ACKNOWLEDGMENTS

We wish to thank M. Barut, H. Bridgman, J. Lee, S. Matsubara, and J. Palos for their able assistance. Investigations were supported in part by the USDA/CSRS Special Grants Program in Tropical and Subtropical Agriculture No. 58-9AHZ-0-546 and Grant 84-1 from the State of Hawaii Governor's Agricultural Coordinating Committee.

THE AUTHORS

J. J. Cho is an associate plant pathologist, University of Hawaii, Maui County Research.

R. F. L. Mau is an associate specialist in entomology, University of Hawaii at Manoa.

W. C. Mitchell is a retired entomologist, University of Hawaii at Manoa.

D. Gonsalves is a plant pathologist, New York Agricultural Experiment Station, Cornell University.

L. S. Yudin is a graduate research assistant in entomology, University of Hawaii at Manoa.

HOST LIST OF PLANTS SUSCEPTIBLE TO TOMATO SPOTTED WILT VIRUS (TSWV)

J. J. Cho, R. F. L. Mau, W. C. Mitchell, D. Gonsalves, and L. S. Yudin

INTRODUCTION

Spotted wilt of tomato was first described by Brittlebank (1919) in Australia. Samuel et al. (1930) characterized the pathogenic agent as a virus and named it tomato spotted wilt virus (TSWV). Since then the disease has been reported in several tropical and temperate regions and is considered worldwide in distribution.

TSWV is unique because it is one of only two plant viruses known to be transmitted by thrips. Pittman (1927) was the first to establish that TSWV could be transmitted by the onion thrips. Six thrips species are known TSWV vectors:

- 1) the western flower thrips, *Frankliniella occidentalis* (Pergande) (Gardner et al., 1935);
- 2) the common blossom thrips, *Frankliniella schultzei* (Trybom) (Samuel et al., 1930);
- 3) the onion thrips, *Thrips tabaci* Lindeman;
- 4) the tobacco thrips, *Frankliniella fusca* (Hinds) (Sakimura, 1963);
- 5) *Scirtothrips dorsalis* Hood (Amin et al., 1981); and
- 6) *Thrips setosus* Moulton (Kobatake, 1984).

Only the first three species are known to occur in Hawaii. Of these, the western flower thrips is the most common vector (Yudin et al., 1986, 1987). TSWV can be acquired from diseased plants only by larval thrips; after a latent period of three to 12 days it can be transmitted by both larval and adult stages.

TSWV produces a variety of disease symptoms including a range of chlorotic, necrotic, stunting, and enation symptoms in all parts of the plant (Ie, 1970). TSWV symptoms on lettuce generally start as necrotic brown leaf spots on one side of the plant, becoming systemic and extending to the heart leaves. This results in a cessation of development, causing the plant to twist to one side. The outer leaves wilt and eventually the whole head collapses. On tomatoes, symptoms are characterized by initial chlorosis of leaves and terminal shoots, developing into bronzing and necrosis. Symptoms on mature fruits are blotchiness of color and rugosity of the fruit surface.

In Hawaii, TSWV has seriously affected production of lettuce, tomato, and bell pepper in the major vegetable-production areas of the state. These areas include the Lalamilo and

Pukapu areas on the island of Hawaii, the Kula area on Maui, and the Waianae area on Oahu. This disease has been quite devastating in recent years, when losses of 50 to 90 percent have been observed in lettuce and tomato production, particularly during the warm, dry summer months.

Development of feasible control procedures has been difficult because TSWV has an extensive plant host range. Best (1968) lists 157 dicotyledonous plant species in 29 families, and six monocotyledonous species in five families, as hosts. Francki and Hatta (1981) added 11 additional host species. Several of these susceptible hosts are commonly found growing along field borders and among crops of Hawaii's major vegetable-growing regions.

