Introduction:

The first Europeans to enter the D'Aguilar Range area were farmers and timber getters in the 1840s (QPWS 2022). The earliest timber reserves were gazetted in 1918 and extensive logging of hardwoods took place after World War II. Maiala National Park was the first to be declared a National Park in the D'Aguilar Range in 1930. Other small National Parks were progressively added; Jollys Lookout (1938), Manorina (1949) and Boombana (1950). In 1977 a partnership between the community, Brisbane City Council and the Queensland government established the “park for the people” Brisbane Forest Park. The declaration of D'Aguilar National Park in 2009 consolidated many smaller NPs into the large D'Aguilar NP (QPWS 2022). The Jinibara people are the Traditional Owners for much of this park. A native title determination was made in November 2012 for federal court number QUD 6128/98 which covers the majority of D'Aguilar National Park and an Indigenous Land Use Agreement Q12012/129 has been registered (NPRSR 2013).

Horse riding has long been a part of the Queensland lifestyle, and many southeast Queensland forests are valued by horse riders as safe and scenic places to ride, although the number of riders is low (DERM 2011; Rossi *et al.* 2013). These horse trail tracks are multiple-use tracks and those close to Brisbane suburbs were found to be used by mountain bike cyclists, walkers, joggers, motorised users, dog-walkers, bushwalkers, horse-riders and motorised trail-bikes (in descending order of numbers) (Fairfax *et al.* 2014). The south-east Queensland horse-riding trail network (HTN) includes more than 500km of trails within 29 reserves between Gympie and the State’s southern border. The HTN trails link to a broader trail network that includes about 340km of trails in Queensland’s forest plantations and at least 470km of trails on other tenures, including several other State Forests (DERM 2010).

Road and trail networks within native forest ecosystems are fundamental in providing access for the purposes of recreational use, extraction of forest products, fire control and routine resource management (Ngugi *et al.* 2014). However disturbance associated with road construction and maintenance, as well as use by vehicles, cyclists, motorbikes, walkers and horses, increase the risk of invasion by non-native (weed) plant species along roads (Potito and Beatty 2005; Ansong and Pickering 2013). Once established in disturbed road verges, some invasive species may colonise adjacent undisturbed native vegetation (Ngugi *et al.* 2014).

Non-native species that become established in natural ecosystems compete with native species for available resources and can replace native species to the detriment of organisms that depend on these native species (Gower 2008). For example, non-native plant species have rapidly invaded and

successfully displaced native species in many conservation areas in Australia (Ngugi and Neldner 2017) and buffel grass (*Cenchrus ciliaris*) forms monocultures in pasture lands of Queensland (Butler and Fairfax 2003).

Multiple vectors including vehicles, machinery, soil movement, animals, wind, water, and humans are involved in the spread of non-native species along forest trails (Ngugi *et al.* 2014). Horses have been implicated as significant vectors in the introduction of plant species observed adjacent to horse trails in nature reserves (Gower 2008). The risks associated with horse riding include seed movements through horse dung, hair, hoof debris, riders, and riding equipment. In a review of world-wide studies analysing the potential dispersal of weeds through horse dung, Ansong and Pickering (2013a) identified 156 naturalised plant species in Australia that germinate from horse dung. Other reported negative impacts from horse use include trampling of vegetation and soils, nutrient addition through urine and dung, introduction of pathogens, as well as enhanced erosion and sediment run-off. All these impacts may trigger changes in species composition of adjacent native ecosystems.

The objective of the Horse Trails Scientific Monitoring Program (DERM 2010) is to monitor horse riding on the Southeast Queensland Horse Riding Trail Network that traverses through Southeast Queensland protected areas, identify any impacts of such use, and recommend management actions to address such impacts. Studies relating to the social, erosional and water quality impacts of horses and horse riding are available on the DES website (Monitoring and managing potential impacts | Parks and forests | Department of Environment and Science, Queensland (des.qld.gov.au)).

This monitoring program was initiated in 2009 and established 52 paired-long-term monitoring sites along designated horse trails located in conservation reserves in seven National Parks in southeast Queensland (Figure 1). These monitoring sites examine (1) the invasion and extent of non-native plant species along the management roads designated as horse trials; and (2) changes in BioCondition over time of vegetation adjacent the horse trails.

Methods:

Study location

D'Aguilar National Park (NP) covers 38 173 hectares and was assessed at 11 sites containing a total of 22 transects in three Regional Ecosystems (REs) shown in Table 1. The monitoring sites for this extensive National Park were distributed across the landscape to sample different conditions. The three RE are 12.11.3, 12.11.5 and 12.11.7 and Technical Descriptions (TDs) for these RE are presented in Appendix 6

2. The TDs are detailed descriptions of the normal range in structure and floristic composition of remnant regional ecosystems and their component vegetation communities.

Table 1. Summary statistics for monitoring sites at D'Aguilar NP arranged by regional ecosystem.

Regional Ecosystem	Extent (ha)	Proportion of park/reserve (%)	No. of transects examined
12.11.3 Open forest generally with <i>Eucalyptus siderophloia</i> , <i>E. propinqua</i> on metamorphic rocks	11 044	29	3
12.11.5 Open forest complex with <i>Corymbia citriodora</i> , <i>Eucalyptus siderophloia</i> , <i>E. major</i> on metamorphics	9792	26	17
12.11.7 <i>Eucalyptus crebra</i> woodland on metamorphics	86	0.2	2

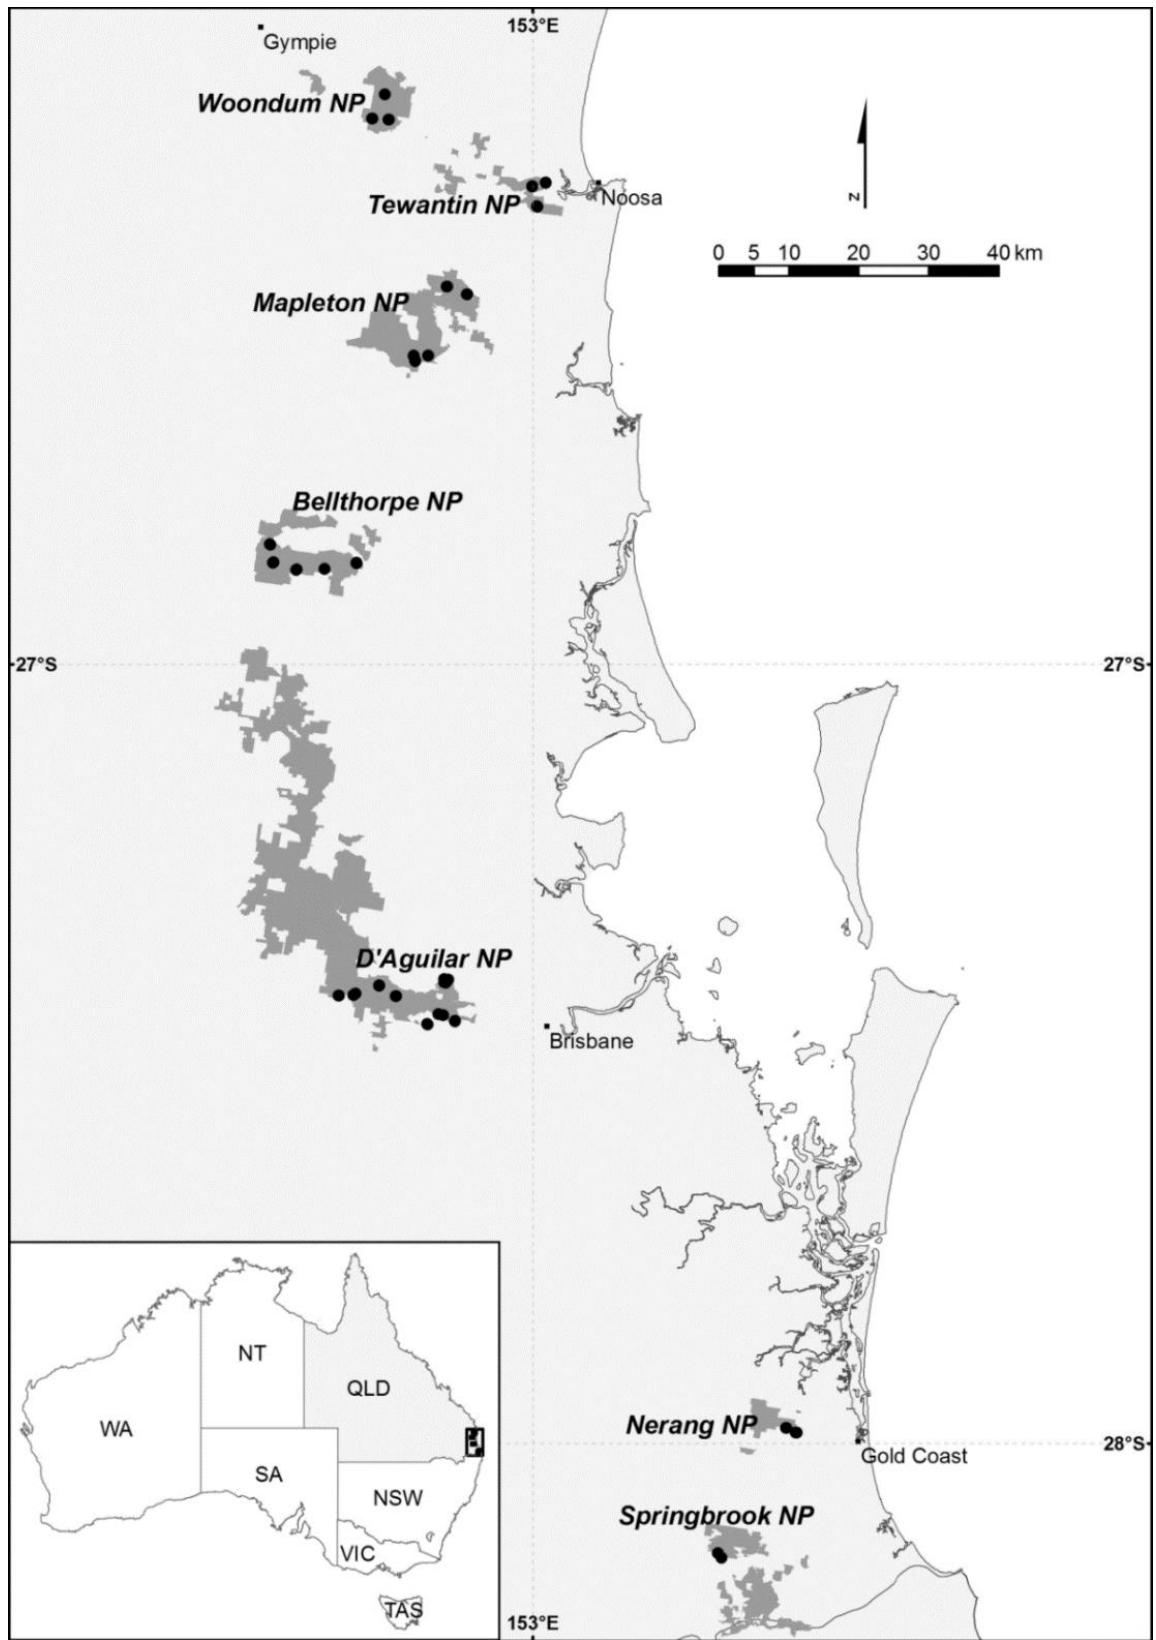

Figure 1. Map of Australia showing Queensland State, location of the seven National Parks (NP) in southeast Queensland that have designated horse trail network, and distribution and location of study sites (Ngugi *et al.* 2014).

