(Received 14 September 2000, accepted 25 June 2001)

Abstract — A list of 269 species of benthic marine algae found in Iceland is given. Twenty-two Cyanophyceae, 77 Phaeophyceae, one Chrysophyceae, 95 Rhodophyceae, seven Xanthophyceae, one Charophyceae, 66 Ulvophyceae are included. Of these, 26 are new records for Iceland. Relevant systematic and taxonomic problems are discussed in notes.

checklist / Cyanophyceae / Iceland / marine benthic algae / Phaeophyceae / Ulvophyceae / Rhodophyceae / Xanthophyceae

Résumé — Catalogue révisé des algues marines d'Islande. Un inventaire de 269 espèces d'algues marines benthiques des côtes islandaises a été dressé. Il comprend 22 Cyanophyceae, 77 Pheophyceae, une Chrysophyceae, 95 Rhodophyceae, sept Xanthophyceae, une Charophyceae et 66 Ulvophyceae. Vingt-six espèces sont signalées pour la première fois en Islande. De nombreuses espèces, posant des problèmes systématiques et taxinomiques particuliers, ont fait l'objet d'annotations.

algues marines benthiques / Cyanophyceae / checklist / Islande / Phaeophyceae / Ulvophyceae / Rhodophyceae / Xanthophyceae

INTRODUCTION

Systematic studies of the benthic marine algae of Iceland began in the last century with Strömfelt's (1887) studies, primarily of the algal flora of the southwest and the east coast. In the beginning of the twentieth century H. Jónsson (1901, 1903a and b) made extensive studies of the benthic flora in the waters all around Iceland. Since H. Jónsson published his account of the marine algal vegetation in the series "Botany of Iceland" (H. Jónsson, 1912), studies of the marine algae were interrupted until in the sixties when S. Jónsson started his studies on the colonization of marine algae on the new volcanic island of Surtsey (see S. Jónsson *et al.*, 1987). Since then phycological activities have continued with studies of the benthic algae of Iceland by a number of authors.

The first comprehensive checklist of the marine algae of Iceland was published by H. Jónsson in 1912 and a revision of the checklist was published in 1972

* Correspondence and reprints: e-mail: karl@hafro.is

(Caram & S. Jónsson, 1972). In the time interval since then a number of new records have been added to the species list of the Icelandic marine algae (e.g. Jónsson & Gunnarsson, 1978; Gunnarsson, 1985). In addition, major taxonomic revisions have been made in several algal groups in the North Atlantic (see e.g. Lokhorst, 1978; Lokhorst & Trask, 1981; Prud'homme van Reine, 1982; Pedersen, 1984; Nielsen, 1979, 1980, 1983, 1984; Koeman, 1985; Fletcher, 1987; Maggs & Hommersand, 1993; Irvine & Chamberlain, 1994; Brodie *et al.*, 1998) and many nomenclatural changes (e.g. Anagnostidis & Komárek, 1985, 1988, 1990; Komárek & Anagnostidis, 1986, 1989; Silva *et al.*, 1996).

The present list encompasses the Cyanophyceae, Phaeophyceae, Chrysophyceae, Rhodophyceae, Xanthophyceae, Charophyceae and Ulvophyceae growing at the coast of Iceland both in littoral and sublittoral zones. In total 269 species are included, distributed amongst the classes as follows: Rhodophyceae 95 species, Phaeophyceae 77 species, Ulvophyceae 66 species, Charophyceae one species, Xanthophyceae seven species, Chrysophyceae one species and 22 species of Cyanophyceae. In the list the numbers in parenthesis indicate notes given at the end of the list. Names in brackets refer to names not in current use but applied for the Cyanophyceae by Petersen (1928) and H. Jónsson (1903b) and in the checklists of marine benthic algae by H. Jónsson (1912) and Caram and S. Jónsson (1972). Included in the list are 26 species (marked with an asterisk) seen and determined by the authors in the years 1972 to 1999 and not recorded in the above mentioned lists (see note 1).

