Abstract: This study presents a checklist of the flora of three coniferous forests of the Himalayan biodiversity hotspot in Kashmir: low-level blue pine (BP), mixed coniferous (MC) and subalpine (SA) forests. The list includes altitudinal distribution and conservation status of 272 vascular plant species representing 196 genera and 64 families. Excluding neophytes (70 taxa, 62 genera, and 27 families), Magnoliophyta comprised 190 taxa, 139 genera, and 50 families; Pinophyta seven taxa, six genera, and three families; and Pteridophyta three taxa, three genera, and two families. Most speciose families from Magnoliophyta include Compositae, Apiaceae, and Rosaceae. Genera such as *Artemisia*, *Potentilla*, *Viola*, and *Saussurea* contributed the maximum number of species. In case of Pinophyta, the principal families are Pinaceae with four taxa followed by Cupressaceae (2 taxa), whereas genus *Juniperus* comprised two species. In Pteridophyta, Pteridaceae (2 taxa) formed the most speciose family. The herbs contributed 177 taxa, followed by trees (15 taxa), shrubs (8) and subshrubs (2). The maximum number of taxa belongs to SA (136 taxa) followed by MC (134 taxa) and BP (83 taxa) forests. The species distribution reveals 20, 30, and 46 taxa are exclusive to BP, MC, and SA forests. More than 16% of taxa are categorized in the International Union for Conservation of Nature (IUCN) Red List, and 24 taxa are endemic to the Himalayan landscape. The checklist provides a roadmap for research, protection and conservation of plant diversity, especially the threatened taxa.

Keywords: Compositae, coniferous forest, conservation, elevation, floristic survey, hotspot, Kashmir Himalaya, mountains, threatened taxa.

Author details: ASHAQ AHMAD DAR is a research scholar/junior research fellow. His areas of interest are forest ecology and plant taxonomy. DR. AKHTAR HUSSAIN MALIK, junior scientist, works in the field of plant taxonomy, biodiversity, and ethnobotany. N. PARTHASARATHY, professor, has expertise in forest ecology, biodiversity conservation, and plant taxonomy.

Author contributions: AAD carried out the fieldwork, gathered, processed & stored the specimens, and prepared the manuscript. AHM identified the plant specimens. NP directed the work and examined the manuscript.

Acknowledgements: Authors are indebted to the Jammu & Kashmir Forest Department for kindly providing permission to carry out research fieldwork. We express gratitude to the Centre for Biodiversity and Taxonomy, Department of Botany, University of Kashmir for their paid assistance in identifying plant specimens. Field excursions would not have been conceivable without the enthusiastic assistance of Mudasir Ahmad Wani, Bilal Ahmad Dar, Basharat Ahmad Wani, Mushtaq Ahmad Dar, and many others especially guard officer Tariq Ahmad. Special thanks to Ayushi Kurian, Institut Français de Pondichéry, for GIS (map) related assistance.

INTRODUCTION

Research on biodiversity became an essential aspect of biological research immediately after the Convention on Biological Diversity (CBD), with the goal of determining the implications of rapid depletion, management and climate change on species composition and diversity. Biodiversity-related data provide a foundation for species conservation and habitat protection (Cadotte 2006). With only 2.2% of global land area, India houses over 18,000 plant species, including 5,000 endemic flora, and is recognized among the 17 global mega-biodiverse countries (Nayar 1996; Singh et al. 2015). About half of the biodiversity hotspots representing 25% of the known biota are reported from mountain ecosystems (Wester et al. 2019). However, until recently, mountains acquired the attention of researchers, policy-makers, and conservationists.

Currently, diverse habitats supporting distinct flora are experiencing the threat of destruction due to fragmentation, rapid human population growth and climate change (Janssen et al. 2016; IUCN 2017). Consistent reductions in plant diversity call for continuous exploration of the population status of flora using systematic (IUCN) criteria, as this is acknowledged as the most rigorous strategy/technique for evaluating the global status of biodiversity and categorizing plants based on their projected risk of extinction (Maes et al. 2015; Orsenigo et al. 2018; Nowak et al. 2020).

