

Topographical Anatomy of the Thorax

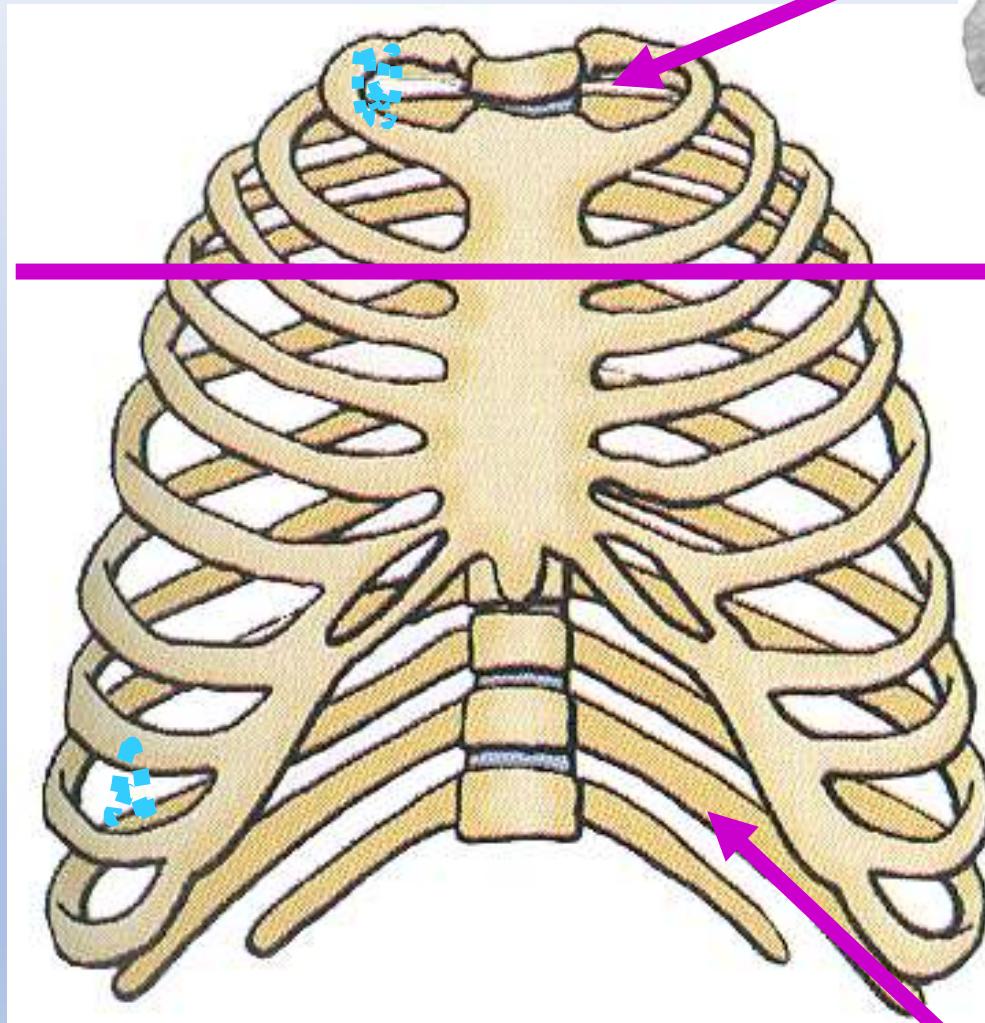

Tibor WENGER

Lecture

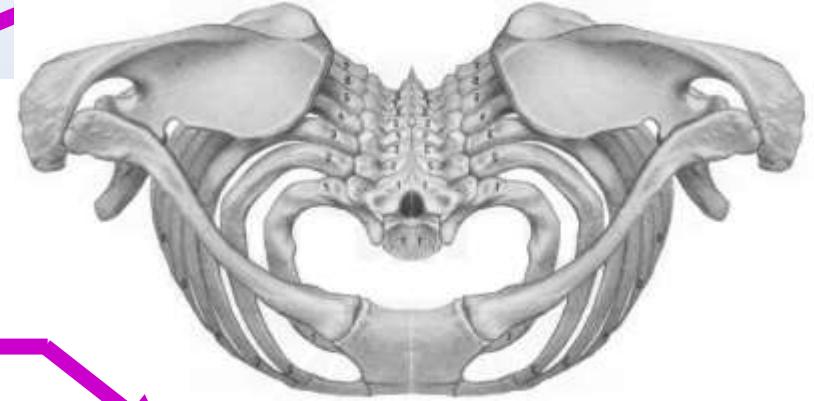

February 3,5, 2020

- Lungs, pleura
- Mediastinum
- Hearth and blood vessels of the mediastinum
 - Blood vessels in the thorax
 - Esophagus
 - Thymus and ductus thoracicus
 - Pericardial and pleural punction

