

HTTP Post API

API Transaction Commands

Version 1.1.1

Introduction

The ECheck Transaction Commands detailed in this API give merchants a comprehensive platform for authorizing, modifying, voiding and processing electronic check payments through their own software.

The purpose of this document is not only to explain how to submit an ACH payment for authorization and processing, but also to present the concepts necessary for understanding what data is required, why, and what the response data should mean to your software application and your customers. Please read each section carefully

The ACHQ Gateway and the Command/Response System

The ACHQ Gateway supports the processing of electronic check (ACH) payments and the remote deposit of scanned paper checks (Check 21).

Software applications can communicate with the ACHQ Gateway through any one of the following established Internet protocols:

- HTTP POST
- SOAP 1.2 Web Services w/MTOM attachment support
- SOAP 1.2 Web Services

Although each of these communication protocols requires API documentation that is specific to the functionality of that protocol, each API shares a common command/response method for interacting with the gateway.

Simply put, your software issues a command to the ACHQ Gateway to accomplish any specific task and the gateway will send back a formatted response to your command.

The Command/Response system is quite extensive and supports the ability to perform a variety of transaction management tasks including:

- Creating/Authorizing new payment transactions
- Uploading batches of transactions
- Modifying/Canceling existing transactions or batches
- Retrieving reports
- Querying payment data

This document, like all other API documents for the ACHQ Gateway, is targeted towards a specific subset of commands that are grouped according to either payment method,

the task(s) to be performed, or both.

Available eCheck Transaction Commands

The following is a list and brief explanation of the ECheck Transaction Commands that can be issued through the **ACHQ HTTP POST API**:

- **ECheck.Authorize** – Validates the transaction data packet for errors, performs basic routing and account number validation and optionally verifies the bank account using the *Express Verify* service. Does not process the electronic check through the Federal Reserve, or verify or lock funds.
- **ECheck.Capture** – Schedules a previously authorized ECheck payment for processing through the Federal Reserve at the next End-of-Day Batch Settlement date/time.
- **ECheck.ProcessPayment** – Processes payments from or payments to a bank account. Performs an *ECheck.Authorize* and *ECheck.Capture* in a single command. Payment is only processed to the Federal Reserve if it passes the authorization process.
- **ECheck.VerifyBankAccount** – Performs basic algorithm verification on a routing number and account number and optionally verifies the bank account using the *Express Verify* service.
- **ECheck.Update** – Modifies a transaction if it has not yet been sent to the Federal Reserve for processing at the daily cut-off time.
- **ECheck.Refund** – Reverses a previous debit that has settled (Cleared) and refunds the same amount (or less if specified) to the same bank account as the original referenced debit. Refunds are automatically captured for settlement.
- **ECheck.Void** – Cancels (stops) an ECheck payment from processing if it has not yet been sent to the Federal Reserve for processing.
- **ECheck.Hold** – Places a Scheduled transaction on indefinite 'Merchant Hold' status if it has not yet been sent to the Federal Reserve for processing. Authorized transactions cannot be placed on hold.
- **ECheck.RemoveHold** – Removes the 'Merchant Hold' status on a transaction and reschedules the transaction for processing on the date specified in the command.

An Overview of Electronic Check Processing

Electronic checks, also referred to as ACH (Automated Clearing House) transactions, are check transactions processed electronically through the Federal Reserve. Just as with paper checks, merchants may utilize the ACH system both to send and to receive check payments between the merchant and their customers, employees, vendors, etc.

Unlike credit cards, electronic check transactions cannot be instantly verified and approved. This is due to the rules that govern the United States Federal Reserve and the fragmented structure of the current banking system. The banking industry is working to make all forms of check processing and authorization occur in real-time, but due to political, economic, and consumer protection issues, that technology is still years away from widespread

implementation.

What has been implemented instead is a system that still provides authorization, but over a period of days instead of seconds. There are several reasons for the slowness of the process, but the bottom line is that the process has been made logistically slow on purpose to protect bank account owners from fraud and error.

Instead of being sent between banks in real-time, all electronic check transactions are batched and sent between banks overnight through the Federal Reserve (on banking business days only). A bank can take up to three business days to indicate if a transaction is rejected (Returned) and why. If no response is received within that timeframe, the transaction is considered approved (Cleared).

