Phacellaria* BENTH.

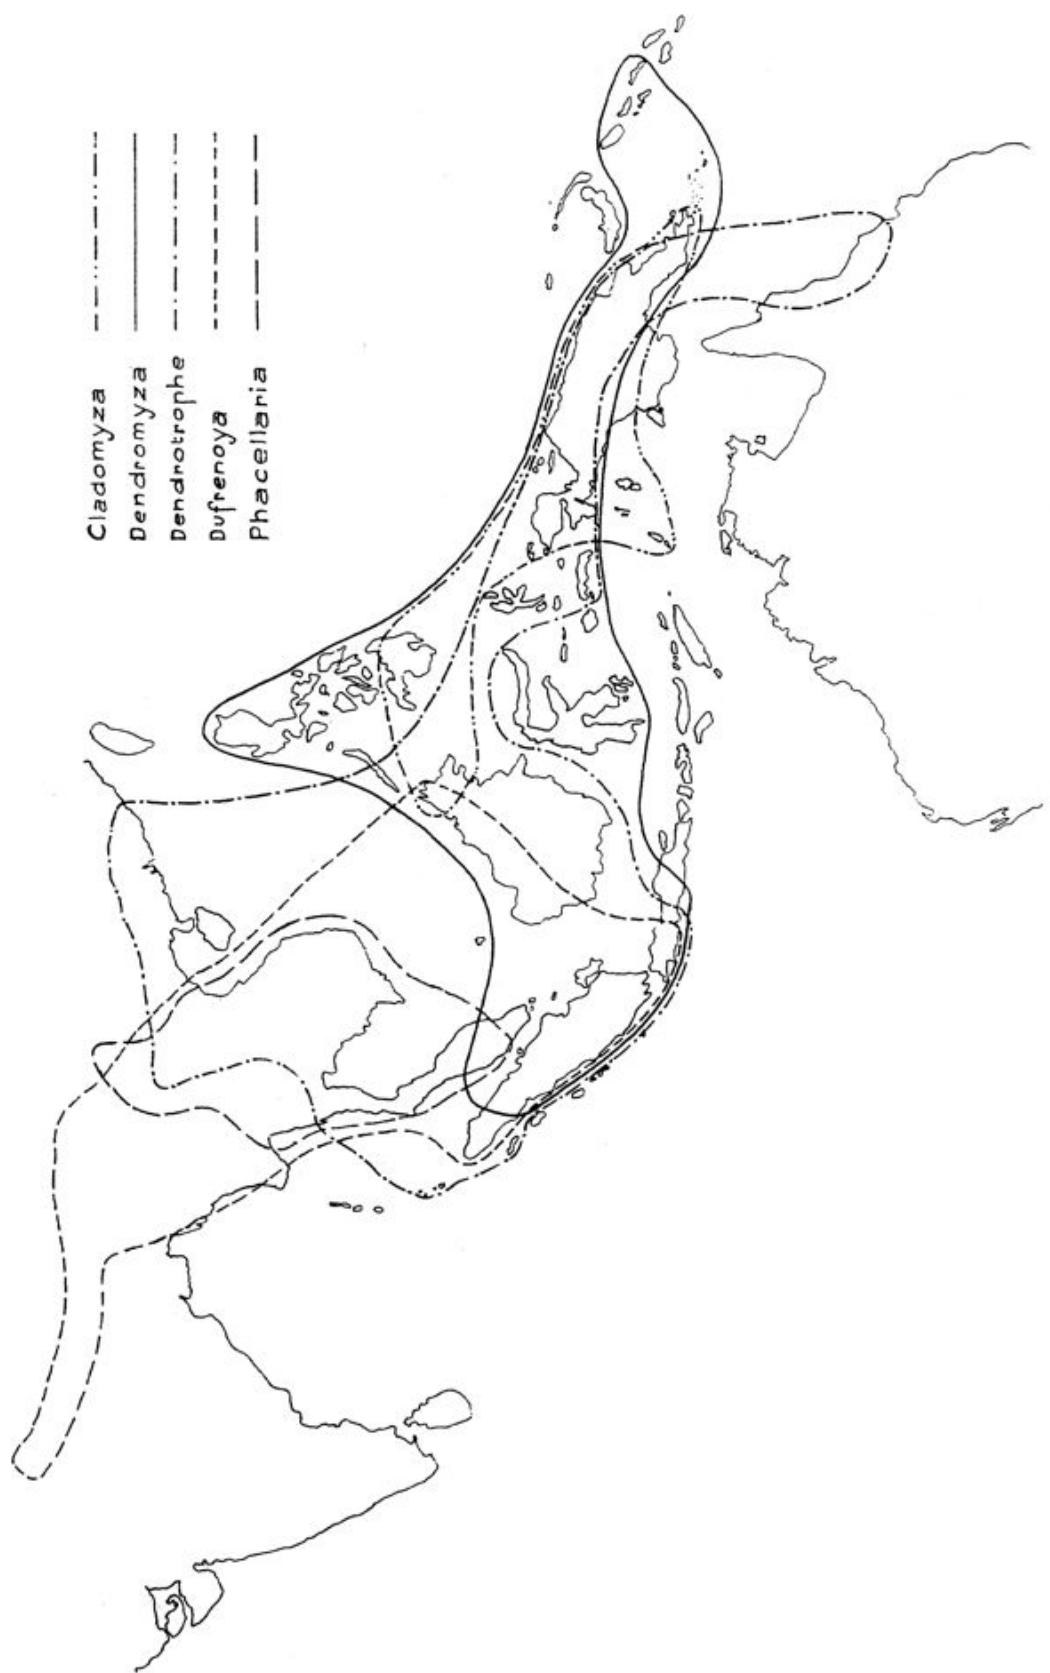

A more or less holoparasitic genus with a developed endophytic system and an outwardly reduced vegetative body. Host specificity: as hosts one observes *Dufrenoya* and some Loranthaceae genera. Distribution: Myanmar, SW China, Malaya. The genus was revised by DANSER in Blumea 3 (1939) 212-235. 7 species: *Ph. caulescens* COLLETT et HEMSLEY – *Ph. compressa* BENTH. Synonym: *Ph. Wattii* HOOK. f. Fl. of Brit. India 5 [1886] 236; *Ph. ferruginea* W. W. SMITH in Notes R. Bot. Gard. Edinburgh 10 [1918] 188 – *Ph. Fargesii* LECOMTE – *Ph. gracilis* DANSER – *Ph. malayana* RIDLEY – *Ph. rigidula* BENTH. – *Ph. tonkinensis* LECOMTE.

9. *Amphorogyne* STAUFFER et HÜRLIMANN

Terrestrial root parasite. Small tree from 1.5 – 5.5 m high. Endemic to New Caledonia. 3 species: *A. celastroides* STAUFFER et HÜRL. (150-230 cm high) – *A. spicata* STAUFFER et HÜRL. (200-550 cm high) – *A. Staufferi* MARKGRAF sp. nov.

10. *Daenikera* HÜRLIMANN et STAUFFER

Holoparasite, which can grow both terrestrially and laterally from the trunk of *Amphorogyne*. Shrublet of 50 cm in height. Probably host specific on *Amphorogyne*, after HÜRLIMANN also on *Myodocarpus fraxinifolius* BRONGN. et GRIS. Endemic in the south of New Caledonia (Dumbéa). Monotypic genus. 1 species: *D. corallina* HÜRLIMANN et STAUFFER (50 cm high).

