

Alternatives to pesticides: effective solutions for Polish farmers

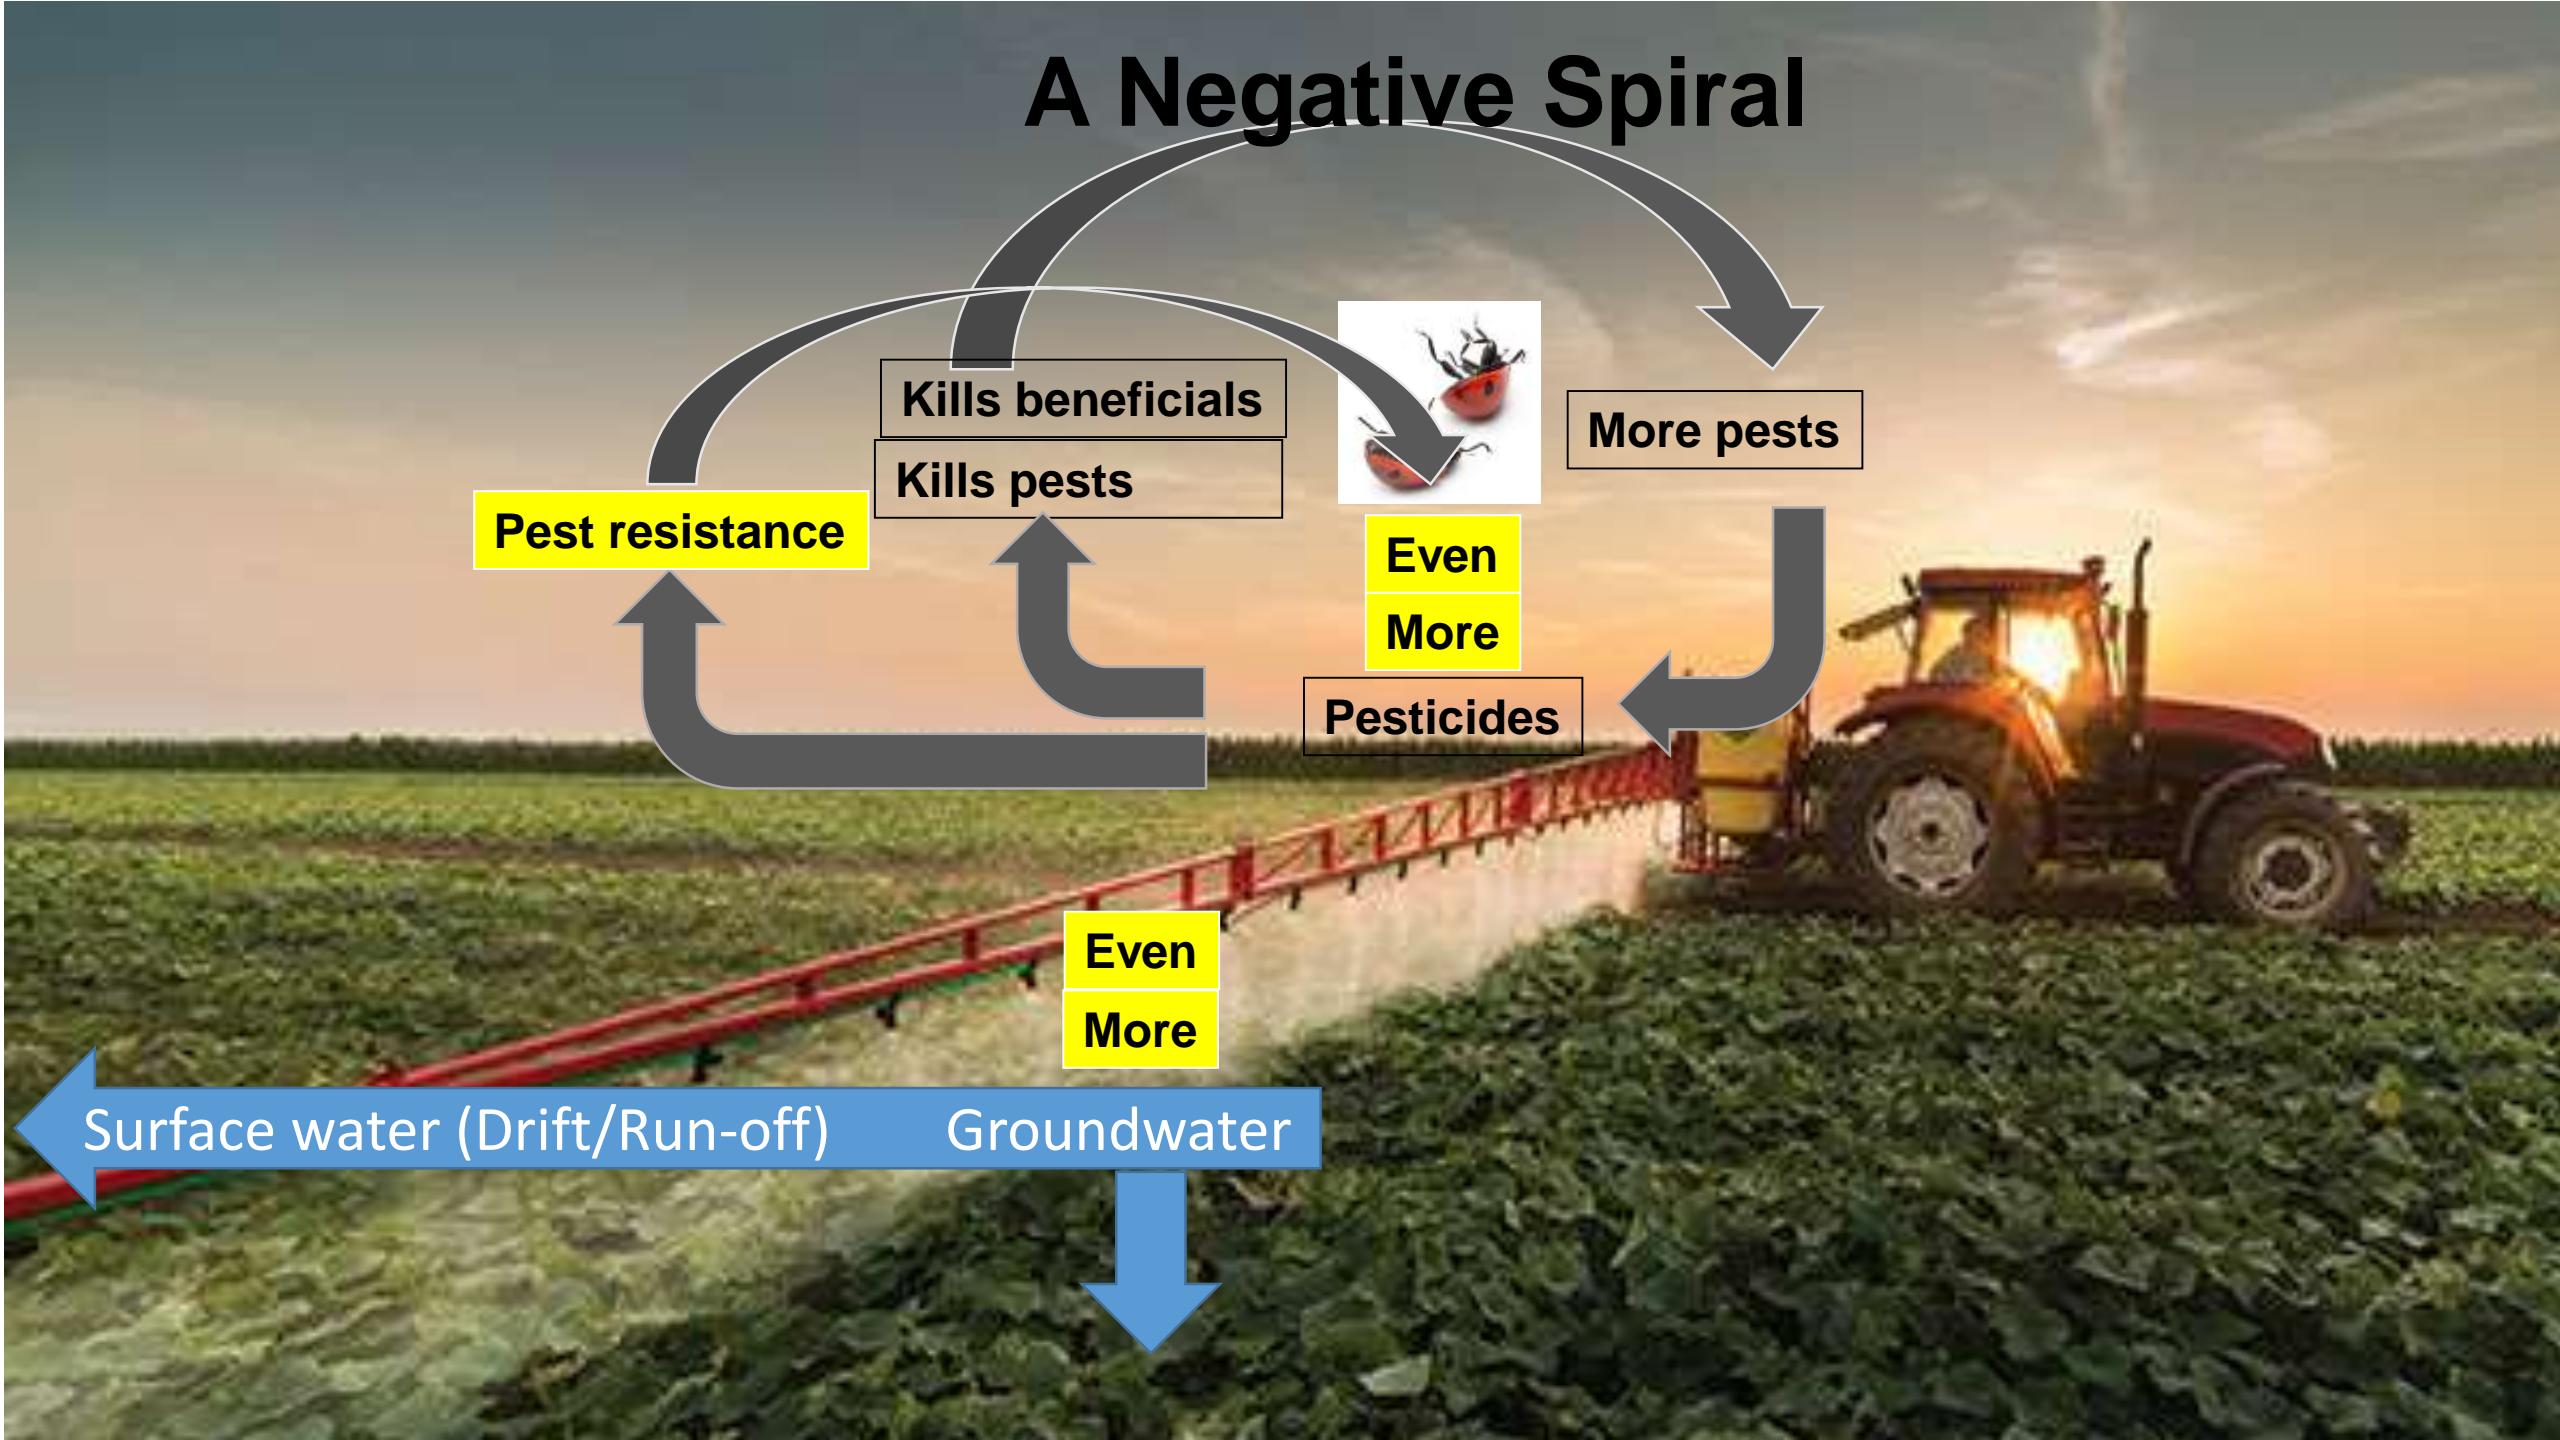

Felix Wäckers

Dir R&D BiobestGroup

Prof Insect-Plant Interactions, Lancaster University

A Negative Spiral

The argument from the chemical industry

One ninth of the world's population does not have enough food.

To feed our growing population, we need to produce food sustainably.