Please note that although banks are expected to respond with any Returns within the three business day timeframe, there are some exceptions to this rule because of laws that protect the customer. If a Return is received after a check payment has been Cleared and funds have been settled to the merchant's account, the Return transaction is classified as a Charged Back because funds will need to be "charged back" from the merchant's account and returned to the customer's bank.

Data Security and Protection

Protecting the financial transaction data processed through the ACHQ Gateway is of utmost priority. This means not only implementing the highest levels of security standards in data encryption and system security, but also setting strict controls that limit authorized access to sensitive information.

Every merchant is assigned a unique Merchant ID, GateID, and GateKey that must be kept confidential and will be required as part of each data packet sent to the ACHQ Gateway. In addition, an IP filtering scheme may be implemented to ensure that command packets are only accepted from IP addresses registered by the merchant.

Verification Using *Express Verify*

Merchants may choose to sign up for an optional bank account verification service called *Express Verify*. This service can report in real-time whether an account exists, or whether it is currently overdrawn, frozen or closed thus ascertaining whether a check is likely to be returned.

The service returns a 3-letter verification status which can be "POS" (positive) indicating the bank account is found and in good standing, "NEG" (negative) indicating the account does not exist or is not in good standing, and "UNK" (unknown) indicating the bank account does not belong to a participating bank. The code "ERR" (error) can also result if technical problems occurred verifying the account. Please see **Appendix B – Express Verify Response Codes** for a complete list of possible responses from the *Express Verify* system and their meanings.

Application Testing

Merchants can test the **ACHQ HTTP POST API** by simply including an optional field called *TestMode* and setting the value of that field to "On". Test commands sent with "*TestMode=On*" will receive valid responses from the ACHQ Payment Gateway but the command will not actually be processed by the ACHQ system.

The following information may be helpful when testing your application:

Test Merchant Gateway Credentials

Merchant ID: 2001
Merchant GateKey: test
Merchant GateID: test

Test Bank Account that Passes Express Verify

Routing Number: 123123123
Account Number <any number>

Test Bank Account that Fails Express Verify

Routing Number: 123123123
Account Number: 987654321

Please Note: Merchant ID 2001 is a demo account. Any information you transmit may be viewed by users running the ACHQ demo. This includes payment accounts, names, addresses, phone numbers, and email addresses. Please always use fabricated test information.

Unique Payment Transaction Identification

Proper communication between two separate transaction management applications (like this gateway and your software application) requires that both applications share a common, unique reference for each transaction in order for the two applications to communicate intelligently.

The ACHQ Gateway supports the following methods for uniquely referencing transactions:

Transact_ReferenceID

At the completion of each successful *Echeck.Authorization*, *Echeck.ProcessPayment* or *Echeck.Refund* command, the *Transact_ReferenceID* value returned by the gateway is the value that must be used to capture, update or void a pending transaction. The *Transact_ReferenceID* value is also included in all transaction reports as a tool for cross-referencing your internal transactions with the report results. Your software will need to store this value and associate it internally with your own payment transaction record for later transaction cross-reference.

Provider_TransactionID

The ACHQ Gateway also supports the ability for merchants to assign their own unique internal ID's to each payment transaction. Although this value cannot be used to capture, update, or void pending transactions, the *Provider_TransactionID* value will be included in all transaction reports as an alternative (and easier) method of cross-referencing your internal transactions with the report results. It will also be possible to query transactions using *Provider_TransactionID* values. And finally, during batch uploads, the *Provider_TransactionID* is actually required in order to facilitate deferred response processing.

Standard Entry Class (SEC) Codes and Payment Authorization

NACHA regulations require that a transaction submitted to the Federal Reserve for processing must include something called a Standard Entry Class (SEC) Code to communicate exactly how the customer gave the merchant authorization to debit/credit their bank account.

The following table shows the proper SEC Codes to use depending on how the merchant obtained authorization to debit/credit an individual or company's bank account:

Available Standard Entry Class (SEC) Codes

Authorization Method	SEC Code
Document Signed by Individual	PPD
Document Signed by Company	CCD
Via the Internet	WEB
Telephone Call	TEL

If NACHA decides to audit a merchant or processor, part of the audit process may require providing proof of the authorization method (SEC Code) specified for any given transaction. Failure to properly comply and provide proof of the authorization can result in fines up to \$10,000 for each transaction in violation, so it is important that you correctly indicate the SEC Code and maintain good records of your authorizations. Additional information about SEC Codes can be provided upon request.