Vouchers and New Descriptions

Dendrotrophe MIQ., Fl. Ind. Bat. I (1855) 779

1. *Dendrotrophe amorpha* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami recti vel leviter curvati, glabri, crassiores teretes, iuveniles paulum appланati, laterales 1-8 ex eodem nodo sub angulo 30°-60° oriundi, acrotoni Brachyblasti floriferi caduci. Cortex fusco-atra, laevis, serius grisea, rimosa. Folia laminifera glabra, acrotona, obovata vel suborbicularia, iniquilatera, carnosa, apice obtusa vel retusa, mucrone destituta, basi cuneata, subdupo longiora quam latiora, 42-170 mm longa, 22-130 mm lata. Nervi 5-11, utrimque perspicui. Folia basalia et apicalia ramorum squamiformia, semicircularia, 0,5 mm longa, 1 mm lata, in margine papillosa. Inflorescentiae dioicae, et brachyblastis et macroblastis insidentes, masculinae 1-10 ex eodem nodo, cymosae, (4-)5 (-7) -florae. Rhachis 1,5-6,5 mm longa. Flores ♂ olivacei, sessiles, 1,5-2,2 mm lati. Tepala floris terminalis 5, florum lateralium 4-5, pilis poststaminalibus ornata. Stamina isomera. Antherae globosae, 4 loculares, binis loculis superpositis. Discus 1 mm latus, subplanus, plerumque sine pistillodio. Inflorescentiae femineae pleraeque singulae ex nodis brachyblastorum oriundae, uniflorae. Rhachis 1 mm, sub fructu 2,5 mm longa, bracteis 2-4 basalibus et 4-5 apicalibus instructa. Flores ♀ sessiles, olivacei, 2 mm longi, 1,5 mm lati. Tepala (4-) 5. Discus 1,2 mm latus. Lobi stigmatis tepalis oppositi. Fructus rubri, 4-5 mm longi, 3-4 mm lati, ellipsoidei, tepalis persistentibus coronati. Endocarpium 2,8-4 mm longum, 2-3,5 mm latum, apice filis (fibrovascularibus) reclinatis ornatum.

Hemiparasitic shrub in tree branches. Branches straight or slightly curved, glabrous, thick, terete, juvenile somewhat flattened, laterals 1-8 from the same node oriented at about a 30°- 60° angle, with caducous acrotonic [shoots which produce leaves below the inflorescence] floriferous brachyblasts [short shoots] caducous. Bark smooth, dark-black, later grey, fissured. Leaf lamina glabrous, acrotonic, obovate or suborbicular, not equally wide, fleshy, apex obtuse or retuse, devoid of a mucro, base cuneate, subdupo long as wide, 42-170 mm long, 22-130 mm wide. Nerves 5-11, evident on both sides. Leaves at the base and apex of the stems squamiform, semicircular, 0.5 mm long, 1 mm wide, papillose on the margin. Inflorescence dioecious, bearing brachyblasts and macroblasts (long shoots), masculine 1-10 from the same node, cymose, (4-)5 (-7) –flowered. Rachis 1.5-6.5 mm long. Male flowers olive colored, sessile, 1.5-2.2 mm wide. Terminal flower tepals 5, lateral flowers 4-5, adorned with post-staminal hairs. Stamens isomerous. Anthers globose, 4 locular, pair of locules superposed. Disk 1 mm wide, nearly planar, generally without a pistillode. Female inflorescence equally emerging single from the short shoot node, single flowered. Pre-fruiting rachis 1 mm, 2.5 mm long, fitted with 2-4 basal and 4-5 apical bracts. Female flowers sessile, olive in color, 2 mm long, 1.5 mm wide. Tepals (3-) 5. Disk 1.2 mm wide. Stigmatic lobes opposite the tepals. Fruit red, 4-5 mm long, 3-4 mm wide, ellipsoid, crowned by the persistent tepals. Endocarp 2.8-4 mm long, 2-3.5 mm wide, apex decorated with backward directed fibrovascular fibers.

New Guinea: Morobe District, Yunzaing, 1500 m, ♀ flowers & fruits 26 6 1936 - CLEMENS # 3438

2. *Dendromyza puberula* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus, uno loco insidens et intra ramos arboris nutricis haustoria turionum modo emittens. Rami crassiores recti vel leviter curvati, teretes, glabri, tenuiores volubiles, applanati, haustoria brevia edentes, iuveniles puberuli, laterales 1-2 ex eodem nodo oriundi. Cortex laevis, rubro-fusca, serius nigra et fissa. Folia glabra, obovata, basi cuneata, apice rotundata et mucrone recto apiculata, coriacea, lucida, iuvenilia rubella, subtriplo longiora quam latiora, 9,8-60 X 3,7-19 mm. Petiolus 1,4-3,5 mm longus. Nervi (3-) 5, indistincti. Inflorescentiae dioicae, masculina 1-3 ex eodem nodo; rhachis puberula, usque ad 2,7 mm longa. Bractae persistentes. Flores ♂ luteoli, (5-) 6 (-8), sessiles, 1,2 mm longi, 1,5 mm lati. Tepala 4-5, pilis poststaminalibus ornata. Stamina 4-5. Filamenta brevissima, antherae globosae, latae, dithecicae, thecis iuxtapositis. Discus planus, in centro pistillodio apiculatus. Inflorescentiae femineae 1 (-3) ex eodem nodo, rhachis subglabra, 1,5 mm longa. Flores ♀ luteoli, 2,8 mm longi, 1,8 mm lati. Tepala 5 (-6), cum lobis stigmatis alternantia. Fructus 7,2 mm longi, 3,2 mm lati, prope basin latissimi. Endocarpium 6 X 3 mm, apice filis coronatum; valvulae faciles fissu.

Hemiparasitic shrub in the branches of trees, sitting in one place and within the branches of the tree, sending off nurse haustoria. Branches straight or slightly curved, terete, glabrous, thinner ones twining, flattened, putting forth short haustoria, young growth puberulous, 1-2 lateral ones originating from the same node. Bark smooth, reddish dark brown, later black and fissured. Leaves glabrous, obovate, base cuneate, apex rounded and mucronate to apiculate, leathery, shiny, young leaves reddish, one third longer than wide, 9.8-60 X 3.7-19 mm. Petiole 1.4-3.5 mm long. Nerves (3-5), indistinct. Inflorescences dioecious, male 1-3 from the same node; rachis pubescence, up to 2.7 mm long. Bracts persistent. The ♂ flowers yellowish, (5-) 6 (-8), sessile, 1.2 mm long, 1.5 mm wide. Tepals 4-5, trimmed with poststaminal hairs. Stamens 4-5. Filaments very short, anthers globose, wide, dithecal, thecae juxtaposed. Disc flat, apiculate in the center of pistillode. Female inflorescences 1 (-3) from the same node, the rachis subglabrous, 1.5 mm long. The ♀ flowers yellowish, 2.8 mm long, 1.8 mm wide. Tepals 5 (-6), alternating with the stigmatic lobes. Fruit 7.2 mm long, 3.2 mm wide, broad at the base. Endocarp 6 X 3 mm, apex crowned with fibers; valves easily split.