#AgFuture
#FarmingTheBiggestJobOnEarth
#Feeding10billion

BASF
We create chemistry

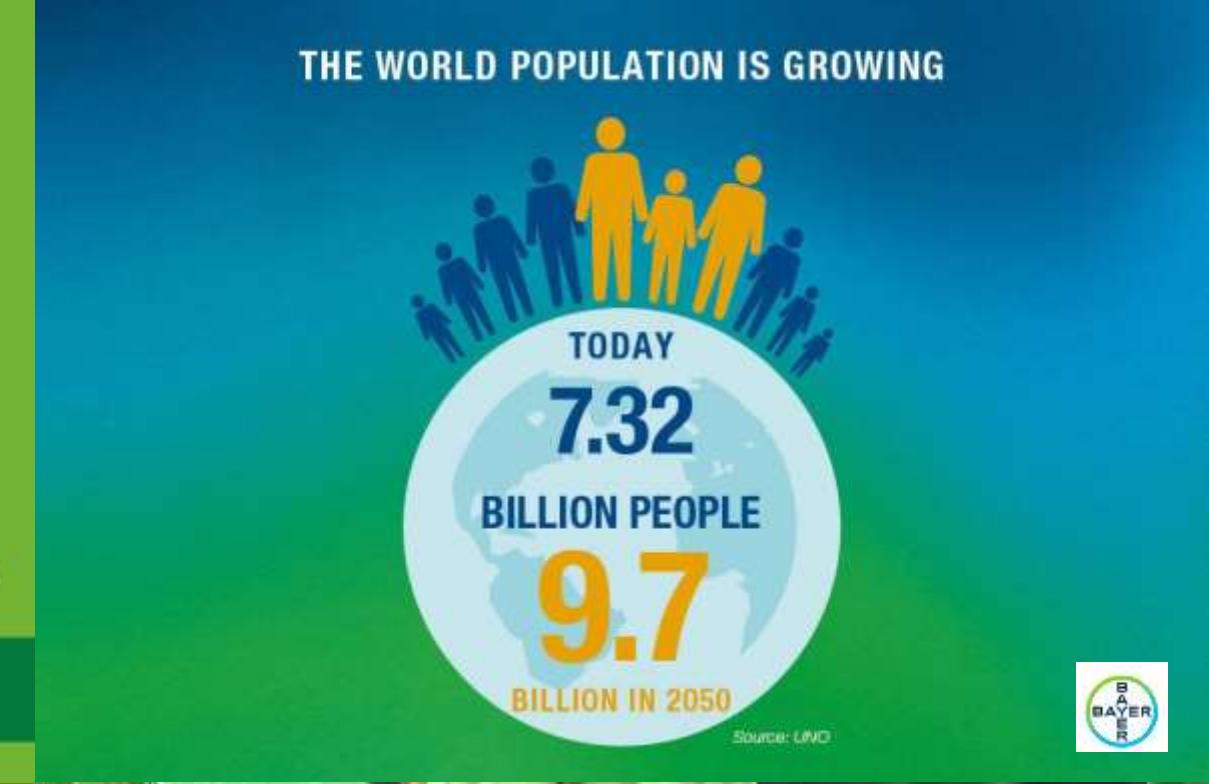

Today...

1 in 9 people is undernourished

- Every day, the world population increases by more than 180,000 people
- But land available for farming is limited
- Smallholder yields are low