The Himalaya, extending from Afghanistan to Myanmar, is one of 36 biodiversity hotspots harbouring a diverse range of flora and fauna, resulting from the phytogeographical complexity of the region (Zachos & Habel 2011). About half of the known biodiversity in India, particularly endemics, is contributed by the 13% land area of the Indian Himalayan Region (IHR). The phytogeographical complexity in the present Jammu & Kashmir, located on the northwestern side of the Himalaya, contributes significantly to various life forms. On account of its floristic status, the Kashmir Himalaya is a part of Himalayan biodiversity hotspot, and it is also considered to be vulnerable to climate change and thus species extinction (Rashid et al. 2015).

Several scholars over the course of time have made significant contributions to floristic knowledge of the Himalayan region: Hooker (1872–1897); Lambert (1933); Javeid (1966, 1978, 1979); Hajra (1983); Polunin & Stainton (1984); Kachroo (1993); Singh & Kachroo (1994); and Malik et al. (2010). However, critical taxonomic knowledge about the Kashmir Himalaya is still poor. In addition, a detailed study on the altitudinal

distribution of taxa across the forest types is lacking. Consequently, the present study was undertaken to document the floristic diversity of the area, and to highlight its conservation significance.

MATERIALS AND METHODS

Study area

The study area spans over five districts of the Kashmir valley ($33.513\text{--}34.659^{\circ}\text{N}$ & $74.497\text{--}75.019^{\circ}\text{E}$) in the present Jammu & Kashmir, India (Figure 1; Image1). Kashmir valley exhibits a warm summer and humid continental climate (Dfa; Peel et al. 2007) with four distinctive seasons, i.e., spring, summer, autumn, and winter. Climate data from the last 38 years revealed that Kashmir valley experiences an annual mean minimum and maximum temperature of $5.4 \pm 0.4^{\circ}\text{C}$ and $17.6 \pm 0.8^{\circ}\text{C}$ (Dad et al. 2021). Furthermore, the mean annual rainfall is $1005.5 \pm 197.6\text{ mm}$ (Dad et al. 2021). About 46% of precipitation occurs during pre-monsoon, followed by south-west monsoon (27%), winter monsoon (25%), and post-monsoon (8%). Disturbances posed by the Mediterranean Sea during winter lead to frequent rain and snowfall in the valley. The period of snowfall extends from October–March. Geologically, the study area consists of rocks chiefly composed of slates, phyllites and quartzites (Krishnan 1982). The predominant soil orders are entisols, inceptisols, alfisols, and mollisols (Mahapatra et al. 2000; Sidhu & Surya 2014).

Low-level blue pine (BP) forest ranges from 1,500–2,400 m on gentle to moderate slopes. Even-aged stands of the blue-pine, *Pinus wallichiana* A.B.Jacks intermixed with deodar, *Cedrus deodara* (Roxb. ex D.Don) G.Don and the spruce, *Picea smithiana* (Wall.) Boiss., occur depending upon the aspect. Since the ground surface is covered with litter, understorey herb vegetation is less comprising of *Poa alpina* L., *Fragaria nubicola* (Lindl. ex Hook.f.) Lacaita, *Viola canescens* Wall. in summer season (Shaheen et al. 2012). Dominant shrub species include *Viburnum grandiflorum* Wall. ex DC., *Berberis lycium* Royle, *Indigofera heterantha* Brandis depending upon aspect and canopy cover. Anthropogenic disturbances include land encroachment (for cultivating *Zea mays* L. and *Solanum tuberosum* L.), non-timber forest product extraction (fruits of *Viburnum grandiflorum* Wall. ex DC., medicinally important herbs, honey, nutritious and medicinally important fungus – *Morchella esculenta* (L.) Pers. etc.), lopping, firewood collection, grazing, and fire.

