ABSTRACT: Bhagwan Mahavir (Molem) National Park, the only National park in Goa, was evaluated for its diversity of Angiosperms. A total number of 721 wild species belonging to 119 families were documented from this protected area of which 126 are endemics. A checklist of these species is provided here.

INTRODUCTION

Protected areas are most important in many ways for conservation of biodiversity. Worldwide there are 102,102 Protected Areas covering 18.8 million km². India has a network of 660 Protected Areas including 99 National Parks, 514 Wildlife Sanctuaries, 43 Conservation Reserves and 4 Community Reserves covering a total of 158,373 km² of geographical area of the country which is approximately 4.82% (National Wildlife Database 2011). There are also 15 Biosphere Reserves and 30 Tiger Reserves as well. The Government of India has declared 2 biosphere reserves and 13 National Parks in the Western Ghats. (National Wildlife Database 2011).

Though fragmented, protected areas in Western Ghats of India are important from conservation point of view, because most of these areas are under threat of rapid destruction. Goa is an important state located along Western Ghats occupying an area of c. 600 km² out of the total 3702 km² geographical area of the state. Western Ghats range extends over the length of c. 125 km in Goa. Due to existence of two and recent declaration of two new protected areas, the prospects of conserving the rich biodiversity have increased. Bhagwan Mahavir National Park is one such habitat with tremendous diversity and forms an important constituent in the green jewel of Western ghats ranges in Goa.

Bhagwan Mahavir National Park also known as Molem National Park is the only National Park in Goa, spreading over a total area of 107 km² on the western escarpment of Western Ghats in the Sanguem Taluka of Goa between 15°14'09.82"-15°24'34.3" N latitude, 74°13'20.6"-74°20'02.92" E longitude (Figure 1). Dudhsagar waterfall, second largest waterfall in India, lies in Bhagwan Mahavir National Park. The National Park forms the core area of Bhagwan Mahavir Wildlife Sanctuary and is located on National Highway 4A (Panaji- Belgaum) c. 60 km from Panaji and c. 85 km from Belgaum. The National Park area is mountainous in terrain with succession of hills and valleys. The altitude ranges from 80 m to about 750 m above m. s. l. in the National Park. Tallest peak in the National Park is a hill near Karanzol railway station, which is about 753 m above m. s. l. The major types of rocks seen

in the National Park are Laterite and Deccan trap Basalt (Naik, 1995). Soil in most places of the National Park area is laterite of high and low level type formed by natural metamorphosis and degradation of undulation rocks. Minerals like bauxite, iron and manganese are obtained from these soils. The general climate of the area is tropical with high percentage of humidity throughout the year. The variation in temperature does not exceed 20°C. The minimum temperature during the coldest month is about 15°C while maximum in summer is about 37°C (Naik, 1995). Monsoon starts during the first week of June. It extends up to the middle of October.

According to Champion and Seth (1968), the forest types in the National Park falls within the biogeographical province 5A/5B and contains pristine vegetation which

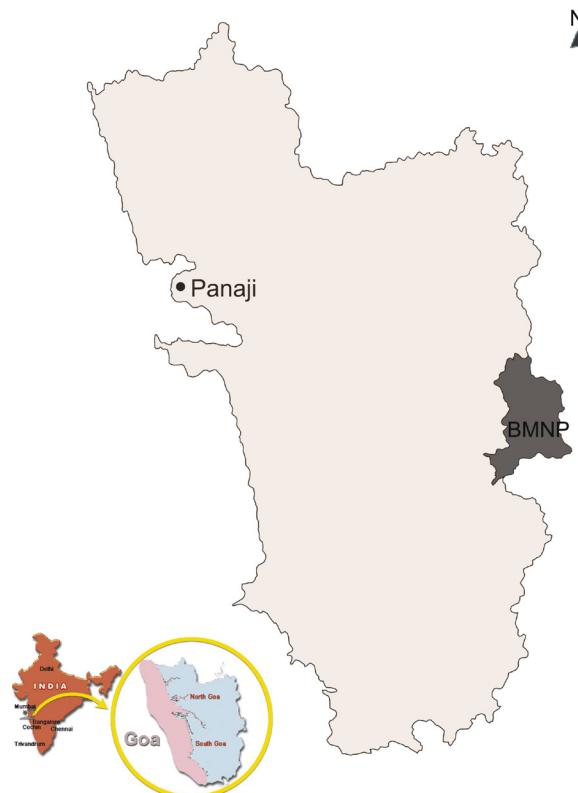

FIGURE 1. Location of Bhagwan Mahavir National Park.