Site selection and Sampling

Permanent sites for vegetation monitoring were established in 2010 and 2011 along the horse trail network in D’Aguilar National Park and monitored in 2015 and 2018. Sites were overlayed where possible on existing ecological research plots used for vegetation mapping and classification purposes (Neldner *et al.* 2022), or native forest permanent plots used for long-term monitoring of forest growth (Ngugi *et al.* 2015), allowing surveys to add to existing valuable datasets. The data collection method is described in Ngugi *et al* (2014) .

1. Assessing impact of non-native species on the vegetation along management roads

Vegetation growing adjacent to the horse trail network was sampled using 20 m transects laid out perpendicular to the trail edge on both sides of the trail. The trail edge was defined as the shoulder edge of the trail surface where vegetation growth is evident, and from which point vegetation cover continues into the adjacent vegetation. Along each transect a total of eight quadrats were sampled. At the start of the transect five contiguous 1 x 1 m quadrats extending from the trail edge to 5 m into the forest were sampled to estimate spread of non-native species. Contiguous plots were used to accurately determine the distance of influence from the trail edge that was impacted by non-native species. In addition, 1x1 m plots were sampled at 10 m, 15 m, and 20 m along the transect line. In each 1x1 m plot, all plant species were recorded, and the projective foliage cover of each ground layer species (less than 1.5 m in height) was estimated. Cover was also assessed for leaf litter, bare-ground and coarse woody debris (> 10 cm diameter) as a percentage of the total area in each quadrat (1 m²) (Ngugi *et al.* 2014). This sampling design is very similar to that used by Potito and Beaty (Potito and Beaty 2005) and Gower (Gower 2008).

2. Assessing the condition of the forest regional ecosystems

To sample the species diversity and cover composition in the relatively less disturbed adjacent native forest at each location, a 50 x 10 m forest transect was established parallel to the horse trail and 25 m from the trail edge. All vascular plant species observed within the transect were recorded and the cover of ground stratum species was assessed in five 1x1 m quadrats along the transect midline. Comprehensive sampling of the structure and floristics of the forests followed the standard Queensland Herbarium vegetation survey methodology (Neldner *et al.* 2022) used for collecting data for the Queensland Biodiversity and Ecology Information System (QBEIS) and allowed each site to be assessed for their BioCondition (Eyre *et al.* 2015).

3. Plant species identification and categorisation

All herbaceous and woody vascular species observed within each plot were identified to species in the field where possible. Where necessary specimens were collected and brought to the Queensland Herbarium for identification. Where available material was insufficient to identify species, identity was recorded at genus level. Nomenclature, and native and non-native status follows the Census of Queensland Flora 2021 (Brown 2020). Characterisation of species as environmental weeds, weeds of national significance and/ or declared weeds under State legislation was done using the online facility maintained by the Queensland Department of Agriculture, Fisheries and Forestry (QPWS 2022).

Results:

D'Aguilar National Park was assessed at 11 sites containing a total of 22 transects across three Regional Ecosystems (RE's). Detailed results for the non-native species richness and vegetation cover, and BioCondition scores for the transects at each site are provided in the report cards in Appendix 1.

A summary of weed species richness and cover in the trail-edge transect is presented in Table 2. The highest observed mean cover of non-native species was 15.5%, and the highest non-native species richness count was six species. The highest values of cover recorded at the trail-edge for the three REs ranged from 25.5 to 40%. Within the QBEIS transect, the highest mean cover of non-native species was 27.4% and the highest reported cover in the range was 44.4% which was mainly composed of *Lantana camara* (Table 2). The highest mean of non-native species richness was 12 species with majority of QBEIS sites having four or fewer species (Table 2).

BioCondition score among all the sites ranged from 47 to 95% on a 0 to 100% scale (the higher the score the better the condition) with the lowest mean score of 58%, indicating that most sites were in reasonable condition (Table 3). The highest BioCondition scores were recorded in RE 12.11.5 with the mean ranging from 75 to 82%.

Table 2. Mean and range of non-native cover*, and absolute numbers (richness) of non-native species identified per visit at each sampled regional ecosystem within D'Aguilar National Park. Values for both trail-edge and QBEIS transects are shown.

Discussion and Conclusions

This study investigated the impacts of horse riding along horse trails and the risk of horses acting as vectors in the introduction of non-native plant species adjacent protected areas within D'Aguilar National Park in southeast Queensland.

Non-native plant species

The construction, maintenance and use of the road networks that traverse regions of native vegetation may predispose these ecosystems to invasion by non-native plant species (Ngugi *et al.* 2014). Following comprehensive sampling of 11 sites (22 transects) across three sampling time points (2010/2011, 2015 and 2018), the majority of sites along designated horse trails in D'Aguilar National Park showed a moderate to high degree of invasion by non-native species with variable cover.

Throughout this national park, all QBEIS (forest) sites showed some level of incursion by non-native species, with the exception of sites 81B, 96A and 96B. Similarly, all the trail-edge sites showed some degree of non-natives species incursion with the exception of site 1B.

Of all the trail-edge sites that showed non-native species incursion, seven sites were found to increase in non-native cover through time (1A, 3B, 5A, 5B, 18A, 68A, 96A). Only four of the trail-edge sites (3A, 68B, 81A, 81B) were found to improve over time and this was indicated by a decrease in number of non-native species recorded during consecutive site revisits.

Generally, incursion of non-native species within D'Aguilar National Park was variable across the examined sites, with high levels of non-native species richness found in both the forest and trail-edge transects. The presence of large numbers of non-native species at the trail-edge and adjacent forest transects is consistent with the idea of road networks acting as corridors for incursion of non-native species, however other environmental influences cannot be excluded. It is likely that high frequency of fires, historical logging, the millennium drought and subsequent wet years also contributed to the variable levels of non-native plant species incursion within this national park.

BioCondition scores within the forest transects

QBEIS sites 1A, 3A, 3B, 18A 30A, 45A, 45B, 59B, 65A and 68A all showed high BioCondition scores or showed improvement over time. Prescribed burns in 2009, 2012, 2013 and 2014 at several of these sites may have played a role in improving BioCondition scores for sites 1A, 3A, 3B, 18A, 30A, 45A, 45B and 68A, however other factors cannot be excluded given that no fires were recorded at sites 59B and 65A which also had high scores. All remaining forest sites exhibited low to moderate BioCondition scores. Interestingly, these low-moderate scored sites had either no record of fires or had not been burned

for several years, suggesting that fire may play a necessary role in maintaining healthy levels of native species richness and cover.

Conclusions

There is a moderate degree of non-native plant species incursion in D'Aguilar National Park along the forest trails. This is likely because of continued and active usage of trails for recreation and essential maintenance of the trails. For few sites, the proximity of freehold properties along Boundary road to the national park may be a source of non-native species as many of the species were similar to weeds found on cultivated farms. QPWS&P weed management which is often localised along the trail edges has had positive effect but may be required to extend further to the adjacent vegetation to limit and control incursion and spread of non-native species in D'Aguilar National Park. The BioCondition scores of the forest were generally high with an improving trend. The monitoring should continue in order to inform long-term non-native species (pests) incursion and management.

BioCondition scores: 2010 – 73 2015 – 78 2018 – 78

Fire history: Burnt June 2014

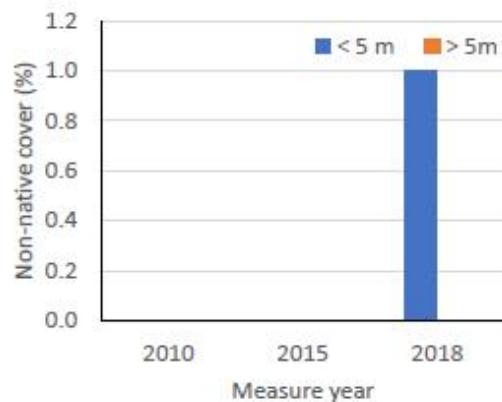

Forest monitoring transect April 2010

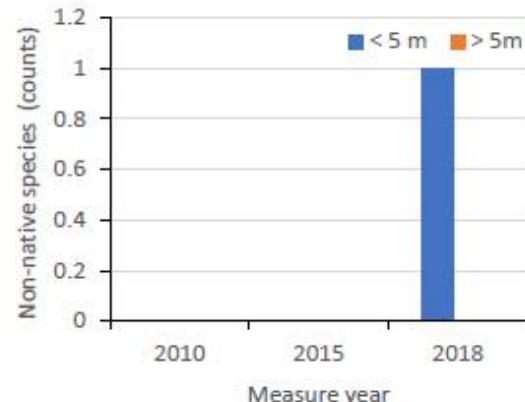

Forest monitoring transect April 2018

General Comments: Since the controlled burn in 2014, the site has had a consistent increase in shrub species richness, grass species richness, tree species richness and shrub canopy cover. Non-native species recorded in the QBEIS BioCondition monitoring site with low covers were: spear thistle (*Cirsium vulgare*), flat-leaved fleabane (*Erigeron bonariensis*), red Natal grass (*Melinis repens*), common sowthistle (*Sonchus oleraceus*) and perennial horse gram (*Macrotyloma axillare* var. *axillare*).

Trail-edge ground cover transect at D'Aguilar 1A

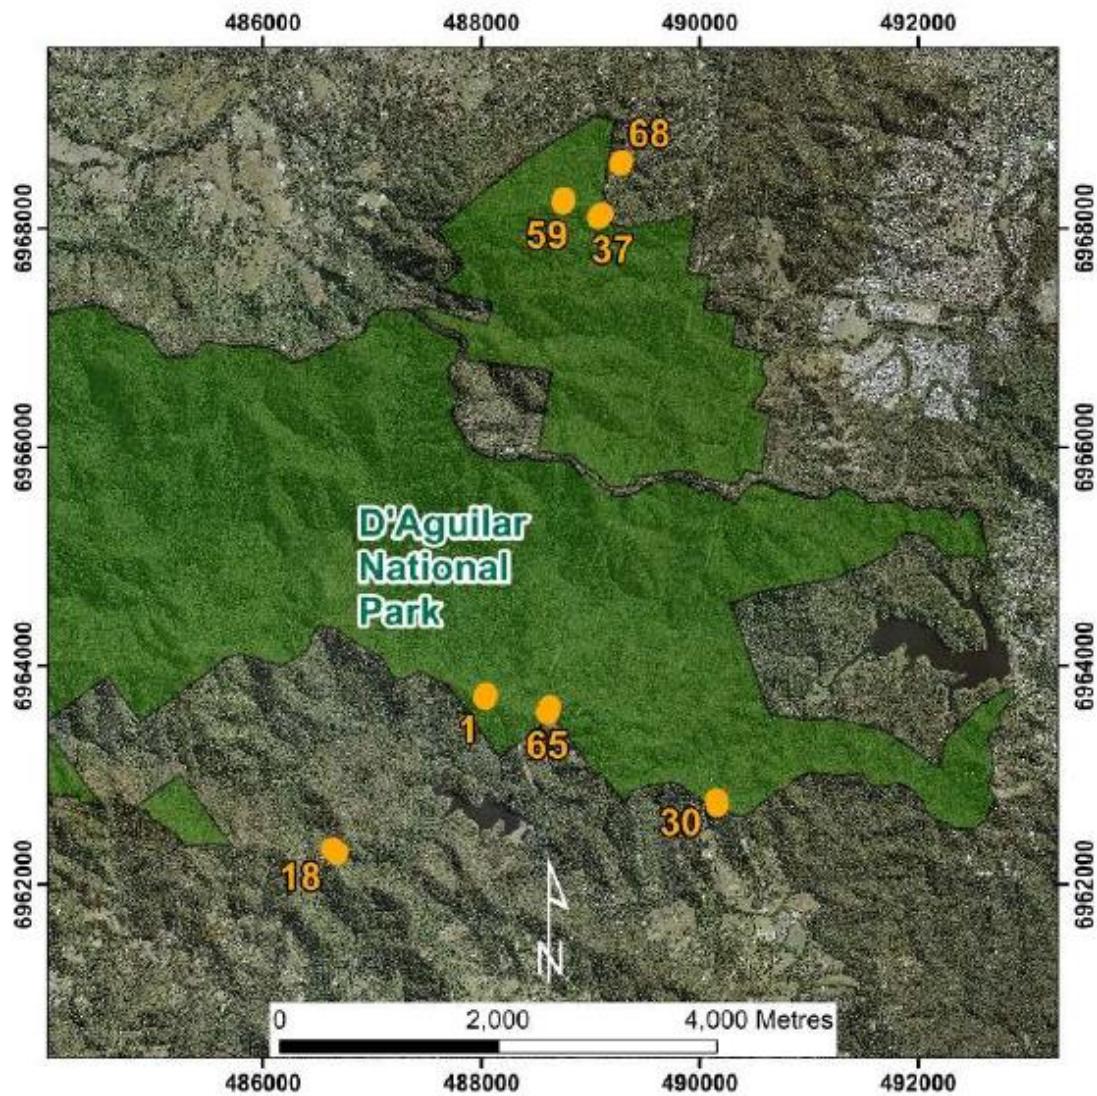

Non-native species cover

Number of non-native species

General comments: No non-native species were recorded in the ground cover transect during 2010 and 2015 monitoring. In 2018, incursion of non-native grass species red Natal grass (*Melinis repens*) was recorded at a low cover percentage.

