## Preface

This Checklist was prepared from data excerpted from NEMERTES, the nemertean digital knowledge base system. The NEMERTES system is accessible through the NEMERTES website (<http://nemertes.si.edu>) hosted by the Smithsonian Institution. Making this checklist available through the website will permit it to be updated on a frequent basis as new taxa are added and new distribution and habitat information becomes available. The authors will appreciate communications of new taxonomic and distribution information and any corrections by e-mail to: [nemertes@nemertes.si.edu](mailto:nemertes@nemertes.si.edu).

This work has been supported by a National Science Foundation grant (DEB9712463) under the Partnerships for Enhancement of Expertise in Taxonomy (P.E.E.T.) program.

**Checklist of the Nemertean fauna of Japan and Northeastern Asia**  
(Excerpted from NEMERTES, the nemertean digital knowledge base)

The 255 taxa listed in this report comprise the nemertean fauna of Japan and the coasts of northeastern Asia from the eastern side of the Bering Strait southward to the southern-most extent of coastal China (including Hainan Island). Most of the species are marine littoral or near-shore benthic; however there are a few pelagic, fresh water, and terrestrial species, which are so noted. Only pelagic forms occurring in waters reasonably near coastal shores are included. The habitat and geographic distribution herein reflect the present limited collection data. Thus, the actual geographic distribution and habitat range of listed taxa may be wider than given here. The lower case letter suffix on publication dates refers to a particular piece of literature where the author had more than one publication in that year and represent the corresponding entry in the NEMERTES literature database. Although recent studies (notably those of Gibson, Sundberg, and Crandall) have proposed other schemes, the higher taxonomic categories used here are those of longest standing and widest use and reflect the work of Hubrecht, Verrill, Coe, Brinkmann, and Stiasny-Wijnhoff.

Over time, many of the species in this checklist have been transferred to genera with a different gender ending than that of their original genus. In a number of these cases the gender ending of the specific epithet was not changed to conform to the gender of the new genus name. In some instances, the gender ending of the specific epithet, as originally published, was incorrectly formed in that it was not in agreement with the gender of the generic name. In all such situations, the gender endings of specific epithets have been changed herein to conform with the gender of the generic name in accordance with Articles 31.2 and 34.2 of the International Code of Zoological Nomenclature (4<sup>th</sup> Ed., 1999).

In the tables below, taxa may appear in more than one category. Thus, marginal totals may be less than the sum of the row or column entries.

	TOTAL	ORDER AND SUBORDER BY REGION

## NOTES IN STATUS COLUMN

The following notes appear in the 'status' column.

- + Indicates a taxon regarded as fully valid at the present time.
- ? Indicates a taxon name that has been reported from the area in the past but is now regarded as being of questionable validity.
- \*1 This taxon is regarded as a nomen dubium, because the description contains no information on internal morphology or characters in life.
- \*2 Korotkevich (1977) collected four species (*Amphiporus bicoloreus*, *A. dorsolineatus*, *A. obtusorostris*, and *Tetrastemma tridentatum*) from a littoral "puddle" with salinity of 17.94‰. However, these species are not brackish forms, since they do not occur in the brackish lagoons and estuaries of Shishkotan Island.
- \*3 Gibson & Crandall (1989) regarded this taxon as a nomen dubium.
- \*4 Although referred to this name by Iwata, this form cannot be confirmed as identical with Stimpson's taxon.
- \*5 This record is of questionable validity, because Kulikova did not supply details on internal and external morphology.
- \*6 In his later works Coe regarded *Amphiporus similis* as synonymous with or as a variety of *Amphiporus imparispinosus*, but they are now known to constitute valid separate species.
- \*7 This record may not be correct. Takakura identified as *Amphiporus nebulosus* forms that Korotkevich (1977) described as *A. fuscoparus* and *A. matuanus*.
- \*8 Chernyshev (1999) listed this species as a junior synonym of *A. papilliformes*.
- \*9 Gibson (1995) regarded this species name as synonymous with *Baseodiscus delineata*, but such an identity has not yet been confirmed by definitive study of actual specimens from this area..
- \*10 This taxon is regarded as a nomen dubium, since Korotkevich's description was based on only a single preserved specimen which was not sectioned for study of internal morphology.
- \*11 The record for Sakhalin is dubious, because Korotkevich did not examine the internal morphology. *Cephalothrix linearis* sensu Yamaoka was synonymized with *Procephalothrix simulus* (see Iwata, 1954).
- \*12 Chernyshev's (1993) description, which cited *Amphiporus bimaculatus* Coe, 1901, as the type species, does not conform to Coe's type specimens, and the principal defining character appears to be a preservation artifact commonly found in many cratenemertid species. Other characters, taken at the time to be unique, are, in fact, common to most cratenemertids. Most workers now regard the name *Collarenemertes bimaculatus* as a junior synonym of *Nipponnemertes bimaculata* or as a *species inquirenda*.