is classified into three main forest types as explained below.

a. West Coast Tropical Evergreen Forests

The tall trees found in West Coast Tropical Evergreen Forests of the National Park include *Actinodaphne angustifolia*, *Canarium strictum*, *Diospyros buxifolia*, *Diospyros pruriens*, *Garcinia gummi-gutta*, *Holigarna grahamii*, *Knema attenuata*, *Mammea suriga*, *Polyalthia fragrans*, *Syzygium laetum*, *Vitex altissima*, etc. The middle-sized trees found are *Litsea coriacea*, *Aporusa cardiosperma*, *Antidesma acidum*, *Blachia andamanica* subsp. *denudata*, *Ixora nigricans*, *Psychotria dalzellii*, *Memecylon terminale*, *Dracaena terniflora*, etc. The trees found in the riparian forests are *Calophyllum calaba*, *Lophopetalum wightianum* and *Hydnocarpus pentandrus*. Some woody climbers or lianas found in this type of forests are *Entada rheedei*, *Gnetum ula*, *Chonemorpha fragrans*, *Ancistrocladus heyneanus*, *Luvunga eleutherandra*, *Paramignya monophylla* and *Toddalia asiatica*. Undergrowth is formed by shrubby species like *Dracaena terniflora*, *Ixora coccinea* and herbaceous species of families Cyperaceae, Zingiberaceae, Commelinaceae and Asteraceae.

Epiphytic plants in evergreen forests are restricted to family Orchidaceae (belonging to the genera like *Aerides*, *Bulbophyllum*, *Cymbidium*, *Eria* and *Vanda*) and Apocynaceae (*Hoya wightii*). Other epiphytes or lithophytes like *Utricularia striatula* and *Argostemma courtaillense* are also found in the crevices of rocks and on trunks of tall trees where there is little soil and moisture. The herbaceous flora includes *Costus speciosus*, *Impatiens* spp., *Phyllanthus* spp., *Urena lobata*, *Gynura nitida*, etc.

b. West Coast Semi - Evergreen Forests

This type of forest is found in upper parts of ghats and lower elevations near stream beds. These forests are transitional between moist deciduous forests and evergreen forests. The semi-evergreen formations are seen with isolated patches of evergreen forests in ravines and valleys.

The following two edaphic types are found depending on local variation in soil and moisture within semi-evergreen forests.

A) Cane Breaks - These occur on the slopes of the ghat region. *Calamus thwaitesii* is more common in lower elevation areas.

B) Lateritic Semi - evergreen forests - These forests are distributed over elevations above 200 m. Important species found in these forests are *Actinodaphne angustifolia*, *Canthium dicoccum*, *Macaranga peltata*, *Careya arborea*, *Lagerstroemia lanceolata*, *Pterospermum diversifolium*, *Macaranga peltata*, etc. The second storey includes *Glochidion hohenackeri*, *Olea dioica*, *Ixora nigricans*, *Celtis timorensis*, etc. The shrubs found in undergrowth are *Chassalia curviflora* var. *ophioxyloides*, *Glycosmis pentaphylla*, *Maesa indica*, *Leea asiatica*, *L. indica*, *Crotalaria retusa* and *Gnidia glauca*. These species are often associated with climbing shrubs like *Connarus monocarpus* and *Clematis gouriana*. Some of the common herbs include *Impatiens balsamina*, *Cyperus* spp., *Asystasia dalzelliana*, *Cynarospermum asperrimum*, *Lindernia* spp., grasses such as *Apluda mutica*, *Eragrostis unioloides*, *Garnotia arboreum* and *Ischaemum* spp.