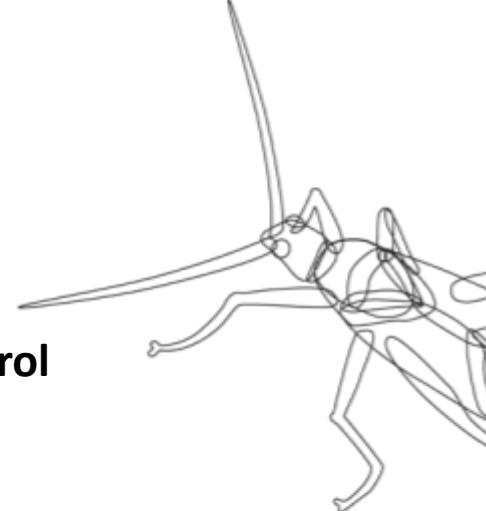

syngenta

Highest yields are achieved
In systems using
no or minimal pesticides

Alternatives Exist

IMPROVING THE EFFECTIVENESS OF INTEGRATED PEST MANAGEMENT OF WINTER OILSEED RAPE IN LINE WITH THE EUROPEAN GREEN DEAL

Biologicals used in disease control

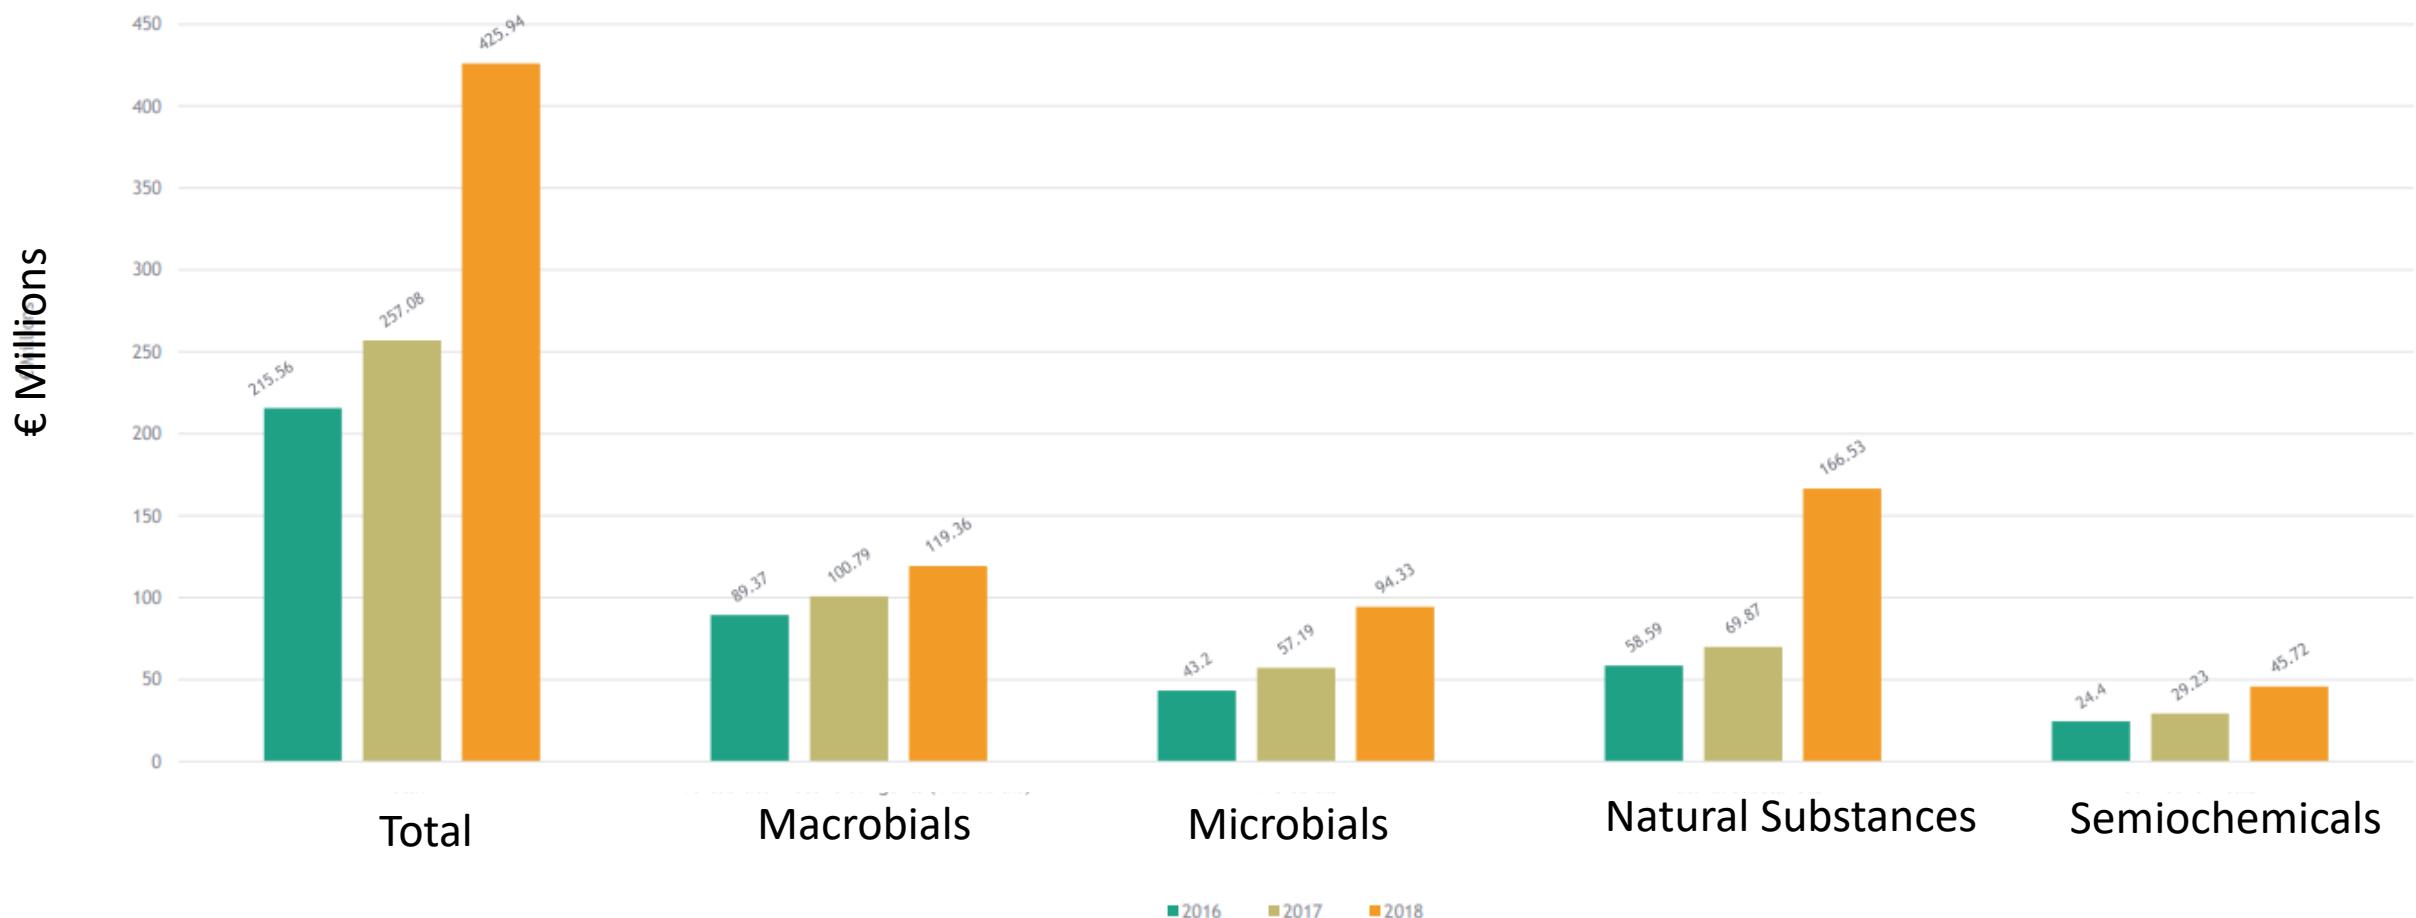

Bacteria

Bacillus (Serenade, Sonata)
Pseudomonas
Streptomyces

Fungi

Ampelomyces (AQ 10)
Aureobasidium
Trichoderma
Clonostachys

Sales of Biologicals and Natural Products (2016-2018; 38% of IBMA members)

Source: IBMA member survey 2020

Sales of Biologicals and Natural Products (2016-2018; 38% of IBMA members)

In 2018, the European Biocontrol Market was €1.015bn, representing 6% of the €16bn crop protection market.

- > 1000 biologicals and natural products available across different European member states.
- > 140 products in the authorisation process across Europe and a further 120 new products not yet submitted to the authorisation process.

Source: IBMA member survey 2020

Four Examples of Existing Effective Alternatives

Example 1:

Using bumblebees (Flying Doctors) for targeted application of biopesticides

Biobest “Flying Doctors®” System

- Easy introduction of product in replaceable trays
- When bumblebees exit through the dispenser, the product adheres to their legs and hairs.
- The bumblebees then transport and deposit the product on flowers during pollination.

Biobest "Flying Doctors®" System

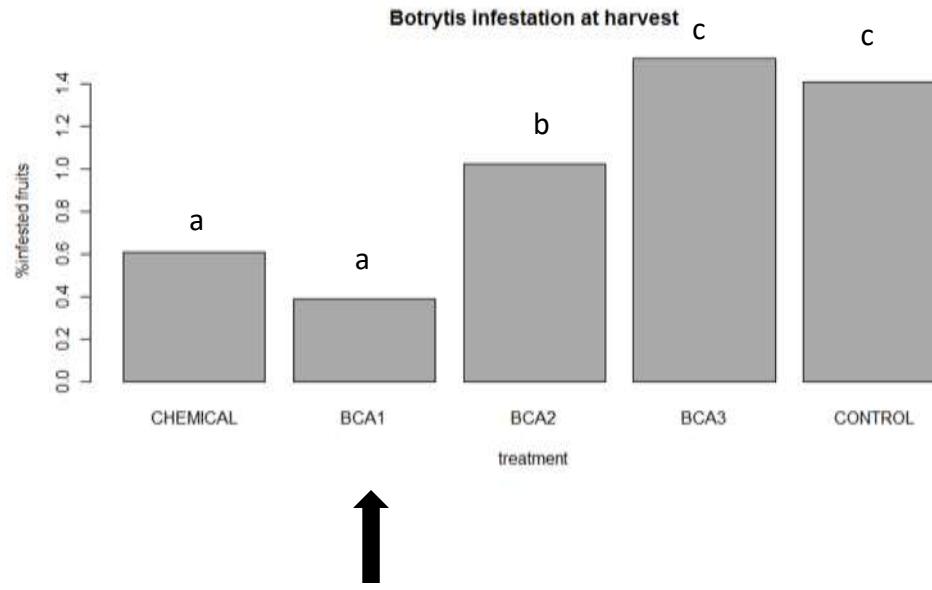

Advantages

- Targeted product delivery
- Strong reduction in product use
- Continuous application
- Considerable savings in labour

