ABSTRACT

Seven taxa of Thai *Campylotropis* are recognized: *C. bonii* Schindl., *C. capillipes* (Franch.) Schindl. subsp. *prainii* (Collett & Hemsl.) Iokawa & H.Ohashi, *C. decora* (Kurz) Schindl., *C. harmsii* Schindl., *C. parviflora* (Kurz) Schindl., *C. pinetorum* (Kurz) Schindl. and *C. sulcata* Schindl. The reinstatement of *C. parviflora* is proposed here and *C. cytisoides* f. *parviflora* is reduced to a synonym of *C. parviflora*. A key to the species and descriptions with notes on their distribution, ecological data, vernacular names and photographs are also provided.

KEYWORDS: *Campylotropis*, Desmodieae, Leguminosae, Thailand.

Published online: 29 October 2018

INTRODUCTION

The genus *Campylotropis* Bunge (Desmodieae, Leguminosae) comprises about 37 species distributed in temperate and tropical Asia (Iokawa & Ohashi, 2002, 2008; Lewis *et al.*, 2005; Huang *et al.*, 2010). The genus was first described by Bunge (1835) based on *C. chinensis* Bunge, now a synonym of *C. macrocarpa* (Bunge) Rehder. This genus is similar to genus *Lespedeza* Michx., but the character to distinguish *Campylotropis* from *Lespedeza* is the presence of one flower per bract while *Lespedeza* has two flowers per bract (Iokawa & Ohashi, 2002). The name ‘*Campylotropis*’ is derived from two Greek words, ‘*campyo*’ meaning curved and ‘*tropis*’ meaning keel which is a distinct character of the genus (Lewis *et al.*, 2005). Craib (1928) listed seven species of *Campylotropis* (as *Lespedeza*), and we recognize six of those (except *C. henryi* non Schindl. treated as a synonym of *C. decora* (Kurz) Schindl.) in the seven species treated here.

MATERIALS AND METHODS

Fresh field collections in Thailand and specimens from the following herbaria: AAU, BCU, BK, BKF,

BM, C, CAL, CMU, CMUB, E, K, KKU, L, P, PSU, QBG, US and WAG (herbarium acronyms follow Thiers, 2016) were examined. Most type specimens cited have been seen, indicated in the text by !, n.v. (*non vide*) indicates when the type was not seen.

Shrubs, 1–4 m tall. Stems erect or ascending, much branched, terete or multi-angular, hairy. Leaves pinnately 3-foliate, alternate, subcoriaceous to chartaceous; petioles hairy; stipules triangular or triangular-lanceolate or triangular-linear, striate, persistent, outside hairy, inside glabrous; stipels absent. Inflorescences axillary raceme or terminal panicle with reduced subtending leaves, peduncles hairy. Flowers papilionaceous, 1-flowered per subtending bract, fragile; bracts present at base

of pedicels, mostly narrowly triangular, persistent or caducous, outside hairy, inside glabrous; bracteoles occurring at base of calyx, triangular, ovate-triangular or setaceous, persistent or caducous, outside hairy, inside glabrous. Calyx of 4 sepals, campanulate, outside hairy, inside glabrous; dorsal 1-lobed, entire or 2-toothed at apex; lateral 2-lobed, slightly shorter than dorsal one; lowest 1-lobed, longest. Corolla of 5 petals, light to dark violet, dark blue or pinkish-white to creamy-white, glabrous; standard variable in shape, mostly broadly obovate or elliptic, clawed, auricle present or absent; wings mostly oblong, clawed, auricle 1; keel boat-shaped, narrowly oblong, falcate, clawed, auricle 1, ventral sutures joined. Stamens 10, diadelphous (9+1), base connate into staminal tubes about $\frac{3}{4}$ of its length; anthers uniform, ovate-oblong or oblong, yellow. Pistils 1-carpellate; ovary superior, oblong, glabrous to hairy, 1-locular, 1-ovuled; styles filiform, incurved at right angle about $\frac{1}{4}$ of its length; stigmas terminal, capitate. Pods a legume, 1-articulated, indehiscent, laterally flattened, apex acuminate or rounded and mucronate, obvious reticulate veins, hairy; fruiting stalks elongated. Seeds 1, reniform, obliquely elliptic or oblong, brown, reddish-brown or blackish-brown; hilum with annulus aril.

A genus of about 37 species, widely distributed in India to Indo-China and East Asia. Six species and 1 subspecies in Thailand.