c. Moist Deciduous Forests

Most of the forest in the National Park between the altitudes from 80 to 200 m lies in this category. Important plants found in these areas are *Careya arborea*, *Dillenia pentagyna*, *Grewia tiliifolia*, *Lannea coromandelica*, *Terminalia* spp., *Schleichera oleosa*, *Xylia xylocarpa*, *Haldina cordifolia*, etc. Other trees found in moist deciduous forests are *Falconeria insignis*, *Wrightia* sp., *Flacourtiaviridis*, *Terminalia* spp., *Hopea ponga* and *Crateva magna* are seen. The shrubs or second storey of trees include *Catunaregam spinosa*, *Flemingia strobilifera*, *Canthium* spp., *Strychnos nux-vomica*, *Meyna laxiflora*, *Ziziphus xylopyrus*, *Xantolis tomentosa*. Common epiphyte, especially on most of the *Terminalia* spp. is *Rhynchostylis retusa*. *Aerides crispa* and *A. maculosa* are also found epiphytic on many trees. The ground flora in forest clearings and exposed situations comprises members of Leguminosae: Papilionoideae (*Geissaspis*, *Crotalaria*, *Indigofera*, *Alysicarpus*, *Desmodium*, *Tadehagi*), Acanthaceae (*Justicia*, *Lepidagathis*, *Rungia*), Rubiaceae (*Spermacoce*, *Neanotis*, *Hedyotis*), Euphorbiaceae (*Phyllanthus*, *Euphorbia*), Asteraceae (*Blumea*, *Elephantopus*, *Senecio*, *Phyllocephalum*) and Lamiaceae (*Leucas*, *Platostoma*, *Pogostemon*, *Hyptis*). In open areas climbers and twiners of Convolvulaceae, Leguminosae: Papilionoideae, Smilacaceae, Ranunculaceae have been recorded.

In addition to these forests, there are some plateaus and grasslands in the National Park. This varied vegetation is responsible for the diversity of the national park.

MATERIALS AND METHODS

The present checklists of wild angiosperms of Bhagwan Mahavir National Park is an outcome of intensive and extensive field collections and laboratory work between the years 2001-2006. Plants were collected during regular field visits and were processed using standard methods. The identification was done using local and regional flora. (Dalgado 1898; Vartak 1966; Rao 1985-86; Naithani et al. 1997). The identity of the plants were confirmed by comparing with authentic specimens deposited at Agharkar Research Institute herbarium (**AHMA**), Botanical Survey of India, Pune (**BSI**), Central National Herbarium, Howrah (**CAL**), Forest Research Institute, Dehra Dun (**DD**) and Goa University Herbarium. In addition, specimens collected by other collectors from Bhagwan Mahavir National Park in these herbaria were also studied. All the specimens collected during the work were deposited in Botanical Survey of India, Pune (**BSI**). A comprehensive checklist for wild angiosperms in the National Park is presented here giving their family, updated botanical names (Karthikeyan, et al. 2009; The Plant List 2010), local name if any, status of endemism and voucher specimen of that taxon (Table 1).

RESULTS AND DISCUSSION

Intensive and extensive exploration tours covering all seasons in various ecosystems of Bhagwan Mahavir National Park have resulted in collection of about 1100

field numbers. The Angiosperm Flora of Bhagwan Mahavir National Park comprises of 119 families, 7 subfamilies, 490 genera and 721 species, which occur in the wild. The dicots are represented by 563 species (about 78% of the angiosperm flora) belonging to 381 genera and 93 families while monocots are represented by 158 species (about 22%) belonging to 109 genera and 26 families.

The largest family in the National Park according to number of species is Leguminosae represented by 63 species, followed by Poaceae (40), Rubiaceae (38), Euphorbiaceae, Orchidaceae and Acanthaceae (34 each). Some of the large genera found in Molem National Park are *Ficus* (12 species), *Eriocaulon* (09 species), *Diospyros* (08 species), *Utricularia* (07 species), *Habenaria*, *Impatiens*, *Lindernia*, *Murdannia*, and *Syzygium* (06 species each) and *Acacia*, *Crotalaria*, *Ixora*, *Ipomoea*, *Phyllanthus* and *Strobilanthes* (05 species each). Largest family according to number of genera in Bhagwan Mahavir National Park is Leguminosae (37 genera), followed by Poaceae (32), Rubiaceae (25), Orchidaceae (24), Apocynaceae and Euphorbiaceae (22 each) and Asteraceae (21). Fifty six families are represented by single genus and 44 families are represented by single species. The pattern of dominance amongst families is almost similar to pattern discussed by Karthikeyan (2000) for Indian flora. Distribution as per the habit of the plant reveals that the flora constitutes

346 herbs, 103 shrubs, 192 trees, 66 climbers and 18 lianas. Habitats like lateritic plateaus and open areas show dominance of herbaceous elements while forested areas show dominance of arboreal members and lianas.