Mixed coniferous (MC) forest, commonly referred to

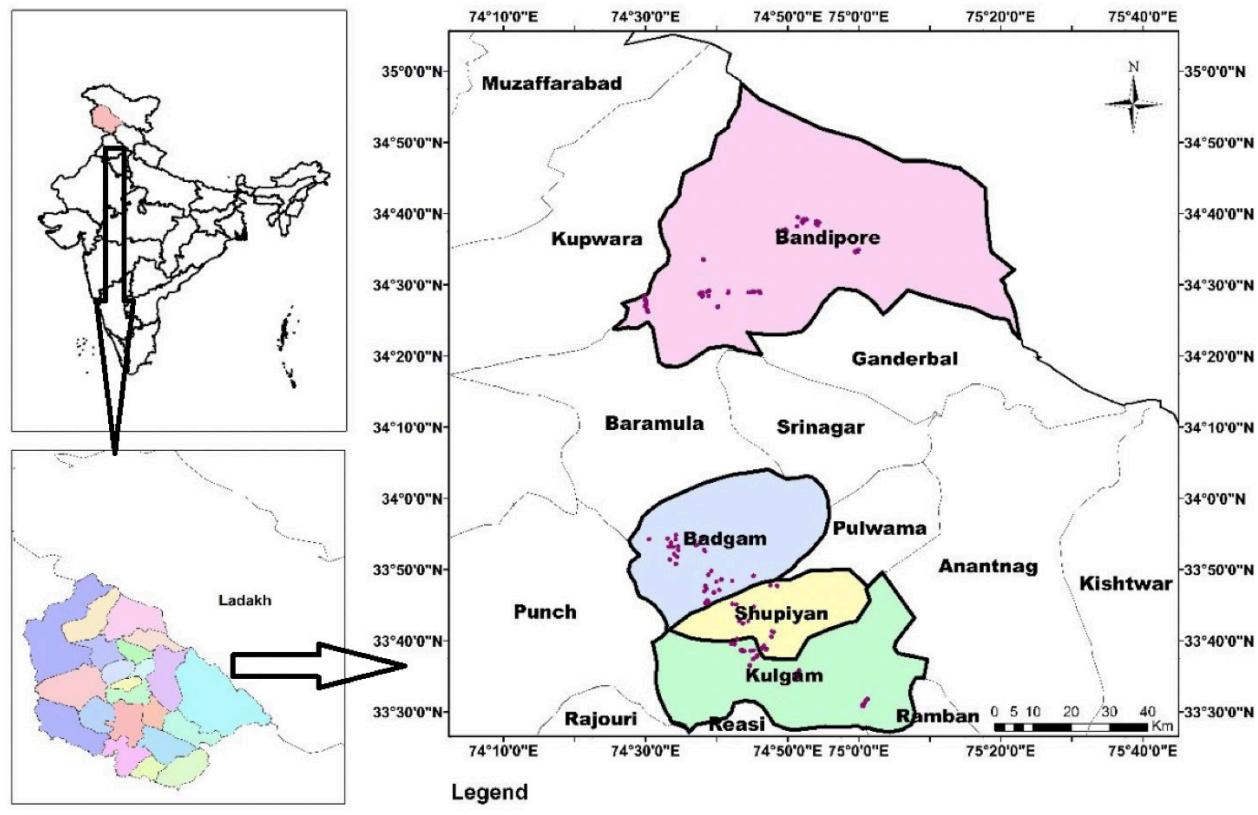

Table 1. Map of India, Jammu and Kashmir state, four districts shown in different colours, and the sampled locations in red dots.