Tokenization

Tokens are randomized strings of information that can be used to represent a bank account. The security benefits are obvious. If your company does not have to store actual bank account information, this reduces your risk of exposing the private banking information of your customers to potential hackers or even malicious employees. A tokenization provider is a company that either manages tokens on your behalf or provides tokens that represent bank accounts as a part of their banking services.

If you are supplying a token from a service provider that has integrated or partnered with ACHQ, you simply supply the token in the *AccountToken* field of the appropriate payment command below and ACHQ will convert that token to the actual bank account for ACH payment processing.

If you do not have a token, then you will provide the routing and bank account of your customer as normal to process their payment. Providing an *AccountToken* and a bank account in the same payment command will result in an error.

Overview of the Command Process

Integrating this API into your software application is not difficult. The following is an overview of the major components of this task:

- **Data Gathering** - Solution Providers are responsible for collecting and submitting all data associated with a transaction command.
- **Submitting a Gateway Command** – You must create a script or program that submits a command packet over the Internet using the secured HTTPS protocol. The rules for constructing the HTTPS command are defined in the next section of this document titled General Implementation Rules and Specifications.
- **Transaction Packet Validation** – The ACHQ Payment Gateway parses the command packet for missing data, invalid field values, security violations, etc.
- **Response Processing** - The ACHQ Payment Gateway will return a comma-delimited, JSON, or XML text response after it receives and processes the command. The exact format and meaning of the text response will be based on the command issued as defined in the next section of this document titled General Implementation Rules and Specifications.

General Implementation Rules and Specifications

1. **Basic Command Template** – The following table defines the basic data fields that will be required when submitting any command through the **ACHQ HTTP POST API**:

Field Name	Usage	Field Value Format Constraints
MerchantID	Required	Provided by your Account Manager
Merchant_GateID	Required	Provided by your Account Manager
Merchant_GateKey	Required	Provided by your Account Manager
Command	Required	Set this value to the name of the command you are issuing to the ACHQ Payment Gateway.
CommandVersion	Required	Set to 1.1 to enforce this API documentation revision.
ResponseType	Optional	Value must be: JSON , XML , or CSV . Default is CSV
TestMode	Optional	Set this value to 'On' to test a command response without actually executing the command. Default value is 'Off'.
<additional fields as required>		Based on the Command value, you may be required to define additional fields to send in the command packet. These fields will be defined in the various sections of this document dedicated to each specific command.

2. **Submitting a Gateway Command** – To submit a gateway command to ACHQ, use either HTTP POST or GET to transmit the necessary command fields to the following secure URL:

If using HTTP GET, please make sure that all data values have been encoded to be URL-safe.

3. **Response Template** – In response to any command, the ACHQ Payment Gateway will return a simple comma-delimited text response indicating whether the command succeeded or failed and any additional information necessary to interpret the response. The following table defines the field values that will be returned in every response and their meaning:

Field Name	Field Contents	Max Length	Additional Information
CommandStatus	Returns one of the following values: <ul style="list-style-type: none"> • Approved • Declined • Error 	30	Indicates the success or failure of the command issued.
ResponseCode	A 3 digit code indicating command success or reason for command failure.	3	Please refer to Appendix A - Response Code Definitions for a list of possible ResponseCode values, their descriptions, and what ErrorInformation may be made available.
Description	Description of the ResponseCode value	255	
ErrorInformation	Additional information to help determine the source of an error.	50	
ExpressVerify.Status	Returns one of the following values if Express Verify is activated: 'POS', 'NEG', 'UNK' or 'ERR'.	3	ExpressVerify is a complex object that contains the bank account verification results from Express Verify.
ExpressVerify.Code	A code indicating the reason for the ExpressVerify.Status value	5	Please refer to Appendix B - Express Verify Response Codes for more details about these responses.
ExpressVerify.Description	A brief explanation for the ExpressVerify.Status value	255	
ResponseData	Please see the documentation for the specific command to be issued for an explanation of the possible value(s) for this field.		This is a generic object that can take the form of any scalar or complex object called for by the command that is issued.
Provider_TransactionID	The Provider_TransactionID value defined in the command.	50	This value can be used as a transaction reference when processing responses must be deferred (like for batch uploads)
Transact_ReferenceID	A unique ID assigned to each command submitted to the ACHQ Gateway.	30	This value can be used for as a unique transaction identifier or as a reference for support on any command.