NOTES

1. The additions of new records to the present checklist are based on specimens seen by the authors. In a long series of articles, Munda (1976, 1977, 1978, 1980a, 1980b, 1983, 1984, 1985, 1992, 1994, 1999) has described the intertidal seaweed vegetation in different parts of Iceland. A list of selected algae, recorded as new for Iceland was given by Munda in 1979. Some of these new records have been questioned as they fall outside the known biogeographical boundaries in the North Atlantic (see Prud'homme van Reine, 1982; Cambridge *et al.*, 1990). A new species *Porphyra thulea* described by Munda & Pedersen from eastern Iceland (Munda & Pedersen, 1978) has by molecular genetic analysis been shown to belong to *P. amplissima* (Brodie *et al.*, 1998). The authors have not had the opportunity to re-examine the material collected by Munda as none of her specimens is available. We therefore chose not to incorporate these records in the present list pending further investigation.

2. Provisional list. Regarding recent treatments of the systematics of the Cyanophyceae see Anagnostidis & Komárek (1985, 1988, 1990) and Komárek & Anagnostidis (1986, 1989).

3. Hariot (1893) records this species amongst algae collected by M. Bouchet in the head of Ísafjörður and in Arnarfjörður. No date is given for the collection.

4. New record; Found at Melabakkar, W-Iceland, 1977.

5. New record; Found in Eyjafjörður, N-Iceland in 1974, Skerjafjörður, SW-Iceland, 1975 and Reykjavík harbour in 1990, parasitic on *Ulothrix* spp.

6. New record for marine habitat in Iceland; Found at Melabakkar, W-Iceland, 1977. Also recorded by Broady (1978) from freshwater habitat in North Iceland.

7. New record for marine habitat in Iceland; This species was found in salt pans in Melabakkar W-Iceland in 1977. It has been recorded earlier in freshwater lake Mývatn (Jónasson & Áðalsteinsson, 1979).

8. *Gononema aecidioides* is placed by Burkhardt & Peters (1998) in the genus *Laminariocolax*.

9. A specimen with recurved branches was recorded in Surtsey in 1977 (S. Jónsson & Gunnarsson, 1982) agreeing with Kuckucks description and illustration of *Hincksia recurvata* (Kuckuck, 1961). This entity was considered to be a synonym of *Hincksia granulosa* (as *Giffordia granulosa*) by Kornmann (*in* Kuckuck, 1961), however, Cardinal (1964) has shown that the species differs significantly from *Hincksia granulosa* and merits a status as an independent species. The species was initially described (with diagnosis in German) and illustrated in 1901 by Kuckuck but not published until 1961 (Kuckuck, 1961). More recently *Ectocarpus recurvatus* Kuckuck has been considered as *nomen nudum* (South & Tittley, 1986) leading to the invalidation of *Giffordia recurvata* (Kuckuck) Cardinal.

10. Pedersen (1984) has examined the material that H. Jónsson collected and determined as *Myriонema globosum* (Reinke) Foslie (= *Microspongium globosum* Reinke) (H. Jónsson, 1903a). According to Pedersen (1984) the correct name for the plants is *Microspongium immersum*.

11. This species has been referred to the genus *Hecatonema* by Pedersen (1984) and *Chilionema* by Fletcher (1987). Here we follow Sauvageau (1897) who considered upright filaments from each cell in the basal disc the main character for the genus *Myriонema*.

12. New record; plants agreeing with Waern's (1952) description of *Porterinema fluviatilis* (Hobard C. Porter) Waern were found growing on *Ulvaria obscura* in the littoral zone in Örfirisey, Reykjavík in April 1975. Pedersen (1981) has shown *Porterinema fluviatilis* to be a part of the life cycle of *Sorapion kjellmanii*.