KEY TO THE SPECIES

1. Corolla pinkish-white to creamy-white; standard with green blotches on both sides; wings less than or equal to 6 mm long
 2. Lower surface of leaflets covered with ascending velutinous hairs; upper surface of leaflets with black spots; pods less than or equal to 6 mm long
 2. Lower surface of leaflets covered with appressed hairs; upper surface of leaflets without black spot; pods more than 6 mm long
 1. Corolla dark blue or light to dark violet; standard without green blotches; wings more than 6 mm long
 3. Upper surface of leaflets pilose; stems with shortly zigzag lateral branches
 3. Upper surface of leaflets glabrous; stems without shortly zigzag lateral branches
 4. Peduncle covered with appressed hairs; pods glabrous or covered with appressed hairs
 5. Standard with white and yellow blotches, 7.5–9 mm long and without auricles; peduncle sparsely cover of appressed-hairy; wings less than or equal to 8.5 mm long
 1. *C. bonii*
 5. Standard without white and yellow blotches, 10–11 mm long and with auricles; peduncle densely appressed-hairy; wings more than 8.5 mm long
 2. *C. capillipes* subsp. *prainii*
 4. Peduncle covered with patent hairs and glandular hairs; pods patent-hairy
 6. Calyx lobes longer than 3 mm long, overlapping, dorsal lobe ovate-triangular; lower surface of leaflets shortly appressed-hairy; pedicels more than 2 mm long
 3. *C. decora*
 6. Calyx lobes shorter or equal to 3 mm long, not overlapping, dorsal lobe triangular; lower surface of leaflets appressed sericeous; pedicels less than or equal to 2 mm long
 7. *C. sulcata*

1. *Campylotropis bonii* Schindl. in Engl., Bot. Jahrb. Syst. 54 (1): 64. 1916; Thuan in Thuan *et al.*, Fl. Cambodge, Laos & Vietnam 23: 143. 1987; Iokawa & H.Ohashi, J. Jap. Bot. 77(4): 201. 2002.—*Lespedeza bonii* (Schindl.) Gagnep. in Lecomte & Gagnep., Fl. Indo-Chine 2: 520. 1920. Type: Vietnam, Tuan-Du, Bon 4320 (holotype P P00758118!, isotypes P P00758120!, P P00758119!).

— *Campylotropis bonii* var. *anguticarpa* Schindl. in Fedde Repert. Nov. Regni Veg. 22: 271. 1926; Craib, Fl. Siam. 1(3): 432. 1928. Type: Thailand, Phang Nga, small island near Panyi island, *Herb. Hort. Singapore* no. 4079 (holotype BM!, isotype K!). Fig. 1A–B.

Shrub, 1–3 m tall. Stems erect or ascending, terete, dark brown, glabrous or sparsely covered with appressed hairs. Leaves: petioles 8–17 mm long, glabrous or sparsely appressed-hairy; rachis 2–5 mm long; stipules triangular or triangular-lanceolate, 2–3 × 0.8–1 mm, outside appressed-hairy; leaflets obcordate-obdeltoid, subcoriaceous; terminal leaflets 1.2–2.5 × 0.9–2 cm, lateral leaflets 1–2 × 0.5–1.5 cm, apex emarginate, base cuneate, margins entire; upper surface green, glabrous; lower surface light green, appressed-hairy; lateral veins 9–12 pairs; petiolules 2.5–4 mm long, densely appressed-hairy. Inflorescences axillary raceme, 2.5–3.5 cm long, laxly flowered; peduncles 8–10 mm long, sparsely appressed-hairy; bracts triangular, 0.5–1 × 0.2–0.5 mm, glabrous; bracteoles triangular, 0.7–1 × 0.3–0.5 mm, glabrous; pedicels 7–11 mm long, sparsely appressed-hairy. Calyx green, appressed-hairy; tube 1.8–2 mm long; dorsal lobe triangular, 1.5–2 × 1–1.5 mm; lateral lobes narrowly triangular, 1.3–1.5 × 0.7–0.8 mm; lowest lobe triangular to narrowly triangular, 1.5–1.8 × 0.6–1 mm. Corolla light to dark purple with white and yellow blotches at base; standard elliptic-ovate, 7.5–9 × 5–7 mm, apex acute, claw 1.5–2 mm long, auricles absent; wings oblong, 8–8.5 × 2.5–3 mm, slightly upward, apex rounded, claw 1.5–2.5 mm long, auricle 0.5–0.6 mm long; keel 7.5–8 × 2.5–3 mm, claw 1.5–2.5 mm long, auricle 0.2–0.3 mm long. Stamens 7–9 mm long, staminal tubes 6–7 mm long, free part of filaments 2–2.5 mm long; anthers oblong 0.3–0.4 × 0.2–0.3 mm. Pistils 9–9.5 mm long; ovary 2–2.5 × 0.3–0.5 mm, appressed-hairy; styles 6–6.5 mm long, appressed-hairy at base. Pods obliquely oblong, 11–15 × 4–5 mm, brown, apex rounded and mucronate, sparsely appressed-hairy; fruiting stalks 8–10 mm

long. Seeds reniform to oblong, 6–8 × 3–3.5 mm, brown.

