

**PARASELLIGUEA, A NEW GENUS OF
MALESIAN POLYPODIACEAE, A CORRECTION**

P.H. HOVENKAMP

Nationaal Herbarium Nederland, Universiteit Leiden branch, P.O. Box 9514,
2300 RA Leiden, The Netherlands

SUMMARY

The monotypic genus *Paraselliguea*, based on *Polypodium leucophorum* Baker, is validated.

Key words: *Paraselliguea*, Polypodiaceae, Malesia.

When I transferred *Polypodium leucophorum* Baker to the new genus *Paraselliguea* (Hovenkamp, 1997), I regrettably omitted the required Latin diagnosis of that new genus (ICBN art. 36.1). The omission is here corrected.

Paraselliguea* Hovenkamp, *gen. nov.

Rhizoma longe repens sinuosa, paleis peltatis longe subulatis patenti-squarrosis rufis obtecta. Frondes 4–5 cm remotae simplices, lamina tomentosa, venis reticulatis, soris irregulariter dispersis.

Type and sole species:

Paraselliguea leucophora* (Baker) Hovenkamp, *comb. nov.

Polypodium leucophorum Baker, J. Linn. Soc. (Bot.) 22 (1886) 229. — Type: *Hose 129* (holo K), Matang, Sarawak.

ACKNOWLEDGEMENT

I am grateful to Dr. I.M. Turner and Dr. J.F. Veldkamp for pointing out the omission in the original paper.