D'Aguilar National Park: Site 1B

BioCondition scores: 2010 – 66 2015 – 66 2020 – 63

Fire History: Burnt September 2004

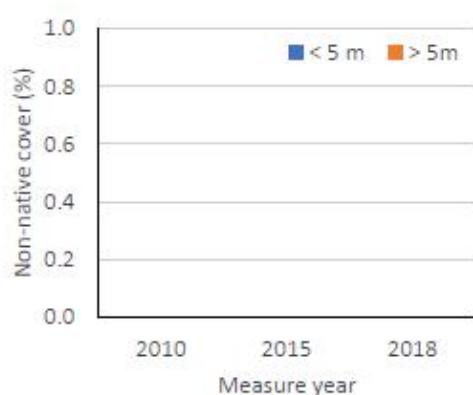

Forest monitoring transect April 2010

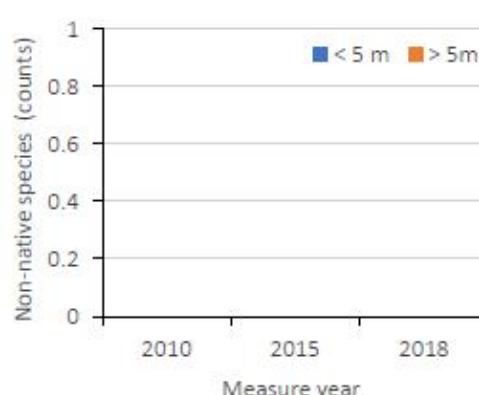

Forest monitoring transect April 2018

General Comments: This site has not been burnt since 2004 and the BioCondition Score has remained consistent in the context of expected seasonal changes. There were no large trees > 46 cm diameter on this site, hence poor score for number of large trees. Non-native species recorded in the QBEIS BioCondition monitoring site with low covers were: corky passion vine (*Passiflora suberosa*), perennial horse gram (*Macrotyloma axillare* var. *axillare*), cobbler's pegs (*Bidens pilosa*) and *Lantana camara*.

Trail-edge ground cover transect at D'Aguilar 1B

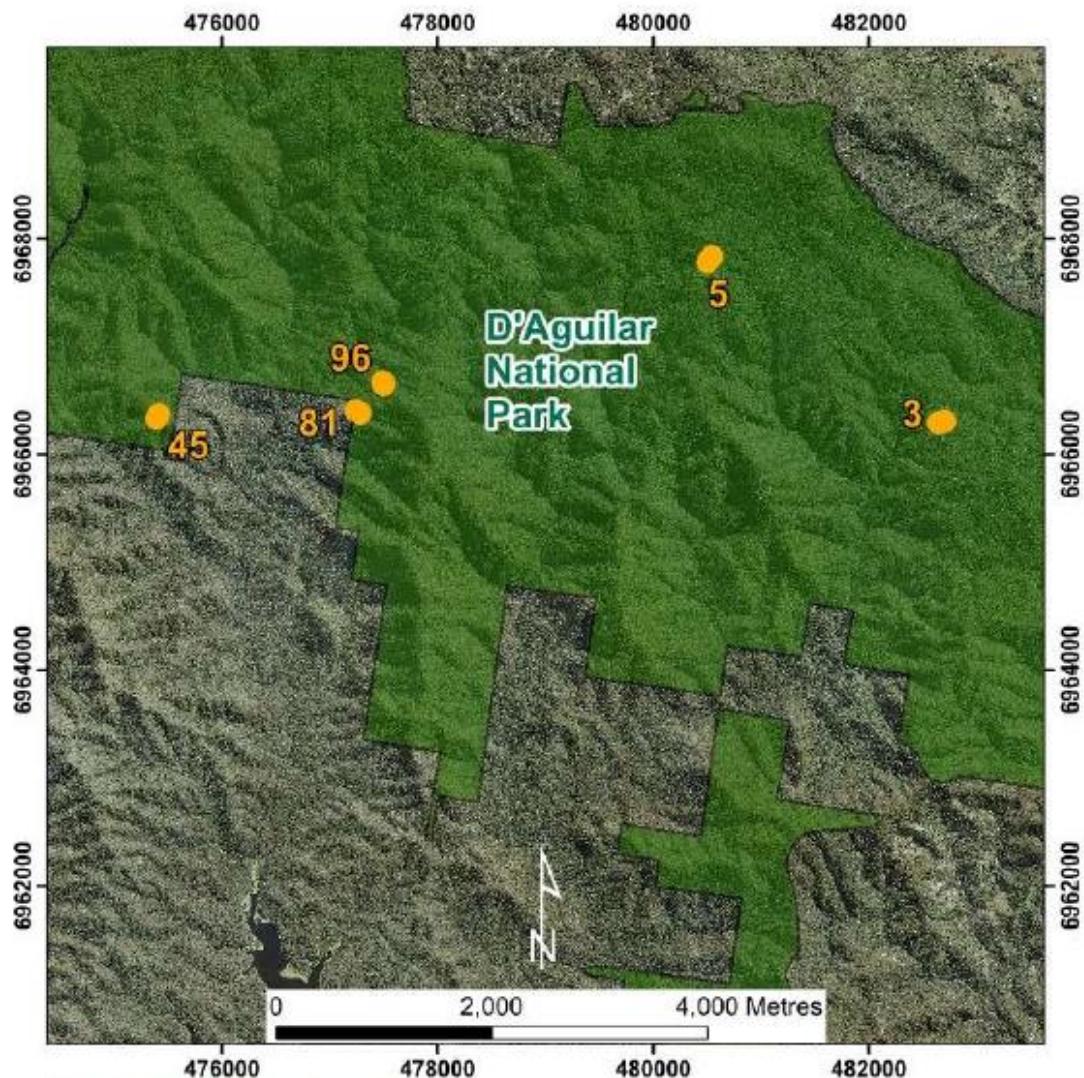

Non-native species cover

Number of non-native species

General comments: No non-native species were recorded adjacent the forest trail on this upper side of the slope for this site.

Fire History: Burnt August 2009

Forest monitoring transect April 2010

Forest monitoring transect May 2018

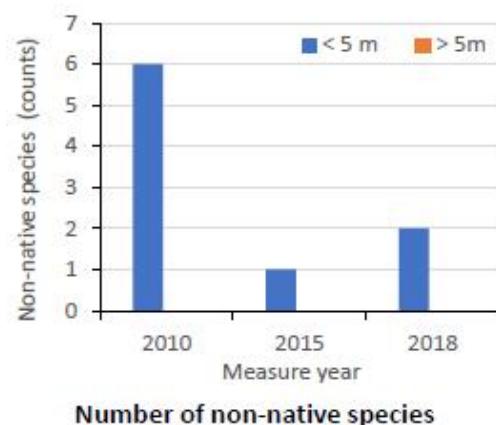

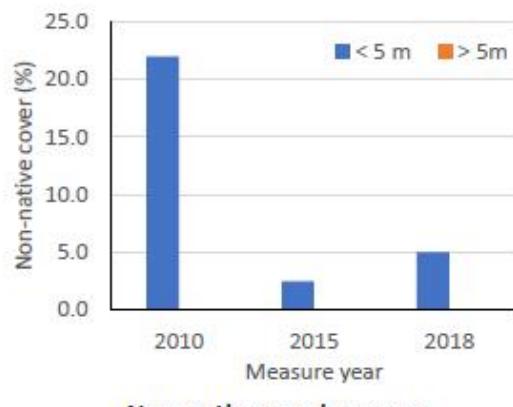

General Comments: This site was last burnt in 2009 before the start of the monitoring. It consistently had a high BioCondition score. Non-native species recorded in the QBEIS BioCondition monitoring site with very low foliage covers were: corkscrew vine (*Passiflora suberosa*), cobbler's pegs (*Bidens pilosa*), *Lantana camara* and thickhead (*Crassocephalum crepidioides*).