Thailand.—PENINSULAR: Krabi [Sra Morakot Wildlife Sanctuary, 10 Apr. 2003, Middleton *et al.* 2100 (BKF); Tham Suea Temple, 5 Jan. 2006, Gardner & Sidisunthon ST2161 (QBG, L), ibid., 18 Apr. 2007, Gardner ST2895 (BKF, QBG), ibid., 24 Oct. 1991, Larsen *et al.* 42555 (BKF, P), ibid., 8 May 2002, Pooma *et al.* 3609 (BKF), ibid., 10 May 2017, Satthaphorn & Leeratiwong 80 (PSU), ibid., 22 Aug. 2017, Satthaphorn & Leeratiwong 81 (PSU)]; Phang Nga [Khao Ping Kan, 25 Oct. 1974, S.N. (BK); Small Island near Panyi Island, 17 Dec. 1928, Herb. Hort. Singapore no. 4079 (BM, K)]; Phuket [28 Feb. 1994, Schmidt s.n. (P)].

Distribution.—Vietnam.

Ecology.—Fissures on limestone outcrops, alt. 150–330 m. Flowering: April to October. Fruiting: April to October.

Vernacular.—Lueat nai tai (เลือดในตีช).

Note.—*Campylotropis bonii* has a light to dark purple corolla with white and yellow blotches on the standard petal, sparsely appressed hairs on the peduncle, and distinctly obcordate-obdeltoid leaflets.

2. *Campylotropis capillipes* (Franch.) Schindl. in Fedde, Repert. Spec. Nov. Regni Veg. 11: 341. 1912; Hand.-Mazz., Symb. Sin. 7: 573. 1933; C.Y.Wu *et al.*, Index Fl. Schindl. in Fedde, Repert. Spec. Nov. Regni Veg. 11: 341. 1912; C.Y.Wu *et al.*, Index Fl. Yunnan. 1: 576. 1984; P.Y.Fu, Bull. Bot. Res., Harbin 7(4): 28. 1987; P.Y.Fu, Fl. Reipubl. Popularis Sin. 41: 98. 1995. Type: Myanmar (Burma), Shan, Collett 951 (holotype K K000894915!). Fig. 1C–D.

Shrub, 1–3 m tall. Stems erect, multi-angular, blackish-brown, densely appressed-hairy. Leaves: petioles 5–33 mm, densely appressed-hairy; rachis 1–3 mm long; stipules triangular-lanceolate or setaceous, 4–10 × 1–2 mm, outside appressed-hairy; leaflets obovate-oblong or obcordate, chartaceous; terminal leaflets 0.8–2.8 × 0.5–1.5 cm, lateral leaflets 0.5–2.2 × 0.5–2 cm, apex retuse or rounded and mucronate, base cuneate or rounded, margins entire; upper surface dark green, glabrous; lower surface light green, densely appressed-hairy; lateral veins 7–12 pairs; petiolules 1–2 mm long, densely appressed-hairy. Inflorescences axillary raceme, 2.5–6 cm long, densely flowered, flowers usually pendulous; peduncles 1–2.6 cm long, appressed-hairy; bracts triangular, 3–7 × 1–2 mm, appressed-hairy; bracteoles triangular, 1–2.5 × 1–2 mm, glabrous; pedicels 3–10 mm long, densely appressed-hairy. Calyx reddish-brown to red, appressed-hairy; tube 2–2.5 mm long; dorsal lobe triangular, 1.2–2.5 × 1–2.5 mm, with or without 2 teeth; lateral lobes triangular 1–2 × 0.5–1.2 mm; lowest lobe narrowly triangular, 1.5–2.2 × 0.5–1.2 mm. Corolla dark blue to purple; standard obovate-oblong, 10–11 × 7–8 mm, apex obtuse or emarginate, claw 1.7–2 mm long, auricles 0.3–0.5 mm long, reflexed; wings oblong to oblong-obovate, 9.5–10 × 4.5–5.5 mm, apex rounded, claw 2.5–3.5 mm long, auricle 0.5–1 mm long; keel 9.5–10 × 2.5–3 mm, claw 2.5–3.5 mm long, auricle 0.4–0.5 mm long. Stamens 9.5–11.5 mm long, staminal tubes 5.5–9 mm long, free part of filaments 1.5–2.5 mm long; anthers ovate-oblong, 0.4–0.6 × 0.3–0.4 mm. Pistils 10.5–13 mm long; ovary 5–7 × 0.6–1 mm, glabrous or appressed-hairy; styles 5.5–8 mm long, glabrous or appressed-hairy; styles 5.5–8 mm long, glabrous or appressed-hairy. Pods obliquely elliptic to oblong, 10–14 × 3–7 mm, greenish-red to brownish-red, apex rounded and mucronate, glabrous or appressed-hairy; fruiting stalks 5–11 mm long. Seeds reniform or obliquely elliptic, 1.5–2 × 0.7–1.2 mm, reddish-brown.