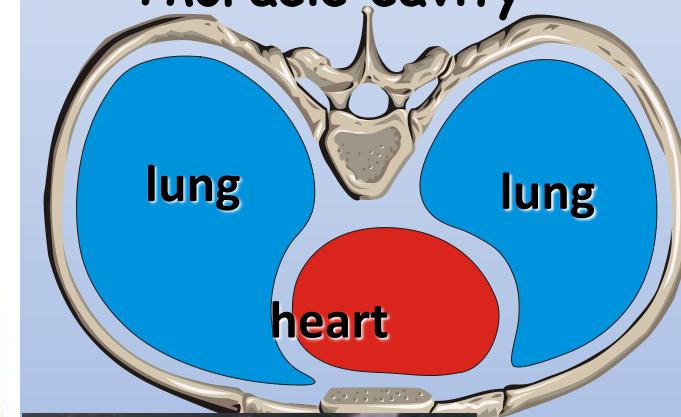

The thorax

Superior thoracic aperture

Thoracic cavity

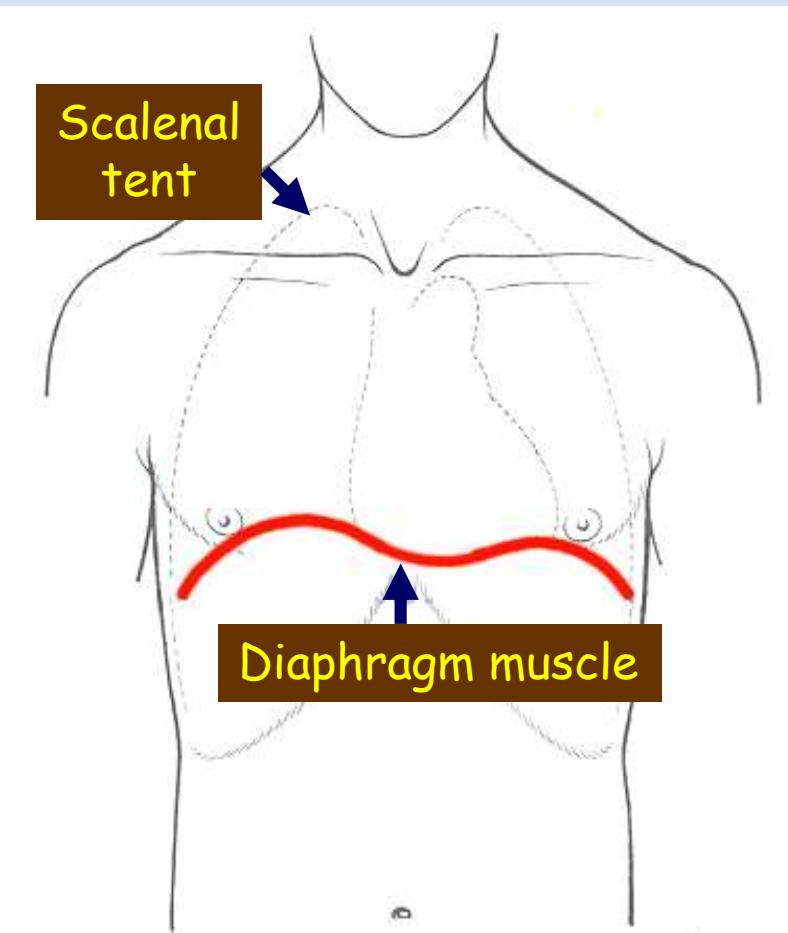

Inferior thoracic aperture