Trail-edge cover transect at D'Aguilar 3A

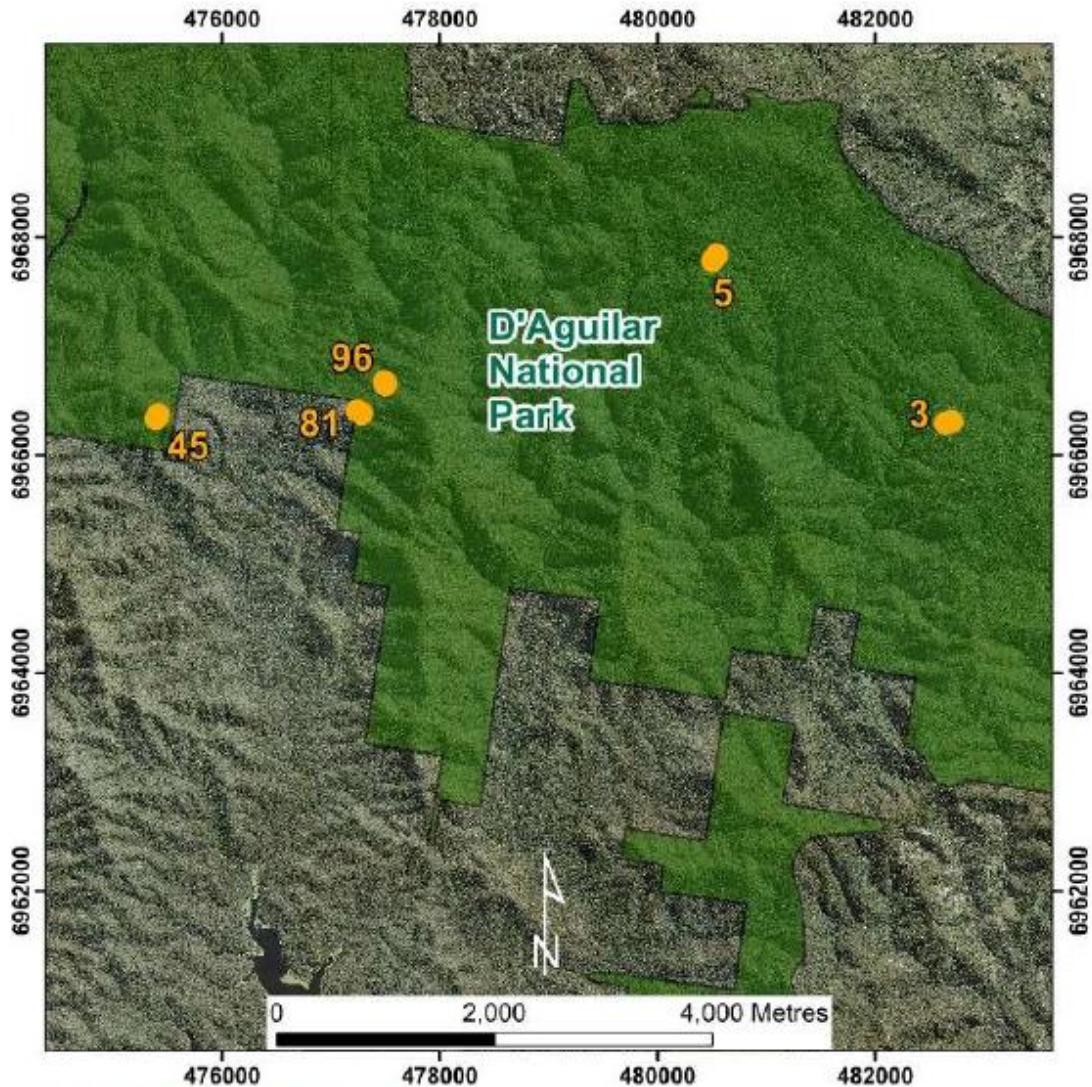

Trail-edge transect March 2015

Trail-edge transect May 2018

General comments: The edge of trail zone had the highest cover and richness of non-native species in 2010. This was a regenerations response following a hazard reduction burn in 2009. The most significant non-native species adjacent the forest trail were cobbler's pegs (*Bidens pilosa*) and slender vervain (*Verbena rigida*). The non-native foliage cover reduced significantly over time since last fire event.

BioCondition scores: 2010 – 81 2015 – 87 2018 – 83

Fire History: Burnt August 2009

Forest monitoring transect April 2010

Forest monitoring transect May 2018

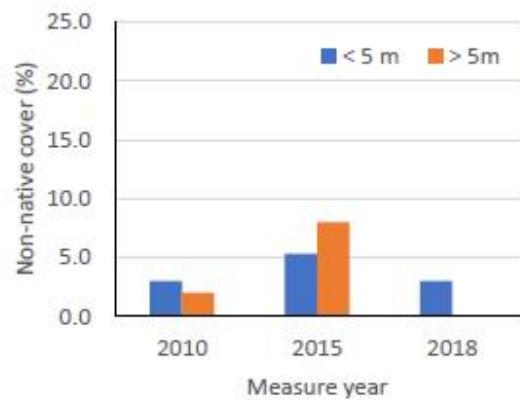

General Comments: This site was last burnt in 2009 months before the start of the monitoring. The fire reduced litter cover, shrub cover and shrub species which has recovered, and the site has a high BioCondition score. Non-native species cover has increased over time. The recorded non-native species were: thickhead (*Crassocephalum crepidioides*), balloon cotton-bush (*Gomphocarpus physocarpus*), cobbler's pegs (*Bidens pilosa*), American black nightshade (*Solanum americanum*), *Lantana camara* and common sowthistle (*Sonchus oleraceus*).

Trail-edge ground cover transect at D'Aguilar 3B

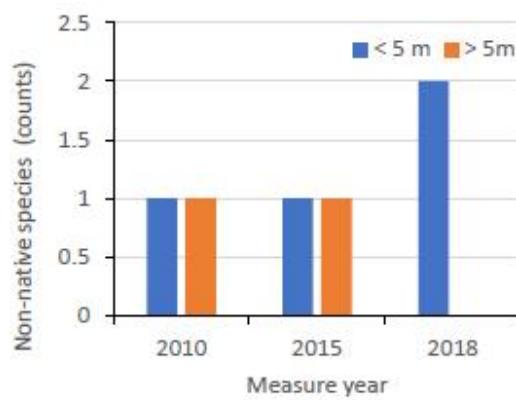

Trail-edge transect March 2015

Trail-edge transect May 2018

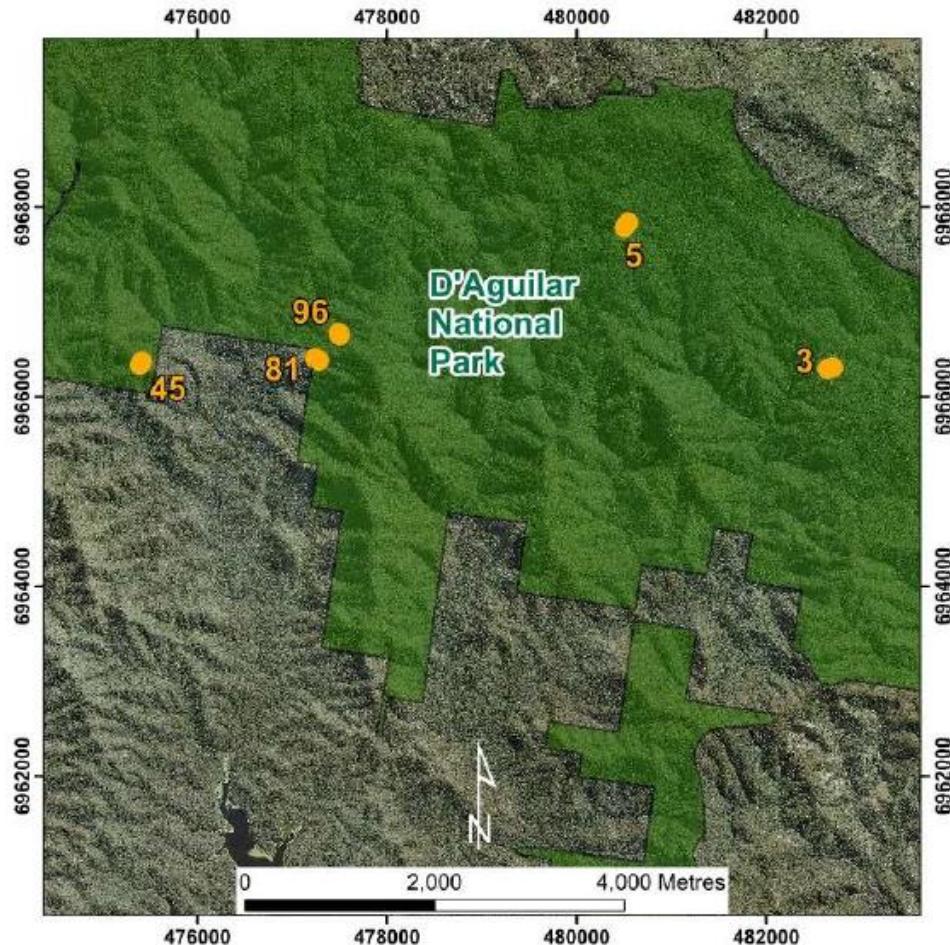

Non-native species cover

Number of non-native species

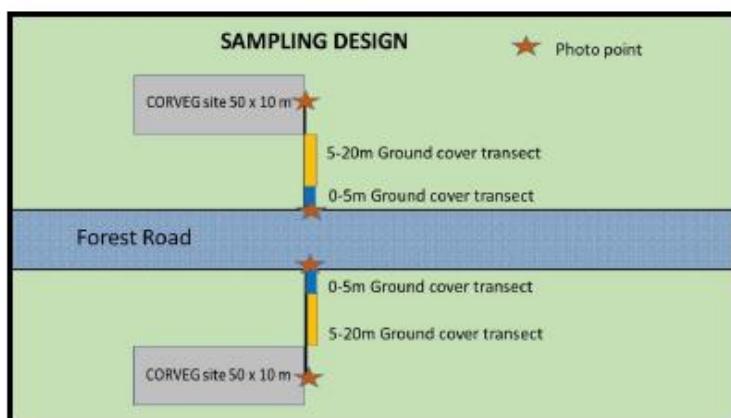

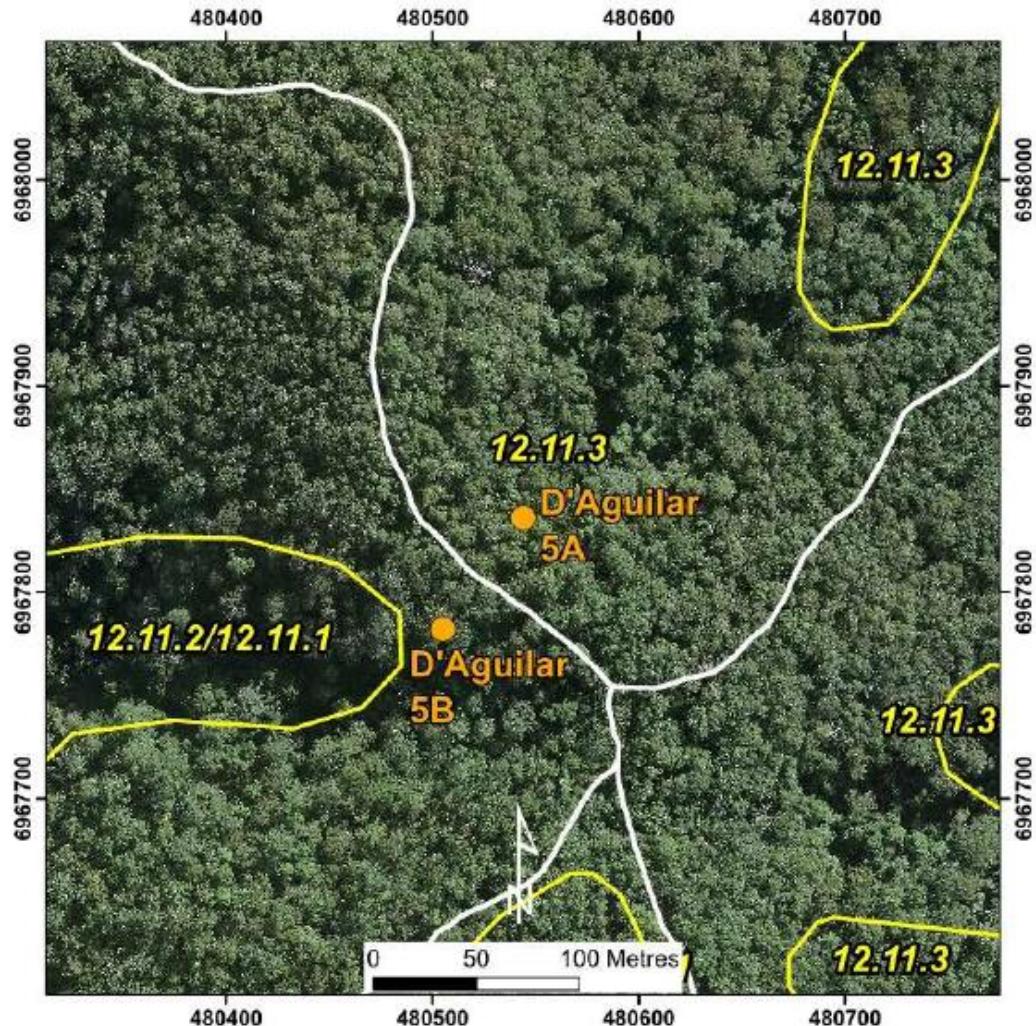

General comments: The track zone has the highest cover and richness of non-native species, and the influence of non-native species increased over the time of sampling. The most significant non-native species were: corky passion vine (*Passiflora suberosa* subsp. *litoralis*), cobbler's pegs (*Bidens pilosa*) and common sowthistle (*Sonchus oleraceus*).