13. Pedersen (1978) has studied the life cycle of this species. The species has an heteromorphic life cycle. *Streblonema sphaericum* possibly represents a microthallus of *Myriotrichia clavaeformis* Harvey.

14. The life cycle of this species in Iceland has been studied by S. Jónsson (1977). The Icelandic plants had four chromosomes.

15. This species was considered by H. Jónsson (1903a) to be synonymous with *Isthmoplea sphaerophora*.

16. Silva *et al.* (1999) have proposed to conserve the name *Pylaiella* for this genus. According to Pedersen (1984) species in the genus *Pylaiella* (as *Pilayella*) differ significantly from species in the Ectocarpales as e.g. species of *Ectocarpus* by having intercalary sporangia and partly multiseriate thallus. The genus is closely related to *Isthmoplea sphaerospora* and is accordingly placed in the Tilipteridales.

17. For the taxonomic status of this species see Pedersen (1984), Kornmann (1990); and Siemer & Pedersen (1995). Petersen's (1984) study includes material from Steingrimsfjörður, NW-Iceland.

18. Regarding the taxonomy of *Sphacelaria* see Prud'homme van Reine (1982).

19. New record; Found in a tide pool in Örfirisey, Reykjavík, in April 1977.

20. Regarding the taxonomy of this species see Pedersen (1976). On the relationship between *Coelocladia arctica* and *Stictyosiphon arcticus* see Pedersen & Kristiansen 1992.

21. Specimens of *Alaria* with short stipe, broad blade and wide sporophylls with asymmetrical bases are here referred to *Alaria pylaii*. According to Widdowson (1971) this species is confined to the western Atlantic and has probably often been confused with sheltered water forms of *A. esculenta* with long stipes and wide thin blades in the eastern Atlantic. South (1984), South and Tittley (1986) and Lüning (1990) consider that the North-Atlantic harbours only one species, *A. esculenta*, of which three morphological forms can be recognised. In a molecular genetic study Kraan & Guiry (2000) considered *A. esculenta* a homogenous species.

22. This species was separated from *Chorda* and placed in the genus *Halosiphon* by Jaasdund (1957) on the bases of presumed differences in life history. Although Jaasdund had mistaken an epiphyte for the gametophyte, it was later shown by Sundene (1963) and Maier (1984) that the species differed from species of *Chorda* in certain life history traits. Peters (1998) has produced additional molecular genetic evidence supporting the separation of this species from the genus *Chorda*.

23. *Laminaria faeroensis* has been considered synonymous with *L. longicruris* de la Pylaie (Kain, 1976; Egan & Yarish, 1988) which in turn has been considered a possible synonym of *L. saccharina*, which has priority in that case (Mann, 1971; Chapman, 1974, 1975; Lüning *et al.*, 1978; Sjøtun & Gunnarsson, 1995). Pending further studies the epithet *L. faeroensis* Börgesen is retained here.

24. *Laminaria nigripes* has been considered to be synonymous with *Laminaria digitata* (South & Hooper, 1980; South & Tittley, 1986). Contrary to *L. digitata*, *L. nigripes* has mucilage ducts in the stipe, resembling *L. hyperborea* in that respect (Agardh, 1868; Rosenvinge, 1892; H. Jónsson, 1903). This character seems to be a stable species character in the Digitatae section of the genus and the species is therefore retained here (see Gunnarsson, 1991 for discussion).

25. Henry & South (1987) have proposed to replace *Phyllaria* with the name *Phyllariopsis* based on the assumption that *Phyllaria dermatodea*, the type species of the genus, is more related to *Sacchorhiza polyschides* (Lightfoot) Batters than it is to *Phyllaria reniformis* (Lamouroux) Rostafinski (=*Phyllariopsis brevipes* (C. Agardh) Henry & South) and *P. purpureascens* (C. Agardh) Rostafinski the other species previously placed in the genus *Phyllaria*. Morphologically, *P. dermatodea* differs significantly from *S. polyschides*, but shares many common morphological characters with *P. brevipes* and *P. purpureascens*, such as the morphology of the stipe, sori being formed only on the lamina, and having unbranched haptera as in some forms of *P. brevipes* (Pérez-Cirera *et al.*, 1991). The name *Phyllaria dermatodea* is therefore retained here.