Command: ECheck.Authorize

Description: Validates the transaction data packet for errors, performs basic routing and account number validation and optionally verifies the bank account using the *Express Verify* service. Does not process the electronic check through the Federal Reserve, or verify or lock funds. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to ECheck.Authorize	50
CommandVersion	Required	Set to 1.1 for this API documentation revision.	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Provider_TransactionID	Optional	A unique identifier the merchant wants assigned to this payment	50
PaymentDirection	Required	Value must be FromCustomer or ToCustomer	12
Amount	Required	The amount of the check.	-
LocationName	Optional	Any location pre-defined by the merchant in their administration console	50
Merchant_ReferenceID	Optional	The internal ID or invoice number the merchant wants assigned to this payment	50
Description	Optional	A description for this transaction	100
Billing_CustomerID	Optional	A unique ID assigned to the Customer.	50
Billing_CustomerName	Required	Name of bank account holder	80
Billing_Company	Conditional	Company name on bank account. Required if <i>CheckType</i> field is set to Business	80
Billing_Address1	Required	Street Address	70
Billing_Address2	Optional	Additional street address information	40
Billing_City	Required	City	70
Billing_State	Required	2-letter state abbreviation	30
Billing_Zip	Required	Zip Code (format: ##### or #####-####)	10
Billing_Country	Optional	2-letter country code (ISO 3166). Default is US	2
Billing_Phone	Required	Phone number	20
Billing_Email	Conditional	Payment notification email address. Required if <i>SendEmailToCustomer</i> is set to Yes	80
SendEmailToCustomer	Required	Value must be Yes or No	3
Customer_IPAddress	Conditional	Customer's IP Address. Only required if the <i>SECCode</i> field is set to WEB .	15
Run_ExpressVerify	Required	Value must be Yes or No	3
SECCode	Required	Value must be PPD , CCD , WEB , or TEL .	3
ResponseType	Optional	Must be JSON , XML , or CSV . Default is CSV	4
Only Required When Submitting a Tokenized Bank Account			
AccountToken	Required	The token representing a customer's bank account information	
TokenSource	Required	Possible values: Plaid	
Only Required When Submitting Standard Bank Account Information			
CheckType	Required	Value must be Personal or Business	8
AccountType	Required	Value must be Checking or Savings	8
RoutingNumber	Required	ABA routing number on customer's check.	9
AccountNumber	Required	Bank account number to debit or credit	30
CheckNumber	Optional	Customer's check number.	25

Command: ECheck.Capture

Description: Schedules a previously authorized ECheck payment for processing through the Federal Reserve at the next End-of-Day Batch Settlement date/time. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to ECheck.Capture	-
CommandVersion	Required	Set to 1.1 for this API documentation revision	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Transact_ReferenceID	Required	The unique <i>Transact_ReferenceID</i> sent in response to the original <i>ECheck.Authorize</i> command.	50
Provider_TransactionID	Optional	Updates the unique identifier the merchant wants assigned to this payment	50
DateScheduled	Optional	Date to process this payment.	-
Amount	Optional	Provides option to process a different payment amount than was originally authorized.	-
Merchant_ReferenceID	Optional	Updates the internal ID or invoice number the merchant wants assigned to this payment	50
ResponseType	Optional	Must be JSON, XML, or CSV . Default is CSV	4