Biobest "Flying Doctors®" System

Botrytis infection at harvest

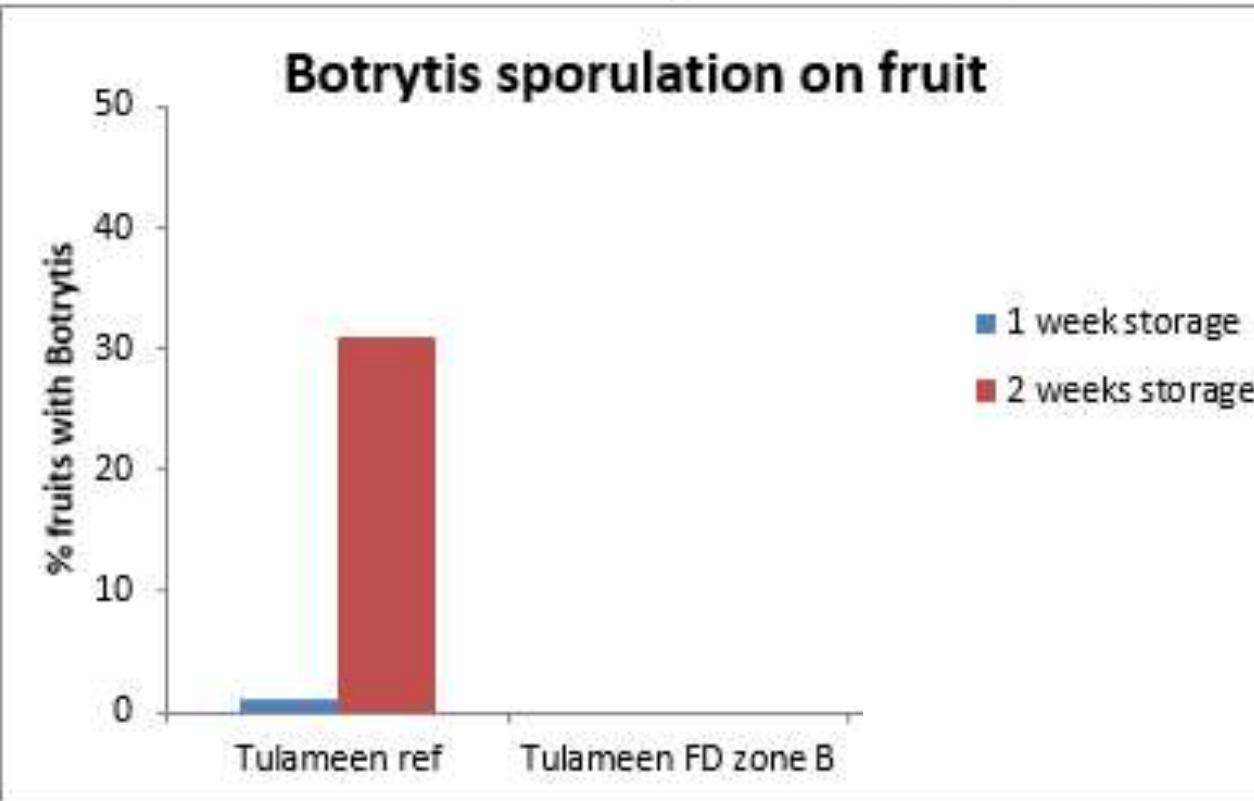

Verdera 4B (*Clonostachys catenulatum*)

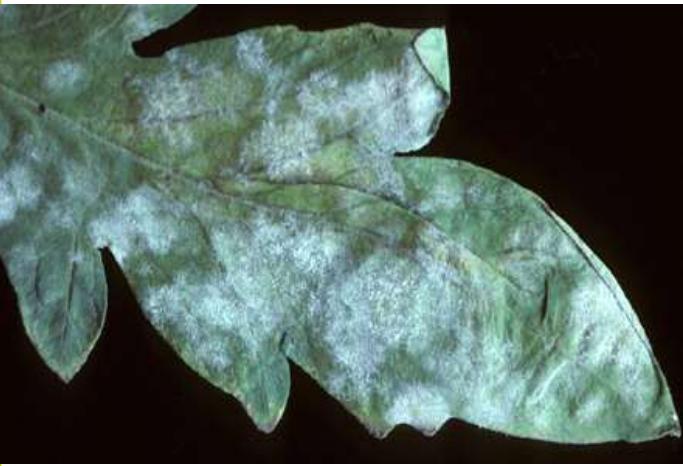

Raspberries, Botrytis

Raspberries, Botrytis (Post harvest assessment)

Example 2: A new solution for the control of Powdery Mildew

Biologicals used in disease control

Bacteria

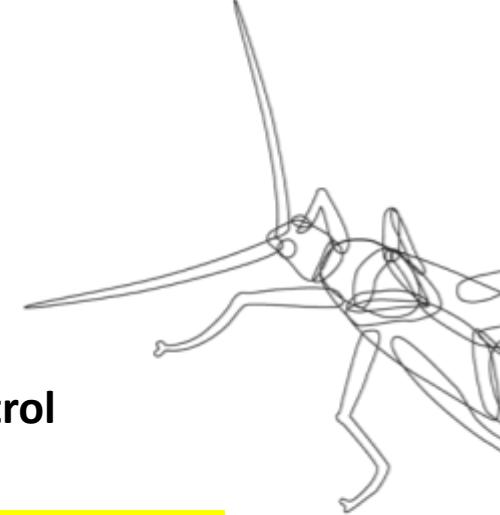

Bacillus (Serenade, Sonata)
Pseudomonas
Streptomyces

Fungi

Ampelomyces (AQ 10)
Aureobasidium
Trichoderma
Clonostachys

Viruses

Bacteriophage

Example 2: A new solution for the control of Powdery Mildew

Pronematus ubiquitus (Pu)