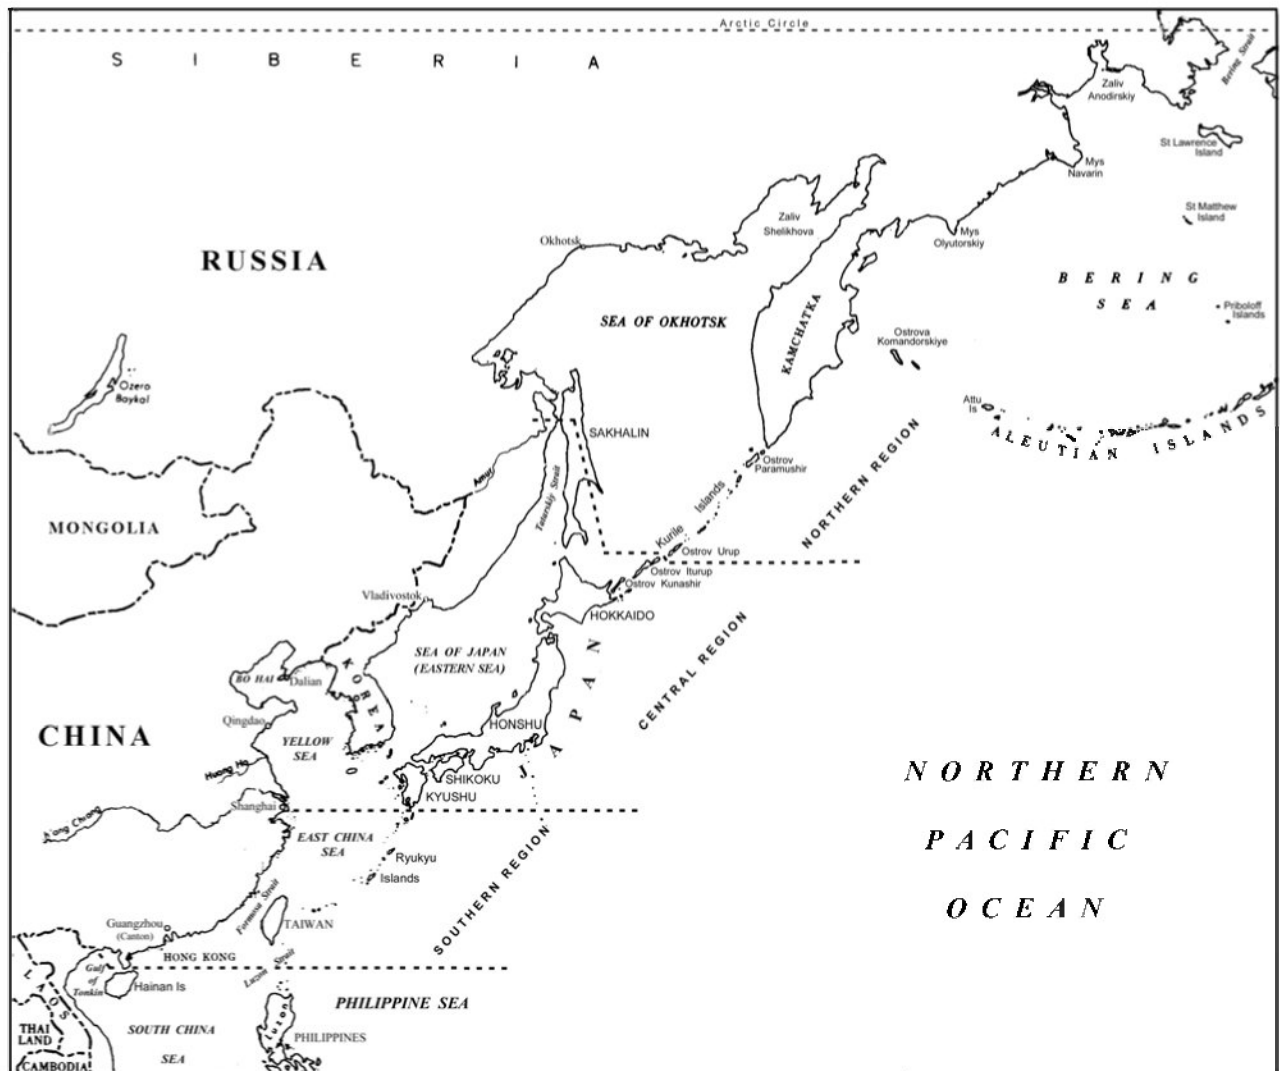

- \*13 Kulikova & Kutischev (1984) listed this species from Peter the Great Bay. Later, Kulikova (1988) listed this form as *Lineus bicolor* Verrill, 1892.
- \*14 *Lineus longifissus* has been used by several different authors to refer to at least three different forms. The form thus identified by Takakura (1898) and Iwata (1952) requires a new name.
- \*15 Six different names have been used to designate forms with strikingly distinctive color patterns of remarkable similarity. *Micrura bella* and *M. impressa* were noted originally by Stimpson (1857) from the western Pacific rim, *M. festiva* by Takakura (1898), plus *Lineus striatus* by Griffin (1898) and *Micrura verrilli* by Coe (1901) from the eastern Pacific rim. The color pattern of all five is an off-white body with a deep vermilion, orange, or brownish tip to the head and a broad longitudinal band of purple, brownish, or grayish rectangles separated by hairline spaces down the dorsal surface. The only significant difference appears to be whether the marking of the head is on the dorsal half only or completely encircles the tip. When reported at all, the extent of the head marking seems to be dorsal in the eastern Pacific and complete in the western Pacific. In his later works, Coe regarded *L. striatus* as synonymous with *M. verrilli* and various authors have treated *M. festiva* and *M. impressa* as synonyms of *M. bella*. Kulikova & Kutishchev (1984) referred a form to *M. bella* with the color of the dorsal band more a dark burnt orange than a deep purple. Chernyshev (1992) regarded this form as distinct and renamed it *Micrura kulikovae* Chernyshev, 1992. Sun (1994) identified a form from Qingdao as *Micrura verrilli*; however, it is not certain that it was not *Micrura bella*. Unfortunately, very little is known of the comparative internal morphology of these various forms; therefore, it is not presently possible to determine whether they represent truly separate species or merely pattern variants as is found, for example, in *Tetrastemma nigrifrons*.