Distribution.—Myanmar, China.

Ecology.—On exposed rugged limestone, lower montane pine oak forest, alt. 1300–2100 m. Flowering: September to November. Fruiting: October to February.

Vernacular.—Thua khao dok khram (ຖោគ្រាម).

Note.—*Campylotropis capillipes* is similar to *C. bonii* in having appressed hairs on the peduncle and purple corolla, but the former species is easily separated by having dense appressed hairs (vs. sparsely appressed hairs) on the peduncle and the absence of white and yellow blotches on the standard petal. The subspecies is different from the typical subspecies by the leaflets being glabrous on the upper surface (vs. appressed hairs).

Shrub, 0.8–2 m tall. Stems erect, multi-angular, greenish-brown to blackish-brown, densely appressed-hairy. Leaves: petioles 0.2–3.5 cm long, sulcate with adaxial wings, appressed-hairy, angled; rachis 1–13 mm long; stipules triangular, 4–7 × 0.5–1.2 mm, outside appressed-hairy, persistent; leaflet obovate or obovate-oblong, subcoriaceous; terminal leaflets 0.6–6.2 × 0.4–3 cm, lateral leaflets 0.5–5.7 × 0.4–3 cm, apex emarginate, rounded or truncate and mucronate, base rounded or slightly cordate, margins entire; upper surface green, glabrous; lower surface, light green, densely appressed-hairy; lateral veins 7–12 pairs; petiolules 1–3 mm long, densely appressed-hairy. Inflorescences axillary raceme or terminal panicle, 2–10 cm long, densely flowered; peduncle 0.2–3 cm long, patent-hairy and densely glandular-hairy; bract triangular 1–4.5 × 0.5–1.2 mm, patent-hairy; bracteoles narrowly triangular, 1–3 × 0.1–0.5 mm, patent-hairy; pedicels 3–11 mm long, patent-hairy and densely glandular-hairy. Calyx reddish-brown, patent-hairy and glandular-hairy; tube 2.5–3.5 mm long; dorsal lobe ovate-triangular, 4–4.8 × 2–3.5 mm, bifid or not; lateral lobes ovate-triangular, 4–5 × 2–2.2 mm long, overlapping other

lobes; lowest lobe triangular, 3.5–5 × 1.5–1.8 mm. Corolla light purple; standard obovate, 9.2–14 × 8–10 mm, apex acute or obtuse, claw 1–2 mm long, auricle 0.1–0.3 mm long; wings oblong, 9–12 × 4–5 mm long, claw 2.4–3 mm long, auricle 0.4–1 mm long, apex rounded; keel boat-shaped, 9–13 × 3–3.8 mm, apex acute, claw 2.4–3.8 mm long, auricle 0.3–0.7 mm long. Stamens 10–16 mm long, staminal tubes 7.5–12 mm long, free part of filaments 1.5–4 mm long; anthers oblong, 0.5–0.6 × 0.2–0.3 mm. Pistils 11–17 mm long, ovary 2.6–3.5 × 0.7–1 mm long, patent-hairy; style 7.4–14 mm long, glabrous. Pods obliquely ovate, 5–10 × 4–5 mm, dark brown, apex acuminate, densely patent-hairy and glandular-hairy; fruiting stalks up to 14 mm long. Seeds reniform, 1.5–4.6 × 1–3 mm, blackish-brown.

Thailand.—NORTHERN: Mae Hong Son [Doi Pha Daeng, 26 Dec. 2012, Norsaengsri 10025 (QBG); Huai San, 5 Feb. 2014, Norsaengsri 10815 (QBG)]; Chiang Mai [Doi Chiang Dao, 26 Mar. 1991, Banziger 918 (CMU, L), ibid., 29 Feb. 1940, Garret 1158 (E, K, L, P), ibid., 28 Nov. 1913, Kerr 2862 (K), ibid., 3 Mar. 1979, Koyama et al. s.n. Distribution.—Myanmar, China, Laos.

Ecology.—In open, or on partly shaded rugged limestone, or deciduous forest, alt. 800–2250 m. Flowering: December to March. Fruiting: January to April.