Pronematus ubiquitus: a unique cosmopolitan mite

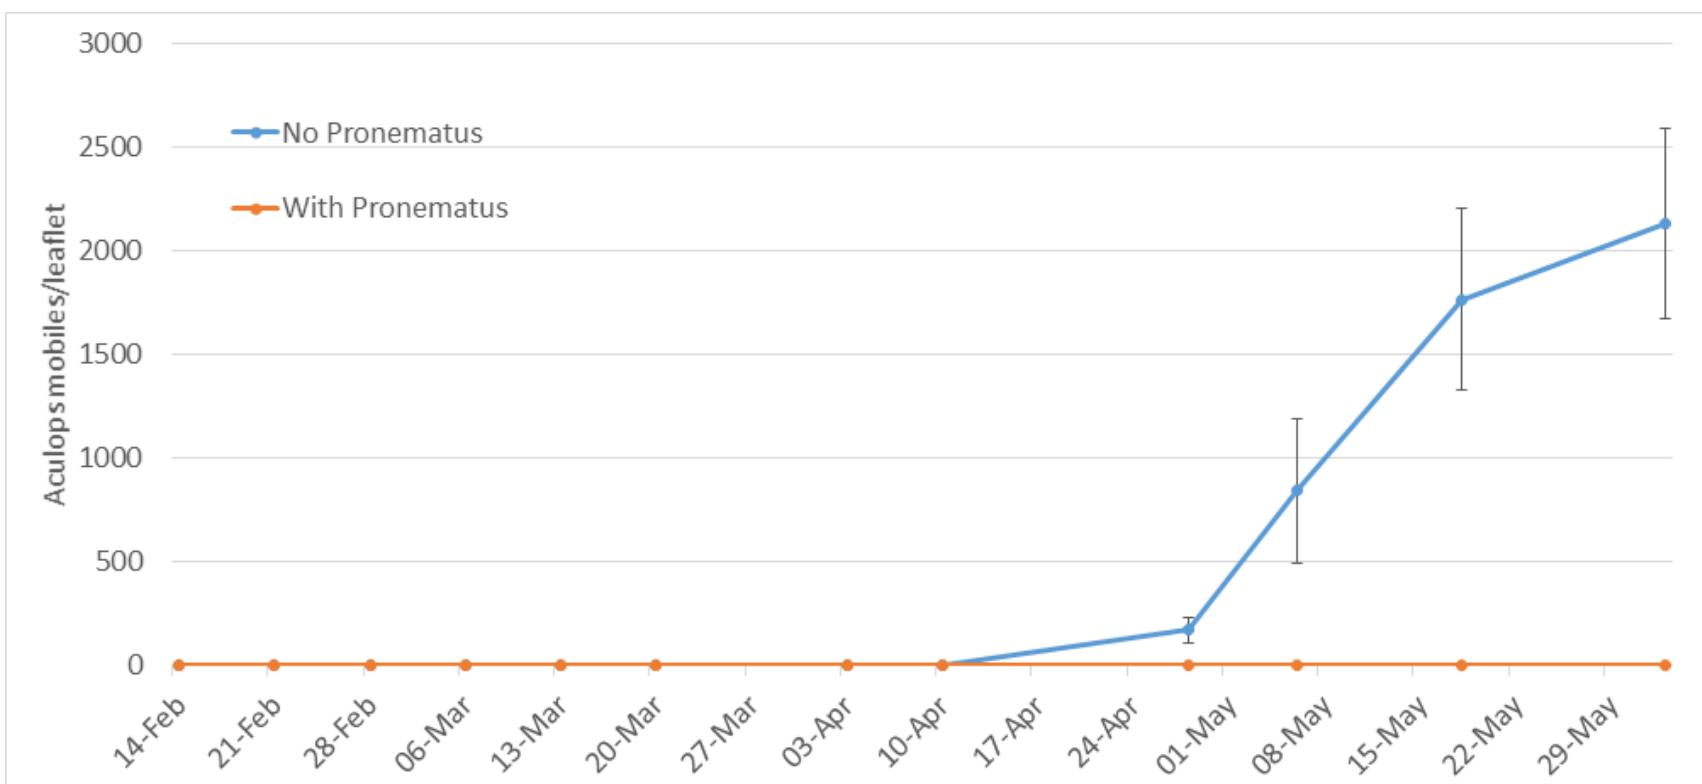

Unique characteristics:

- Size
- Omnivore. Can feed on
 - Small arthropods (stages)
 - pollen
 - fungi
 - Plant sap
- Can be used preventatively
- Large populations

First Biocontrol agent to control
Tomato Russet Mite (TRM)