New Guinea: Vogelkop-Peninsula, Kebar-Tal, 850 m, against Andjai, above the sulfur source on the way to Hatai on *Acsmithia* sp., ♂ flowers 20. 11. 1961 - VAN ROYEN & SLEUMER # 7340 (holotype L). Cyclops Mountains, Hollandia District, way from Ifar to Ormoe, 1220 m, on *Quintinia* sp., ♀ flowers & fruits 28. 6. 1961 - VAN ROYEN & SLEUMER # 6069 (paratype ♀ L).

5. *Dendromyza volubilis* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami plerique volubiles, dense intricati, nutricem suffocantes, laterales 1-3 ex eodem nodo, sub angulo 30°-100° oriundi, crassiores teretes, tenuiores applanati, conspicue angulosi, 6-7 mm lati; internodia 2-46 mm longa. Brachyblasti indistincti. Folia omnia laminifera, oblanceolata vel lanceolata, basi cuneata, apice rotundata sed apiculo incurvo cucullata, supra sub lucida, iuvenilia luteofusca, plerumque tripla longiora quam latiora, 9-51 X 3-15 mm. Nervi (3-) 5 (-8), conspicui. Rami floriferi simplices vel interdum racemoso-ramificati. Inflorescentiae dioicae, masculinae plerumque singulae, cymosae, (4-) 5 (-7)-florae. Rhachis 1,5-6 mm longa, 0,9 mm lata, applanata, basi bracteis modo 2/5 insertis usque ad medianam partem ornata, apice bracteis 4 confertis, 0,6-0,8 mm longis, 0,5 mm latis, lanceolatis, ciliatis ornata. Flores ♂ albi, pedicellati, 1,5 mm lati. Tepala 5, rugulosa, 1 mm longa. Stamina 5, 0,5-0,6 mm longa. Antherae globosae, ditheciccae, thecis iuxtapositis. Discus planus, in centro pistillodio minimo, conico apiculatus. Inflorescentiae femineae singulae, uniflorae; rhachis ad 3 mm longa. Flores ♀ albi, 2,5 mm longi, 1,5 mm lati. Tepala 5, cum lobis stigmatis alternantes. Fructus ellipsoidei, in tertia inferiore parte latissimi, 7,3-8,5 mm longi, 3,0-3,5 mm lati; collum breve, crassum.

Hemiparasitic shrub in the branches of trees. Stems mostly twining, densely entangled, strangling the host plants, lateral stems 1-3 from the same node, the angle of orientation 30° -100°, larger ones terete, thinner ones flattened, noticeably angular, 6-7 mm wide; internodes 2-46 mm long. Brachyblasts indistinct. Leaves all laminar, oblanceolate or lanceolate, base cuneate, apex rounded but apiculate incurved cucullate, above somewhat shiny, young leaves yellowish brown, for the most part three times longer than wide, 9-51 X 3-15 mm. Nerves (3-) 5 (-8), conspicuous. Flowering branches simple or sometimes in racemose clusters. Inflorescences dioecious, male for the most part solitary, cymose, (4-) 5 (-7) -flowered. Rachis 1.5-6 mm long, 0.9 mm wide, flattened, basal bracts in a 2/5 insertion mode up to the median part ornate, apical bracts 4 crowded, 0.6-0.8 mm long, 0.5 mm wide, lanceolate, ciliately trimmed. ♂ flowers white, pedicellate, 1.5 mm wide. Tepals 5, rugulose, 1 mm long. Stamens 5, 0.5-0.6 mm long. Anthers globose, dithecal, thecae juxtaposed. Disc flat, in the center a small, conical, apiculate pistillode. Female inflorescences solitary, unifloral; rachis to 3 mm long. ♀ flowers white, 2.5 mm long, 1.5 mm wide. Tepals 5, alternating with the stigmatic lobes. Fruit ellipsoidal, in the lower third part very broad, 7.3-8.5 mm long, 3.0-3.5 mm wide; collar short, thick.

3. *Cladomyza stellata* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami partim recti, teretes, partim volubiles, applanati, costati, in sinibus nutricem tangentibus haustoria ramosa edentes. Rami laterales

1-2 (-4) ex eodem nodo sub angulo 20°-130° oriundi. Cortex fusca. Folia obovata vel elliptica, apice rotundata, non mucronata, basi cuneata, utrimque lucida, 15-72 X 6-45 mm, 1-5 in brachyblastis. Petiolus 0,6-9 mm longus. Nervi utrimque conspicui, 7-15. Inflorescentiae dioicae, masculinae 1-3 (-5) ex eodem nodo, plerumque triflorae, rhachis 0,7-2,1 mm longa. Flores ♂ luteoli. Tepala (3-) 4 (-5), pilis poststaminalibus destituta. Stamina totidem. Pistillodium distinctum. Inflorescentiae femineae 1-5 ex eodem nodo, plerumque uniflorae, rhachis subnulla vel usque ad 1 mm longa, bracteata. Flores ♀ luteoli, 2,5 mm longi, 1,3 mm lati. Tepala 4-5. Stigma capitatum. Fructus 5,5-7,8 mm longi, 2,4-3,3 mm lati, collum 1,7 mm longum. Endocarpium costatum, costis tepalis oppositis, 4 x 2,8 mm, apice filis patulis coronatum.

Hemiparasitic shrub in the branches of trees. Branches are partly straight, terete, partly twining, flattened, ribbed, putting forth branched haustorial in sinuses touching the host. Lateral branches 1-2 (-4) originating from the same node at an orientation angle of 20°-130°. Bark dark brown. Leaves obovate or elliptic, apex rounded, not mucronate, base cuneate, shiny on both sides, 15-72 X 6-45 mm, 1-5 in the brachyblasts. Petiole 0.6-9 mm long. Nerves conspicuous, 7-15. Inflorescences dioecious, male 1-3 (-5) from the same node, and, for the most part triflorous, the rachis 0.7-2.1 mm long. ♂ flowers yellowish. Tepals (3-) 4 (-5), deprived of poststaminal hairs. Stamens just as many. Pistillode distinct. Female inflorescence 1-5 from the same node, usually unifloral, rachis nearly lacking or up to 1 mm long, bracteate. The ♀ flowers yellowish, 2.5 mm long, 1.3 mm wide. Tepals 4-5. Stigma capitite. The fruit 5.5-7.8 mm long, 2.4-3.3 mm broad, collar 1.7 mm in length. Endocarp costate, ribs opposite the tepals, 4 x 2.8 mm, apex crowned with spreading fibers.

New Guinea: EYMA 4423 ♀. PULLE 817 ♂.

5. *Cladomyza dendromyzoides* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus, ad 1 m altus, densus, pendulus et scandens. Rami omnes volubiles, nutricem non suffocantes, teretes, iuveniles in sinibus nutricem tangentibus haustoria edentes. Brachyblasti 0,9-5 cm longi, 3-8 folia laminifera gerentes, a reliquis ramis distincte differentes. Flagellae squamiferae et floriferae, interdum inter se ipsas parasiticae. Folia obovata, basi cuneata, iuvenilia apice mucronata, concava, margine revoluta, 3-7 (-18,5) X 1,5-5 (-12) mm. Petiolus 0,5-4,5 mm longus. Nervi 3 (-5) inconspicui. Inflorescentiae dioicae. Flores ♂ luteo-virides, sessiles, 1,8 m longi, tepalis patulis 2,2 mm lati. Tepala 3 (-4) pilis poststaminalibus destituta. Stamina totidem. Antherae quadriloculares, loculis superpositis. Pistillodium distinctum. Inflorescentiae femineae 1-3 ex eodem nodo, brevissimae multibracteatae, uniflorae. Flores ♀ luteo-virides. Tepala 3-5. Lobi stigmatis tepalis isomeris oppositi. Fructus intense purpurei, 5,4-6,3 mm longi, 3,0-3,3 mm lati. Endocarpium 3,3 X 2 mm, dense pilosum, apice filis

(fibrovascularibus) plumosis coronatum.