Vernacular.—Thua khao hin pun (ถั่วเขานปุน)

Note.—*Campylotropis decora* is distinguished by having densely patent hairs mixed with glandular hairs throughout the peduncle, and ovate-triangular overlapping calyx lobes which are distinctly longer than the calyx tube. From field observations, specimens at Doi Chiang Dao, Chiang Mai province, had thicker leaflets than other collections.

4. *Campylotropis harmsii* Schindl. in Fedde, Repert. Spec. Nov. Regni Veg. 11: 342. 1912; P.Y.Fu, Bull. Bot. Res., Harbin 7(4): 28. 1987; P.Y.Fu, Fl. Reipubl. Shrub, 0.3–2 m tall. Stems erect, multi-angular, brown to dark brown, appressed-hairy. Leaves: petioles 0.4–5.5 cm long, sparsely appressed-hairy; rachis 1–10 mm long; stipules triangular-linear, 5–10 × 0.5–1 mm, outside appressed-hairy; leaflets narrowly ovate to elliptic, subcoriaceous; terminal leaflets 1.3–5 × 0.5–1.6 cm, lateral leaflets 0.9–3.8 × 0.3–1.6 cm, apex acute or rounded and mucronate, base rounded or cuneate, margins entire; upper surface dark green, glabrous or slightly appressed-hairy mainly on midrib; lower surface pale green to grey, shortly appressed-hairy; lateral veins 7–12 pairs; petiolules 1.5–2 mm long, densely appressed-hairy. Inflorescences axillary raceme or terminal panicle, 8.5–11 cm long, densely flowered; peduncles 5.2–6 cm long, densely patent-hairy and sparsely glandular-hairy; bracts triangular, 1–1.2 × 0.2–0.3 mm, appressed-hairy, reddish-brown, usually caducous; bracteoles setaceous, 0.5–1 mm long, densely appressed-hairy; pedicels 1.5–4 mm long, appressed-hairy and sparsely glandular-hairy. Calyx green, densely appressed-hairy; tube 1–2 mm long; dorsal lobe narrowly triangular to setaceous, 1.5–2 × 0.5–0.6 mm, with or without 2 teeth; lateral lobes narrowly triangular to setaceous 1.5–1.8 × 0.3–0.4 mm; lowest lobe narrowly triangular to setaceous, 1.5–2 × 0.5–0.6 mm. Corolla pinkish-white to creamy-white with green blotches on both surface of standard; standard elliptic-oblong, 5.5–6 × 2.5–3 mm, apex acute, claw 1–1.2 mm long, auricle absent; wings oblong, 5–6 × 2–2.2 mm, apex rounded, slightly upward, claw 1.4–1.5 mm, auricle 0.5–0.6 mm long; keel 5.5–6 × 1.4–1.5 mm, claw 1–1.2 mm long, auricle 0.3–0.5 mm long. Stamens 6–7 mm long, staminal tubes 4.5–5 mm long, free part of filaments 2–3 mm long; anthers oblong, 0.4–0.5 × 0.3–0.4 mm. Pistils 6–7 mm long; ovary 2–3 × 0.5–0.7 mm, densely appressed-hairy; styles 4–5 mm long, appressed-hairy at base. Pods obliquely obovate, 6.5–9 × 4–5 mm, dark brown, arranging mainly one side of rachis, apex acuminate, patent-hairy; fruiting stalks 3–5 mm. Seeds reniform, 2–4.5 × 1.5–2.5 mm, brown.

Distribution.—Myanmar, China, Laos, Vietnam.

Ecology.—In open, partly shaded areas on limestone mountains and dry evergreen forest, alt. 600–1800 m. Flowering: November to March. Fruiting: November to March.

Vernacular.—*Lueat nai* (ລູ້ອັດໄນ), *hing men* (ຫິ່ງມິນ).

Note.—According to Iokawa & Ohashi (2002), *Campylotropis cytisoides* f. *parviflora* was established as distinct from the typical form, *C. cytisoides* f. *cytisoides*, by using the density of glandular hairs, the length and the texture of leaflets and the length of inflorescences. From specimen investigation of both forms, we have found additional characters to distinguish between the two forms. *Campylotropis cytisoides* f. *parviflora* also differs from the typical form by having a pinkish-white to creamy-white corolla (vs. purplish-blue), the 1–2 mm long calyx tube (vs. 2–3 mm), the 5.5–6 mm long standard (vs. 7.5–9 mm) and being sparsely short appressed-hairy on the lower surface of leaflets (vs. densely long appressed-hairy). Therefore, we here reinstate this taxon to species level, *C. parviflora*.

Hist. 66: 375. 1897; Gagnep. in Lecomte & Gagnep., Fl. Indo-Chine 2: 524. 1920; Craib, Fl. Siam. 1(3): 433. 1928. Type: Myanmar (Burma), Martaban, Kurz 1637 (holotype CAL 0000012101!). Fig. 2C–D.