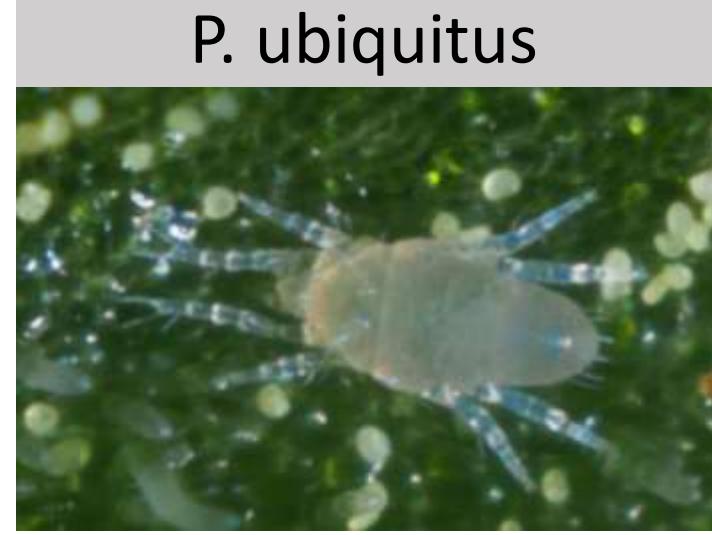

UNTREATED

P. ubiquitus

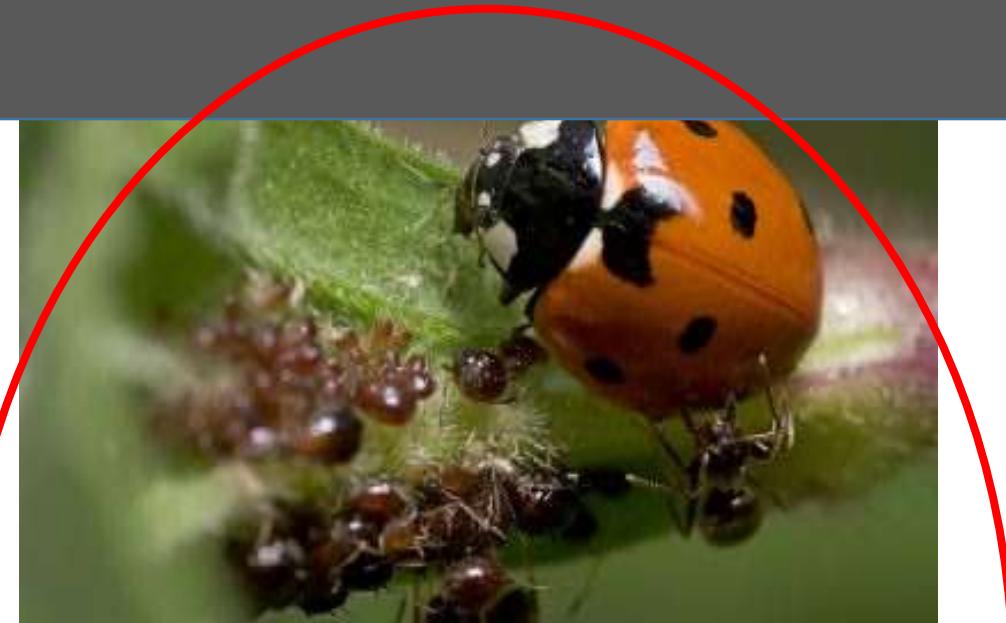

Cucumber

Strawberry

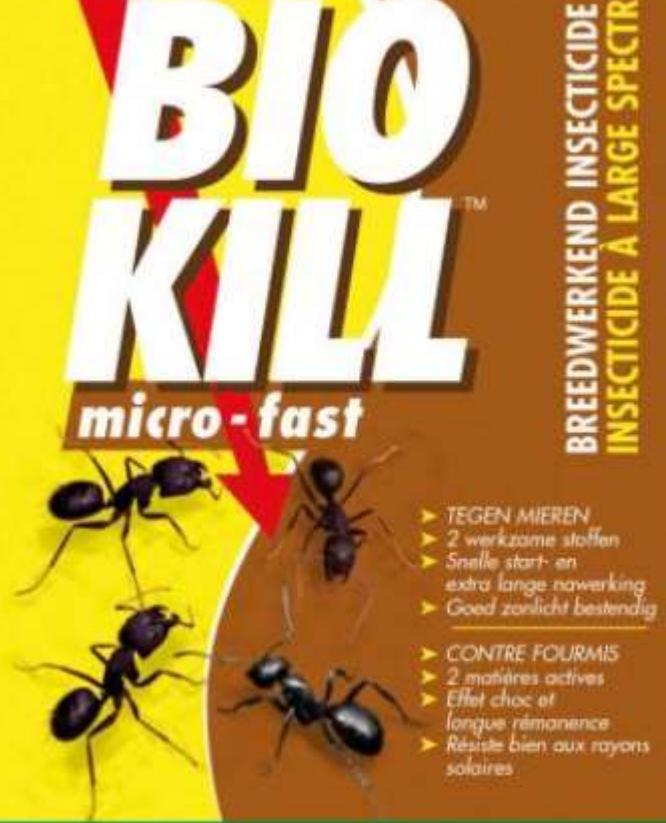

Example 3: Turning ants from foes to friends

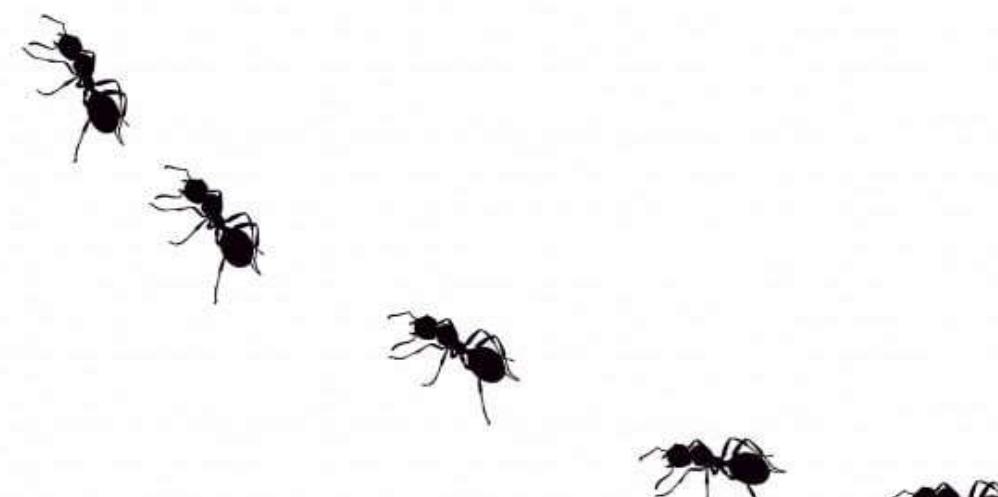

By eliminating ants...