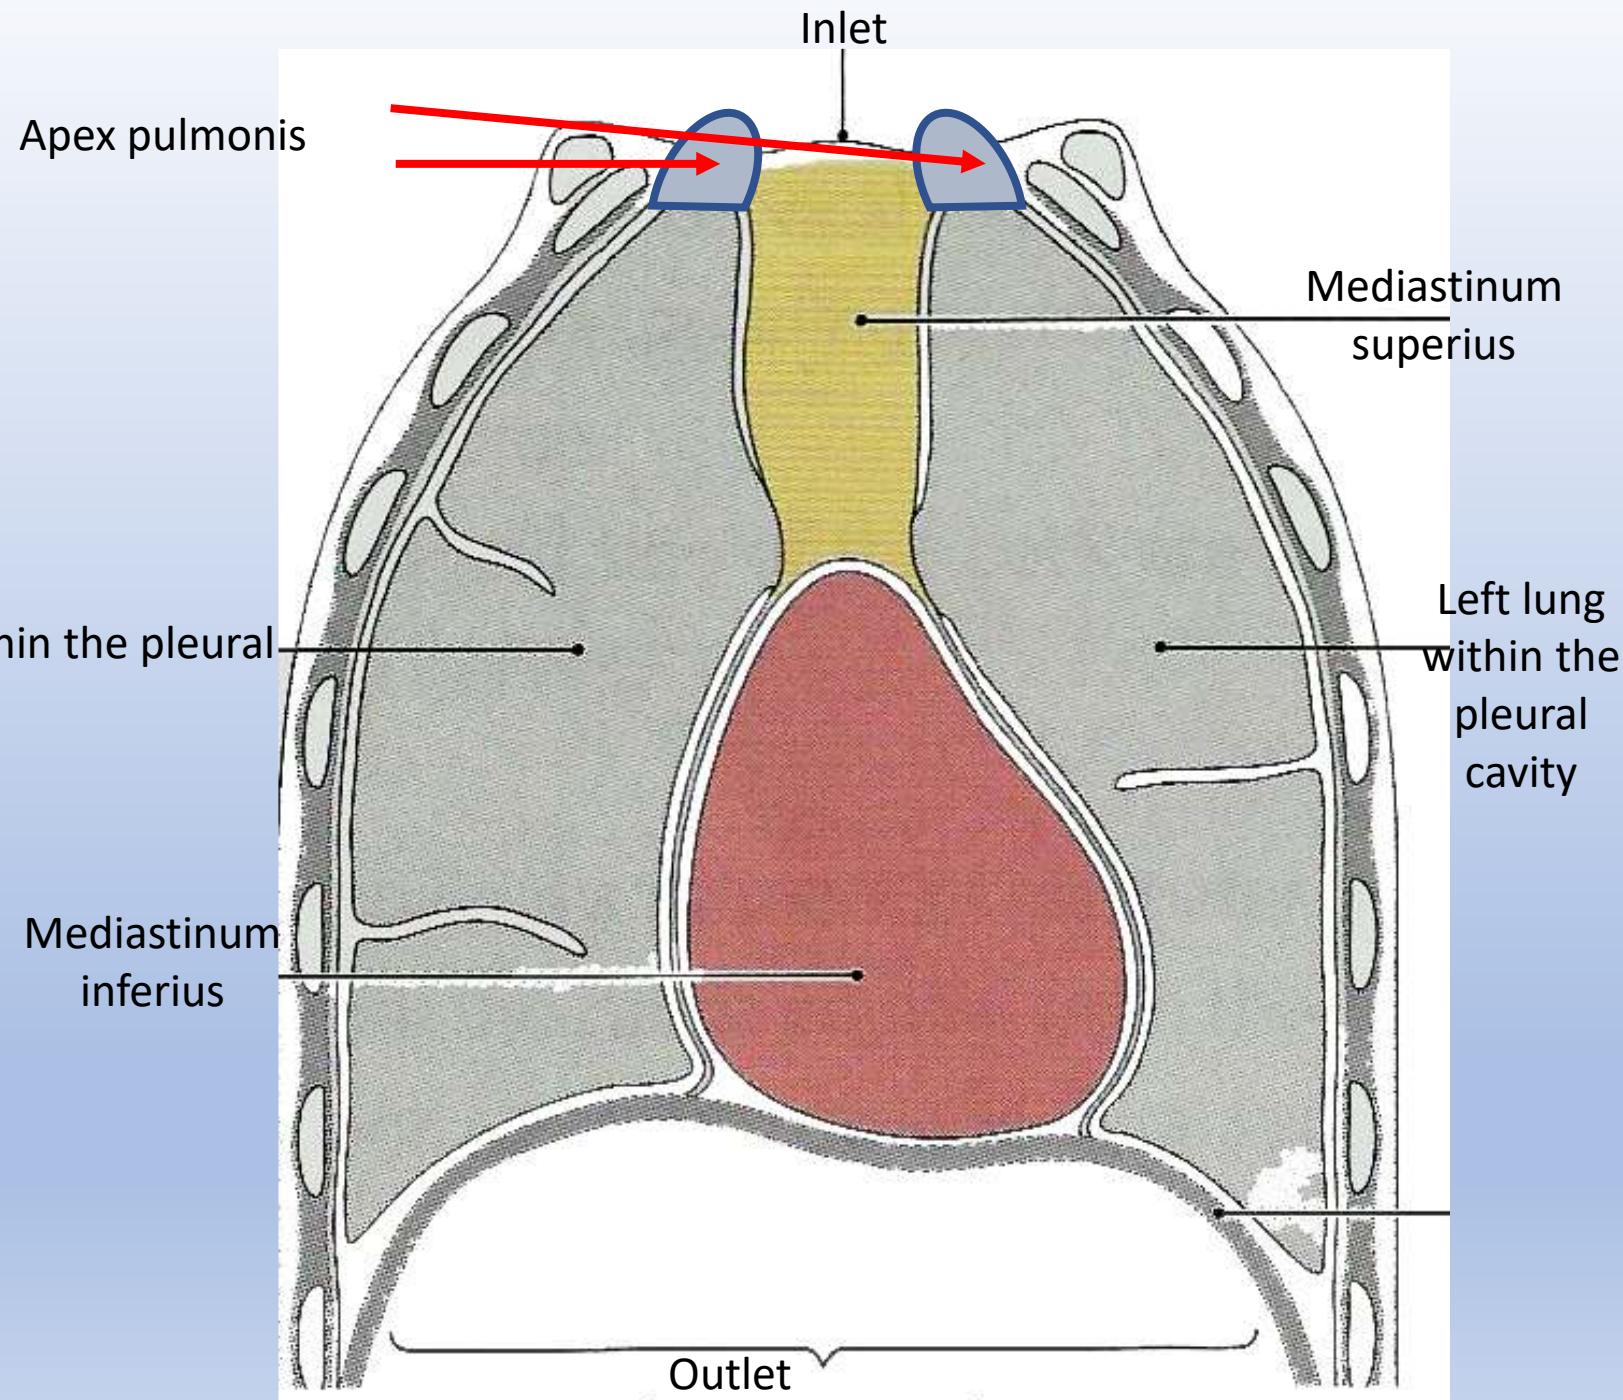

The bony (+joints) thorax is not the same as the thoracic cavity!