Shrub, 0.4–1.5 m tall. Stems erect, multi-angular, brown, densely yellowish-velutinous. Leaves: petioles 1.8–2.8 cm long, velutinous; rachis 3–6 mm long or indistinct; stipules triangular, 7–9 × 2.5–4 mm, outside velutinous, persistent; leaflets narrowly elliptic, subcoriaceous; terminal leaflets 5.5–9 × 1.4–4.6 cm, lateral leaflets 4.8–7.7 × 1.3–3.3 cm, apex acute, base cuneate, margins entire; upper surface light green, finely appressed-hairy, especially on veins; lower surface pale green, densely ascending velutinous, mature leaflets with scattered black spots; lateral veins 7–12 pairs; petiolules 1.5–2 mm long, velutinous. Inflorescences axillary raceme, 3–6 cm long, densely flowered; peduncles 0.5–1.5 cm long, velutinous and sparsely glandular-hairy; bracts triangular, 5–8 × 2–3 mm, patent-hairy; bracteoles setaceous, ca 1 mm long, patent-hairy, early caducous; pedicels 1.5–2 mm long, patent-hairy. Calyx reddish-brown, patent-hairy; tube 2–2.5 mm long; dorsal lobes triangular, 2.5–3 × 1.8–2 mm, with or without 2 long teeth, lateral lobes triangular, 2.5–3 × 1–1.1 mm, lowest lobe narrowly triangular, 2.8–3 × 0.7–1 mm. Corolla pinkish-white to creamy-white; standard obovate-oblong, 7.5–8 × 6–7 mm, apex rounded, claw 1.5–2 mm long, auricle absent; wings spatulate, 5.3–5.5 × 2.5–3.2 mm, apex rounded, claw 2.5–2.7 mm long, auricle 0.8–1 mm long; keel 6–6.5 × 2.5–3 mm, claw 2.8–3 mm long, auricle 0.3–0.5 mm long. Stamens 8–8.5 mm long, staminal tubes 4–6 mm long, free part of filaments 2–2.5 mm long; anthers oblong, 0.3–0.4 × 0.1–0.2 mm. Pistils 8.5–9 mm long; ovary 1.5–2 × 0.7–0.8 mm, densely patent-hairy; styles 6.5–7 mm long, densely patent-hairy. Pods obliquely ovate, 5–6 × 2.5–3 mm, brown, apex rounded and mucronate, densely patent-hairy; fruiting stalks 2–3 mm long. Seeds oblong or reniform, swollen, 2.6–2.8 × 1.3–1.5 mm, reddish-brown.

Distribution.—Myanmar, Laos, Vietnam.

Ecology.—In open, grassy areas, hill evergreen forest, lower montane forest, alt. 1000–2250 m. Flowering: November to March. Fruiting: January to March.

Vernacular.— Thua khao (ත්වශා), thua doi (ත්වදොය), thua pa (ත්වපා), ka sam pik (කාසම්පික).

Note.— *Campylotropis pinetorum* resembles *C. parviflora* in having a pinkish-white to creamy-white corolla. However, the former has black spots on the upper leaf surface, velutinous hairs on the lower leaf surface and pods less than or equal to 6 mm long, while the latter has no black spots on the upper leaf surface, appressed hairs on the lower leaf surface and pods more than 6 mm long.

(holotype P P03089818!).

— *Campylotropis rockii* Schindl. in Fedde, Repert. Spec. Nov. Regni Veg. 22: 270. 1926; C.Y.Wu *et al.*, Index Fl. Yunnan. 1: 576. 1984; P.Y.Fu, Bull. Bot. Res., Harbin 7(4): 29. 1987; P.Y.Fu, Fl. Reipubl. Popularis Sin. 41: 100. 1995; X.F.Gao, in Inst. Bot. Kunming. Acad. Sin., Fl. Yunnan. 10: 553. 2006. Type: China, Yunnan, Simao, Ganlanba as west of Mekong, Salween water divide, upper Kan-lan-chai, Rock 7059 (holotype US, n.v.).

— *Campylotropis purpurascens* Ricker in Rehder *et al.*, J. Wash. Acad. Sci. 36: 39. 1946. Type: China, Yunnan, Hila, Shunning, Yü 17571 (holotype A, n.v.; isotypes E E00025717!, US 00288564!). Fig. 2E–F.

