

The Diversity of Medicinal Plants of the Himalayan Kingdom of Bhutan

ABSTRACT: Most nations depend heavily on plants as economic resources. They can be categorized according to their contribution to economic development thanks to their taxonomic classes. Plant components are used in pharmaceutical research and the creation of novel medications in the healthcare industry. Plant components or herbal concoctions are utilized as herbal medicines in Bhutan and other parts of the world to treat various illnesses. The study aimed to list all the plants possessing medicinal properties from the published sources. The proponents of herbal medicine in Bhutan assert that plant parts contain a variety of phytochemicals that show a range of pharmacological and biological responses. The related data were searched online using various boolean operations. Bhutan is home to around 637 medicinal plant species under 132 families and 418 genera, of which only 229 species are used in Bhutanese traditional medicine. More research and interactions with the local traditional medicinal practitioners can reveal more plants with medicinal properties.

INTRODUCTION

Plants with medicinal value have been used from time immemorial. The foundation for treating human ailments is natural compounds derived from plants, animals, and minerals [6]. Plants play a crucial part in ecosystems by providing necessary functions. Humans and other living beings cannot exist without plants. Plants, particularly therapeutic herbs, have long served as a general indication of ecosystem health [19]. The plants used in treating disease have a long history, dating back to when humans looked for a tool in their environment to help them recover from illness [8]. The pharmaceutical and cosmetic industries use more than a tenth of all plant species [9]. However, medicinal plant distribution is not constant worldwide [18], and medicinal herbs are mostly obtained from the wild population. The area or villages with poor transport and communication facilities tend to have a rich knowledge base on the use of medicinal plants [12]. Kumar & Singhal (2019) concluded that there is a decline in traditional knowledge of medicinal plants as young people show less interest in the knowledge system of their community.

Medicinal plants flourish throughout the Himalayan valleys and foothills. The primary gathering centers are the temperate and subtropical valleys. Various parts of medicinal plants, like leaves, stems, flowers, roots, and the whole plant, are collected. Some medicinal plants have substituted ingredients sourced from rare and endangered species. Proper study will provide ample opportunities to discover new medications that will be helpful to the larger community.

In recent decades, demand for animal supplies has surged by 8% to 15% each year in Asia, North America, and Europe [23]. Different types of flowers, skin, fruits, leaves, roots, seeds, or even the entire plant may be therapeutic plant components. Certain chemicals known as active compounds are created and stored in the bodies of these plants, and they have physiological effects on living beings [17]. Humans rely heavily on raw plant resources to suit their medicinal demands to stay healthy and treat ailments [10]. According to the World Health Organization, more than 80% of the world's population now uses traditional medications, mostly plants, as their primary source of health treatment. This statistic

covers not just China, India, and all of the world's developing countries but also many developed countries [7]. Many early medications, such as Digoxin, Quinine, Morphine, Aspirin, and Pilocarpine, are based on clinical, pharmacological, and chemical research of these ancient remedies, mostly derived from plants. It is believed that over half of all medications are derived from medicinal plants [34].

Herbal medicines are still used by a considerable portion of the world's population. Bhutan is known by several names, including *bruk-rtsen-lden-ske-pai-ljhong* (land of sandalwood forest) and *smen-ljlong-rgyal-khab* (land of medicinal plants). With *Sowa Rigpa* (traditional Bhutanese medicine) medicine, folklore medicine led the Bhutanese healthcare system until the 1960s, when modern allopathic medicine took over [28]. Medicinal herbs are frequently used in these traditional medical systems. Bhutan is claimed to have 600 medicinal plants, and more than 229 species are used to manufacture more than 103 traditional medicines and 21 commercial commodities in the country [27] [32]. *Sngo-smen* (high altitude medicinal plants) found between the altitudes of 5,000 and 6,000 masl and *khrog-smen* (low altitude medicinal plants) found between 600 and 2,000 masl are the two primary categories of medicinal plants. Bhutan has nearly all of the world's high-altitude medicinal plants growing in the wild [25]. More than 80% to 85% of these medicinal herbs are collected by Menjong Sorig Pharmaceuticals from the country's rich biodiversity [26].

METHODOLOGY

Online databases like Google Scholar, JSTOR, ResearchGate, CORE, ScienceOpen, Directory of

Open Science Journals, Education Resource Information Center, Social Science Research Network, Public Library of Science, openDOAR, Bielefeld Academic Search Engine, BioMed Journal, PubMed, and MDPI were scoured for the relevant literature.

The paper for preparing the manuscript is extracted from the online databases from 2001 to 2022. The papers published before 2001 were omitted as most species were included in the papers published after 2001. The booklets published by the Faculty of Traditional Medicine (FoTM) were greatly used in preparing the manuscript and searching for other papers to prepare the manuscript. The papers were searched using boolean operations (AND, OR, NOT, or AND NOT) related to Bhutan and Traditional Medicine. A limited number of papers are published on medicinal plants' use in Bhutanese ways of life. The manuscript may not be the final number of medicinal plants available in the Himalayan Kingdom of Bhutan.