A hemiparasitic shrub in the branches of the trees, up to 1 m tall, dense, pendulous and scendent. Branches are all twining, not strangling the host, terete, juveniles putting forth haustoria in recesses touching the host. Brachyblasts 0.9-5 cm long, carrying 3-8 laminar leaves, distinctly different from the other branches. Squamiform and floriferous whips sometimes parasitic among themselves. Leaves obovate, base cuneate, juvenile apices mucronate, concave, margin revolute, 3-7 (-18.5) X 1.5-5 (-12) mm long. Petiole 0.5-4.5 mm long. Nerves 3 (-5) inconspicuous. Inflorescences dioecious. ♂ flowers yellow-green, sessile, 1.8 m long, open tepals 2.2 mm wide. Tepals 3 (-4) or without poststaminal hairs. The same number of stamens. Anthers quadrilocular, loculae *super-positioned*. Pistillode distinct. Female inflorescences 1-3 from the same node, shortly multibracteate, uniflora. Flowers ♀ yellow-green. Tepals 3-5. Stigmatic lobes same number as and opposite tepals. Fruit intensely purple, 5.4-6.3 mm long, 3.0-3.3 mm wide. Endocarp 3.3 X 2 mm, densely pilose, apex crowned with feathery fibrovascular fibers.

9. *Cladomyza densa* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus, subrectus. Rami glabri, pleiochasiales, teretes, juveniles costati, laterales 1-2 ex eodem nodo sub angulo 15°-60° oriundi, acrotoni. Cortex fusca, laevis, serius grisea. Folia laminifera glabra, modo 2/5 disposita, ovato-lanceolata vel basalia suborbicularia, apice obtusa, non mucronata, basi cuneata, plana, crassa, 18-38 mm longa, 15-22 mm lata, juvenilia lucida. Nervi supra conspicui, (3-) 5.

Folia squamiformia in ramis basalia, triangularia, 1,5-2 mm longa, 0,9-1,2 mm lata. Inflorescentiae femineae singulae, uniflorae, rhachis valde abbreviata, dense bracteata. Flores ♀ sessiles, 2 mm longi et aequilati. Tepala 5 luteola, erecta, apice cartilaginea, 1-1,3 mm longa et aequilata. Staminodia nulla. Lobi stigmatis cum tepalis alternantes. Fructus tepalis persistentibus coronati, obtuse 5-costati, 6-7,9 mm longi, 3,3-4 mm lati, collum 2-4 mm longum. Mesocarpium fibrosum, endocarpium 3,8 mm longum, 2,9-3,3 mm latum, 5-costatum, apice filis (fibrovascularibus) 5 X 4 plumosis, reclinato-patulis ornatum.

Hemiparasitic shrub in the branches of trees, suberect. Branches glabrous, pleiochasic, terete, juvenile ribbed, laterals 1-2 originating from the same node at an orientation angle of 15°-60°, acrotonic. Bark dark brown, smooth, later gray. Laminar leaves glabrous, disposed in a 2/5 mode, ovate-lanceolate or the basal ones suborbicular, apex obtuse, not mucronate, base cuneate, flat, thick, 18-38 mm long, 15-22 mm wide, juvenile shiny. Nerves from above conspicuous, (3-) 5. Squamiform leaves basal on branches, triangular, 1,5-2 mm long, 0,9-1,2 mm wide. Female inflorescences solitary, unifloral, rachis very abbreviated, densely bracteate. The ♀ flowers sessile, 2 mm long and equally wide. Tepals 5 yellow, erect, the tip cartilaginous, 1-1,3 mm long, and equally wide. Staminodia absent. Stigmatic lobes with alternate with the tepals. Fruit crowned with persistent tepals, bluntly 5-ribbed, 6-7,9 mm long, 3,3-4 mm wide, collar 2-4 mm in length. Mesocarp fibrous, endocarp 3,8 mm long, 2,9-3,3 mm wide, 5-ribbed, apex ornamented with feathery, reclined-spreading fibrovascular fibers 5 X 4.

12. *Cladomyza angustifolia* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami teretes, modice ramificati, undato-volvibiles, in sinibus nutricem tangentibus haustoria usque ad 34 mm longa edentes, laterales 1 (-3) ex eodem nodo sub angulo 45°-60° oriundi, brachyblasti bene distincti, multifolii. Folia oblongo-linearia, crassiuscula, uninervia, apice acuta et mucronata, basi subito angustata, prope basin latissima, 2,5-12,6 mm longa, 1,2-3,0 mm lata, Petiolus 0,4-1,3 mm longus. Inflorescentiae dioicae, masculinae bracteatae, 3- ad 6-florae. Flores ♂ rubelli, 2,5 mm longi, 3 mm lati. Tepala 4-5, pilis poststaminalibus ornata. Stamina isomera, 0,5 mm longa. Antherae globosae, dithecicace, thecis oblique iuxtapositis. Discus 1 mm latus, in centro pistillodio minimo apiculatus. Inflorescentiae femineae plerumque uniflorae. Flores ♀ rubri, 2 mm longi, 1,3 mm lati. Tepala 4-5. Stylus crassus, brevis, lobi stigmatis cum tepalis alternantes. Fructus rubro-suffusi, 6,0-7,2 mm longi, 2,5-3 mm crassi,

endocarpium 4 X 2 mm.

Hemiparasitic shrub in the branches of trees. Branches terete, slightly branching, undulating twining, putting forth haustoria to 34 mm long in sinues touching the host, laterals 1 (-3) from the same node at an orientation angle of 45°-60°, brachyblasts quite distinct, multifoliate. Leaves oblong-linear, rather thick, single-nerved, apex acute and mucronate, the base narrowed abruptly, near the base wide, 2.5-12.6 mm long, 1.2-3.0 mm wide, petioles 0.4-1.3 mm long. Inflorescences dioecious, male bracteate, 3- to 6-flowered. The ♂ flowers reddish, 2.5 mm long, 3 mm wide. Tepals 4-5 ornamented with poststaminal hairs. Stamens isomeric, 0.5 mm long. Anthers globose, dithecal, thecae obliquely juxtaposed. Disc 1 mm wide, the center pistillode minutely apiculate. Female inflorescence mostly unifloral. The ♀ flowers red, 2 mm long, 1.3 mm wide. Tepals 4-5. Style thick, short, stigmatic lobes with alternate tepals. The fruit red-suffused, 6.0-7.2 mm long, 2.5-3 mm thick, endocarp 4 X 2 mm.