- \*16 Kulikova & Kutischev (1984) listed this species from Peter the Great Bay. Chernyshev (1996) listed the taxon from the Komandorskiye Islands. Manchenko & Kulikova (1996) regarded the "brown" and "cherry" morphs as different species.
- \*17 Past reports of this taxon in this area may have been the result of erroneous identifications.
- \*18 There are three *Nipponnemertes* species occurring around the northern Pacific rim having brown blotch color patterns so similar that they can only be conclusively distinguished by microscopic study of the internal morphology. *Nipponnemertes punctatula* occurs on both the eastern and western sides of the Pacific. Thus far, *N. occidentalis* has been reliably reported only from North America, while *N. arenaria* has been found in both Japanese and Russian waters. In the 1950s Iwata identified a number of specimens as *Amphiporus punctatulus*, but his careful morphological notes indicated that some of them differed somewhat from Coe's (1905) form in internal morphology. We now know that these were almost certainly *Nipponnemertes arenaria* (Uschakov, 1927) (formerly *Amphiporus arenarius*), which coexists over much of the same western Pacific geographic range as *N. punctatula*.
- \*19 The form identified and figured by Iwata (1954) as *Amphiporus bimaculatus* Coe, 1901, appears identical with one found later in Alaska by Norenburg and sectioned and studied by Crandall. Although having a superficial resemblance to Coe's species, this form, which has a pair of quadrantic head markings rather than the long triangular markings of Coe's taxon and a quite different proboscis central armature, is not a cratenemertid, has not been definitively described, and at present, is regarded as having uncertain affinities.