26. Recent molecular studies by Rousseau *et al.* (1998) and Serrão *et al.* (1999) have shed light on the phylogenetic relationships within the Fucales that appears to be a monophyletic group.

27. *Fucus distichus* Linnaeus emend. Powell has been split into two distinct species, *F. distichus* Linnaeus and *F. evanescens* C. Agardh by Rice & Chapman (1985) on the basis of morphological characters. H. Jónsson (1903a) considered the complex consisting of one species (as *F. inflatus* Linnaeus), having four different forms and Powell (1957) split the species into four subspecies. Serrão *et al.* (1999) failed to detect genetic difference between the two taxa using internal transcribed spacers (ITS). There is an enormous form

variability in this complex and pending transplant and further molecular genetic studies only one species, with four forms, is retained in the present list.

28. Gunnarsson (1985) gives an account of the species and distribution of the genus *Vaucheria* in W-Iceland, adopted here, and lists new records.

29. New record; found in Gerðartangi, Vatnsleysuströnd, SW-Iceland in July 1963.

30. New record; found by Steffen Lundsteen (pers. comm.) in Lónakot, SW-Iceland in 1983.

31. Concerning the taxonomy of North-Atlantic *Porphyra* species see Brodie *et al.* (1998).

32. See Brodie & Irvine (1997) for the description of this species and the identity of species earlier described under the name *Porphyra laciniata* Strömfelt.

33. The generic circumscription is according to Lee & Lee (1988). See also Papenfuss (1945), Dixon (in Parke & Dixon, 1976) and Stegenga *et al.* (1997).

34. Concerning the life history of *Acrochaetium alariae* see Lee (1983), Lee & Kurogi (1983) and Kuiper (1983). According to Lee & Kurogi (1983) the species has a heteromorphic life cycle in Korea, where *A. alariae* is the gametophyte and *Rhodochorton repens* represents the tetrasporophyte.

35. Stegenga & Borsje (1977) have shown that *Acrochaetium hallanicum* has a heteromorphic life cycle and the entity referred to the present species is the gametophyte. The tetrasporophyte is recognised as *A. polyblastum* (Rosenvinge) Børgesen, which has not been recorded in Iceland. Considered by some authors to be a synonym of *A. parvulum* (Kylin) Hoyt, possibly is the gametophyte of *A. virgatum* (see Borsje, 1973).

36. Abdel-Rahman & Bidoux (1989) have shown that *Acrochaetium secundatum* in France, has a heteromorphic life cycle, with the tetrasporophyte corresponding to the type of the species. Woelkerling (1973) considers *A. secundatum* a synonym of *A. virgatum*, the former name having priority.

37. Borsje (1973) studied the life history of *Acrochaetium virgatum* in the Netherlands and obtained gametangial plants resembling *A. parvulum* and *A. ripidandrum* (Rosenvinge) Hamel. *A. parvulum* has been considered a synonym with *A. hallanicum* that is recorded in Iceland. *A. ripidandrum* has not been recorded in Iceland. Abdel-Rahman (1984) cultured *A. parvulum* and obtained controversial results, *A. parvulum* being the tetrasporophyte and gametophytic plants resembling *A. maluinum* Hamel and *A. battersianum* Hamel. Further studies are needed.

38. New record; found by Steffen Lundsteen (pers. comm.) in Lónakot, SW-Iceland in 1983 and Surtsey S-Iceland 1984. According to Boillot & Magne (1973) the species has a heteromorphic life cycle with *A. pectinatum* as the tetrasporophytic phase and *Kylinia rosulata* Rosenvinge as the gametophytic phase. *K. rosulata* has not been recorded from Iceland. The identity of the tetrasporophyte has been questioned by Stegenga & Van Wissen (1979).