15. *Cladomyza dubia* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami volubiles, teretes, iuveniles in sinibus nutricem tangentibus haustoria edentes, brachyblasti 1. et 2. ordinis floriferi lateraliter ad 1-3 ex eodem nodo sub angulo 30°-100° oriundi, recti, densissimi. Internodia 2 mm longa. Cortex nigricans, dense granulosa. Folia luteo-viridia, valde carnosa, obovata vel elliptica, basi cuneata, apice mucronata, 2,5-11,5 X 1,5-6,4 mm. Petiolus 0,6-3 mm longus. Nervi inconspicui. Inflorescentiae dioicae, masculinae singulæ ex eodem nodo, uni- ad triflorae. Flores ♂ virides, pedicellati, 1,9 mm longi, tepalis patulis 3,3 mm lati. Tepala 4 (-5), pilis poststaminalibus destituta. Stamina isomera, patula. Antherae ditheciae, thecis iuxtapositis. Pistillodium conicum. Inflorescentiae femineae singulæ ex eodem nodo, uni- ad triflorae. Flores ♀ minimi, virides, 2 mm longi, 2,2 mm lati. Tepala (3-) 4 (-5) patula. Stylus 0,5-0,5 mm longus, disco immersus. Fructus 7 mm longi, 2,3-2,5 mm lati, endocarpium 2,8-5,5 mm longum, 1,8-2 mm latum, apice filis (fibrovascularibus) coronatum.

Hemiparasitic shrub in the branches of trees. Branches twining, terete, juveniles putting forth haustoria in sinuses touching the host, floriferous brachyblasts of 1 and 2 orders, 1-3 originating laterally from the same node at an orientation angle of 30° -100°, straight, dense. Internodes 2 mm long. Bark blackish, densely granular. Leaves yellow-green, very fleshy, obovate or elliptic, base cuneate, apex mucronate, 2.5-11.5 X 1.5-6.4 mm. Petiole 0.6-3 mm long. Nerves inconspicuous. Inflorescences dioecious, male single from the same node, 1-3-flowered. The ♂ flowers green, pedicellate, 1.9 mm long, spreading tepals 3.3 mm wide. Tepals 4 (-5), poststaminal hairs absent. Stamens isomeric, spreading. Anthers dithecal, thecae juxtaposed. Pistillode conical. Female inflorescence single from the same node, 1-3-flowered. The ♀ flowers small, green, 2 mm long, 2.2 mm wide. Tepals (3-) 4 (-5) spreading. Style 0.5-0.5 mm long, immersed in a disk. Fruit 7 mm long, 2.3-2.5 mm wide, endocarp 2.8-5.5 mm long, 1.8-2 mm wide, apex crowned with fibrovascular fibers.

New Guinea: Southern Highlands District: West summit of Giluwe mountain, alpine grassland and scrub, 3150 m, on *Vaccinium* sp., ♂ flowers & fruits 8. 8. 1961 - SCHODDE # 1746 (Holotype CANB) (indigenous name:.. maudidi, in Meudi language), Eastern Highlands District: Chimbu watershed, Marafunga clearcut, upper Asaro valley near Goroka, on *Symplocos* sp. ♂ flowers 7. 9. 1961 - WOMERSLEY & SLEUMER # 14026 (Paratype ♂ CANB). Otto Mountain, South slopes, 2680 m, on *Nothofagus*, in lower altitudes on several other trees, flowers & fruits ♀ 7. 8. 1959 - BRASS # 30896. William mountain, east slope, 2770 m, often on different host trees in the moist moss forest, ♂ flowers 16. 7. 1959 - BRASS # 30896. Ibid Pengal-Bach, 2550 m, on *Dimorphantha* (# 5642.) & a, ♀ flowers & fruits. 2. 2. 1964 - STAUFFER # 5643 and # ♂ flowers # 5644.

The similar *Cl. cuneata* DANSER has upwardly curved, not spreading tepals, and its style is not sunken. The arrangement of the leaves is less dense (internodes 3-5 mm long).

16. *Cladomyza trinervia* STAUFFER sp. nov.

Frutex in arborum ramis hemiparasiticus, volubilis (ex notis collectoris). Rami recti vel leviter curvati, basales teretes, apicales applanati, laterales 1-4 ex eodem nodo sub angulo 30°-80° oriundi, brachyblasti floriferi bene distincti. Folia laminifera glauca, obovata vel elliptica, apice rotundata vel leviter retusa, iuvenilia submucronata, basi cuneata, 6-49 mm longa, 4,2-30 mm lata. Petiolus 2-7 mm longus. Nervi supra conspicui, 3 (-5). Folia squamiformia in ramis basalia, breviter triangularia, 1 mm longa, 0,7 mm lata.

Inflorescentiae dioicae, masculinae 1-7 ex eodem nodo, pleraeque uniflorae, rhachis 0,4-0,7 mm longa, bracteata. Flores ♂ virides, pedicellati, 2 mm longi, tepalis patentibus 3,2 mm lati. Tepala (3-) 4 (-5), 1,2 mm longa et aequilata, reclinato-patula, pilis poststaminalibus destituta. Stamina isomera, 0,9 mm longa. Antherae 0,4 mm longae, dithecicae, thecis iuxtapositis. Discus patelliformis, 1,6 mm latus. Pistillodium 0,4-0,5 mm altum.

Hemiparasitic shrub in the branches of trees, twining (from the collector notes). Branches straight or slightly curved, basally terete, apically flattened, the laterals 1-4 originating from the same node at an orientation angle of 30°-80 °, floriferous brachyblasts quite distinct. Leaf lamina glaucous, obovate or elliptic, apex rounded or slightly retuse, juvenile submucronate, base cuneate, 6-49 mm long, 4,2-30 mm wide. Petiole 2-7 mm long. Nerves from conspicuous, 3 (-5). Squamiform leaves basal on the branches, shortly triangular, 1 mm long, 0,7 mm wide. Inflorescences dioecious, male 1-7 from the same node, most unifloral, rachis 0,4-0,7 mm long, bracteate. The ♂ flowers green, pedicellate, 2 mm long, spreading tepals 3,2 mm wide. Tepals (3-) 4 (-5), 1,2 mm long and equally wide, downwardly spreading, without poststaminal hairs. Stamens isomeric, 0,9 mm long. Anthers 0,4 mm long, dithecal, thecae juxtaposed. Disk patelliform, 1,6 mm wide. Pistillode 0,4-0,5 mm high.

New Guinea: Papua, Northern slopes of the mountain Daymau, Mameau chain on a tree of lower growth in an oak forest, 1450 m, ♂ flowers 5.7.1953 - BRASS # 23305 (Holotype A).

3. *Dufrenoya aurantiaca* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami teretes, laterales 1-2 ex eodem nodo sub angulo 30°-100° oriundi. Folia crassiuscula, opaca, obovato-elliptica, apice rotundata, mucrone destituta, basi longe cuneata, paulo plus quam dupla longiora ac latiora, 15-57 X 6-27,5 mm. Petiolus 3-6 mm longus. Inflorescentiae femineae 1-3 ex eodem nodo, rhachis

2,8-5 mm longa. Fructus ovati, rubri, 6,5-7,0 X 3,9-4,4 mm, tepalis 5, staminodiis, pilis poststaminalibus coronatum. Stylus brevis. Stigma vix lobatum, lobi cum tepalis alternantes. Exocarpium coriaceum, endocarpium 5,2 X 2,5 mm.