as fir forest, occupies the central and western Himalaya from an elevation of about 2,400–3,000 m. Tree species such as evergreen coniferous (*Abies pindrow* (Royle ex D. Don) Royle, *Picea smithiana* and *Pinus wallichiana*) and deciduous broad-leaved tree species (*Acer caesium* Wall. ex Brandis, and *Prunus cornuta* (Wall. ex Royle) Steud.) predominate. The regeneration of tree species is low or absent, as indicated by the presence of few saplings and seedlings. Understorey vegetation blossoms after the snowmelt during the spring season and is quite dense and diverse. The dominant shrub and herb species include *Viburnum grandiflorum* and *Stipa sibirica* (L.) Lam., (Dar & Sundarapandian 2016). Epiphytic moss and lichen cover the trunk and lower branches of emergent tree species. Activities such as grazing, extraction of plants and plant materials of economic and medicinal value, firewood collection, illegal logging, etc., contribute to forest degradation.

The subalpine forest (SA) forms a transition between MC forest and alpine scrub or grassland from 2,900–3,500 m. *Abies pindrow* is a characteristic and dominant species intermixed with *Betula utilis* D. Don. *Rhododendron* spp. occur as undergrowth or

form individual stands. The species of Primulaceae, Ranunculaceae, and Compositae constitute the main understory herbaceous vegetation. The subalpine forest is equally subjected to anthropogenic disturbances like the other forest types besides heavy winter snowfall as a natural disturbance (Gairola et al. 2009).

Sampling, herbarium preparation, and data analysis

A reconnaissance floristic survey was undertaken in the landscape between the elevation gradient of 1,500 m and 3,800 m to understand the forest types and composition. Three coniferous forests of Kashmir Himalaya: BP, MC, and SA (Champion & Seth 1968) were identified in the region. Botanical explorations were undertaken during 2019 (March–July) and 2020 (May–August) by employing a random sampling approach considering the accessibility and forest types. During the survey, plants such as trees, shrubs and herbs were documented and voucher specimens were collected. Specimens were processed (pressing, drying, chemical treatment, and mounting) following recommended standard techniques (Rao & Sharma 1990), and examined and identified at the Centre for Biodiversity

and Taxonomy, University of Kashmir. The voucher specimens were deposited at the Department of Ecology and Environmental Sciences Herbarium, Pondicherry University. The Plant List (TPL; <http://www.theplantlist.org/>) was referred for updated binomial nomenclature and the author names. Angiosperm Phylogeny Group III (APG III) Classification (2009) and Chase & Reveal (2009) for angiosperms and Gymnosperms were followed for categorizing families. Khuroo et al. (2007) was referred for the origin and alien status of flora. Various information sources were explored to acquire Himalayan and global records of inventoried taxa, including Himalayan flora literature (Hooker 1872–1897; Polunin & Stainton 1984), Tropicos (<http://www.tropicos.org/>), India Biodiversity Portal (<https://indiabiodiversity.org/>), Flowers of India (<http://www.flowersofindia.net/>) and Plants of the World online (<http://www.plantsoftheworldonline.org/>).

RESULTS

Species composition and distribution

A total of 272 taxa belonging to 196 genera and 64 families were recorded across the three Kashmir Himalayan coniferous forests (Table 1). Of the total vascular plants, neophytes (aliens) represent 70 (25.73%) taxa within 27 and 62 families and genera (Table 2). This includes invasive aliens (IA; 51.42%), naturalised aliens (NZ; 38.57%), casual/naturalised aliens (C/NA; 8.57%) and cultivated unescaped aliens (CU; 1.43%). Among the aliens, woody flora accounted five (7.14%) species (*Robinia pseudoacacia* L., *Syringa emodi* Wall. ex Royle, *Crataegus songarica* K. Koch, *Rosa brunonii* Lindl., *Aesculus indica* (Wall. ex Cambess.) Hook.). All the neophytes are excluded hereafter from further analysis.