39. Regarding the life history and the nuclear cycle of this species in Iceland see S. Jónsson & Chesnay (1982).

40. The ultrastructure of *Halosacciocolax kjellmanii* S. Lund in Iceland and its relationship with its host is described in S. Jónsson & Chesnay (1988). Meiosis and tetrasporogenesis in the Icelandic plants are described by Chesnay & S. Jónsson (1989).

41. Tetrasporophytic phase of this species, *Porphyrodiscus simulans* Batters, has not been recorded in Iceland.

42. In the herbarium of the Botanical Museum in Copenhagen there are specimens of this species labelled "ad littora Islandiae pr. Reykjavik ..." collected by Faber who travelled in Iceland in the years 1819-1821.

43. Hansen (1986) has proposed a resurrection of the genus *Euthora* for this species.

44. New record; found on *Polysiphonia lanosa* in various localities in SW- and W-Iceland and on *P. arctica* in Eyjafjörður, N-Iceland.

45. Specimens in H. Jónsson's herbarium in the Botanical Museum in Copenhagen, collected at Öndverðarnes W-Iceland and marked with the species name *Dilsea edulis* Stackhouse (syn. *D. carnosia* (Schmidel) Kuntze), are not *D. carnosia* but resemble small specimens of *Schizymenia dubyi*.

46. This species was recorded in Breiðifjörður, W-Iceland growing on *Rhodomela confervoides* in the shallow sublittoral (Gunnarsson & Þórisson, 1979).
47. See Irvine & Chamberlain (1994).
48. Regarding the taxonomy of this species and its synonymy with *Phymatolithon rugulosum* Adey see Chamberlain (1991).
49. Düvel & Wegeberg (1996) have studied the type material of *Lithothamnion laeve* Strömfelt collected by Strömfelt in Eyrarbakki, S-Iceland. They conclude that it belongs to *Phymatolithon lemormandii*.
50. This species was first found in Heimaey in the Vestmannaeyjar arhipelago S-Iceland in August 1966. The locality was covered with new lava during the volcanic eruption in Heimaey in 1973. The species has not been found in the area since.
51. New record; found in Vestmannaeyjar, S-Iceland and Grindavík, SW-Iceland. Maggs (1989) has cultured this species from Britain and obtained a heteromorphic life history. Maggs identified the sporophyte as *Erythrodermis allenii* Batters. The sporophytic phase *E. allenii* has not been recorded in Iceland.
52. This species exhibits basically two types of life cycles in the North Atlantic; (i) an heteromorphic life cycle where the tetrasporophyte is a crust described as, *Petrocelis cruenta* J. Agardh and the blade like gametophytes are monocious, and (ii) a direct, apomictic life history with dioecious, blade like gametophytes and no tetrasporophytes. Specimens from two different populations in Iceland show the latter type of development (Guiry & West, 1983).
53. New record; this crustose *Haematocelis*-stage has been found in the littoral zone in various places on the Reykjanes peninsula SW-Iceland, growing together with *Schizymenia dubyi*. Ardré (1980) discovered a heteromorphic life cycle of *Schizymenia dubyi* in France, involving *Haematocelis rubens* as the tetrasporophyte.
54. For the life cycle of this species see South, Hooper & Irvine (1972).
55. For the taxonomy of the Ceramiales see Maggs & Hommersand (1993).
56. *Aglaothamnion scopulorum* was considered to be a form variety of *Aglaothamnion hookeri* (Dillwyn) Maggs & Hommersand, by Dixon & Price (1981). *A. scopulorum* has some distinct morphological characters separating it from *A. hookeri* a.o. lack of cortication (see Maggs & Hommersand, 1993). The name *A. scopulorum* is maintained here pending further studies of Icelandic specimens.
57. *C. circinatum* was first recorded by H. Jónsson (1912) for Iceland. It has been recorded widely in the north Atlantic (South & Tittley, 1986), however Maggs & Hommersand (1993) consider it a Mediterranean species with its northern distribution limit in Southern England. *C. circinatum* is maintained on the present list pending further studies of specimens collected by H. Jónsson.
58. Maggs & Hommersand (1993) used the name *Ceramium nodulosum* (Lightfoot) Ducluzeau for this species. Silva *et al.* (1996) considered this name change erroneous and suggested conserving the name *Ceramium rubrum* (Hudson) C. Agardh after considering the pervasive application of the name and difficulties in finding the earliest valid name for the species. Maggs *et al.* (2000) have suggested using the name *C. virgatum* Roth for this species.
59. A specimen of this species exists in the algal herbarium of the Botanical Museum in Copenhagen labelled *Ex. Islandia*. But as neither the collector nor the sampling locality are known, H. Jónsson (1901) considered it a doubtful record for the Icelandic flora.
60. Classes within green algae follow Melkonian's & Surek's (1995) concept.
61. New record; found growing endophytically in *Enteromorpha* spp. and *Blidingia minima* in the littoral zone in Vestmannaeyjar (Eiðið) S-Iceland in August 1966. It produced biflagellate swarmers.
62. *Halochlorococcum marinum* grew up in stock culture of various algae collected in Örfirisey SW-Iceland in autumn 1964. Produced biflagellate swarmers in culture.
63. New record; The species was found in Melabakkar, W-Iceland in 1977 and in Reykjavík harbour in April 1990, growing on *Rhizoclonium implexum*.
64. For the life history of this species in Iceland see S. Jónsson (1980).