A total number of 126 species of endemic plants (Figures 2-5) are documented here. The endemic plants occurring in the National Park show a peculiar pattern of distribution. About 58% of the total endemic species, i.e. 74 species occurring in the National Park are endemic to Western Ghats while about 31 endemic species are endemic to Peninsular India. Rest other are endemic to India (7 species), Western India (3 species), Southern and Northern Western India (2 species each) and strictly endemic to Goa (2 Species), etc. Bhagwan Mahaveer National Park, a comparatively smaller protected area, occupies 0.05% of the total area of Western Ghats but harbours about 8.4% of species of endemics that are endemic to Western Ghats. Leguminosae and Orchidaceae (12 species each) followed by Rubiaceae and Acanthaceae (10 species each) are dominant families in Endemic plants of National Park. Family Eriocaulaceae is not species rich but rich in endemic species.

The National Park area is just 2.5% of the total area of Goa, but it harbours about half of the species that occur in entire Goa. This point highlights the importance of the protected areas is conservation of the flora.

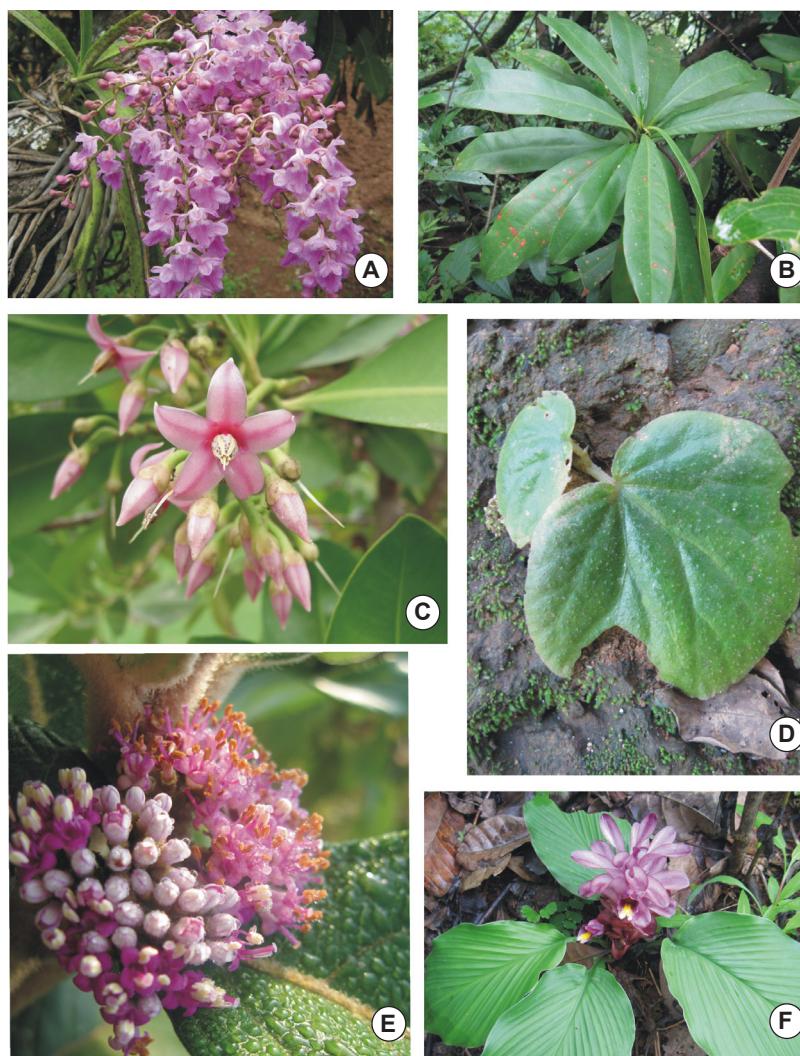

FIGURE 2. Some endemic species from the National Park. A) *Aerides maculosa*. B) *Ancistrocladus heyneanus*. C) *Ardisia solanacea*. D) *Begonia trichocarpa*. E) *Callicarpa tomentosa*. F) *Curcuma decipiens*.