Shrub, 1–2 m tall. Stems erect, multi-angular, dark brown, densely patent-hairy. Leaves: petioles 0.4–2.9 cm long, sulcate, densely sericeous; rachis 1–6 mm long; stipules triangular-linear, 8–10 × 0.6–1 mm, outside appressed-hairy, persistent; leaflets elliptic-oblong or obovate-elliptic, subcoriaceous; terminal leaflets 2–6.5 × 0.4–2.8 cm, lateral leaflets 1.5–4.5 × 0.3–2.3 cm, apex acute or retuse and mucronate, base cuneate, margins entire; upper surface dark green, appressed-hairy; lower surface light green, densely sericeous, midrib adaxially

sunken, 7–12 pairs; petiolules 1–3 mm long, densely sericeous. Inflorescences axillary raceme or terminal panicle, 2.5–16 cm long, densely flowered; peduncles 1.2–2 cm long, densely patent-hairy and sparsely glandular-hairy; bracts triangular, 3.5–4.5 × 0.4–0.5 mm, appressed-hairy, reddish-brown usually caducous before anthesis; bracteoles triangular, 0.5–1 × 0.2–0.3 mm, appressed-hairy; pedicels 1–2 mm long, densely patent-hairy, young flowers subsessile. Calyx reddish-brown, appressed-hairy; tube 1.5–1.8 mm long; dorsal lobe triangular, 2.2–3 × 1.8–2 mm, with or without 2 teeth; lateral lobes triangular, 2–2.2 × 0.8–1 mm, lowest lobe triangular 2.2–3 × 0.7–1 mm. Corolla light to dark purple; standard elliptic, 8.5–11 × 5–6.5 mm, apex acute, claw 0.8–1 mm long, auricle absent; wings oblong, 8–9.5 × 3–4 mm, slightly falcate, apex rounded, claw 1.5–2 mm long, auricle 0.5–1 mm long; keel 9.5–11 × 2.5–3 mm, claw 1.5–2.5 mm long, auricle 0.5–1 mm long. Stamens 8–10 mm long, staminal tubes 6–8 mm long, free part of filaments 2.5–3 mm long, upward; anthers ovate-oblong, 0.3–0.4 × 0.2–0.3 mm. Pistils 8–12 mm long; ovary 2–2.5 × 0.4–0.5 mm, densely patent-hairy; styles 6.5–9.5 mm long, densely patent-hairy. Pods obliquely ovate, 4–7 × 2–4 mm, dark brown, apex acuminate, densely short patent-hairy, calyx and style persistent; fruiting stalks 1–5 mm long. Seeds reniform, 1.2–1.5 × 0.5–1 mm, blackish-brown.

Thailand.— NORTHERN: Mae Hong Son [Doi Laem Rang, 27 Dec. 2012, Norsaengsri 10061 (QBG); Nong Khao Klang (Karen) Village, 29 Oct. 2007, Maxwell 07-680 (QBG)]; Chiang Mai [Doi Chiang Dao, 12 Nov. 2011, Clark 235 (QBG), ibid., 2 Nov. 1922, Kerr 6509 (BK, E, K), ibid., 4 Nov. 1995, Maxwell 95-1067 (BKF, CMUB, L), ibid., 27 Jan. 1996, Maxwell 96-101 (BKF, CMUB, L), ibid., 19 Dec. 2015, Pisuttimarn 410-1 (KKU), ibid., 17 Oct. 1994, Pooma 873 (BKF, CMUB), ibid., 11 Nov. 2016, Satthaphorn 75 (PSU), ibid., 14 Jan. 2018, Satthaphorn & Leeratiwong 87 (PSU), ibid., 17 Dec. 2003, Sawai 508 (KKU), ibid., 11 Dec. 1987, Smitinand s.n. (BKF), ibid., 7 Nov. 1997, Triboun 698 (BK)]; Chiang Rai [Khun Jae National Park, 23 Nov. 1997, Maxwell 97-1416 (BKF, CMUB, L), ibid., 1 Jan. 1998, Maxwell 98-4 (BKF, CMUB, L)]; Phitsanulok [Phu Hin Rong Kla National Park, 1 Oct. 1990, Chantaranothai *et al.* 90/515 (KKU), ibid., 9 Oct. 1987, Sridith 53 (BCU),

ibid., 30 Oct. 1987, Sridith 76 (**BCU**), ibid., 29 Oct. 2001, Watthana & Suksathan 1543 (**AAU, CMUB, QBG**); EASTERN: Chaiyaphum [Phu Khiao, 8 Nov. 1984, Murata *et al.* T-41784 (**BKF**)].

Distribution.— China.

Ecology.— In open, rugged limestone, mixed deciduous forest, scrub forest, alt. 850–2000 m. Flowering and fruiting: October to January. Fruiting: October to January.

Vernacular.— Thua doi khon yao (ถื้อดอกอยู่นาน).