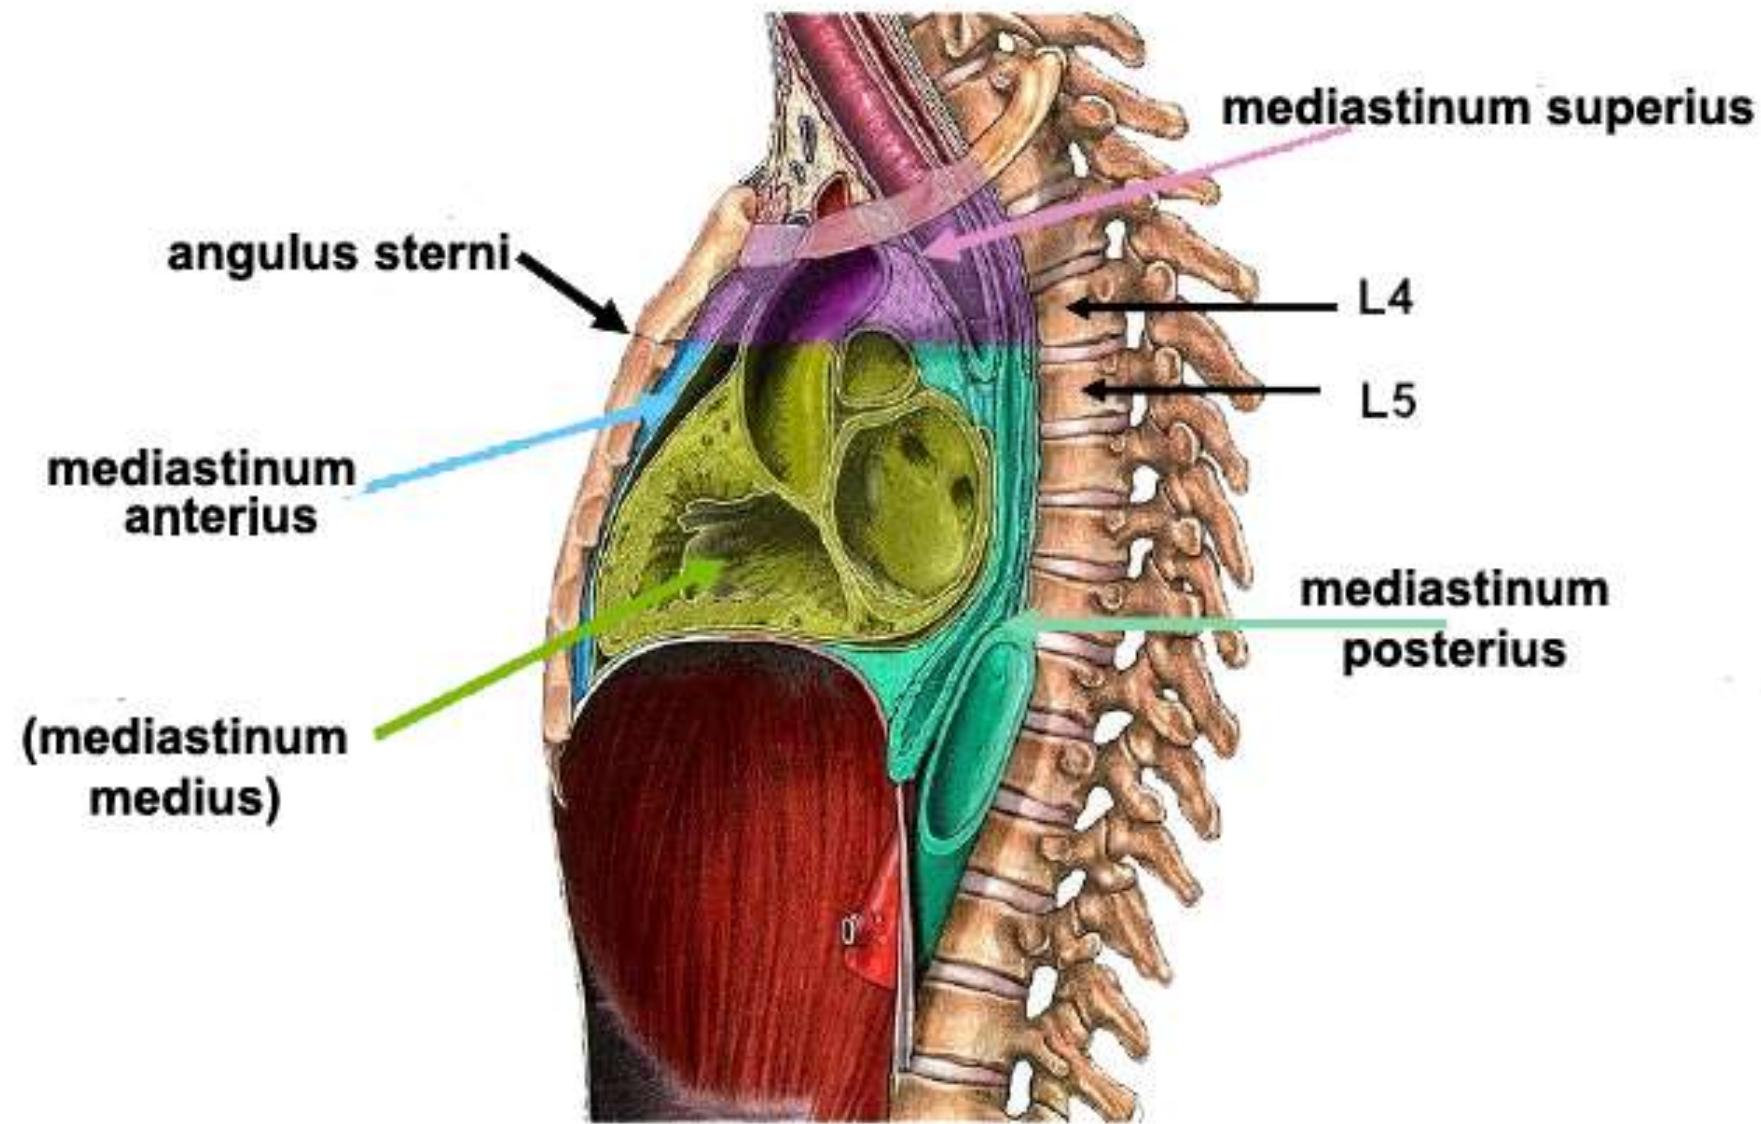

The thoracic cavity is the region of the thorax above the diaphragm, and it exceeds the level of the first rib, and extends to the scalenal tent.

Thoracic cavity

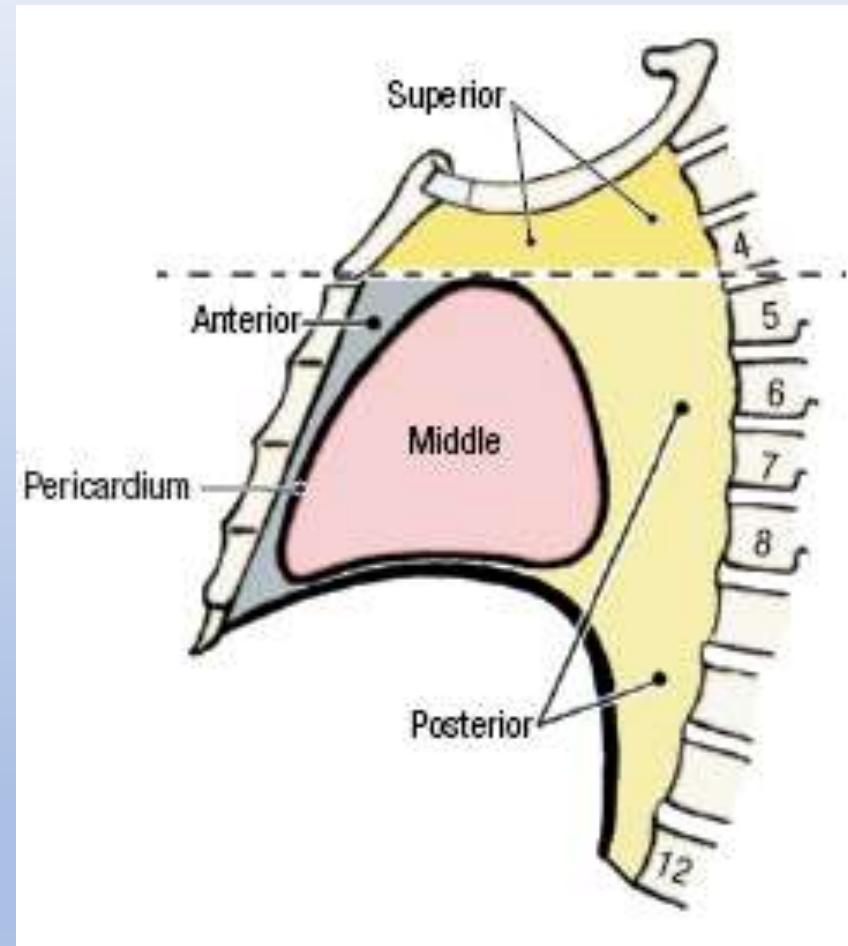

Division of the thoracic cavity

Division of the mediastinum

- **Anterior mediastinum** – the part that lies between the sternum and the pericardium. In children and adolescents, part of the thymus may be found in the anterior mediastinum.
- **Middle mediastinum** – the part that contains the pericardium, the heart, and the roots of the great vessels.
- **Posterior mediastinum** – the part that lies posterior to the pericardium and anterior to the bodies of vertebrae T5 to T12. The posterior mediastinum contains structures that pass between the neck, thorax, and abdomen (esophagus, vagus nerves, azygos system of veins, thoracic duct, thoracic aorta).