65. New record; found in Hvalfjörður, W-Iceland 1974 at 1-3 m depth (S. Jónsson & Gunnarsson, 1975) and in a tide pool in Keilisnes, SW-Iceland in 1997. The specimens are referable to the subspecies *tomentosoides* (van Goor) Silva.

66. New record; The gametophyte of *Derbesia marina*, *Halicystis ovalis* was found at 15 m depth on crustose corallines in Hvaleyri, Hafnarfjörður, SW-Iceland in May, 1994. Sporophytes with sporocysts had been recorded before (Caram & S. Jónsson, 1973).

67. For the discussion on the nomenclature of this species see Silva *et al.* (1996).

68. See S. Jónsson *et al.* (1989) for the species delimitation adapted here.

69. A specimen of this species is in the Natural History Museum in Paris (PC, No 369) collected in an expedition of Prince Napoléon to Reykjavík and NW-Iceland in 1856.

70. This species was collected by Rietema in 1983, amongst *Laminaria* in overflow from a tide-pool, between Eyrarbakki and Stokkseyri, S-Iceland (Cambridge *et al.*, 1990).

71. Specimens of *Rhizoclonium* with cell diameter of 10 to 15 µm were referred to this species as opposed to *R. riparium* with cell diameter of 20-48 µm (for comments see Silva *et al.* 1996, pp. 936-937).

72. New record; found by Steffen Lundsteen (pers. comm.) in Lónakot, SW-Iceland in 1983. Kornmann & Sahling (1994) classified this species as *Urospora* but Rueness (1992) suggested that it belongs to Cladophoraceae within the order Siphonocladales.

73. See Lokhorst (1978) for a revision of the genus.

74. For the species concept adopted in the present paper see S. Jónsson (1999) and Silva *et al.* (1996) for discussion of the *Acrosiphonia-Spongomorpha* complex.

75. For the typification of this genus see S. Jónsson (1991)

76. Icelandic specimens of this genus have been reexamined by Lokhorst & Trask (1981).

77. Lockhorst & Trask (1981) reexamined specimens of *Urospora* spp. collected by H. Jónsson in Iceland and kept in Botanical Museum of Copenhagen. They found that some of the specimens identified as *Urospora harttii* by H. Jónsson belonged to *U. banioides* and others to *U. penicilliformis* or *U. wormskjoldii*.