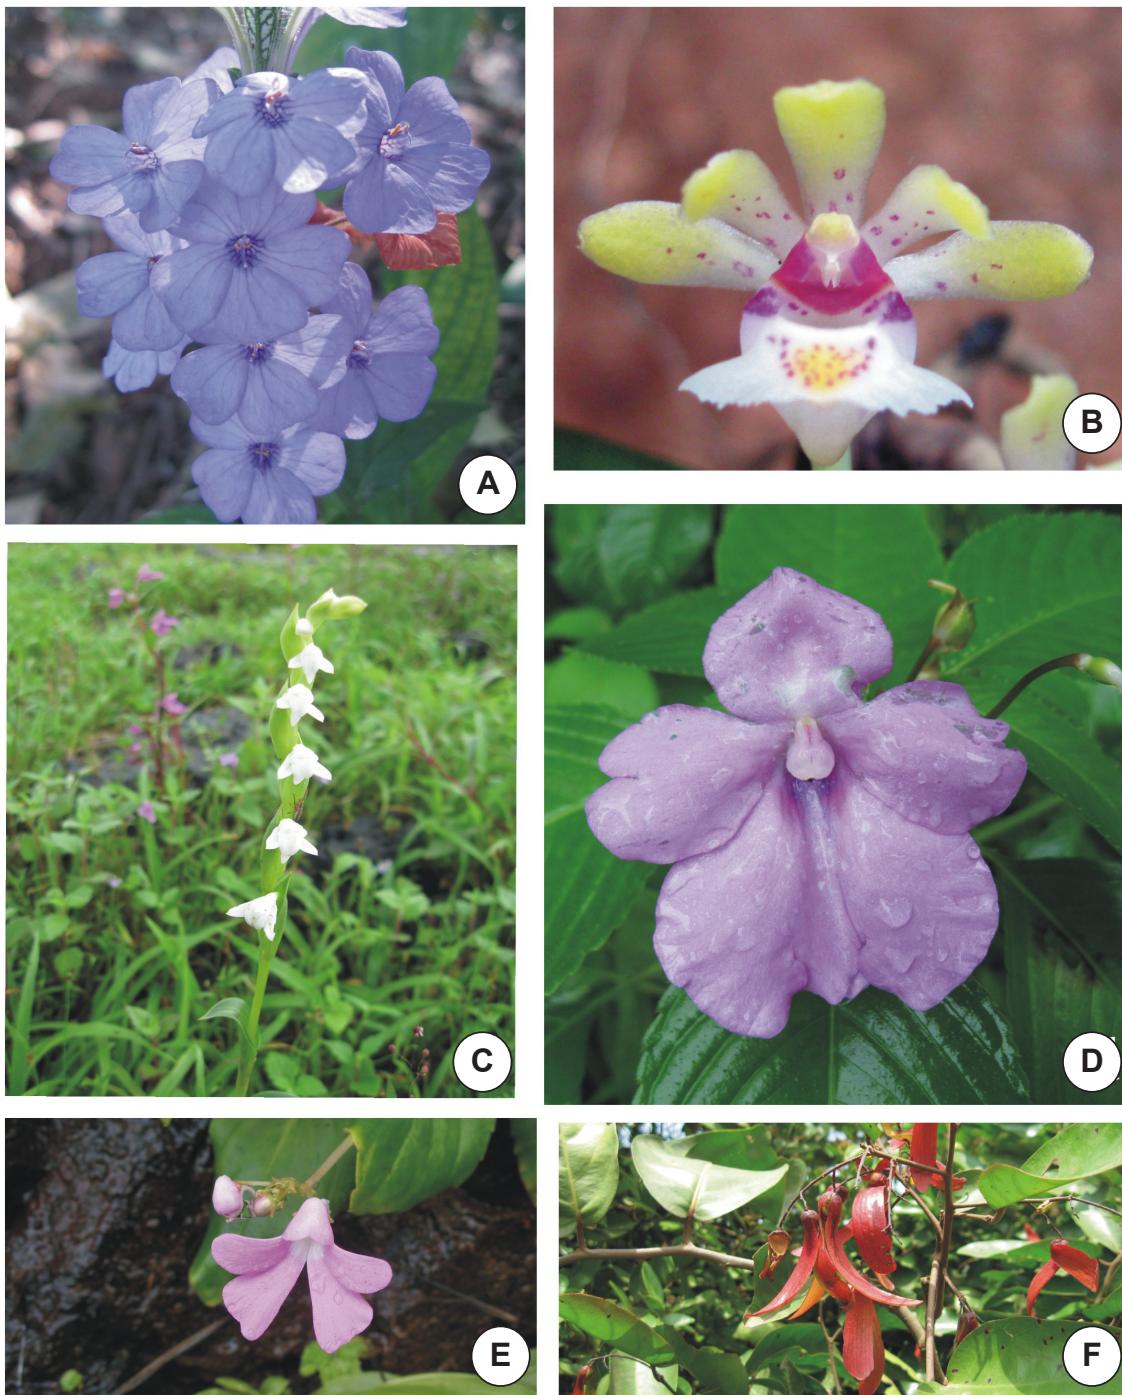

FIGURE 3. Some endemic species from the National Park . A) *Eranthemum roseum*. B) *Gastrochilus flabelliformis*. C) *Habenaria heyneana*. D) *Impatiens pulcherrima*. E) *Impatiens acaulis*. F) *Hopea ponga*.