Most of the native taxa belong to Magnoliophyta (192 taxa, 139 genera, and 50 families), whereas Pinophyta (seven taxa, six genera, and three families) and Pteridophyta (three taxa, three genera, and two families) are less represented (Table 2). Within Magnoliophyta, 177 taxa (92%) belong to Magnoliopsida

and 15 (7.8%) to Liliopsida. Among these, there are 177 herb taxa (174 Magnoliophyta and three Pteridophyta), eight shrub taxa (Magnoliophyta only), 15 tree taxa (eight Magnoliophyta and seven Pinophyta) and two subshrubs (Magnoliophyta only). Herbs are dominated by perennials (150 taxa, 85%), followed by annuals (17 taxa, 9.6%), biennials (two taxa, 1.1%) and evergreen (one taxon, 0.56%). Moreover, seven (3.9%) herbaceous taxa are either perennials, annuals or biennials (Table 2). Of the 15 reported tree taxa, most of them are deciduous (8, 59%), followed by evergreen conifers (seven, 41%). Similarly, among the shrubs, seven (88%) are deciduous (including one climber), and one (12.5%) is evergreen. The images of selected plant taxa are provided (Images 2–7).

Three families in Magnoliophyta with greater contribution to species richness include Compositae (28 taxa, 13.86%) and Apiaceae and Rosaceae (13, 6.44% each). Families with ten or more species (besides above three) include Lamiaceae, Leguminosae, Poaceae (11, 5.45% each), and Ranunculaceae (10, 4.95%) (Figure 2). Species-rich genera, i.e., *Artemisia*, *Potentilla*, *Viola*, and *Saussurea* contributed 16 (7.92%) taxa. Majority of families (26, 47.27%) and genera (108, 72.97%) are monotypic with a single taxon. Among Pinophyta, Pinaceae (four taxa) and Cupressaceae (two taxa) are predominant families, whereas *Juniperus* is the principal genus contributing two taxa. Pteridophyta is represented by Pteridaceae (two taxa) and Equisetaceae (one taxon), and all the three genera (*Adiantum*, *Equisetum*, and *Pteris*) contributed equally, i.e., one species. In contrast to tree and understory herb vegetation, all shrub families and genera contributed one species each. The number of taxa varied among the forest types and corresponding elevation due to the uneven distribution of taxa (Table 1). The SA and MC forests represent greater number of taxa, i.e., 136 and 134, followed by BP forest (83 taxa). The species distribution revealed that 20 taxa are exclusive to BP forest, whereas 30 and 46 taxa are limited to MC and SA forests. However, 22.77% of taxa with a wide distributional range are shared among forest types. Furthermore, BP & MC, BP & SA, and MC

Table 1. Distribution of taxa among various taxonomic groups in three coniferous forests viz., low-level blue pine forest (BP), mixed coniferous forest (MC), subalpine forest (SA) of Kashmir Himalaya, India.

Phylum	Taxon	Genera	Family	Trees	Shrubs	Subshrub	Herbs
Magnoliophyta	262	187	59	10	10	3	239
Pinophyta	7	6	3	7	—	—	—
Pteridophyta	3	3	2	—	—	—	3
Total	272	196	64	17	10	3	242

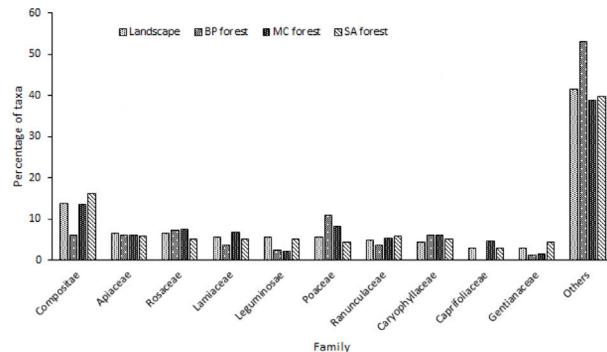

Figure 2. Percentage contribution to taxa across three coniferous forests of Kashmir Himalaya, India by families.