Radar diagram of BioCondition Scores by attribute and year sampled

BioCondition scores: 2010 – 82 2015 – 74 2018 – 89

Fire History: Burnt May 1994

Forest monitoring transect October 2010

Forest monitoring transect November 2018

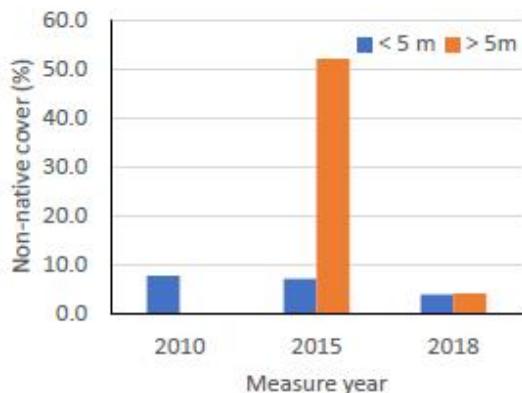

General Comments: The site had relatively high BioCondition score except the 2015 measure which took place during a dry weather spell and very low shrub cover. Considerable fluctuations of BioCondition attributes reflects the rainfall conditions during field measurements. Many non-native species were recorded but in very low covers as shown by the high score for non-native plant cover. These species were: *Ageratum houstonianum*, *Bidens bipinnata*, *Lantana camara*, *Macroptilium atropurpureum*, *Ochna serrulata*, *Senna pendula* var. *glabrata*, *Melinis minutiflora*, *Passiflora suberosa* subsp. *litoralis*

Trail-edge transect at D'Aguilar 68A

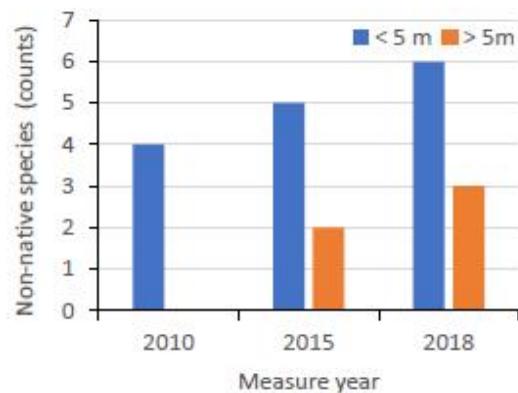

Trail-edge transect October 2010

Trail-edge transect November 2018

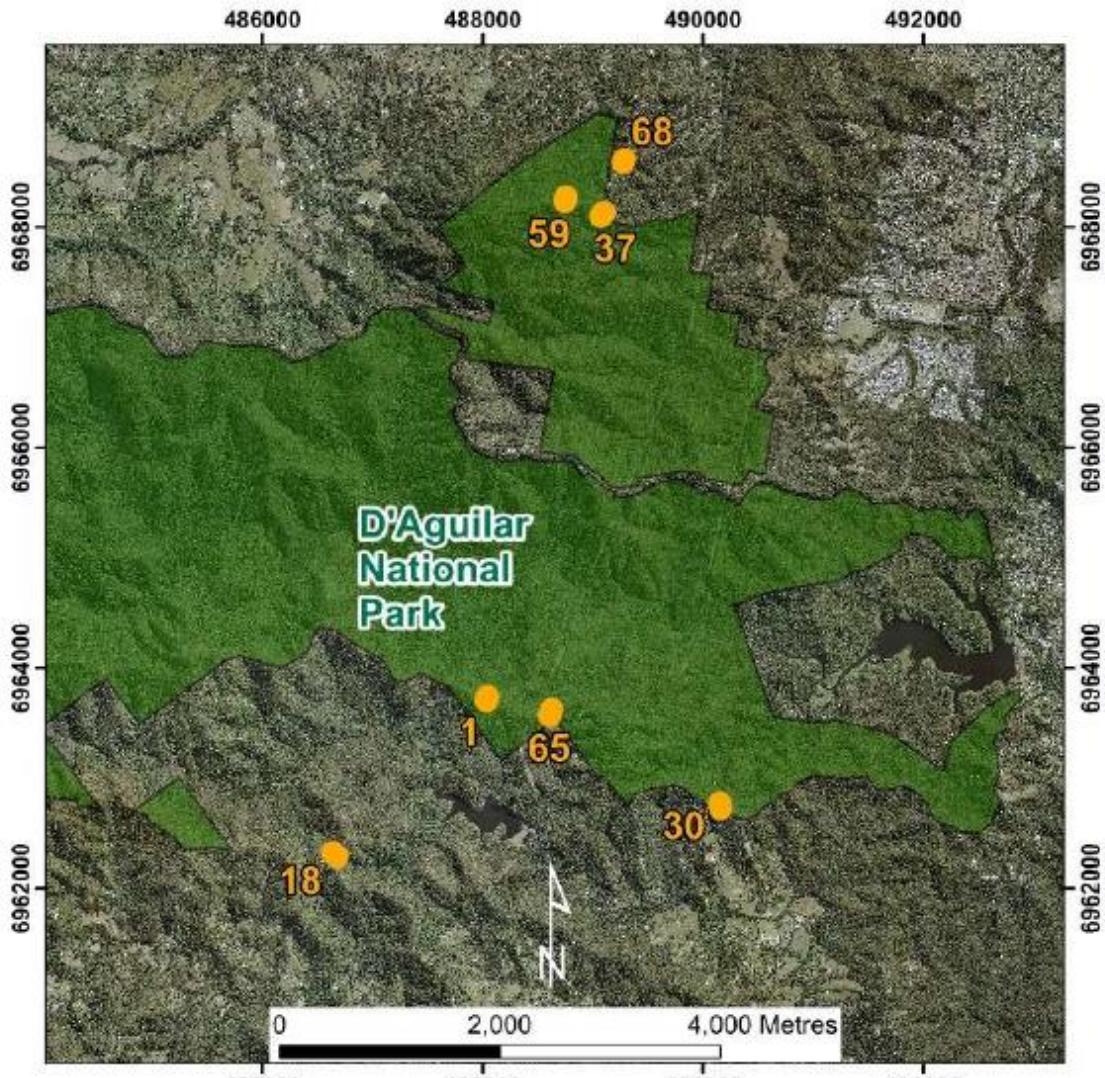

Non-native species cover

Number of non-native species

General comments: The very high cover of non-native species observed during the 2015 measure was a lush *Lantana camara* bush that was then removed. The richness of non-native species increased over the time of sampling. The most significant non-native species were perennial horse gram (*Macrotyloma axillare*) and *Lantana camara*. Other non-native species present at the site were: cobbler's pegs (*Bidens pilosa*), ground asparagus fern (*Asparagus aethiopicus*), easter cassia (*Senna pendula*), common sida (*Sida rhombifolia*), ochna (*Ochna serrulata*), tall fleabane (*Erigeron sumatrensis*) and white eye (*Mitracarpus hirtus*).

Queensland Herbarium, October 2021

QBEIS Site BioCondition monitoring

Radar diagram of BioCondition Scores by attribute and year sampled

BioCondition scores: 2010 – 84 2015 – 78 2018 – 81

Fire History: No fire data

Forest monitoring transect October 2010

Forest monitoring transect November 2018

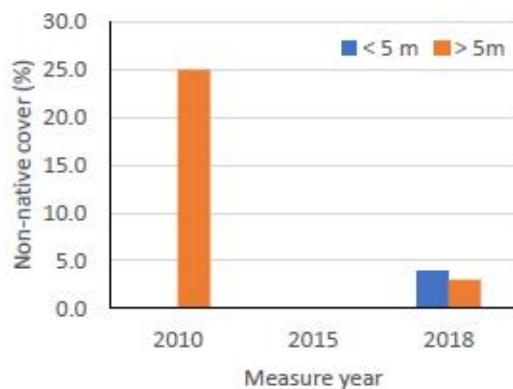

General Comments: The BioCondition scores are moderately high and shrub species cover and richness have all increased. Non-native species cover has increased and could be affecting grass species richness which has decreased. Coarse wood debris in 2018 had also increased relative to past records. Moderate non-native species presence observed in 2010 and 2015 had worsened by 2018. The most significant environmental weeds are lantana (*L. camara*), ground asparagus (*Asparagus aethiopicus*), ochna (*O. serrulata*), siratro (*Macroptilium atropurpureum*), and easter cassia (*Senna pendula*).