A list of medicinal plants along with their uses was prepared, referring to Lama et al. (2001); Wangchuk (2004); Wangchuk et al. (2008); Wangchuk et al. (2011a); Wangchuk et al. (2011b); Lakey & Dorji (2016); Wangchuk et al. (2016); Thomas (2017); Wangchuk et al. (2017); Yeshi et al. (2017); Chetri et al. (2018); Drakpa et al. (2018); Jamba & Kumar (2018); Chetri (2019); FoTM (2019a, 2019b); Penjor et al. (2020); Wangchuk et al. (2020); Tenzin & Tendar (2021); Yangzom et al. (2021); and Nepal (2022).

RESULTS & DISCUSSION

Lama et al. (2001) recorded 407 medicinal plants from Dolpa, Nepal and 68 species of medicinal plants found in Bhutan were also made to the record of the authors. Wangchuk (2004) listed around 150 species of medicinal plants found in Bhutan. The study was a part of the author's MSc thesis. Wangchuk et al. (2008) identified 100 medicinal plants from high altitudes used in Bhutanese Traditional Medicine (*gSo-ba-rig-pa*). Wangchuk et al. (2011a) recorded 113 medicinal plants from the lower elevations of Bhutan. Wangchuk et al. (2011b) conducted a phytochemical screening on 25 selected species. Lakey & Dorji (2016) studied the ecological status of the 16 high altitudinal medicinal species. Wangchuk et al. (2016) identified 100 species of medicinal plants from the Dagala *Gewog* under Thimphu *Dzongkhag*. Thomas (2017) listed 265 medicinal plant species from the published papers. Wangchuk et al. (2017) identified 61 medicinal plants from the Lower Kheng Region in Bhutan used in the Bhutanese *Sowa Rigpa* Medicine. Yeshi et al. (2017) recorded 71 species of medicinal plants which are either consumed as fruits, food, or vegetables by the people of Bhutan. Chetri et al. (2018) conducted a study in Kilikhar Mongar, recording 61 medicinal plants under 37 different families. Drakpa et al. (2018) prepared a field guide for the Ugyen Wangchuck Institute for Conservation and Environmental Research with 108 species of medicinal plants found in Bumthang *Dzongkhag*. Jamba & Kumar (2018) published a list of 69 species belonging to 69 genera and 41 families from Tshothing *Chiwog*, Samdrup Jongkhar, Bhutan. The study was part of the first author's M.Sc. thesis. Chetri (2019) recorded 93 medicinal plants from Pemathang *Gewog*, Samdrup Jongkhar. FoTM (2019a, 2019b) listed around 219 species of

medicinal plants found in the higher and lower altitudes of Bhutan. Penjor et al. (2020) studied Taktse Chiwog, Trongsa, and found 82 medicinal plant species. Wangchuk et al. (2020) described three species of *Corydalis*; *Corydalis crispa* Prain., *C. calliantha* D.G.Long, and *C. dubia* Prain. Tezin & Tender (2021) recorded 74 species of medicinal plants in two *Gewogs* of Gasa *Dzongkhag*, Bhutan. Yangzom et al. (2021) documented 63 medicinal plants from Dekiling *gewog*, Sarpang *Dzongkhag*, and Pemathang *gewog*, Samdrup Jongkhar, Nepal (2022) studied the traditional ecological knowledge of the people of Dorokha, and the author listed around 71 medicinal species from the study area.

Bhutan is home to around 637 medicinal species belonging to 418 genera and 132 families (table 1). The family Asteraceae has the highest number of species, with 55 species, followed by Fabaceae and Rosaceae with 29 and 25 species, respectively. Out of 637 species found in the country, only 229 species are used to prepare the traditional Bhutanese medicine. The use of the traditional medicinal plant for treating different ailments is common in Bhutan. Figure 1 shows the collection of different parts of plants to make traditional herbal medicine or those utilized by the local healers. Leaves are the most commonly collected parts to treat the ailment, followed by whole plants and roots.

Figure 1. Plant parts used for medication of different ailments

The highest number of plants are used for fever (94), followed by wounds (85) and Diarrhea (52). The plants treat toothache, boil, swelling, jaundice, body ache, asthma, colic pain, throat-related illness, eye-related illness, stomach-related illness, blood purifier, blood pressure, snake bites, constipation, skin-related illness, etc. (Figure 2).

Figure 2. Number of medicinal plants for different ailments

The study does not accurately show the number of medicinal species present in the Himalayan Kingdom of Bhutan as the country is still in the early stage of documenting the fauna and flora species.

The plants may not be consumed directly as it may cause an adverse reaction or have serious complications that must be used after proper advice and guidance from the local healers and *Dungtsho* (traditional medicinal doctor).

CONCLUSIONS

Bhutan has been known as the land of medicinal herbs in the past. The country uses around 229 (35.94 %) species to manufacture various traditional medicine and other products. The study was able to list around 637 species of medicinal plants found in the Himalayan Kingdom of Bhutan. The plants are used for various ailments by the local people.

Traditional medicine is most popular among those who know the value of it, practice it, and those older folks. Traditional medicinal plants have also been a source of income for several households. Bhutan can add more to the total number of medicinal plants database if it conducts more research.