78. Lockhorst & Trask (1981) reexamined specimens of *Urospora* spp. collected by H. Jónsson in Iceland and kept in Botanical Museum of Copenhagen. They found that some of the specimens identified as *Urospora mirabilis* by H. Jónsson belonged to *U. neglecta* and others to *U. penicilliformis*.

79. This species was transferred to *Capsosiphon* by Vinogradova (1969).

80. It has been demonstrated that *Gomontia polyrhiza* represents two species, differing by their life history: *Eugomontia sacculata* that is filamentous with isomorphic generations (Kornmann, 1960) and *G. polyrhiza* that has a parenchymatous gametophyte alternating with a shell boring unicellular sporophyte (Kornmann, 1959; Nielsen & Correa, 1987). In addition the sporophyte of *Monostroma grevillei* which may also be calcicole can resemble *G. polyrhiza* (Kornmann, 1962; S. Jónsson, 1968).

81. New record; The species was found in Eyjafjörður, N-Iceland in May 1974.

82. For the generic concept adopted in the present paper see a.o. Golden & Garbary (1984).

83. See Koeman (1985) for the species delimitation adopted here.

84. Blomster *et al.* (1999) have shown by molecular analysis using internal transcribed spacers (ITS) that *Enteromorpha clathrata* and *E. muscoides* (Clemente et Rubio Cremades are synomyms, the latter name having priority.

85. For life history and influence of different environmental factors inducing the gametogenesis in *Enteromorpha prolifera* in Iceland, see S. Jónsson (1983).

86. See Nielsen, 1979, 1980, 1983, 1984.

87. New record; The species was found in the littoral zone at Hvassahraun, SW-Iceland in September 1998, endophytic in *Chondrus crispus*.

88. New record; The species was found in the lower littoral zone in Eyjafjörður, N-Iceland in May 1974.

89. Nielsen & Pedersen (1977) showed that the algae usually referred to as *Pringsheimiella scutata*, actually comprised two distinct species and separated *Syncoryne reinkei* from the complex as a new species. In the Botanical Museum in Copenhagen (C) specimens sampled by Ostenfelt at Brimnes, Reykjavík, Njarðvík and Isafjörður and

referred to *Pringsheimia scutata* Reinke by H. Jónsson (1903a) are all *Syncoryne reinkei* (R. Nielsen, pers. comm.). H. Jónsson (1903a) refers to the same species an alga growing on *Chaetopteris plumosa* and found by A. Mörk. Neither *Pringsheimiella scutata* nor *Syncoryne reinkei* could be found on this host in C (R. Nielsen, pers. comm.). Whether *Pringsheimiella scutata* grows in Iceland needs further studies.

90. New record; The species was found in the littoral zone at Straumur, SW-Iceland in September 1998, growing in the periostrachum of *Littorina obtusata* (Linnaeus, 1758).

Acknowledgement — We are grateful to Ian Tittley, British Museum of Natural History, who critically reviewed the manuscript and two referees of the journal for their constructive criticism that improved the paper. We also thank Sigurlína Gunnarsdóttir librarian at the Marine Research Institute in Reykjavík for assistance in searching literature.

INDEX TO GENERA

Valid names are written in italics and older names in roman.