Trail-edge ground cover transect at D'Aguilar 68B

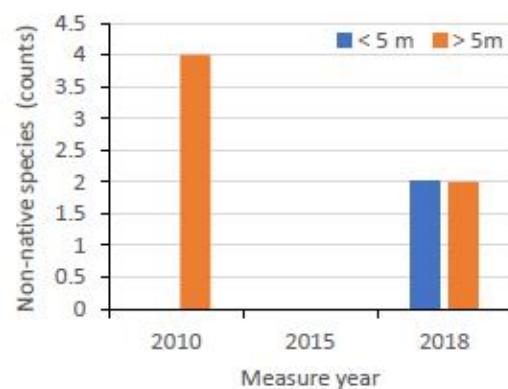

Trail-edge transect November 2010

Trail-edge transect November 2018

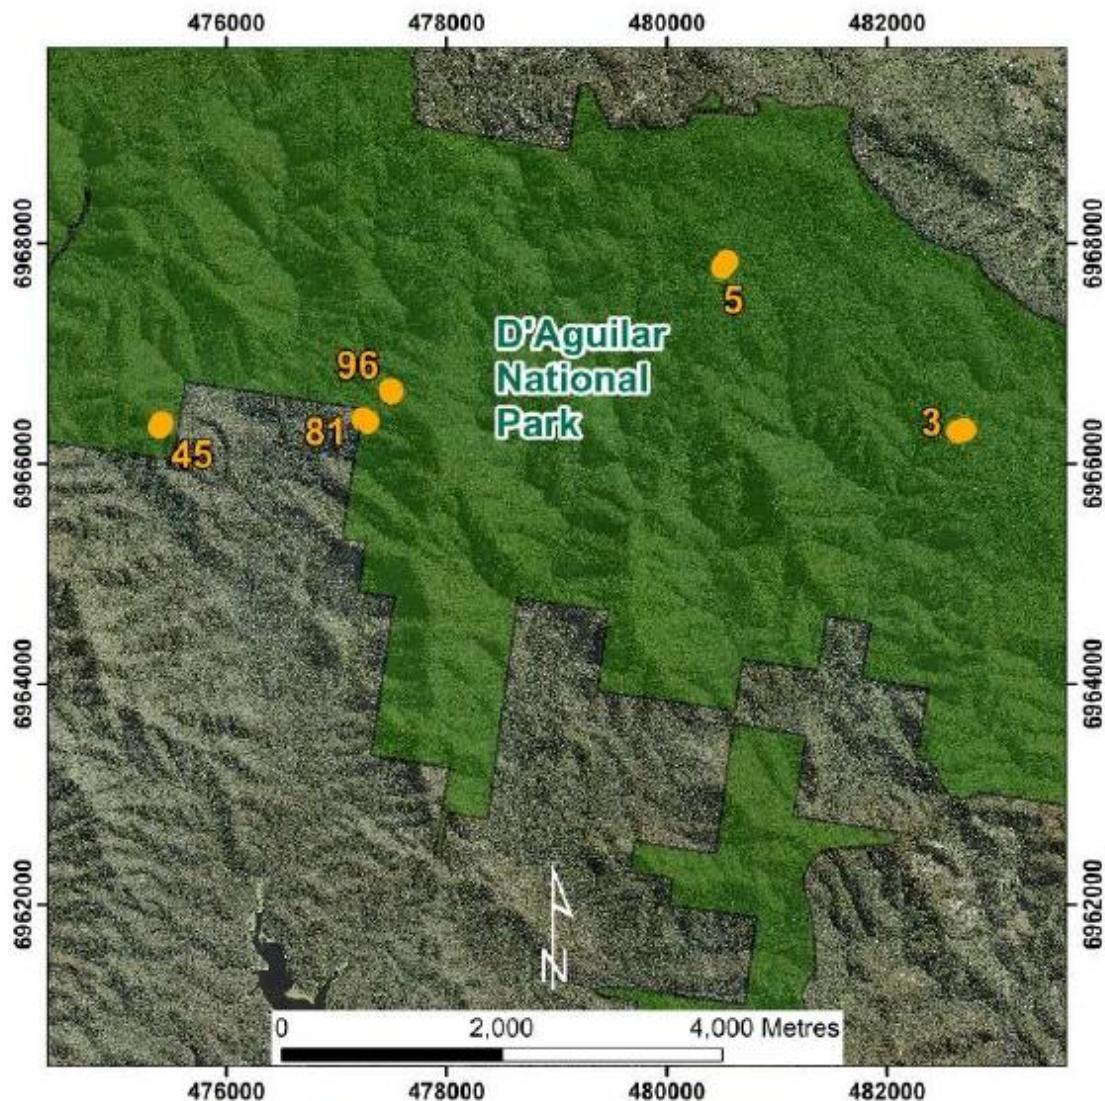

Non-native species cover

Number of non-native species

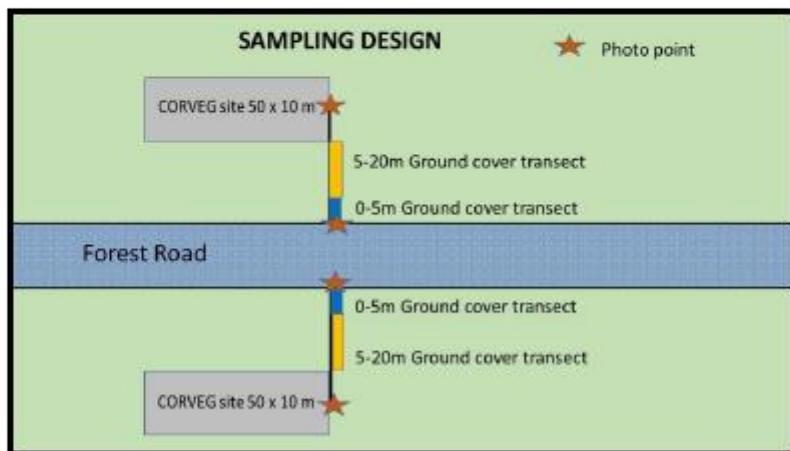

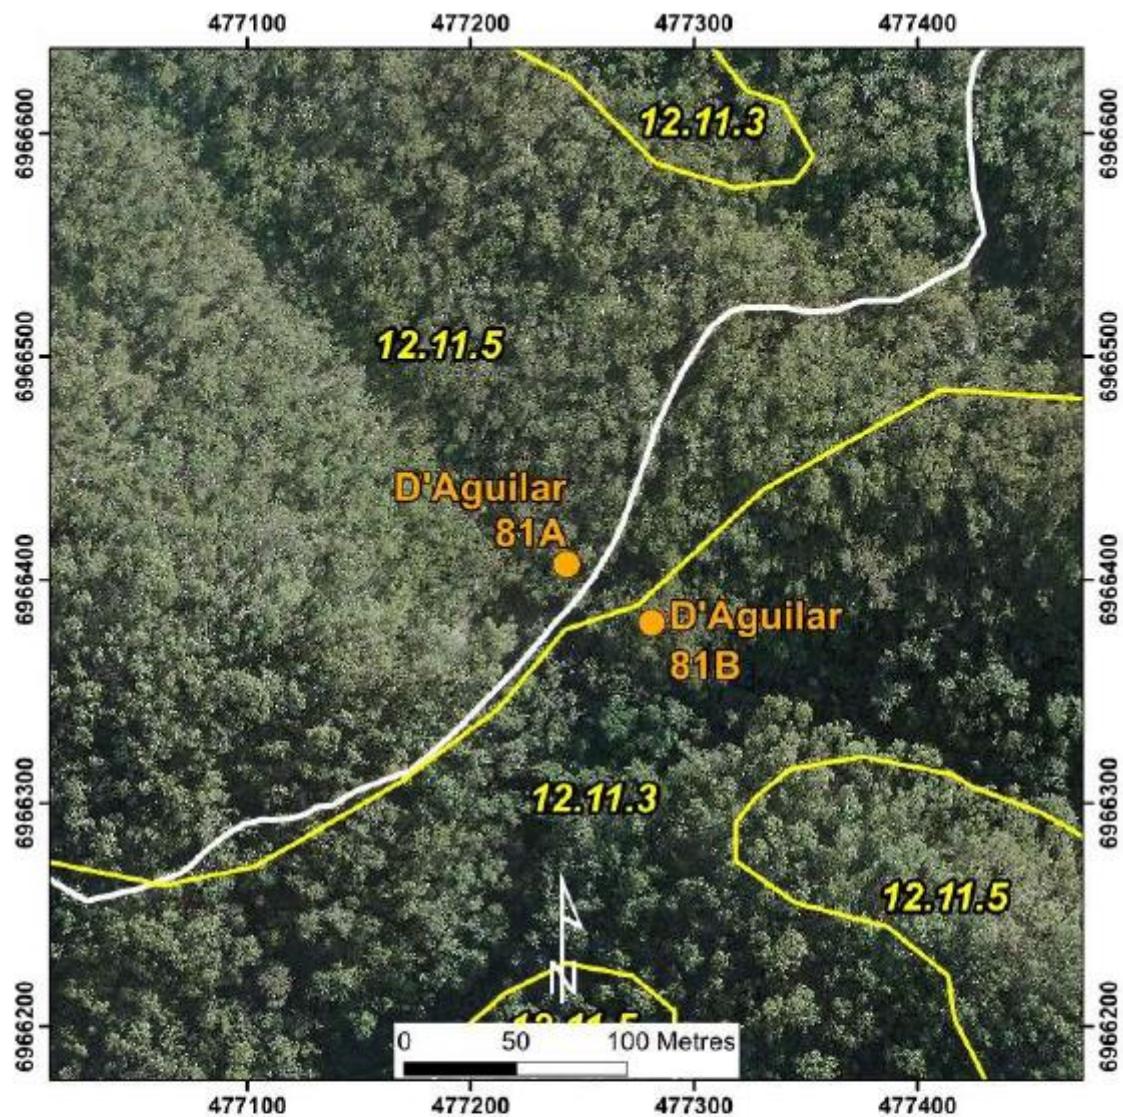

General comments: Non-native species cover and number of non-native species decreased overall since 2010. Easter cassia (*Senna pendula*) and red Natal grass (*Melinis repens*) have not been observed in the ground cover transect since 2010 despite persisting in the forest monitoring transect. Low cover of lantana (*L. camara*) was recorded closer to the track by 2018, and corkstem passionflower (*Passiflora suberosa*) was recorded for the first time. The Millennium drought and wet years that followed may have contributed to the fluctuation in species presence at each sample.

QBEIS Site BioCondition monitoring

Radar diagram of BioCondition Scores by attribute and year sampled

BioCondition scores: 2010 – 80 2015 – 77 2018 – 93

Fire History: Burnt September 2013

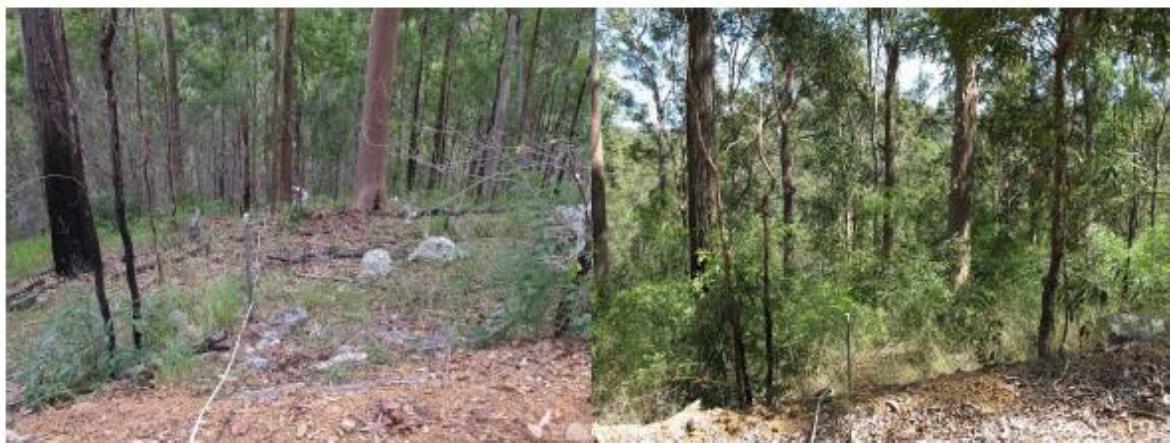

Forest monitoring transect March 2015

Forest November 2018

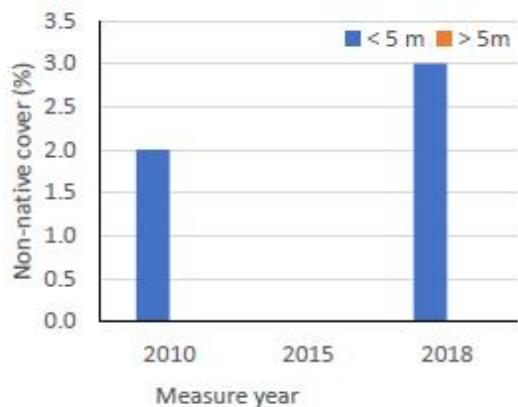

General Comments: This site had slight decrease in BioCondition score between 2010 and 2015, possibly related to late fire in 2013. In 2018, approximately 5 years after fire, increased canopy cover, shrub species richness, and native perennial grass cover was recorded, giving a higher BioCondition score. Observed decrease in grass species richness may be associated with increase in shrub cover. Large tree abundance increasing to benchmark levels may indicate longer-term recovery from disturbance such as logging.