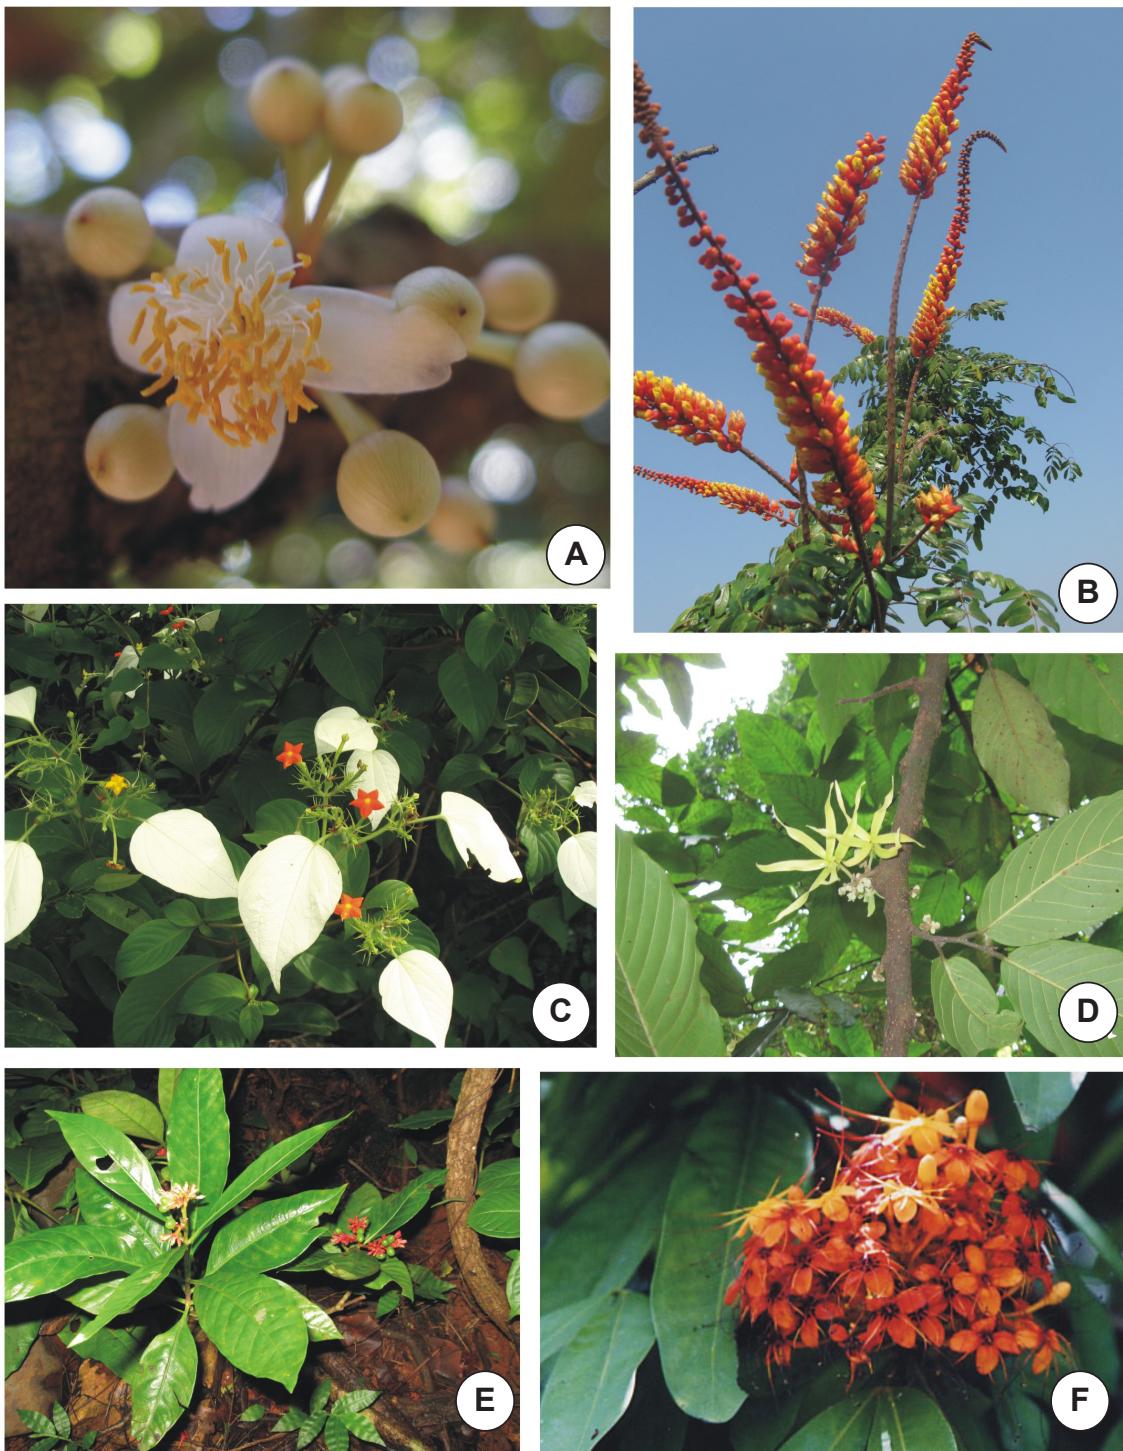

FIGURE 4. Some endemic species from the National Park . A) *Mammea suriga*. B) *Moullava spicata*. C) *Mussaenda glabrata*. D) *Polyalthia fragrans*. E) *Rauvolfia serpentina*. F) *Saraca asoca*.