<i>Acrochaete</i>	145	<i>Choreocolax</i>	139	<i>Eudesme</i>	134
<i>Acrochaetium</i>	138	<i>Chroococcus</i>	132	<i>Eugomontia</i>	145
<i>Acrosiphonia</i>	143	<i>Cladophora</i>	143	<i>Euthora</i>	139
<i>Actinococcus</i>	140	<i>Clathromorphum</i>	139	<i>Fimbrifolium</i>	140
<i>Aglaothamnion</i>	141	<i>Coccotylus</i>	140	<i>Foslia</i>	135
<i>Ahnfeltia</i>	138	<i>Codiolum</i>	142, 143, 144	<i>Fucus</i>	137
<i>Alaria</i>	136	<i>Codium</i>	143	<i>Geitlerinema</i>	132
<i>Anabaena</i>	133	<i>Coelocladia</i>	135	<i>Giffordia</i>	134
<i>Antithamnion</i>	141, 142	<i>Coilodesme</i>	136	<i>Gigartina</i>	140
<i>Antithamnionella</i>	141	<i>Conchocelis</i>	137	<i>Gomontia</i>	144
<i>Aphanothece</i>	132	<i>Corallina</i>	139	<i>Gomphosphaeria</i>	132
<i>Ascocyclus</i>	134	<i>Cruoria</i>	140	<i>Gononema</i>	133
<i>Ascophyllum</i>	137	<i>Cyanocystis</i>	132	<i>Haematocelis</i>	140
<i>Asperococcus</i>	136	<i>Cystoclonium</i>	140	<i>Haemescharia</i>	140
<i>Audouinella</i>	138	<i>Delamarea</i>	135	<i>Halicystis</i>	143
<i>Bangia</i>	137	<i>Delesseria</i>	141	<i>Halochlorococcum</i>	142
<i>Blidingia</i>	144	<i>Derbesia</i>	142	<i>Halosacciocolax</i>	138
<i>Bolbocoleon</i>	145	<i>Dermatocelis</i>	134	<i>Halosaccion</i>	138
<i>Bonnemaisonia</i>	139	<i>Dermatolithon</i>	140	<i>Halosiphon</i>	136
<i>Bryopsis</i>	142	<i>Dermocarpa</i>	132	<i>Haplospora</i>	135
<i>Callithamnion</i>	141	<i>Desmarestia</i>	135	<i>Harveyella</i>	139
<i>Callophyllis</i>	139	<i>Devaleraea</i>	138	<i>Hildenbrandia</i>	139
<i>Calothrix</i>	133	<i>Dictyosiphon</i>	136	<i>Hincksia</i>	134
<i>Capsosiphon</i>	144	<i>Dilsea</i>	139	<i>Isthmoplea</i>	135
<i>Castagnea</i>	134	<i>Dumontia</i>	139	<i>Jonssonia</i>	134
<i>Catenella</i>	140	<i>Ectocarpus</i>	133, 134	<i>Kornmannnia</i>	144
<i>Ceramium</i>	141	<i>Ectochaete</i>	145	<i>Kvaleya</i>	139
<i>Ceratocolax</i>	140	<i>Elachista</i>	134	<i>Kylinia</i>	138
<i>Chaetomorpha</i>	143	<i>Enteromorpha</i>	144	<i>Laminaria</i>	136
<i>Chaetopteris</i>	135	<i>Entoderma</i>	145	<i>Laminariocolax</i>	134
<i>Chantransia</i>	138	<i>Entonema</i>	134	<i>Leathesia</i>	134
<i>Chlorochytrium</i>	142, 144	<i>Epicladia</i>	145	<i>Leptolyngbya</i>	132
<i>Chondrus</i>	140	<i>Erythrocladia</i>	137	<i>Leptonema</i>	134
<i>Chorda</i>	136	<i>Erythrodermis</i>	140	<i>Leptonematella</i>	134
<i>Chordaria</i>	134	<i>Erythrotrichia</i>	137	<i>Leptophytum</i>	140

Lithoderma	134	Phloeospora	135	Rhodymenia	138
Lithophyllum	139	Phycodrys	141	Rivularia	133
Lithothamnion	139, 140	Phyllaria	136	Rosenvingiella	145
Litosiphon	136	Phyllitis	136	Saccorrhiza	136
Lola	143	Phyllophora	140	Sahlingia	137
Lomentaria	141	Phymatolithon	139, 140	Sarcinastrum	132
Lyngbya	133	Plectonema	132	Scagelothamnion	142
Mastocarpus	140	Pleurocapsa	132	Schizymenia	140