- \*20 This taxon occurs in a number locations along the coasts of Japan and Russia and perhaps in more southerly locations as well. However, the specimens reported by Coe (1940) from the Sea of Japan and the Sea of Okhotsk are a quite different form of undetermined affinities but certainly not of the same family as *Nipponnemertes bimaculata* (formerly *Amphiporus bimaculatus*).
- \*21 There has been significant recent debate about whether the genera *Oersteddiella*, *Paroersteddia*, and related genus group taxa should be subsumed within the genus *Oersteddia* or whether this assemblage should be divided into additional genera and subgenera. For purposes of this checklist, we have retained the generic placements of species that have been in use for some time and are familiar to the widest audience.
- \*22 *Mesarmaueria pellucida* Korotkevich, 1955, is not the same species as *Proarmaueria pellucida* Coe, 1926, thus Chernyshev, when he transferred the taxon, renamed it *Proarmauria korotkevitschae* Chernyshev, 1992.
- \*23 Several later workers have regarded *Prostoma grande* Ikeda, 1913, as probably synonymous with *P. lumbricoideum*, a European form. *Prostoma hokkaidoense* Stiasny-Wijnhoff, 1938, has been variously regarded as *P. gracense*, *P. lumbricoideum*, or *P. lacustre*. Gibson & Moore (1976) regarded it as a nomen invalidum.
- \*24 Chernyshev (1998) described *Tetrastemma coronatum* sensu Yamaoka as a new species, *T. psuedocoronatum* with Kunashir, Kurile Islands as the type locality. Older referrals to *T. coronatum* (Quatrefages, 1846) may be erroneous.
- \*25 Chernyshev has suggested that this form is sufficiently distinct from the rest of the genus *Tetrastemma* to warrant separate generic status. *Tetrastemma viridis* Kulikova, 1989, is neither a primary nor secondary homonym of *Tetrastemma viride* (= *Fasciola viridis* Müller, 1774, now *Lineus viridis*). Oersted (1844) listed *Tetrastemma ? viride* without description for the *Planaria viridis* of Müller (1776). Thus, Gibson's (1995) proposed name change is of questionable validity, and Kulikova's taxon requires additional investigation to establish proper nomenclatural status and taxonomic placement.
- \*26 Chernyshev (1992) regarded *Prostoma stigmatum* sensu Yamaoka, 1940, as distinct from *Tetrastemma stigmatum* (Stimpson, 1857) and, since both the latter and *T. yamaoki* were preoccupied, renamed the species as *Tetrastemma stimpsoni* Chernyshev, 1992.
- \*27 Chernyshev regarded this taxon as a nomen dubium and suggested that Korotkevich's specimen might actually be a *Tetrastemma nigrifrons* variant.
- \*28 Chernyshev (1998) suggested that *Tetrastemma yamaokai* sensu Sun may actually be *Tetrastemma pimaculatum*.
- \*29 Sundberg & Hylbom (1994), based on cladistic analysis, suggest that this taxon is a hubrechtid paleonemertean.
- \*30 Chernyshev listed as *Cosmocephala beringiana* Stimpson, 1857 from Kommandorskiye Islands.

## MAP OF REGIONS AND KEY TO LOCATIONS IN JAPAN AND NORTHEASTERN ASIA

The area covered by this checklist encompasses a wide variety of climates and habitats. However, for convenience it can be divided into four main regions, viz Northern, Central, Southern, and North Pacific Ocean. The first three are largely defined by the various seas that lie between the continental land mass and the island chains that form the boundaries between them and the Pacific Ocean. Although it may be argued that the eastern and western sides of these island chains, most notably in the case of Japan, have substantial differences in climate and habitats, the divisions used here are useful generalizations. The regions are as shown on the map below and as follows:

**Northern Region:** The Bering Sea from the Bering Strait south to the Aleutian Islands and Komandorskiye Islands and west to the Russian Coast; the Kamchatka Peninsula and northern and central Kurile Islands; the Sea of Okhotsk and northeastern Sakhalin Island.

Central Region: The Russian continental coast from the Tatarskiy Strait (between Sakhalin Island and the mainland) southward, including the southwestern portion of Sakhalin Island; the southern Kurile Islands; Japan; the Sea of Japan (Eastern Sea); the Korean peninsula; the coast of China south to approximately Shanghai; the Bo Hai and Yellow Sea.

Southern Region: The continental coast of China south of Shanghai, exclusive of Hainan Island (the climate and habitats of which are more like southeast Asia); the Ryukyu Islands; Taiwan; the East China Sea and northern-most portion of the South China Sea.

North Pacific Ocean: The Pacific Ocean from the Aleutian and Komandorskiye Islands south to approximately latitude 20° N and up to 1000 Km east of the Asian island chains.

**ABBRV REG LOCATION**