Trail-edge transect March 2015

Trail-edge transect November 2018

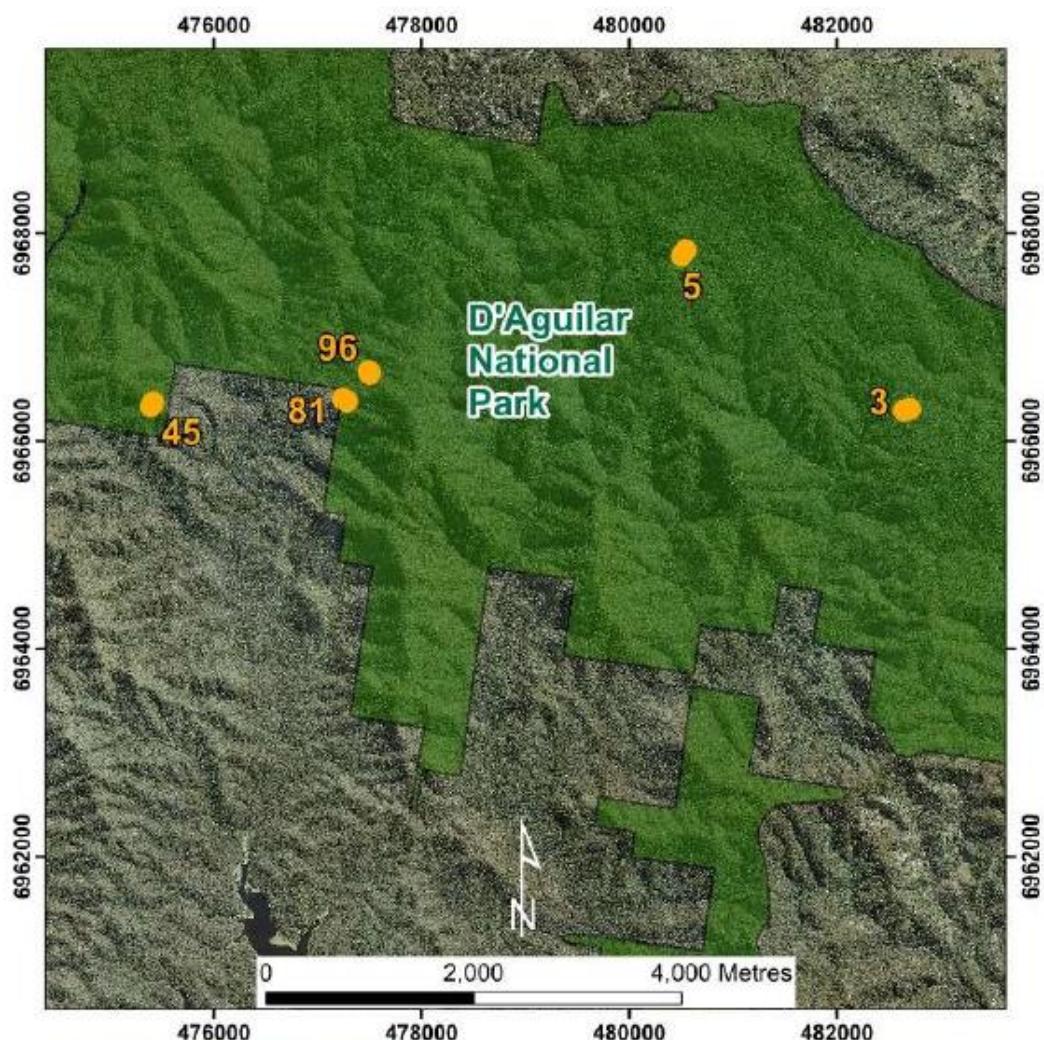

Non-native species cover

Number of non-native species

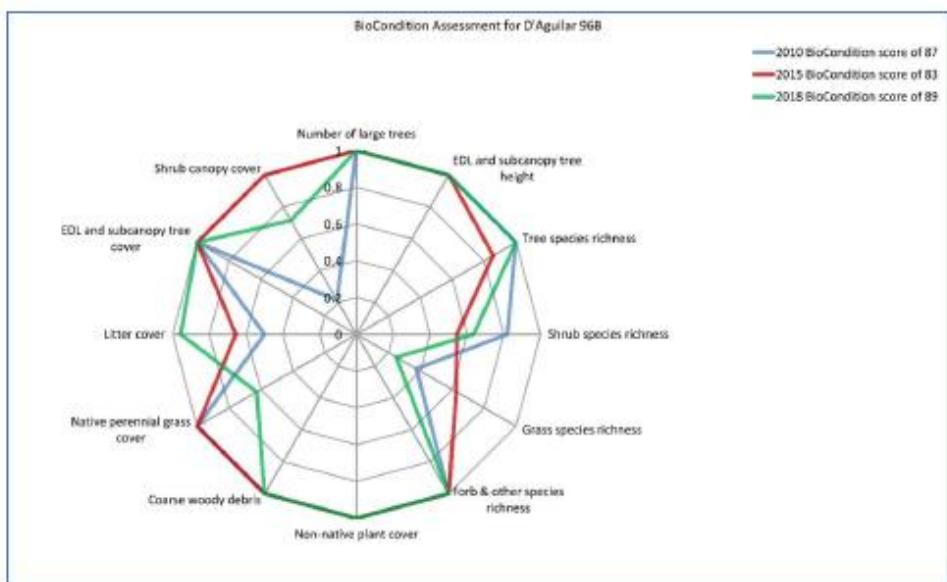

General comments: Red Natal grass (*Melinis repens*) is the only non-native species recorded on the ground cover transect. In 2010 there was low red Natal grass cover (3%), it was not recorded in 2015 which may relate to the 2013 fire, and it was recorded at 1% cover in 2018. Such low levels of non-native cover are not high concern, but we may find increased cover with time since fire in future samples.

Radar diagram of BioCondition Scores by attribute and year sampled

BioCondition scores: 2010 – 87 2015 – 83 2018 – 89

Fire History: Burnt September 2003

Forest monitoring transect November 2010

Forest monitoring transect November 2018

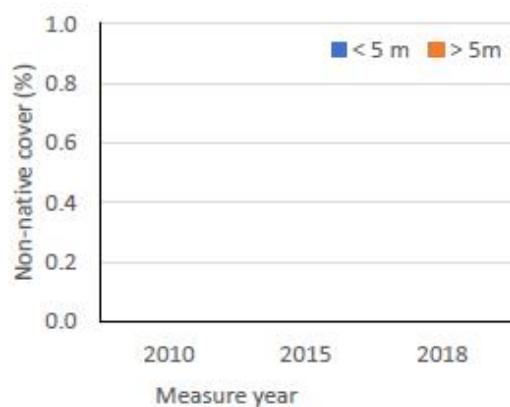

General Comments: Shrub species richness and litter cover have increased during each sample interval, and tree species richness increased from 2010 to 2015 and remained high. Shrub canopy cover decreased between 2015 and 2018 but remains high relative to the 2010 state. Grass species richness has decreased during each sample interval, and native perennial grass cover was high in 2010 and 2015 but decreased by 2018, probably accounting for some increase in the litter cover recorded.

Height: average: 0.58m; range: 0.20 - 1.80m; (66 sites)

Projective foliage cover (PFC): average: 33.4%; range: 3.0 - 94.0%; (66 sites)

Species list (frequency (%), average cover (%)):

Grass - perennial:

Most frequent species (up to 6):

Imperata cylindrica (77.3, 9.3), *Themeda triandra* (62.1, 15.7), *Cymbopogon refractus* (37.9, 5.2), *Poa labillardierei* var. *labillardierei* (36.4, 8.9), *Entolasia stricta* (34.8, 4.8), *Ottochloa gracillima* (33.3, 12.5)

Additional species:

Digitaria parviflora (30.3, 1.8), *Oplismenus aemulus* (27.3, 2.6), *Panicum effusum* (16.7, 4.7), *Oplismenus imbecillus* (12.1, 5.3), *Arundinella nepalensis* (10.6, 18.7), *Sarga leiocladum* (9.1, 44.0), *Entolasia marginata* (7.6, 0.0), *Aristida calycina* var. *calycina* (6.1, 0.0), *Capillipedium spicigerum* (6.1, 5.0), *Echinopogon ovatus* (6.1, 0.0), *Microlaena stipoides* (6.1, 1.0), *Poa cheelii* (6.1, 7.0), *Aristida gracilipes* (4.5, 14.5), *Aristida queenslandica* (4.5, 0.0), *Dichelachne micrantha* (4.5, 0.0), *Eragrostis spartinaeoides* (4.5, 1.5), *Eremochloa bimaculata* (4.5, 1.0), *Ottochloa nodosa* (4.5, 0.0), *Paspalidium gracile* (4.5, 0.0), *Poa sieberiana* (4.5, 8.7), *Alloteropsis semialata* (3.0, 2.0), *Chrysopogon sylvaticus* (3.0, 0.0), *Melinis minutiflora** (3.0, 11.0), *Oplismenus* (3.0, 3.0), *Paspalidium distans* (3.0, 0.0), *Rytidosperma* (3.0, 1.0), *Aristida vagans* (1.5, 2.0), *Austrostipa* (1.5, 1.0), *Austrostipa ramosissima* (1.5, 0.0), *Capillipedium parviflorum* (1.5, 5.0), *Danthonia* (1.5, 5.0), *Digitaria* (1.5, 0.0), *Megathyrsus maximus** (1.5, 0.0), *Microlaena stipoides* var. *stipoides* (1.5, 0.0), *Paspalum conjugatum** (1.5, 0.0), *Paspalum dilatatum** (1.5, 0.0), *Paspalum scrobiculatum* (1.5, 0.0), *Poa* (1.5, 1.0), *Sporobolus* (1.5, 1.0), *Sporobolus creber* (1.5, 0.0), *Urochloa decumbens** (1.5, 2.0)

Grass - annual/biennial:

Not present

Forbs & other:

Most frequent species (up to 6):

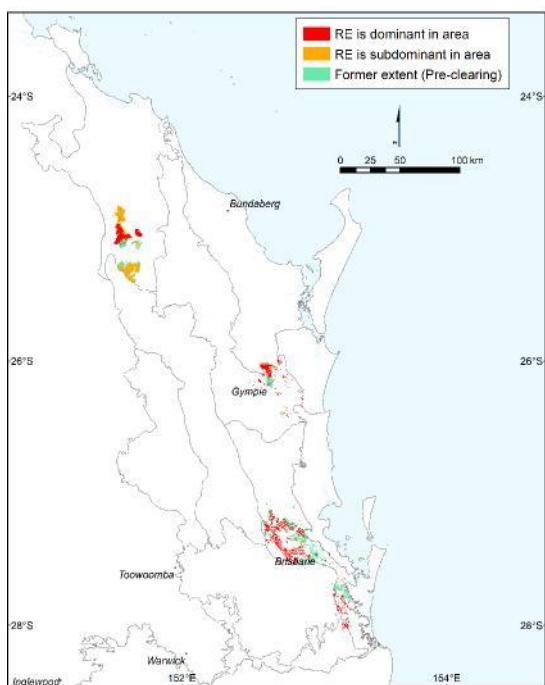

Desmodium rhytidophyllum (78.8, 2.7), *Desmodium gunnii* (77.3, 2.7), *Eustrephus latifolius* (72.7, 1.8), *Cyanthillium cinereum* (71.2, 2.2), *Glycine clandestina* var. *clandestina* (71.2, 1.3), *Hardenbergia violacea* (69.7, 2.0)

Additional species:

Lomandra longifolia (62.1, 2.2), *Coleus australis* (57.6, 3.5), *Goodenia rotundifolia* (51.5, 3.8), *Lobelia purpurascens* (50.0, 3.0), *Oxalis chnoodes* (48.5, 0.0), *Smilax australis* (43.9, 1.6), *Clematicissus opaca* (42.4, 0.0), *Lepidosperma laterale* (36.4, 1.0), *Dianella caerulea* (34.8, 0.8), *Pseuderanthemum variabile* (34.8, 2.5), *Pigea enneasperma* (33.3, 0.0), *Pigea stellaroides* (30.3, 1.0), *Sigesbeckia orientalis* (30.3, 2.5), *Blechnum neohollandicum* (28.8, 3.7), *Cyperus laevis* (28.8, 3.0), *Causonis clematidea* (27.3, 0.0), *Cissus antarctica* (25.8, 0.5), *Geitonoplesium cymosum* (24.2, 0.0), *Gymnostachys anceps* (24.2, 0.0), *Pteridium esculentum* (24.2, 3.5), *Viola hederacea* (24.2, 2.8), *Desmodium brachypodium* (22.7, 0.0), *Hydrocotyle laxiflora* (22.7, 2.0), *Veronica plebeia* (22.7, 3.0), *Billardiera scandens* (21.2, 0.6), *Viola betonicifolia* (21.2, 0.0), *Ajuga australis* (19.7, 1.1), *Lomandra multiflora* subsp. *multiflora* (19.7, 0.5), *Lordhowea amygdalifolia* (19.7, 3.0), *Ozothamnus diosmifolius* (19.7, 0.0), *Hibbertia aspera* (18.2, 0.0), *Adiantum hispidulum* (16.7, 0.0), *Brunoniella australis* (16.7, 0.0), *Stephania japonica* (16.7, 0.0), *Commelinia diffusa* (15.2, 0.0), *Cyperus enervis* (15.2, 0.0), *Dianella longifolia* (15.2, 0.0), *Dioscorea transversa* (15.2, 3.0), *Kennedia rubicunda* (15.2, 3.0), *Macrozamia lucida* (15.2, 1.0), *Poranthera*

microphylla (15.2, 0.0), *Rubus parvifolius* (15.2, 3.5), *Solanum densevestitum* (15.2, 3.5), *Clematis glycinoides* (13.6, 1.5), *Dianella* (13.6, 0.0), *Dianella caerulea* var. *vannata* (13.6, 12.0), *Gonocarpus humilis* (13.6, 0.0), *Pandorea pandorana* (13.6, 0.0), *Teucrium argutum* (13.6, 0.0), *Centratherum riparium* (12.1, 0.0), *Cyperus tetraphyllum* (12.1, 0.0), *Dianella caerulea* var. *assera* (12.1, 3.0), *Dichondra repens* (12.1, 3.1), *Galium leptogonium* (12.1, 0.8), *Parsonia straminea* (12.1, 0.0), *Passiflora suberosa** (12.1, 0.0), *Phyllanthus virgatus* (12.1, 0.0), *Scleria mackaviensis* (12.1, 0.0), *Geranium solanderi* var. *solanderi* (10.6, 2.0), *Gomphocarpus fruticosus** (10.6, 0.0), *Lomandra laxa* (10.6, 8.0), *Mentha satureioides* (10.6, 5.0), Most frequent species (up to 6):