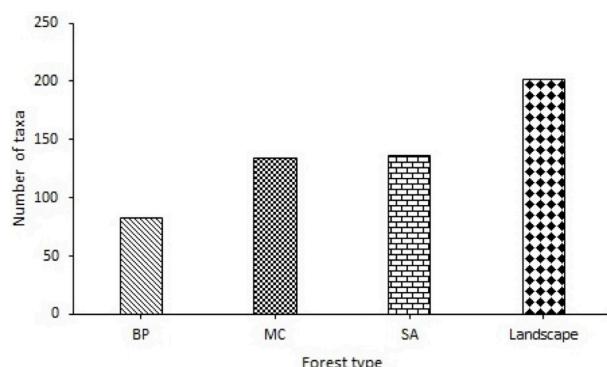

Figure 3. Number of taxa in three coniferous forests of Kashmir Himalaya, India.

& SA forests shared 16, two, and 43 taxa, respectively. The SA forest harbours greater number of species of Compositae (16.18%) and Caryophyllaceae (5.15%) than to landscape-scale flora (13.86% and 4.46%) in top 10 families. Similarly, Poaceae, and Rosaceae in BP (10.84% & 7.23%) and MC forests (8.21% & 7.46%) contributed greater number of taxa than to the overall landscape (5.45% & 6.44%).

Determination of phytogeographic distribution and taxa status

The distribution of most of the recorded taxa is confined to the northern temperate regions. However, 24 taxa restricted their distribution to the Himalayan landscape (Table 2). Despite the considerable research on plant conservation in Kashmir Himalaya, the analysis of the conservation status of the flora revealed that 169 taxa are not assessed (NA), and the remaining 33 (16.37%) taxa are included under IUCN Red List category (Table 2). Among them, two species *Saussurea costus* (Falc.) Lipsch. and *Aconitum chasmanthum* Stapf ex Holmes are Critically Endangered (CR); four

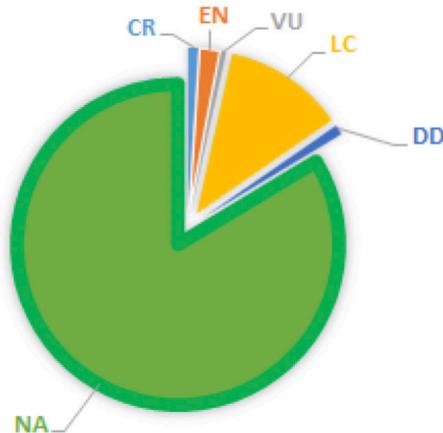

Figure 4. Pie-chart showing IUCN category of species across the three coniferous forests of Kashmir Himalaya, India.

species *Trillium govanianum* Wall. ex D.Don, *Aconitum heterophyllum* Wall. ex Royle, *Taxus wallichiana* Zucc. and *Atropa acuminata* Royle ex Lindl. are Endangered (EN); one species *Cypripedium cordigerum* D.Don is Vulnerable (VU), two species *Asparagus filicinus* Buch.-Ham. ex D.Don and *Corylus jacquemontii* Decne. fall under Data Deficient (DD) category and 24 species are Least Concern (LC). With regard to the forest type and vertical distribution, the maximum number of threatened taxa (VU+EN+CR) occur in SA forest at high altitudinal zones.

DISCUSSION

The floristic survey revealed 272 taxa from 196 genera and 64 families categorized in three life-forms, i.e., trees and understorey shrubs and herbs (Table 1 & 2). The number of taxa reported in the present study was greater than most of the floristic studies in temperate Kashmir Himalaya (Shaheen et al. 2012; Mir et al. 2019; Malik et al. 2021) and other Himalayan studies (Ahmad et al. 2020; Asif et al. 2020; Tiwari et al. 2020) and also elsewhere (Bai et al. 2011). Compositae and Apiaceae constituted species-rich families in this survey. These families were also well represented in other studies of the Kashmir Himalaya: Asif et al. (2020) *Betula* forests in northwestern Kashmir Himalaya; Dar & Sundarapandian (2016) forests of western Himalaya, and elsewhere Devi et al. (2014) northwestern Himalaya. Variation in species distribution among the forest types/altitudinal zones could be due to micro-climatic heterogeneity resulting from a change in elevation, slope, and other ecological gradients (Körner 2007), besides evolutionary