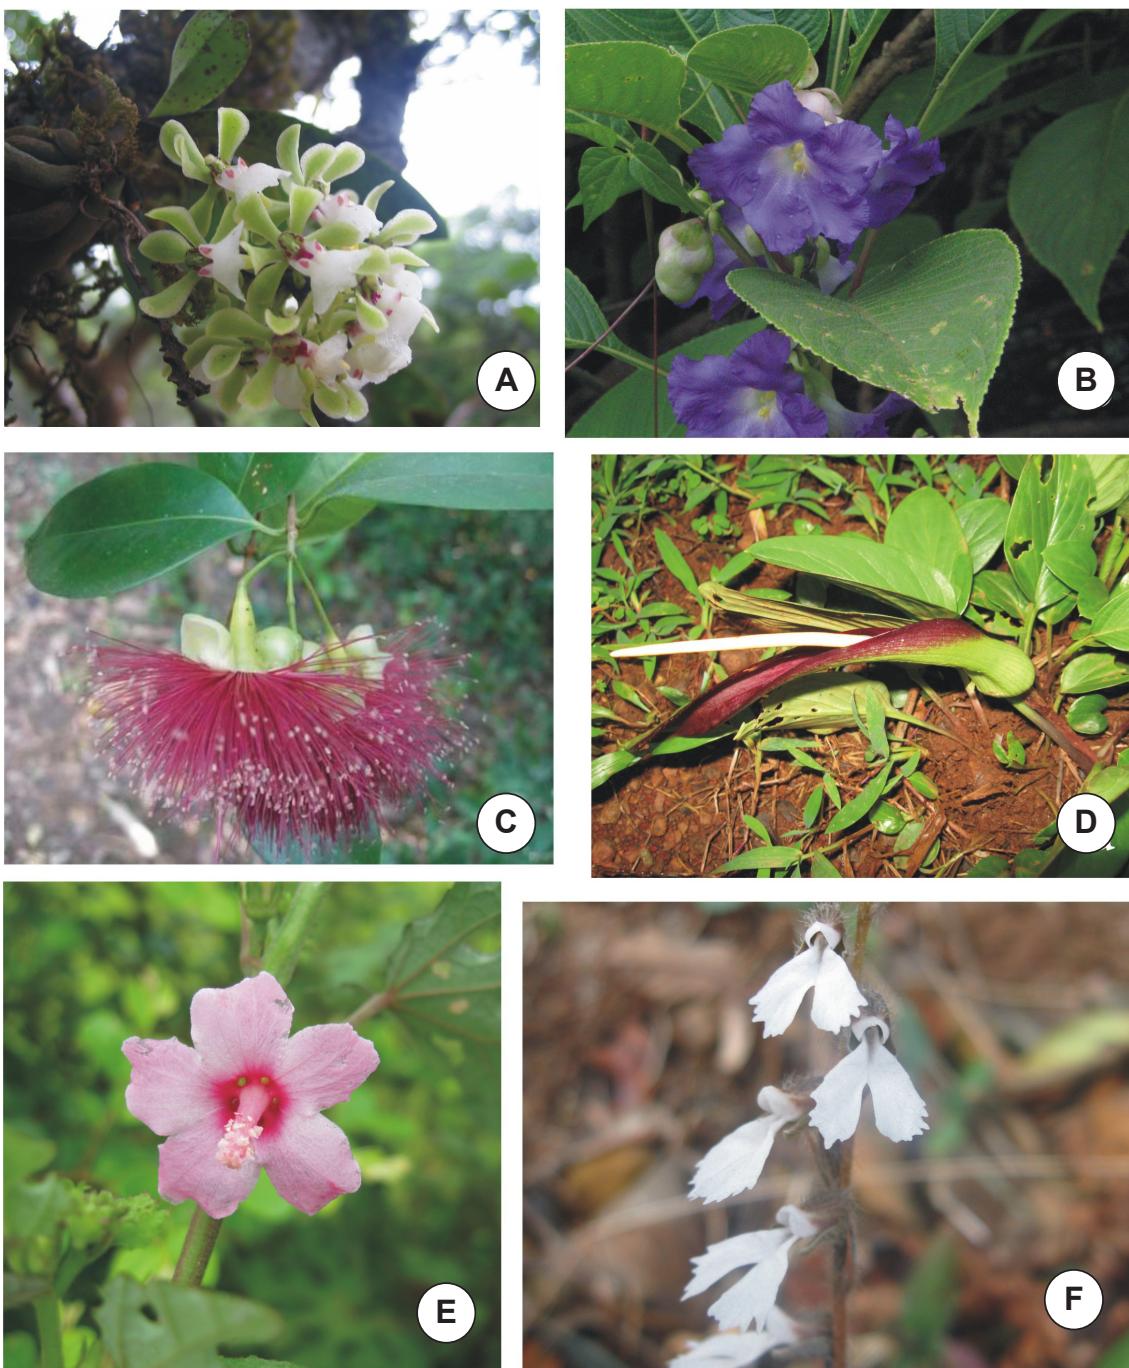

FIGURE 5. Some endemic species from the National Park . A) *Smithsonia viridiflora*. B) *Strobilanthes callosa*. C) *Syzygium laetum*. D) *Theriophonum dalzellii*. E) *Urena lobata*. F) *Zeuxine longilabris*.

TABLE 1. Wild Angiosperms of Bhagwan Mahavir National Park, Goa, India.

Abbreviations used for Endemism. WG- Western Ghats; PI -Peninsular India; PI and AN-Peninsular India, Andaman and Nicobar islands; IND- India; SWI- South West India; NWG- Northern Western Ghats; WI- Western India; WSI- Western and Southern India; PCI-Peninsular and Central India; WPI- Western Peninsular India; Goa- Goa state.

Acronyms and shortforms of herbaria to which Voucher specimens are referred: AHMA: Herbarium of Agharkar Research Institute, Pune, India; BLAT: Blatter Herbarium, St. Xevier College Mumbai, India; DD: Forest Research Institute Herbarium, Dehradun, India; GU : Goa University herbarium, Goa, India (GU is not standard acronym- this is shortform used for convenience); BSI : Botanical Survey of India, Western Circle Herbarium, Pune, India;

*All the voucher specimens without any herbarium acronym in bracket are referred to BSI.

ERRATUM

Though most species in the figures are endemic, a few of them are not. So the legend of **Figures 2-5** (pages 188-191) should be: "Some plant species from the National Park (...)".

In **FIGURE 4**, page 190, "*mammea suriga*" should be *Mammea suriga*.

The authors regret these errors.