Hemiparasitic shrub in the branches of trees. Branches terete, the laterals 1-2 from the same node at an orientation angle of 30°-100°. Leaves thick, opaque, obovate-elliptic, rounded at the apex, without mucro, base long cuneate, a little more than twice as long as wide, 15-57 10 6-27.5 mm. Petiole 3-6 mm long. Female inflorescences 1-3 from the same node, rachis 2.8-5 mm long. Fruit ovoidal, red, 6.5-7.0 X 3.9-4.4 mm, tepals 5, staminodial, crowned with poststaminal hairs. Style short. Stigma hardly lobed, lobes alternate with tepals. Exocarp leathery, endocarp 5.2 10 2.5 mm.

Vietnam: Tourane, Col des Nuages, 1200 m, forest on moderate rock and gravel bottom, fruits 18.9.1923 - POILANE # 8118 (Holotype P).

4. *Dufrenoya papillosa* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami recti, breviusculi, laterales 1-2 ex eodem nodo sub angulo 20°-80° oriundi. Cortex laevis, ferrugineo-nigra, serius grisea. Folia obovata, apice rotundata, non mucronata, basi cuneata, subtriplo vel subduplo longiora quam latiora, 13-66 X 4-34 mm. Petiolus 1,6-7,5 mm longus. Nervi 7-9, supra distinctiores. Inflorescentiae dioicae, masculinae 1-4 ex eodem nodo, rhachis 1,2-6 mm longa. Flores ♂ plerumque 6, sessiles, 2 mm longi, 1,5-2 mm lati. Tepala 5 (-6), extus papillosa, patula, pilis poststaminalibus ornata. Stamina 5. Discus patelliformis, in centro pistillodio apiculatus. Inflorescentiae femineae 1-8 ex eodem nodo, uniflorae. Rhachis 1,6-3 mm longa. Flores ♀ virides, 2,1 mm longi, 1,5 mm lati. Tepala 5 (-7), extus papillosa, pilis poststaminalibus ornata. Staminodia isomera. Lobi stigmatis isomera, cum tepalis alternantia. Fructus (immaturi) 4,4 mm longi, 2,2 mm lati.

Hemiparasitic shrub in the branches of trees. Branches straight, short, laterals 1-2 originating from the same node at an orientation angle of 20°-80°. Bark smooth, dark rusty-brown, later gray. Leaves obovate, apex rounded, not mucronate, base cuneate, half to one third as long as wide, 13-66 X 4-34 mm. Petiole 1.6-7.5 mm long. Nerves 7-9, distinct above. Inflorescences dioecious, male 1-4 from the same node, rachis 1.2-6 mm long. The ♂ flowers generally 6, sessile, 2 mm long, 1.5-2 mm wide. Tepals 5 (-6), papillose, spreading, ornamented with poststaminal hairs. Stamens 5. Disk patelliform, in the center an apiculate pistillode. Female inflorescences 1-8 from the same node, unifloral. Rachis 1.6-3 mm long. The ♀ flowers green, 2.1 mm long, 1.5 mm wide. Tepals 5 (-7), papillose on the outside, ornamented with poststaminal hairs. Staminodia isomeric. Stigmatic lobes isomeric, alternating with tepals. Fruit (unripe) 4.4 mm long, 2.2 mm wide.

Malay Peninsula: Pahang, Cameron- Highland, 1200 m, ♂ flowers 15. 4. 1930 - HENDERSON # 23578 (Holotype SING); ibid, Boh Plantation, 1200 m, ♂+♀. flowers 1. 4. 1937 - MOHAMED NUR # 32813.

6. *Dufrenoya longicuneata* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami modice densi, recti vel leviter curvati, iuveniles acute costati, laterales 1-2 ex eodem nodo sub angulo (20-) 45 (-60)° oriundi. Cortex fusca, striata. Folia cuneato-obovata, apice rotundata, non mucronata, basi longe cuneata, plerumque dupla longiora quam latiora, 11-44 X 4,2-26 mm. Petiolus 2,0-7,0 mm longus. Nervi supra conspicui, (5-) 7-10 (-12). Inflorescentiae dioicae, masculinae (1-) 3 (-5) ex eodem nodo, rhachis 1,4-2,8 mm longa. Flores ♂ (4-) 6-7, 2 mm longi, 1,5 mm lati. Tepala 5, glabra, pilis poststaminalibus ornata. Stamina 5. Discus patelliformis, lobatus, in centro pistillodio apiculatus. Inflorescentiae femineae 1-3 (-4) ex eodem nodo, nonnullae terminales, uniflorae, rhachis 0,6-2,2 mm longa. Flores ♀ virides, 4-5 mm longi, 1,5 mm lati. Tepala 5, pilis poststaminalibus ornata. Staminodia 5. Discus patelliformis. Stylus brevis, lobi stigmatis cum tepalis alternantes. Fructus 4,5-6-8 mm longi, 2-4 mm lati, ellipsoidei. Mesocarpium floccosum, endocarpium plerumque 3,0-3,4 X 1,4-1,6 mm, filis apicalibus destitutum.

Hemiparasitic shrub in the branches of trees. Branches moderately dense, straight or slightly curved, juveniles acutely ribbed, laterals 1-2 out of the same node at an orientation angle of (20-) 45 (-60)°. Bark dark brown, streaked. Leaves cuneate-obovate, apex rounded, not mucronate, base long cuneate, usually twice as long as wide, 11-44 X 4.2-26 mm. Petiole 2.0-7.0 mm long. Nerves above conspicuous, (5-) 7-10 (-12). Inflorescences dioecious, male (1-) 3 (-5) out of the same node, the rachis 1.4-2.8 mm long. The ♂ flowers (4-) 6-7, 2 mm long, 1.5 mm wide. Tepals 5, glabrous, ornamented with poststaminal hairs. Stamens 5. Disk patelliform, lobed, in the center and apiculate pistillode. Female inflorescences 1-3 (-4) from the same node, some of them terminal, unifloral, the rachis 0.6-2.2 mm long. The ♀ flowers green, 4-5 mm long, 1.5 mm wide. Tepals 5, ornamented with poststaminal hairs. Staminodia 5. Disk patelliform. Style short, the stigmatic lobes alternate with tepals. Fruit 4.5-6-8 mm, 2-4 mm wide, ellipsoidal. Mesocarp floccose [with tufts of soft hairs], endocarp generally 3.0-3.4 X 1.4-1.6 mm, without apical fibers.

Vietnam: Langbian Massif, Dran, 1000-1200 m, fruits 29. 4. 1919 - CHEVALIER # 40396 (Holotype P). Between Dalat and Daninh, on an oak with white leaf undersides, ♂ flowers, 28. 11. 1911 - LECOMTE & PROFINET # 1459 Dalat, fruits 3. 6. 1921 - HAYATA # 135 Dalat, old way to Prenh, ♀ flowers & fruits 15. 12. 1924 - EVRARD # 2204 Province Haut Douai, agricultural station Blao, 800 m, on an oak tree, fruits 24. 4. 1933 - POILANE # 22351 (name in Moï language: eop yor).