Themeda triandra (75.0, 14.3), *Aristida queenslandica* var. *dissimilis* (62.5, 1.0), *Arundinella nepalensis* (50.0, 0.2), *Bothriochloa decipiens* var. *decipiens* (50.0, 15.5), *Cymbopogon refractus* (50.0, 4.3), *Heteropogon contortus* (50.0, 3.0)

Additional species:

*Melinis repens** (50.0, 0.6), *Panicum effusum* (50.0, 0.0), *Eragrostis spartinoides* (37.5, 0.0), *Sporobolus elongatus* (37.5, 0.0), *Aristida personata* (25.0, 5.0), *Aristida queenslandica* var. *queenslandica* (25.0, 0.2), *Aristida spuria* (25.0, 0.0), *Capillipedium spicigerum* (25.0, 0.0), *Chrysopogon sylvaticus* (25.0, 0.7), *Digitaria diffusa* (25.0, 30.0), *Digitaria parviflora* (25.0, 0.0), *Digitaria ramularis* (25.0, 0.2), *Enneapogon lindleyanus* (25.0, 0.0), *Eragrostis brownii* (25.0, 0.0), *Panicum simile* (25.0, 1.0), *Paspalidium distans* (25.0, 1.0), *Paspalidium gracile* (25.0, 1.0), *Aristida gracilipes* (12.5, 12.0), *Chloris divaricata* (12.5, 1.0), *Chrysopogon fallax* (12.5, 0.0), *Cymbopogon queenslandicus* (12.5, 20.0), *Dichanthium setosum* (12.5, 0.0), *Digitaria divaricatissima* (12.5, 0.0), *Digitaria longiflora* (12.5, 0.0), *Digitaria minima* (12.5, 0.0), *Digitaria violascens** (12.5, 0.0), *Eragrostis sororia* (12.5, 0.0), *Eragrostis tenuifolia** (12.5, 0.0), *Eremochloa bimaculata* (12.5, 1.0), *Imperata cylindrica* (12.5, 0.4), *Megathyrsus maximus* var. *maximus** (12.5, 0.0), *Sarga leiocladum* (12.5, 0.0), *Schizachyrium pseudeulalia* (12.5, 0.0), *Sehima nervosum* (12.5, 0.0), *Setaria palmifolia** (12.5, 0.0), *Setaria pumila** (12.5, 0.0), *Sporobolus creber* (12.5, 0.5), *Sporobolus fertilis** (12.5, 0.0), *Urochloa whiteana* (12.5, 0.0)

Grass - annual/biennial:

Not present

Forbs & other:

Most frequent species (up to 6):

Desmodium rhytidophyllum (100.0, 2.2), *Crotalaria montana* (87.5, 0.5), *Cyanthillium cinereum* (87.5, 0.5), *Phyllanthus virgatus*

(75.0, 0.0), *Scleria brownii* (62.5, 0.4), *Cyperus fulvus* (50.0, 0.0)

Additional species:

Dianella caerulea (50.0, 0.0), *Emilia sonchifolia** (50.0, 0.0), *Glycine tabacina* (50.0, 0.6), *Grewia latifolia* (50.0, 0.3), *Lomandra longifolia* (50.0, 0.6), *Rostellularia adscendens* (50.0, 0.5), *Sigesbeckia orientalis* (50.0, 1.2), *Spermacoce brachystema* (50.0, 0.2), *Bidens pilosa** (37.5, 2.2), *Brunoniella australis* (37.5, 0.0), *Capparis canescens* (37.5, 0.0), *Cheilanthes distans* (37.5, 0.8), *Cheilanthes sieberi* subsp. *sieberi* (37.5, 0.5), *Cyperus gracilis* (37.5, 0.5), *Desmodium varians* (37.5, 0.5), *Euphorbia hirta** (37.5, 0.0), *Eustrephus latifolius* (37.5, 0.0), *Galactia tenuiflora* (37.5, 5.0), *Glossocardia bidens* (37.5, 0.5), *Indigofera linnaei* (37.5, 30.0), *Lantana camara** (37.5, 4.2), *Pigea stellarioides* (37.5, 0.3), *Planchonia careya* (37.5, 0.0), *Pterocaulon* (37.5, 0.0), *Tephrosia filipes* subsp. *filipes* (37.5, 0.0), *Zornia dyctiocarpa* var. *dyctiocarpa* (37.5, 0.5), *Abildgaardia ovata* (25.0, 0.0), *Acacia disparrima* subsp. *disparrima* (25.0, 0.0), *Acacia*

leiocalyx subsp. *leiocalyx* (25.0, 0.0), *Chamaecrista absus* var. *absus* (25.0, 0.0), *Chamaecrista nomame* var. *nomame* (25.0, 0.2), *Chrysocephalum apiculatum* (25.0, 0.5), *Clematicissus opaca* (25.0, 0.0), *Coelospermum reticulatum* (25.0, 0.0), *Corymbia intermedia* (25.0, 0.0), *Desmodium brachypodium* (25.0, 0.0), *Evolvulus alsinoides* (25.0, 0.0), *Fimbristylis dichotoma* (25.0, 0.0), *Glycine clandestina* var. *clandestina* (25.0, 0.5), *Indigofera baileyi* (25.0, 7.0), *Indigofera hirsuta* (25.0, 0.5), *Lantana montevidensis** (25.0, 7.0), *Lomandra filiformis* (25.0, 0.5), *Lomandra laxa* (25.0, 0.3), *Lomandra multiflora* subsp. *multiflora* (25.0, 0.0), *Melhania oblongifolia* (25.0, 0.5), *Oxalis corniculata** (25.0, 0.0), *Passiflora suberosa** (25.0, 0.0), *Peripleura hispidula* var. *hispidula* (25.0, 0.0), *Petalostigma pubescens* (25.0, 0.0), *Scleria mackaviensis* (25.0, 0.5), *Sida hackettiana* (25.0, 0.0), *Acacia maidenii* (12.5, 0.0), *Achyranthes aspera* (12.5, 0.0), *Ageratum houstonianum** (12.5, 0.0), *Allocasuarina torulosa* (12.5, 0.0), *Alphitonia excelsa* (12.5, 0.0), *Altemanthera nana* (12.5, 0.0), *Anisomeles* (12.5, 1.0), *Aristolochia pubera* (12.5, 0.0), *Austrosteenisia blackii* (12.5, 0.0), *Boerhavia* (12.5, 0.0), *Breynia oblongifolia* (12.5, 0.0), *Bulbostylis barbata* (12.5, 0.0), *Cajanus reticulatus* (12.5, 0.0), *Cassytha filiformis* (12.5, 0.2), *Clerodendrum floribundum* (12.5, 0.0), *Corchorus trilocularis* (12.5, 0.0), *Corymbia citriodora* subsp. *variegata* (12.5, 0.0), *Corymbia clarksoniana* (12.5, 0.0), *Crassocephalum crepidioides** (12.5, 0.0), *Cycas megacarpa* (12.5, 0.0), *Cyperus laevis* (12.5, 0.2), *Cyperus leiocalylon* (12.5, 0.5), *Desmodium gangeticum* (12.5, 0.0), *Dianella* (12.5, 0.5), *Dianella longifolia* (12.5, 0.0), *Dioscorea transversa* (12.5, 0.5), *Erigeron sumatrensis** (12.5, 0.0), *Eucalyptus crebra* (12.5, 0.0), *Eucalyptus exserta* (12.5, 0.0), *Eucalyptus tereticornis* (12.5, 0.0), *Euchiton sphaericus* (12.5, 0.0), *Euphorbia* (12.5, 0.5), *Fimbristylis vaginata* (12.5, 0.0), *Flemingia parviflora* (12.5, 0.0), *Gahnia aspera* (12.5, 0.0), *Glandularia aristigera** (12.5, 0.0), *Glycine tomentella* (12.5, 0.0), *Gomphocarpus physocarpus** (12.5, 0.0), *Gomphrena celosioides** (12.5, 0.0), *Hardenbergia violacea* (12.5, 0.5), *Heliotropium amplexicaule** (12.5, 0.0), *Indigofera linifolia* (12.5, 0.0), *Indigofera polyanthoides* (12.5, 0.0), *Ipomoea plebeia* (12.5, 0.0), *Jacksonia scoparia* (12.5, 0.0), *Jasminum didymum* subsp. *racemosum* (12.5, 0.5), *Jasminum simplicifolium* subsp. *australiense* (12.5, 0.5), *Lagenophora sublyrata* (12.5, 0.0), *Leucas martinicensis** (12.5, 0.0), *Lomandra confertifolia* subsp. *pallida* (12.5, 0.0), *Macrotyloma uniflorum** (12.5, 0.0), *Macrozamia miquelii* (12.5, 0.0), *Malvastrum americanum* var. *americanum** (12.5, 0.0), *Malvastrum coromandelianum* subsp. *coromandelianum** (12.5, 0.0), *Oxalis* (12.5, 0.5), *Parsonsia* (12.5, 0.0), *Polycarpaea corymbosa* var. *minor* (12.5, 0.0), *Polygala triflora* (12.5, 0.0), *Poranthera microphylla* (12.5, 0.0), *Pseuderanthemum variabile* (12.5, 0.0), *Pulteraea villosa* (12.5, 0.0), *Rhynchosia minima* (12.5, 0.0), *Richardia brasiliensis** (12.5, 0.0), *Scleria sphacelata* (12.5, 0.0), *Sida rhombifolia** (12.5, 0.0), *Sida rohlenae* (12.5, 0.0), *Smilax australis* (12.5, 0.0), *Solanum sturtianum* (12.5, 0.0), *Teucrium argutum* (12.5, 0.5), *Verbena rigida** (12.5, 0.2), *Xanthorrhoea latifolia* subsp. *latifolia* (12.5, 0.0), *Zornia* (12.5, 0.0), *Zornia muriculata* subsp. *angustata* (12.5, 0.0), *Zornia muriculata* subsp. *muriculata* (12.5, 0.0)

Species list: Frequency (percent of total sites) and cover (average of species cover across sites where that species is present). Ordered by decreasing frequency. Naturalised species have an asterisk (*) after the name. Indet. after listed name if indeterminate species or genus.