Table 2. List of plant species in three temperate coniferous forests, viz., low-level blue pine forest (BP), mixed coniferous forest (MC), subalpine forest (SA) of Kashmir Himalaya, India.

effects (Qian et al. 2015). The variation in microclimate would have enabled the taxa to adjust to a wide range of niches along elevation and a variety of pre-adapted lineages to colonize in the mountain ranges. Therefore, it can be considered that climatic factors differentiate taxa as indicated by resilience developed over their evolutionary past, with these phylogenetic variations, in turn, deciding species heterogeneity (Wiens & Donoghue 2004; Rana et al. 2019).

One of the prerequisites for biodiversity conservation is to determine the areas of particular importance in the context of taxa vulnerability and characteristic habitats and critically evaluate the same, thus enabling them to prioritize these areas for further consideration (Spehn 2011). In the present study, the situation for seven (2.57%) taxa categorized under threatened, i.e., *Saussurea costus* & *Aconitum chasmanthum* (CR), *Trillium govanianum*, *Aconitum heterophyllum*, *Taxus wallichiana*, & *Atropa acuminata* (EN), and *Cypripedium cordigerum* (VU) were found occasionally in the present study and requires immediate conservational priorities across the landscape. Besides climate change and overgrazing, the species in high demand for traditional medicinal and pharmaceutics has led to their extensive collection and illegal trading, thus pushing them closer to extinction (Devi et al. 2014; Nowak et al. 2020). The sustainability of such flora is imperative across

the landscape. Ecological rehabilitation, site-specific in particular should be accomplished by re-vegetating degraded sites with natural vegetation. Existing management regulations must be examined in order to adopt strict guidelines to enhance efficiency in decision-making and avoid fraud. Extensive quantitative plant diversity inventories and biogeographical explorations ought to be directed on the threatened flora to identify its abundance and frequency. Additionally, ex situ management methods must be in place in addition to the in situ conservation programmes. Overall, from our study we infer that all three types of coniferous forests are rich in flora, demonstrating their importance for conservation. We hope that our results will serve as a benchmark for potential future studies on plant ecology of the area. With notable plant diversity, Kashmir Himalaya is probably a suitable site for further investigations. Moreover, because Kashmir Himalayan forests face threats due to various anthropogenic activities, qualitative data of documented flora will help local and regional authorities to propose management and conservation priorities.

Reviewers 2018–2020

Due to paucity of space, the list of reviewers for 2018–2020 is available online.

The opinions expressed by the authors do not reflect the views of the Journal of Threatened Taxa, Wildlife Information Liaison Development Society, Zoo Outreach Organization, or any of the partners. The journal, the publisher, the host, and the partners are not responsible for the accuracy of the political boundaries shown in the maps by the authors.

Print copies of the Journal are available at cost. Write to:
The Managing Editor, JoTT,
c/o Wildlife Information Liaison Development Society,
No. 12, Thiruvannamalai Nagar, Saravanampatti - Kalapatti Road,
Saravanampatti, Coimbatore, Tamil Nadu 641035, India
ravi@threatenedtaxa.org

Journal of Threatened Taxa is indexed/abstracted in Bibliography of Systematic Mycology, Biological Abstracts, BIOSIS Previews, CAB Abstracts, EBSCO, Google Scholar, Index Copernicus, Index Fungorum, JournalSeek, National Academy of Agricultural Sciences, NewJour, OCLC WorldCat, SCOPUS, Stanford University Libraries, Virtual Library of Biology, Zoological Records.

NAAS rating (India) 5.64

OPEN ACCESS

The Journal of Threatened Taxa (JoTT) is dedicated to building evidence for conservation globally by publishing peer-reviewed articles online every month at a reasonably rapid rate at www.threatenedtaxa.org. All articles published in JoTT are registered under [Creative Commons Attribution 4.0 International License](#) unless otherwise mentioned. JoTT allows unrestricted use, reproduction, and distribution of articles in any medium by providing adequate credit to the author(s) and the source of publication.