Command: ECheck.ProcessPayment

Description: Processes payments to or from a bank account. Performs an *ECheck.Authorize* and *ECheck.Capture* in a single command. Payment is only processed to the Federal Reserve if it passes the authorization process. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to <i>ECheck.ProcessPayment</i>	50
CommandVersion	Required	Set to 1.1 for this API documentation revision.	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Provider_TransactionID	Optional	A unique identifier the merchant wants assigned to this payment.	50
DateScheduled	Optional	Date to process this payment.	-
PaymentDirection	Required	Value must be FromCustomer or ToCustomer	12
Amount	Required	The amount of the check.	-
LocationName	Optional	Any location pre-defined by the merchant in their administration console	50
Merchant_ReferenceID	Optional	The internal ID or invoice number the merchant wants assigned to this payment	50
Description	Optional	A description for this transaction	100
Billing_CustomerID	Optional	A unique ID assigned to the Customer.	20
Billing_CustomerName	Required	Name of person on bank account	80
Billing_Company	Conditional	Company name on bank account. Required if CheckType field is set to Business	80
Billing_Address1	Required	Street Address on bank account	70
Billing_Address2	Optional	Additional street address information	40
Billing_City	Required	City	70
Billing_State	Required	State	30
Billing_Zip	Required	Zip Code (format: ##### or #####-####)	10
Billing_Country	Optional	2-letter country code (ISO 3166). Default is US	2
Billing_Phone	Required	Phone number	20
Billing_Email	Conditional	Payment notification email address. Required if SendEmailToCustomer is set to Yes	80
SendEmailToCustomer	Required	Value must be Yes or No	3
Customer_IPAddress	Conditional	Customer's IP Address. Only required if the SECCode field is set to WEB .	15
Run_ExpressVerify	Required	Value must be Yes or No	3
SECCode	Required	Value must be PPD , CCD , WEB , or TEL .	3
ResponseType	Optional	Must be JSON , XML , or CSV . Default is CSV	4
Only Required When Submitting a Tokenized Bank Account			
AccountToken	Required	The token representing a customer's bank account information	100
TokenSource	Required	Possible values: Plaid	50
Only Required When Submitting Standard Bank Account Information			
CheckType	Required	Value must be Personal or Business	8
AccountType	Required	Value must be Checking or Savings	8
RoutingNumber	Required	ABA routing number on customer's check.	9
AccountNumber	Required	Bank account number to debit or credit	30
CheckNumber	Optional	Customer's check number.	25

Command: ECheck.VerifyBankAccount

Description: Performs basic algorithm verification on a routing number and account number and optionally verifies the bank account using the *Express Verify* service. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to ECheck.VerifyBankAccount	50
CommandVersion	Required	Set to 1.1 for this API documentation revision.	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
PaymentDirection	Required	Value must be FromCustomer or ToCustomer	12
Amount	Required	The amount of the check.	-
CheckType	Required	Value must be Personal or Business	8
AccountType	Required	Value must be Checking or Savings	8
RoutingNumber	Required	ABA routing number on customer's check.	9
AccountNumber	Required	Customer's bank account number	30
Run_ExpressVerify	Required	Value must be Yes or No	3
ResponseType	Optional	Must be JSON, XML, or CSV . Default is CSV	4

Response Note: If *Run_ExpressVerify* is set to **Yes**, the ACHQ Gateway will return a failure *ResponseCode* value of **202 (Failed Express Verify)** when the *ExpressVerify.Status* value returns is **NEG** (negative).

If the *ExpressVerify.Status* value is **POS** (positive) or **UNK** (unknown), the *ResponseCode* value will be set to **000 (Command Successful. Approved.)**.

Please refer to **Appendix B - Express Verify Response Codes** for more details about the possible responses from the *Express Verify* service to make sure your code handles each type of response appropriately according to your company's or your merchant's policies.

Command: ECheck.Update

Description: Modifies a transaction if it has not yet been sent to the Federal Reserve for processing. The following table defines the data field rules for this command:

Note: Please do not specify a value for an optional field if you do not intend to modify its value.