Note.— *Campylotropis sulcata* is distinct in having a multi-angular stem, patent hairs on the peduncle and light to dark purple petals. The species may resemble *C. decora* in some aspects, e.g. multi-angular stems, obovate-elliptic leaflets and the peduncle with patent hairs, however it differs from the latter in having sericeous hairs on the lower surface of leaflets (vs. appressed hairs), without glandular hairs on the peduncle (vs. with patent hairs mixed with glandular hairs), bracts which are more than 2 mm long (vs. less than or equal to 2 mm long) and standard petal without auricles.

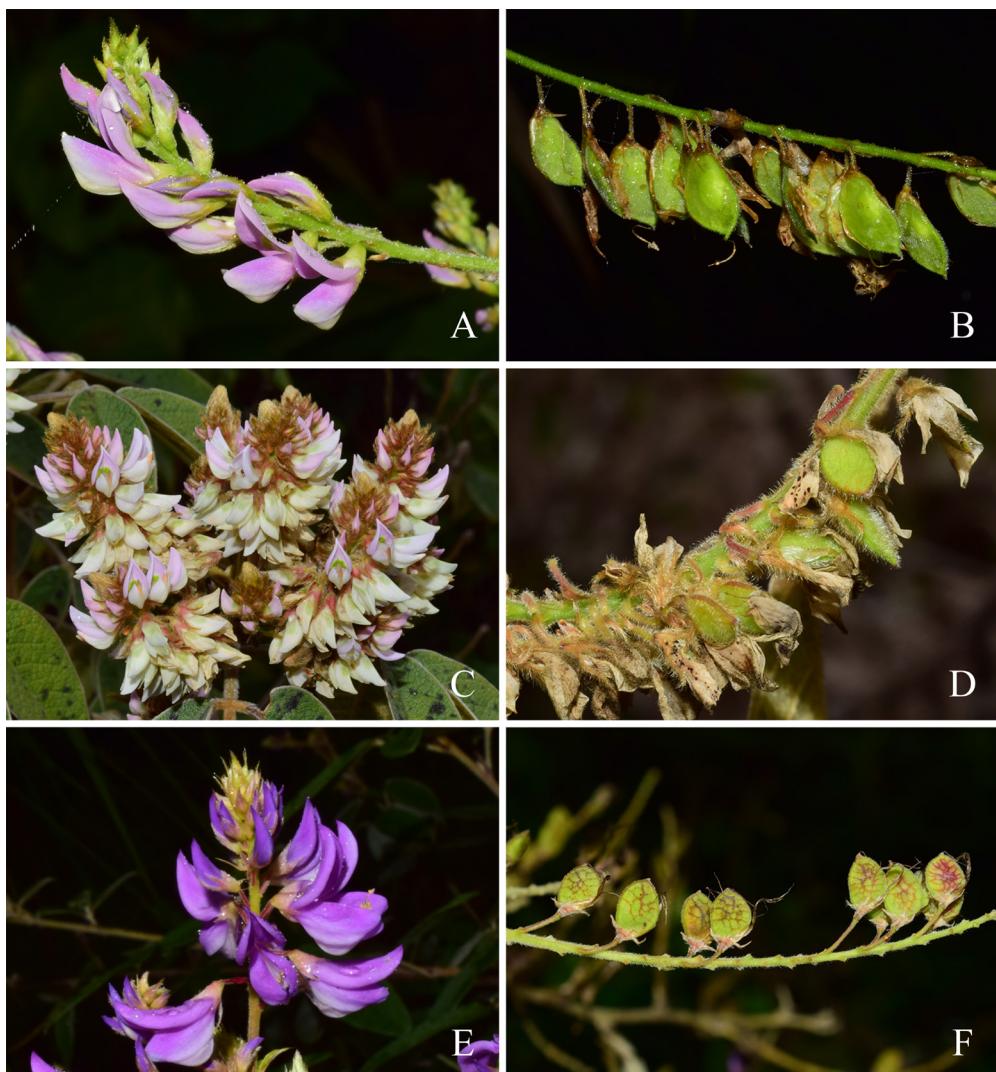

Figure 2. A–B: *Campylotropis parviflora* (Kurz) Schindl.; C–D: *C. pinetorum* (Kurz) Schindl.; E–F: *C. sulcata* Schindl.

ACKNOWLEDGEMENTS

The authors are grateful to the curators and staffs of the herbaria cited. We would like to thank Prof. Dr Henrik Balslev and Asst Prof. Dr Sahut Chantanaorrapint for their valuable helps. This research was financially supported by Carlsberg Foundation, Science Achievement Scholarship of Thailand, Graduate School, Dissertation Funding for Thesis, Prince of Songkla University and Center of Excellence on Biodiversity (BDC-PG3-160013).