7. *Dufrenoya pruinosa* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus, sublaxus. Rami recti, crassiores teretes, iuveniles costati, laterales 1-2 ex eodem nodo sub angulo 30-80° oriundi, acrotoni. Cortex grisea, laevis. Folia obovata, crassiuscula, apice rotundata vel leviter emarginata, non mucronata, basi cuneata, subduplo longiora quam latiora, 23,0-68,5 X 9-40 mm. Petiolus 3-9 mm longus. Nervi (5-) 7-9, utrimque perspicui. Inflorescentiae dioicae, masculinae 1-8 ex eodem nodo, rhachis 3,4-7,6 mm longa. Flores ♂ 4-6-8, extus pruinosi. Tepala 5, pilis poststaminalibus ornata. Stamina 5. Discus profunde cyathiformis, 1,4 X 1,0 mm, in centro

pistillodio breviter apiculatus. Inflorescentiae femineae 1-5 ex eodem nodo, uniflorae, rhachis 0,8-3,0 mm longa. Flores ♀ extus leviter pruinosi, 1,1-1,3 mm lati. Tepala 5 glabra, pilis poststaminalibus ornata. Staminodia 5. Lobi stigmatis 5, breves sed distincti.

Hemiparasitic shrub in the branches of trees, somewhat loose. Branches straight [upright?], thickly terete, juveniles ribbed, lateral 1-2 from the same node with an orientation angle of 30-80°, acrotonic. Bark gray, smooth. Leaves obovate, rather thick, apex rounded or slightly emarginate, not mucronate, base cuneate, one half as long as wide, 23.0-68.5 X 9-40 mm. Petiole 3-9 mm long. Nerves (5-) 7-9, evident on both sides. Inflorescences dioecious, male 1-8 from the same node, rachis 3.4-7.6 mm long. The ♂ flowers 4-6-8, externally pruinose [with waxy, powdery secretion- a „bloom“]. Tepals 5, ornamented with poststaminal hairs. Stamens 5. Disk deeply cyathiform [cup-shaped], 1.4 10 1.0 mm, the center a shortly apiculate pistillode. Female inflorescences 1-5 from the same node, unifloral, rachis 0.8-3.0 mm long. The ♀ flowers externally slightly pruinose, 1.1-1.3 mm wide. Tepals 5 glabrous ornamented with poststaminal hairs. Staminodia 5. Stigmatic lobes 5, short but distinct.

Vietnam: Northern border of Kontum Province, between the villages Eu Inh and Mang Lum, 1800-2000 m, granite substrate, mild rainy climate, ♂ flowers 7. 3. 1941 - POILANE 32125 to (Holotype P). Province Haut Doual, Blao, 800 m, dense young forest on good red soil, ♂ flowers 22. 1. 1933 - POILANE # 21767; ibid, on a tree, ♀ shoots 31. 11. 1933 - POILANE # 21783 (Moi Name: eap yor.) West of Nha Trang, on an oak (# 4394), ♂ flowers with galls 4. 7. 1922 - CHEVALIER # 4396 (Moi Name: chua). Dalat, ravine behind the police station, ♂ buds 2. 10. 1924 - EVRARD # 1300 Quang Nam Province, Item 6, 600-700 m, on Lauraceae (# 29403), ♀ buds 1939 - POILANE # 29404.

8. *Dufrenoya Poilanei* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami recti vel curvati, laterales 1-3 (-5) ex eodem nodo sub angulo 30°-90° oriundi. Cortex rubro-fusca, laevis, opaca, serius grisea, fissa. Folia obovata, apice rotundata, plerumque non mucronata, basi cuneata, plerumque subduplo longiora quam latiora, 11-67 X 4-24 mm. Petiolus 2,5-9 mm longus. Nervi (5-) 8 (-11), utrimque conspicui. Inflorescentiae dioicae, masculinae in ramulis iuvenilibus ad 1-3 ex eodem nodo sub angulo 30°-80° oriundae, (4-) 6-florae. Rhachis 1,5-5,0 mm longa, bracteis patulis, 2,8 mm latis instructa. Flores ♂ subsessiles, angulosi, 1,9 mm longi, tepalis patulis 3 mm lati. Tepala 5 (-6), glabra, pilis poststaminalibus paucis ornata. Stamina isomera. Discus planus, 1,5 mm latus. Pistillodium humile vel nullum. Inflorescentiae femineae in ramulis iuvenilibus 1-5 ex eodem nodo, rhachis 2,1-2,8 mm longa, bracteis 2,8 mm latis induta. Flores ♀ lutei, 1,6-1,9 mm lati. Tepala 5 (-6). Staminodia nulla. Discus 1,3 mm latus, planus vel pulvinatus. Stylus brevissimus. Lobi stigmatis inconspicui, si isomeri, tepalis oppositi. Fructus rubri, 3,5-5,0 mm longi, 2,6-4,0 mm lati. Endocarpium 3 mm longum, 1,9-2,4 mm latum.

Hemiparasitic shrub in the branches of trees. The branches are straight or curved, the laterals 1-3 (-5) from the same node at an orientation angle of 30°-90°. Bark reddish dark brown, smooth, opaque, later gray, fissured. Leaves obovate, apex rounded, generally not mucronate, base cuneate, usually one half as long as wide, 11-67 X 4-24 mm. Petiole 2.5-9 mm long. Nerves (5-) 8 (-11), conspicuous on both sides. Inflorescences dioecious, male in juvenile branches, 1-3 originating out of the same node at an orientation angle of 30°-80°, (4-) 6- flowered. Rachis 1.5-5.0 mm long, bracts spreading, 2.8 mm wide in the array. The

♂ flowers subsessile, with prominent angles, 1.9 mm long, spreading tepals 3 mm wide. Tepals 5 (-6), glabrous, ornamented with few poststaminal hairs. Stamens isomeric. Disk flat, 1.5 mm wide. Pistillode small or none. Female inflorescences on young branches 1-5 from the same node, rachis 2.1-2.8 mm long, clad with 2.8 mm wide bracts. The ♀ flowers yellow, 1.6-1.9 mm wide. Tepals 5 (-6). Staminodia none. Disk 1.3 mm wide, flat or pulvinate. Style short. Lobes of the stigma inconspicuous, if isomeric, tepals opposite. Fruit red, 3.5-5.0 mm long, 2.6-4.0 mm wide. Endocarp 3 mm long, 1.9-2.4 mm wide.

Vietnam: Province Haut Douai, massif Bi Doup, 2000 m, high forest, on an oak, fruits 11. 10. 1940 - POILANE # 30716 (Moï Name: etono) (Holotype P); ibid 2200, ancient forest, fruits 13. 10. 1940 - POILANE # 30872 Province Haut Doual, massif Braian in Djiring, from 1700 to 1800 m, the forest on sandstone soil, ♂ flowers 16. 1. 1935 - POILANE # 23897 (Moï -Name: tap dor, tap yor); ibid 1500 to 1700 m, on a tree in the forest, ♀ flowers 02.18.1935 - POILANE # 24366 (Moï -Name: eoc dor) Haut Douai, north of Dankia, 1400-1500 m, on an oak or *Castanopsis* sp., fruits, 2. 9. 1940 - POILANE # 30272. 11. *Dufrenoya robusta* STAUFFER sp. nov.

