INTRODUCTION

The San Francisco Bay in California was sampled during August 2001 to assess benthic habitat conditions. One aspect of this evaluation was benthic community characterization, which was accomplished via sample collection by National Oceanic and Atmospheric Administration (NOAA) personnel and laboratory and data analysis by Barry A. Vittor & Associates, Inc. (BVA).

The 2001 San Francisco Bay sampling stations are indicated in Figure 1; location data for the stations are given in Table 1.

METHODS

Sample Collection And Handling

A Young-modified Van Veen grab (area = 0.04 m²) was used to collect a bottom sample at 86 stations in San Francisco Bay, California. Macrofaunal samples were sieved through a 0.5-mm mesh screen and preserved with 10% formalin on ship. Macrofaunal samples were transported to the BVA laboratory in Mobile, Alabama.

Macrofaunal Sample Analysis

In the BVA laboratory, benthic samples were inventoried, rinsed gently through a 0.5-mm mesh sieve to remove preservatives and sediment, stained with Rose Bengal, and stored in 70% isopropanol solution until processing. Sample material (sediment, detritus, organisms) was placed in white enamel trays for sorting under Wild M-5A dissecting microscopes. All macroinvertebrates were carefully removed with forceps and placed in labelled glass vials containing 70% isopropanol. Each vial represented a major taxonomic group (*e.g.* Polychaeta, Mollusca, Arthropoda). All sorted macroinvertebrates were identified to the lowest practical identification level (LPIL), which in most cases was to species level unless the specimen was a juvenile, damaged, or otherwise unidentifiable. The number of individuals of each taxon, excluding fragments, was recorded. A voucher collection was prepared, composed of representative individuals of each species not previously encountered in samples from the region.

DATA ANALYSIS

All data generated as a result of laboratory analysis of macroinfauna samples were first coded on data sheets. Enumeration data were entered for each species according to station and replicate. These data were reduced to a data summary report for each station, which included a taxonomic species list and benthic community parameters information. Archive data files of species identification and enumeration were prepared.

The Quality Assurance/Quality Control (QA/QC) reports for the San Francisco Bay 2001 samples are given in the Appendix.

Assemblage Structure

Several numerical indices were chosen for analysis and interpretation of the macroinfaunal data. Infaunal abundance is reported as the total number of individuals per station and the total number of individuals per square meter (= density). Taxa richness is reported as the total number of taxa represented in a given station collection.

Taxa diversity, which is often related to the ecological stability and environmental "quality" of the benthos, was estimated by the Shannon-Weaver Index (Pielou, 1966), according to the following formula:

$$H' = -\sum_{i=1}^S p_i(\ln p_i)$$

where, S = the total number of taxa identified in the sample

(including LPILs),

i = the i'th taxa in the sample, and

p_i = the number of individuals of the i'th taxa divided by the total number of individuals in the sample.

Taxa diversity was calculated using ln; however, diversity may also be calculated using \log_2 . Both methods of calculating diversity are common in the scientific literature. The taxa diversity calculated in this report using ln, can be converted to \log_2 diversity by

multiplying the ln taxa diversity by 1.4427. Taxa diversity within a given community is dependent upon the number of taxa present (taxa richness) and the distribution of all individuals among those taxa (equitability or evenness). In order to quantify and compare the equitability in the fauna to the taxa diversity for a given area, Pielou's Index J' (Pielou, 1966) was calculated as $J' = H'/\ln S$, where $\ln S = H'_{\max}$, or the maximum possible diversity, when all taxa are represented by the same number of individuals; thus, $J' = H' /H'_{\max}$.

HABITAT CHARACTERISTICS

Water quality data for the 96 stations are given in Table 1 and Figure 2. Bottom salinities ranged from 4.00 at station 2-1 to >30 ppt at numerous stations in San Francisco Bay proper (Figure 2).

BENTHIC COMMUNITY CHARACTERIZATION

Faunal Composition, Abundance, and Community Structure

A total of 60,673 organisms, representing 194 taxa, was identified from the 96 stations (Table 2). Malacostracans were the most numerous organisms present and represented 56.2% of the total assemblage, followed in abundance by polychaetes (27.7%) and bivalves (9.7%). Polychaetes represented 51.0% of the total number of taxa followed by malacostracans (28.4%) and bivalves (10.3%) (Table 2). The percent abundance of the major taxa at the 96 stations is given in Table 3 and Figure 3.

The dominant taxon collected from the 96 San Francisco Bay stations was the amphipod, *Ampelisca abdita*, representing 34% of the total number of individuals identified (Table 4). The polychaete, *Exogone lourei*, (6.1%) and the oligochaete family, Tubificidae (5.3%) were the only other taxa representing greater than 5% of the total number of organisms identified (Table 4). *Ampelisca abdita* and tubificids were the most widely distributed taxa being found at more than 63% of the stations. The distribution of taxa representing >10% of the total assemblage at each station is given in Table 5.

Taxa richness (mean number of taxa per station) and density data are given in Table 6 and Figures 4, 5, 6 and 7. Taxa richness was extremely variable (2 taxa at station 1-3 to

46 taxa at station 22-5), but was generally correlated with bottom salinities (Figure 5). Densities were also variable and ranged from 50 organisms·m⁻² at station 6-5 to 117,425 organisms·m⁻² at station 16-3 (Table 6, Figures 6 and 7). Taxa diversity and evenness data are given in Table 6 and Figures 8 and 9. Taxa diversity (H') ranged from 0.12 at station 6-3 to 2.88 at station 37-3. Taxa evenness (J) ranged from 0.08 at station 6-3 to 1.0 at station 6-5.

Taxa Key

Ann = Annelida
 Olig = Oligochaeta
 Poly = Polychaeta
 Art = Arthropoda
 Inse = Insecta
 Mala = Malacostraca

Cho = Chordata
 Asci = Ascidiacea
 Cni = Cnidaria
 Anth = Anthozoa
 Hydr = Hydrozoa

Ech = Echinodermata
 Ophi = Ophiuroidae
 Mol = Mollusca
 Biva = Bivalvia
 Gast = Gastropoda

Pho = Phoronida
 Rhy = Rhynchocoela
 Anop = Anopla

QUALITY ASSURANCE STATEMENT

Client/Project **NOAA**

Work Assignment Title **San Francisco Bay 2001**

Work Assignment Number Task Number **Opt 1-8**

Description of Data Set or Deliverable: **96 Benthic macroinvertebrate samples collected
August, 2001; Young Dredge grabs.**

Description of audit and review activities: **Judged accuracy rates were well above standard levels for sorting and taxonomy. Laboratory QC reports were completed. Copies of QC results follow (see attachment.) All taxonomic data were entered into computer and printed. This list was checked for accuracy against original taxonomic data sheets.**

Description of outstanding issues or deficiencies which may affect data quality: **None**