TSWV-infected plant hosts in vegetable-growing regions play an important role in the epidemiology of the disease. Forty-four plant species representing 16 plant families have been found to be naturally infected with TSWV. Twenty-six plant species are considered important reservoirs of TSWV (see Table 1). These plant sources perpetuate TSWV, are important habitats for thrips vectors, and serve as foci for subsequent movement and infection of susceptible crop plants. *Ipomoea congesta* (blue morning glory) and *Tropaeolum majus* (nasturtium) are present throughout the year on the islands of Hawaii and Maui. On Oahu, *Amaranthus spinosus* (spiny amaranth) is commonly found. A high percentage of those plants found on farmland harbor the virus and were associated with abundant vector thrips. Elimination of these and other important TSWV reservoirs should be helpful in reducing disease losses.

Several additional new plant hosts have been identified since 1981, and this paper presents an up-to-date listing of TSWV-susceptible plant species. Several references listed in the table cite original articles demonstrating TSWV susceptibility of plant species or host lists of TSWV-susceptible plants.

TABLE 1. HOSTS OF TOMATO SPOTTED WILT VIRUS

Scientific name	Common name	Reference
<i>Acanthospermum hispidum</i> DC.	---	Greber and McCarthy, 1977
<i>Ageratum houstonianum</i> Mill.	ageratum	Gumpf and Weathers, 1972
<i>Amaranthus caudatus</i> L.	---	Best, 1968
<i>Amaranthus graecizans</i> L.	---	Best, 1968
<i>Amaranthus hybridus</i> L.*	green amaranth	Cho et al., 1986
<i>Amaranthus retroflexus</i> L.	redroot pigweed	Milbrath, 1939
<i>Amaranthus spinosus</i> L.*	spiny amaranth	Cho et al., 1986
<i>Amaranthus viridis</i> L.*	slender amaranth	Cho et al., 1984, 1986
<i>Amaryllis</i> sp.	Barbados lily	Gardner et al., 1935
<i>Ananas comosus</i> (L.) Merr.	pineapple	Linford, 1932
<i>Anemone</i> sp.	anemone	Smith, 1957
<i>Antirrhinum</i> sp.	snapdragon	Smith, 1957
<i>Apium graveolens</i> L.*	celery, celeriac	Best, 1968
<i>Aquilegia vulgaris</i> L.	common columbine	Smith, 1957
<i>Arachis hypogaea</i> L.	peanut	Costa, 1941
<i>Arctium lappa</i> L.*	burdock	Cho et al., 1986
<i>Arum palaestinum</i> Boiss	calla	Tompkins and Severin, 1950
<i>Aster</i> sp.	aster	Smith, 1957
<i>Atropa belladonna</i> L.	deadly nightshade	Smith, 1932
<i>Begonia</i> x <i>hiemalis</i> Fotsch	begonia	Barnes and Halliwell, 1985
<i>Begonia semperflorens</i> Link & Otto	begonia	Gardner et al., 1935
<i>Begonia</i> sp.	begonia	Best, 1968
<i>Belamcanda chinensis</i> (L.) DC.	blackberry lily	Yamamoto and Ohata, 1977
<i>Bidens pilosa</i> L.*	Spanish needle	Greber and McCarthy, 1977
<i>Bidens pilosa</i>		
var. <i>minor</i> (Bl.) Sherf*	Spanish needle	Cho et al., 1984, 1986
<i>Brassica campestris</i> ssp. <i>chinensis</i> L.	white stem cabbage	Cho et al., 1986
<i>Brassica oleracea</i> var. <i>botrytis</i> L.	cauliflower	Gardner et al., 1935
<i>Browallia americana</i> L.	browallia	Gardner et al., 1935
<i>Browallia speciosa</i> Hook.	---	Smith, 1957
<i>Calceolaria</i> sp.	slipperwort	Smith, 1957
<i>Calendula officinalis</i> L.	calendula	Best, 1968
<i>Callistephus chinensis</i> (L.) Nees	China aster	Best, 1968
<i>Campanula americana</i> L.	bellflower	Gardner et al., 1935
<i>Campanula pyramidalis</i> L.	chimney bellflower	Smith, 1957
<i>Capsella bursa-pastoris</i> (L.) Medic.*	shepherd's purse	Best, 1968
<i>Capsicum annuum</i> L.	bell pepper	Sakimura, 1940
<i>Capsicum frutescens</i> L.	red pepper	Smith, 1932
<i>Capsicum</i> sp.	pepper	Best, 1968
<i>Carica papaya</i> L.	papaya	Cook, 1972