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to ECheck.Update	50
CommandVersion	Required	Set to 1.1 for this API documentation revision.	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Transact_ReferenceID	Required	The unique <i>Transact_ReferenceID</i> sent in response to the original <i>ECheck.Authorize</i> or <i>ECheck.ProcessPayment</i> command.	50
Provider_TransactionID	Optional	Updates the unique identifier the merchant wants assigned to this payment	50
DateScheduled	Optional	Date to process this payment.	-
PaymentDirection	Optional	Value must be FromCustomer or ToCustomer	12
Amount	Optional	The amount of the check.	-
CheckType	Optional	Value must be Personal or Business	8
AccountType	Optional	Value must be Checking or Savings	8
RoutingNumber	Optional	ABA routing number on customer's check.	9
AccountNumber	Optional	Customer's bank account number	30
CheckNumber	Optional	Customer's check number. Only required for non-ACH merchants.	25
LocationName	Optional	Any location pre-defined by the merchant in their administration console	50
Merchant_ReferenceID	Optional	The internal ID or invoice number the merchant wants assigned to this payment	50
Description	Optional	A description for this transaction	100
Billing_CustomerID	Optional	A unique ID assigned to the Customer.	20
Billing_CustomerName	Required	Name of person on bank account	80
Billing_Company	Conditional	Company name on bank account. Required if <i>CheckType</i> field is set to Business	80
Billing_Address1	Required	Street Address on bank account	70
Billing_Address2	Optional	Additional street address information	40
Billing_City	Required	City	70
Billing_State	Required	State	30
Billing_Zip	Required	Zip Code (format: ##### or #####-####)	10
Billing_Country	Optional	2-letter country code (ISO 3166). Default is US	2
Billing_Phone	Required	Phone number	20
Billing_Email	Conditional	Payment notification email address. Required if <i>SendEmailToCustomer</i> is set to Yes	80
SendEmailToCustomer	Optional	Value must be Yes or No	3
Customer_IPAddress	Optional	Payer's IP Address. Only required if the <i>SECCode</i> field is set to WEB .	15
Run_ExpressVerify	Optional	Value must be Yes or No	3
SECCode	Optional	Value must be PPD , CCD , WEB , or TEL .	3
ResponseType	Optional	Must be JSON , XML , or CSV . Default is CSV	4

Command: ECheck.Refund

Description: Reverses a previous debit that has settled (Cleared) and refunds the same amount (or less if specified) to the same bank account as the original referenced debit. Refunds are automatically captured for settlement. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to ECheck.Refund	-
CommandVersion	Required	Set to 1.1 for this API documentation revision	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Transact_ReferenceID	Required	The unique <i>Transact_ReferenceID</i> sent in response to the original debit <i>ECheck.Authorize</i> or <i>ECheck.ProcessPayment</i> command.	50
Provider_TransactionID	Optional	A unique identifier the merchant wants assigned to the new refund payment	50
DateScheduled	Optional	Date to process this payment.	-
Amount	Optional	Use this field if you need to specify a refund amount less than the original debit amount.	-
Merchant_ReferenceID	Optional	The internal ID or invoice number the merchant wants assigned to this refund transaction.	50
Description	Optional	A description for the refund transaction	100
ResponseType	Optional	Must be JSON, XML, or CSV . Default is CSV	4

Command: ECheck.Void

Description: Cancels (stops) a transaction from processing to the Federal Reserve. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to <i>ECheck.Void</i>	50
CommandVersion	Required	Set to 1.1 for this API documentation revision.	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Transact_ReferenceID	Required	The unique <i>Transact_ReferenceID</i> sent in response to the original <i>ECheck.Authorize</i> or <i>ECheck.ProcessPayment</i> command.	50
ResponseType	Optional	Must be <i>JSON</i> , <i>XML</i> , or <i>CSV</i> . Default is <i>CSV</i>	4

Command: ECheck.Hold

Description: Places a scheduled transaction on 'Merchant Hold' if it has not yet been sent to the Federal Reserve for processing. This is a delay in processing that a merchant may impose on a transaction until they are ready to remove the hold. Authorized transactions cannot be placed on hold.