Articles

Estimating the completeness of orchid checklists and atlases: a case study from southern Italy

– Antonio Croce, Pp. 20311–20322

A floristic survey across three coniferous forests of Kashmir Himalaya, India – a checklist

– Ashaq Ahmad Dar, Akhtar Hussain Malik & Narayanaswamy Parthasarathy, Pp. 20323–20345

Associations of butterflies across different forest types in Uttarakhand, western Himalaya, India: implications for conservation planning

– Arun Pratap Singh, Pp. 20346–20370

Comparison of bird diversity in protected and non-protected wetlands of western lowland of Nepal

– Jagan Nath Adhikari, Janak Raj Khatiwada, Dipendra Adhikari, Suman Sapkota, Bishnu Prasad Bhattacharai, Deepak Rijal & Lila Nath Sharma, Pp. 20371–20386

Local hunting practices and perceptions regarding the distribution and ecological role of the Large Flying Fox (Chiroptera: Pteropodidae: *Pteropus vampyrus*) in western Sarawak, Malaysian Borneo

– Jayasilan Mohd-Azlan, Joon Yee Yong, Nabila Norshuhadah Mohd Hazzrol, Philovenny Pengiran, Arianti Atong & Sheema Abdul Aziz, Pp. 20387–20399

Communications

Macrolichens of Mathikettan Shola National Park, Western Ghats: a preliminary investigation with some new records

– Aswathi Anilkumar, Stephen Sequeira, Arun Christy & S.M. Arsha, Pp. 20400–20405

New distribution record of globally threatened Ocean Turf Grass *Halophila beccarii* Ascherson, 1871 from the North Andaman Islands highlights the importance of seagrass exploratory surveys

– Swapnali Gole, Prasad Gaidhani, Srabani Bose, Anant Pande, Jeyaraj Antony Johnson & Kuppusamy Sivakumar, Pp. 20406–20412

An inventory of new orchid (Orchidaceae) records from Kozhikode, Kerala, India

– M. Sulaiman, C. Murugan & M.U. Sharif, Pp. 20413–20425

Abundance and spatial distribution analyses of *Stemonoporus moonii* Thwaites (Dipterocarpaceae) – a critically endangered species endemic to Sri Lanka

– K.A.M.R.P. Atapattu, H.D.D.C.K. Perera, H.S. Kathriarachchi & A.R. Gunawardena, Pp. 20426–20432

Plant diversity of Point Calimere Wildlife Sanctuary and fodder species grazed by the Blackbuck *Antilope cervicapra* L.

– Ashutosh Kumar Upadhyay, A. Andrew Emmanuel, Ansa Sarah Varghese & D. Narasimhan, Pp. 20433–20443

Raptors observed (1983–2016) in National Chambal Gharial Sanctuary: semi-arid biogeographic region suggestions for parametric studies on ecological continuity in Khathiar-Gir Ecoregion, India

– L.A.K. Singh, R.K. Sharma & Udayan Rao Pawar, Pp. 20444–20460

Nesting success of Sharpe's Longclaw (*Macronyx sharpei* Jackson, 1904) around the grasslands of lake Ol'bolessat Nyandarua, Kenya

– Hamisi Ann Risper, Charles M. Warui & Peter Njoroge, Pp. 20461–20468

Population, distribution and diet composition of Smooth-coated Otter *Lutrogale perspicillata* Geoffroy, 1826 in Hosur and Dharmapuri Forest Divisions, India

– Nagarajan Baskaran, Raman Sivaraj Sundarraj & Raveendranathanpillai Sanil, Pp. 20469–20477

Utilization of home garden crops by primates and current status of human-primate interface at Galigamuwa Divisional Secretariat Division in Kegalle District, Sri Lanka