We also lose a powerful ally
in pest control

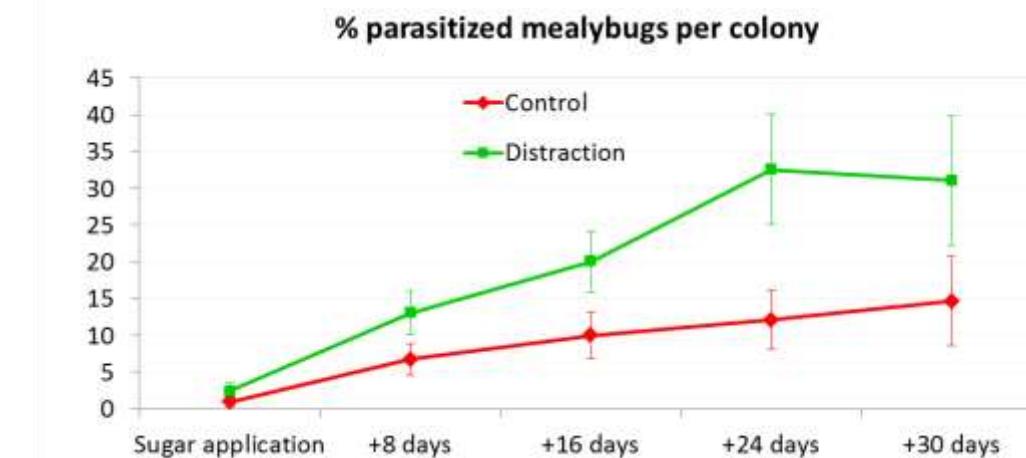

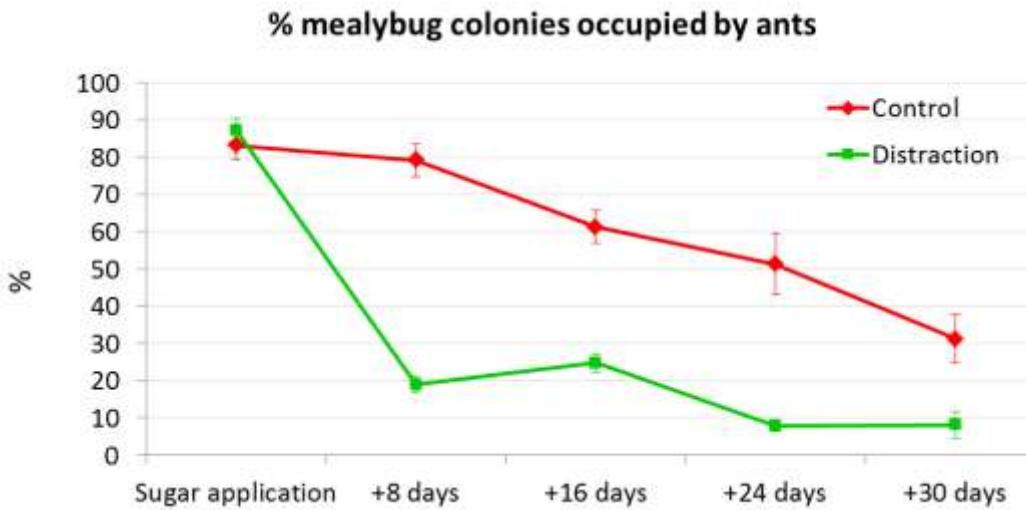

Ant Distraction

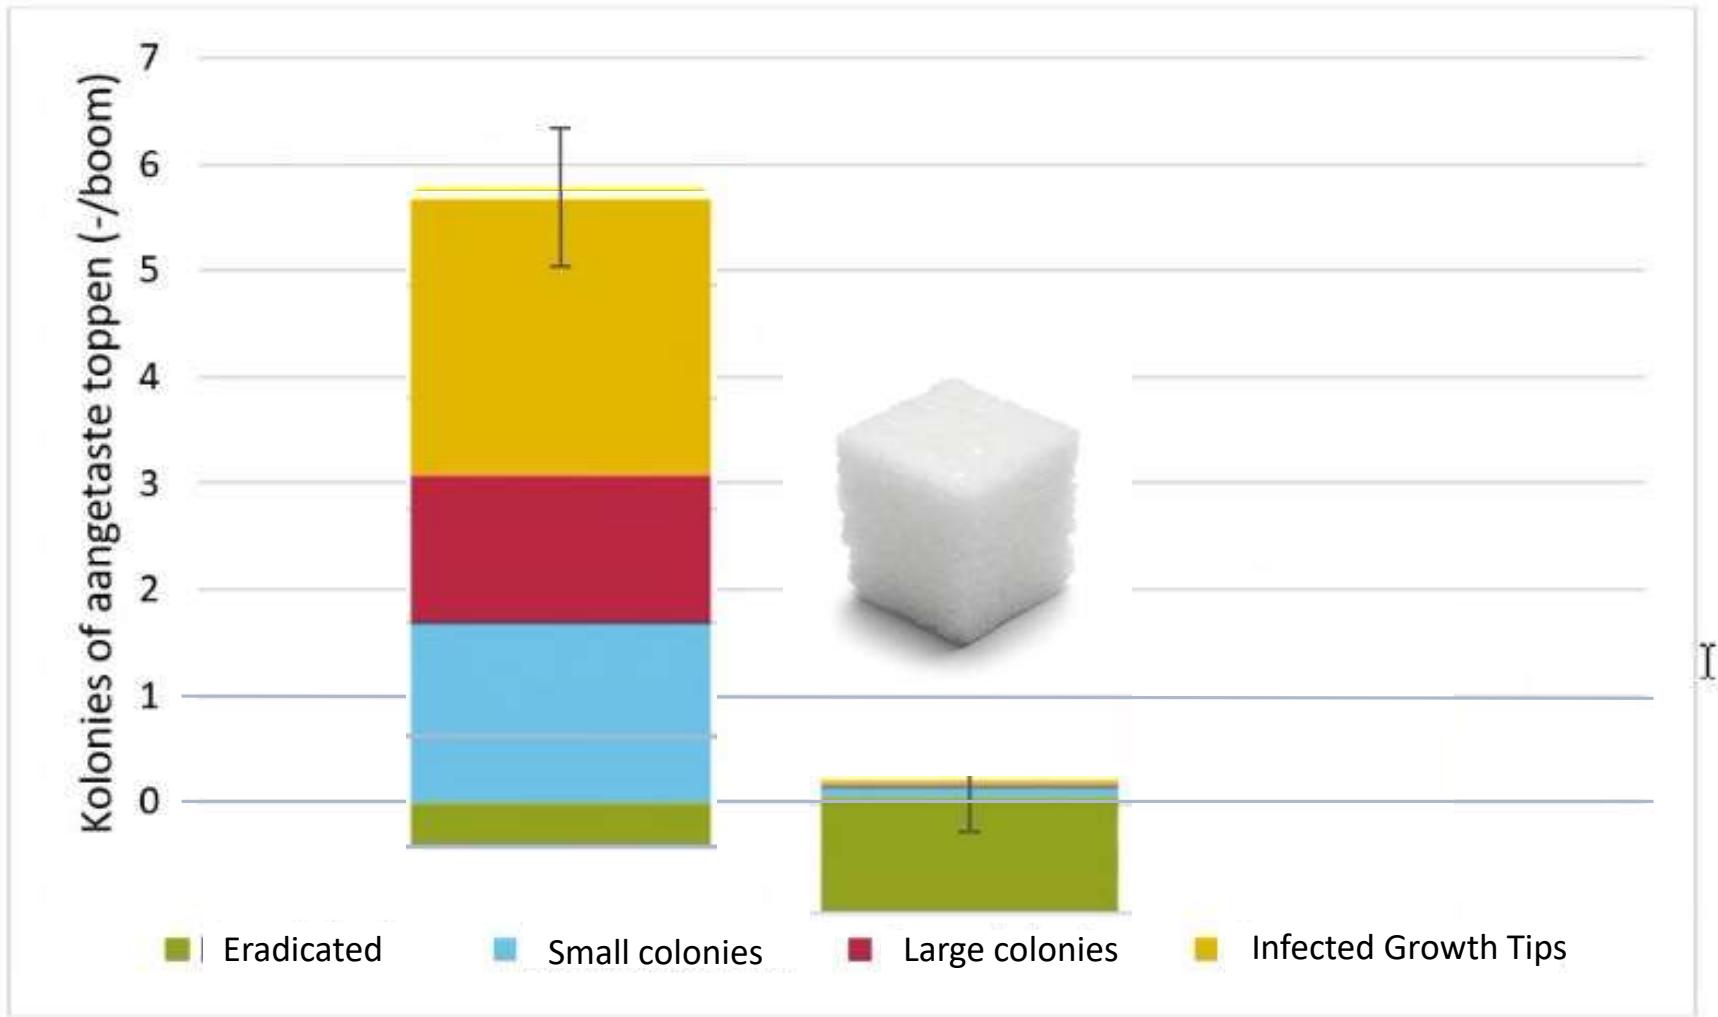

Citrus Trials 2015

Rosy Apple Aphid (2021, the Netherlands)

Example 4: Making Flower Power work for farmers
Not only pollinators, also pest natural enemies need flowers,
but...

...not all flowers feed natural enemies

Select plants that optimize biological pest control

(Wäckers and van Rijn, 2012)

Targeted Flower strips

Our largescale projects in the Netherlands, Belgium, UK, Switzerland and Germany
in support of horticulture and arable crops

**Getting More Power from Your Flowers:
Multi-Functional Flower Strips Enhance Pollinators
and Pest Control Agents in Apple Orchards**

Alistair John Campbell ^{1,*} , Andrew Wilby ², Peter Sutton ³ and Felix Wäckers ^{2,4}

Biodiversity works for farming

REDUCTION IN INSECTICIDE USE

 In conventional wheat
and potato production
pesticides reduced by >90%
(van Rijn, 2018)

**Sustainable systems and productivity
go hand in hand**

YIELD IMPACT (NATURAL PEST CONTROL & POLLINATION)

 In conventional wheat
and vegetable production
yield increased:
Wheat 11%, Peas 26% (Wäckers
et al., Ecostac)

 Beans 30%

Targeted Insect Conservation for Productive Agriculture: a Win-Win for Farmers and Nature

- **Perennial flowering strips for biocontrol**
- **Targeted to supporting antagonists of agricultural pest**
- **On 15 - 30 farms in Lower Saxony, Saxony and Thuringia**
- **Assessment of short- and long-term impacts in several field crops**
- **Workshops for farmers, NGO**
- **Development of a new agri-environmental measure**

Duration:

August 2020 – July 2026

Total financial volume:

1.4 Mio. €