The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to <i>ECheck.Hold</i>	50
CommandVersion	Required	Set to <i>1.1</i> for this API documentation revision.	-
TestMode	Optional	Set this value to <i>On</i> to test a command response. Default value is <i>Off</i> .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Transact_ReferenceID	Required	The unique <i>Transact_ReferenceID</i> sent in response to the original <i>ECheck.Authorize</i> , <i>ECheck.ProcessPayment</i> or <i>ECheck.Refund</i> command.	50
ResponseType	Optional	Must be <i>JSON</i> , <i>XML</i> , or <i>CSV</i> . Default is <i>CSV</i>	4

Command: ECheck.RemoveHold

Description: Removes the 'Merchant Hold' status on a transaction and reschedules the transaction for processing on the date specified in the command. The following table defines the data field rules for this command:

Field Name	Usage	Field Value Format Constraints	Max Length
Command	Required	Set to <i>ECheck.RemoveHold</i>	50
CommandVersion	Required	Set to 1.1 for this API documentation revision.	-
TestMode	Optional	Set this value to On to test a command response. Default value is Off .	3
Merchant_Credentials	Required	Please refer to the Transact_Command Class – Basic Command Template for more details	-
Transact_ReferenceID	Required	The unique <i>Transact_ReferenceID</i> sent in response to the original <i>ECheck.Authorize</i> , <i>ECheck.ProcessPayment</i> or <i>ECheck.Refund</i> command.	50
DateScheduled	Required	Date to process this payment.	-
ResponseType	Optional	Must be JSON, XML , or CSV . Default is CSV	4

Appendix A – Response Code Definitions

Response Code	Description	Contents of the ErrorInformation Field
GATEWAY COMMAND SUCCESS		
000	Command Successful. Approved.	
GATEWAY COMMAND ERRORS		
100	Invalid Gateway Credentials	Credential Object Name
101	Invalid Gateway Command	
102	Duplicate Command Not Processed	Transact_ReferenceID of the original Command
103	Transaction Cannot Be Modified	Transaction Status
104	Batch Cannot Be Modified	Batch Status
105	Invalid Transact_ReferenceID	
106	Invalid BatchID	
107	Non-Unique Reference/Transaction ID	Field Name
108	Invalid Reference/Transaction ID	Field Name
109	Invalid Source IP	
110	Invalid Value In Message	
INPUT DATA VALIDATION ERRORS		
150	Required Field Missing	Field Name
151	Field Value Is Not Valid	Field Name
152	Field Value Exceeds Maximum Length	Field Name
PAYMENT ACCOUNT VERIFICATION FAILURES		
200	Failed AVS	
201	Failed CVN	
202	Failed Express Verify	
203	Invalid Credit Card Number	
204	No Such Card Issuer	
205	Expired Card	
206	Invalid Expiration Date	
208	Call Issuer for Further Information	
209	Invalid Routing Number	
210	Invalid Bank Account Number	
211	Invalid PIN	
212	Invalid PaymentKey	
PAYMENT ACCOUNT DECLINES		
300	Transaction was Declined by Processor	
301	Transaction was Rejected by Gateway	
302	No Card Number on File with Issuer	
304	Invalid Account Type	
305	Account Closed	
306	Account Inactive	
<i>Response Code Definitions Continued on Next Page...</i>		

Appendix A – Response Code Definitions

Response Code	Description	Contents of the ErrorInformation Field
PAYMENT ACCOUNT DECLINES (continued...)		
307	Account Frozen	
309	Insufficient Funds	
310	Over Limit	
311	Do Not Honor

Appendix B – Express Verify Response Codes

Bank accounts that are found and in good standing are approved with a POS (positive) result status. Accounts that do not exist or are in a negative standing at their bank are rejected with a NEG (negative) result status. If a bank account is from a bank that is not part of the *Express Verify* network or the bank is not reporting information about the bank account, the transaction is approved with an UNK (unknown) result status.

The following table shows all possible responses from the *Express Verify* system:

Status	Code	Description
ERR	E01	EXPRESS VERIFY SERVICE NOT ACTIVATED
NEG	P00	ACCT NOT LOCATED
NEG	P01	ACCOUNT CLOSED
NEG	P03	NO DEBITS
NEG	P04	NO CHECKS
NEG	P05	NSF
NEG	P06	UNCOLLECTED FUNDS
NEG	P12	ISSUER DECLINED
UNK	P40	NO INFO
NEG	P41	NEGATIVE INFO
UNK	P50	NON PARTICIPANT
POS	P70	VALIDATED
POS	P72	VALIDATED AMOUNT
NEG	V02	ACCOUNT NOT APPROVED
NEG	V10	INVALID ROUTING NUMBER
UNK	V90	PREAUTH VENDOR UNAVAILABLE
UNK	V91	PREAUTH VENDOR ERROR