Frutex in ramis arborum hemiparasiticus. Rami recti vel leviter curvati, iuveniles distincte costati, laterales 1-3 ex eodem nodo sub angulo 30°-80° oriundi, acrotoni. Folia laminifera obovato-elliptica, crassiuscula, supra lucida, apice rotundata, non mucronata, basi cuneata, subduplo longiora quam latiora, 11-67 X 5,2-42 mm. Petiolus 2-7 mm longus. Nervi (7-) 9 (-11). Folia squamiformia basalia, 1 mm longa, 1,8 mm lata. Inflorescentiae masculinae 1-4 ex eodem nodo, (5-) 6-florae, rhachis 2,8-6,5 mm longa, bracteata. Flores ♂ subsessiles, virides, 2 mm longi, tepalis patulis 2,9-3,5 mm lati. Tepala 5 (-7), glabra, pilis poststaminalibus destituta. Stamina isomera, magna. Discus 1,6 mm latus, planus, in centro pistillodio apiculatus.

Hemiparasitic shrub in the branches of trees. Branches straight or slightly curved, juveniles distinctly ribbed, laterals originating from the same node at an orientation angle of 30°-80°, acrotonic. Leaves laminate, obovate-elliptic, rather thick, shiny above, apex rounded, not mucronate, base cuneate, half as long as wide, 11-67 X 5.2-42 mm. Petiole 2-7 mm long. Nerves (7-) 9 (-11). Squamiform leaves basal, 1 mm long, 1.8 mm wide. Male inflorescences 1-4 out of the same node, (5-) 6-flowered, the rachis 2.8-6.5 mm long, bracteate. The ♂ flowers subsessile, green, 2 mm long, spreading tepals 2.9-3.5 mm wide. Tepals 5 (-7), glabrous, without poststaminal hairs. Stamens isomeric, large. Disk 1.6 mm wide, flat, in the center an apiculate pistillode.

Thailand: Province Kauburi, Kao Ri Yai, 1600 m, evergreen forest, on *Quercus* sp., ♂ flowers 1. 2. 1926 - KERR # 10393 (Holotype K).

Burma: Pegu, Loko-Rücken, ♂ flowers - KURZ # 381.

Southl. Shan-Staaten: Taunggyi-Klippen, 1700 m, on oak and chestnut, ♀ flowers 3. 4. 1926 - ROBERTSON # 2109.

Amphorogyne STAUFFER et HÜRL.
in Vierteljahrsschr. Naturf. Ges. Zürich 102 (1957) 337

1. *Amphorogyne spicata* STAUFFER et HÜRL. l. c. 338.

New Caledonia: BALANSA 2882. HÜRLIMANN 949 und 1747. STAUFFER et BLANCHON 5711
und 5757.

2. *Amphorogyne celastroides* STAUFFER et HÜRL. l. c. 342.

New Caledonia: HÜRLIMANN 452, 855 und 1568. STAUFFER 5707, 5708, 5722, 5794.

3. *Amphorogyne Staufferi* MARKGRAF sp. nov.

Frutex glaber, ramis teretibus, articulatis densiuscule divaricato-ramosus. Ramuli
praesertim infra nodos lineis a foliis decurrentibus angulosi. Cortex laevis, lenticellis
paucis, serius lateraliter dilatatis notata. Internodia 2-4 cm longa, ramuli sub angulo 30-45°
oriundi, prope basin squamis paucis, minimis, triangularibus obsiti. Folia
pseudoverticillata, 4-5 in quoque nodo, valde coriacea, cuneato-obovata, paulo inaequalia,
(20-) 25-30 (-35) mm longa, 15-20 mm lata, apice obtusa, subtus pallidiora quam supra.
Nervus medianus crassus, infra prominulus, venae nec supra nec infra distinctae. Petiolus
crassus, 2-3 mm longus. Inflorescentiae axillares et terminales, ad 3-4 ex axillis
superioribus oriundae, ramulis usque ad quartum ordinem ramificatis paniculatae,
multiflorae, minute bracteolatae, 25-30 mm longae, 15-20 mm latae. Flores luteoli,
obconici, 2 mm longi, 0,8 mm lati, hermaphroditici. Receptaculum sensim in pedicellum
0,5 mm longum attenuatum. Tepala 5, erecta, triangularia, valvata, intus pilis
poststaminalibus ornata. Stamina 5, epitepala; filamenta brevissima, antherae
quadriloculares, loculi bini superpositi. Pollinis granula lenticularia. Discus conspicuus.
Stylus conicus, stamina vix superans. Stigma punctiforme. Ovarium triloculare, in parte
superiore uniloculare. Ovula 3, placenta centrali pendula. Fructus desunt.

Glabrous shrub, branches terete, articulated with dense, divaricate branches. Branchlets,
especially within the nodes angled down in decurrent lines from the leaves. Bark smooth,
with few lenticels, later markedly laterally dilated. Internodes 2-4 cm long, the branches
originating in an orientation angle of 30-45°, near the base beset with a few scales, very
small, triangular. The leaves pseudoverticillate, 4-5 at each node, very coriaceous, cuneate-

obovate, a little unequal, (20-) 25-30 (-35) mm long, 15-20 mm wide, apex obtuse, the underside is paler than above. Median nerve thick, prominent beneath, the veins not distinct either above nor below. Petiole thick, 2-3 mm long. Inflorescences axillary and terminal, 3-4 originating from the axes in the upper part, up to the fourth order ramified branchlets, paniculate, many flowered, minutely bracteolate, 25-30 mm long, 15-20 mm wide. The flowers yellowish, obconic, 2 mm long, 0.8 mm wide, hermaphroditic. Receptaculum gradually attenuated into the pedicel, 0.5 mm long. Tepals 5, erect, triangular, valvate, ornamented inside with poststaminal hairs. Stamens 5, epitepalous; filaments very short, anthers quadrilocular, thecae paired, superposed. Pollen grains lenticular. Disk conspicuous. Style conical, barely surpassing the stamens. Stigma punctiform. Ovary trilocular, in the upper part unilocular. Ovules 3, placenta free-central, pendulous. The fruit is lacking.

New Caledonia: Montagne des Sources, ca. 900 m, shrub in gully forest, flowers 6.11. 1959 - R. F. THORNE # 28637 (Holotype RSA, Isotypus P).

These species had already been recognized by Dr. STAUFFER to be new. Dr. GUTZWILLER had made for him microtome sections of flowers. As with the other two species of these endemic species in the same narrow area of New Caledonia, the richly branched inflorescences indicate it is closer to *A. celastroides*. However, its flowers are more than twice as large, and its smallest leaves correspond to the length of the largest of the new species. Moreover its lateral nerves are more apparent.

Notes. This work was created by Dr. Stauffer during his last days. It is to be understood as a preliminary work for a monograph, which he had likewise already tackled, first for the Malesian genera *Cladomyza*, *Dendromyza*, *Dendrotrophe*, and *Dufrenoya*. Many herbarium specimens, including the holotypes, were checked and detailed notes were laid down in a number of copies, partly written by Ms. Dr. GUTZWILLER. It seemed to me to be quite sensible to use these advanced-stage investigations and at least to describe his newly established species. He had indeed already mentioned the names in the almost-ready-for-press pages 1-6 (this work) that were left behind. So I tried to figure out the essentials in this form of circular characteristics to complement his manuscript from his raw notes and to summarize the Latin diagnoses, have led also to the synonyms he mentioned their original quotes and entered into the distribution map the missing area of *Phacellaria*. Furthermore, it seemed to me necessary to enumerate the documents which establish the limits of the species. They are in various herbaria and had already been collected by him in short lists. Also, the order of the species, as is observed here, is an expression of his opinion about their relatedness.