Mediastinal Anatomy

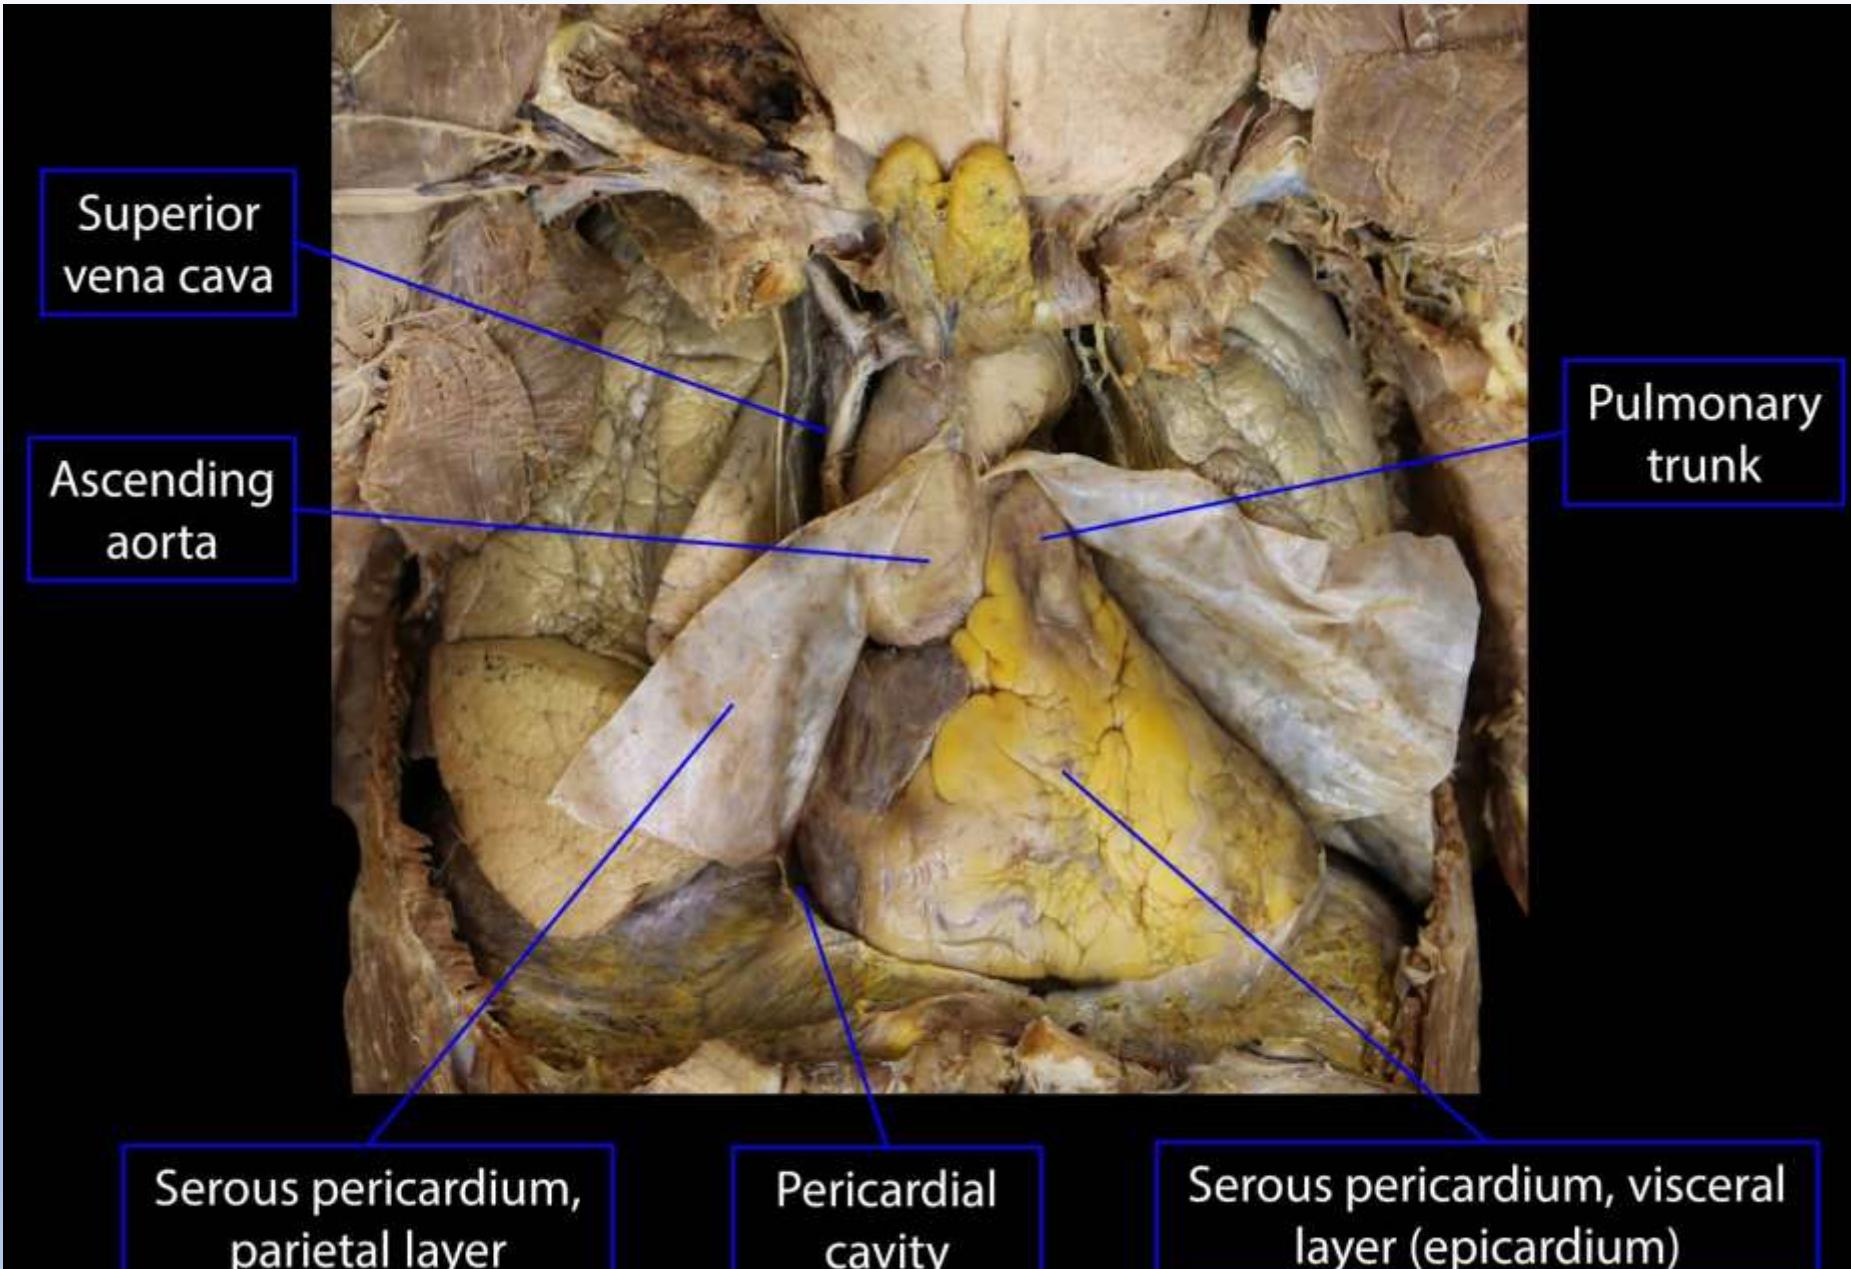

- **ANTERIOR (includes “superior”)**
- bordered by sternum and heart
- Contains thymus, thyroid, parathyroid, lymphatics

Mediastinal Anatomy

- **MIDDLE**
- Anterior border comprised of anterior heart border, and posteriorly by posterior heart border and trachea
- Contains heart, trachea, aortic arch, pulmonary arteries, pulmonary hila and lymph nodes

Mediastinal Anatomy

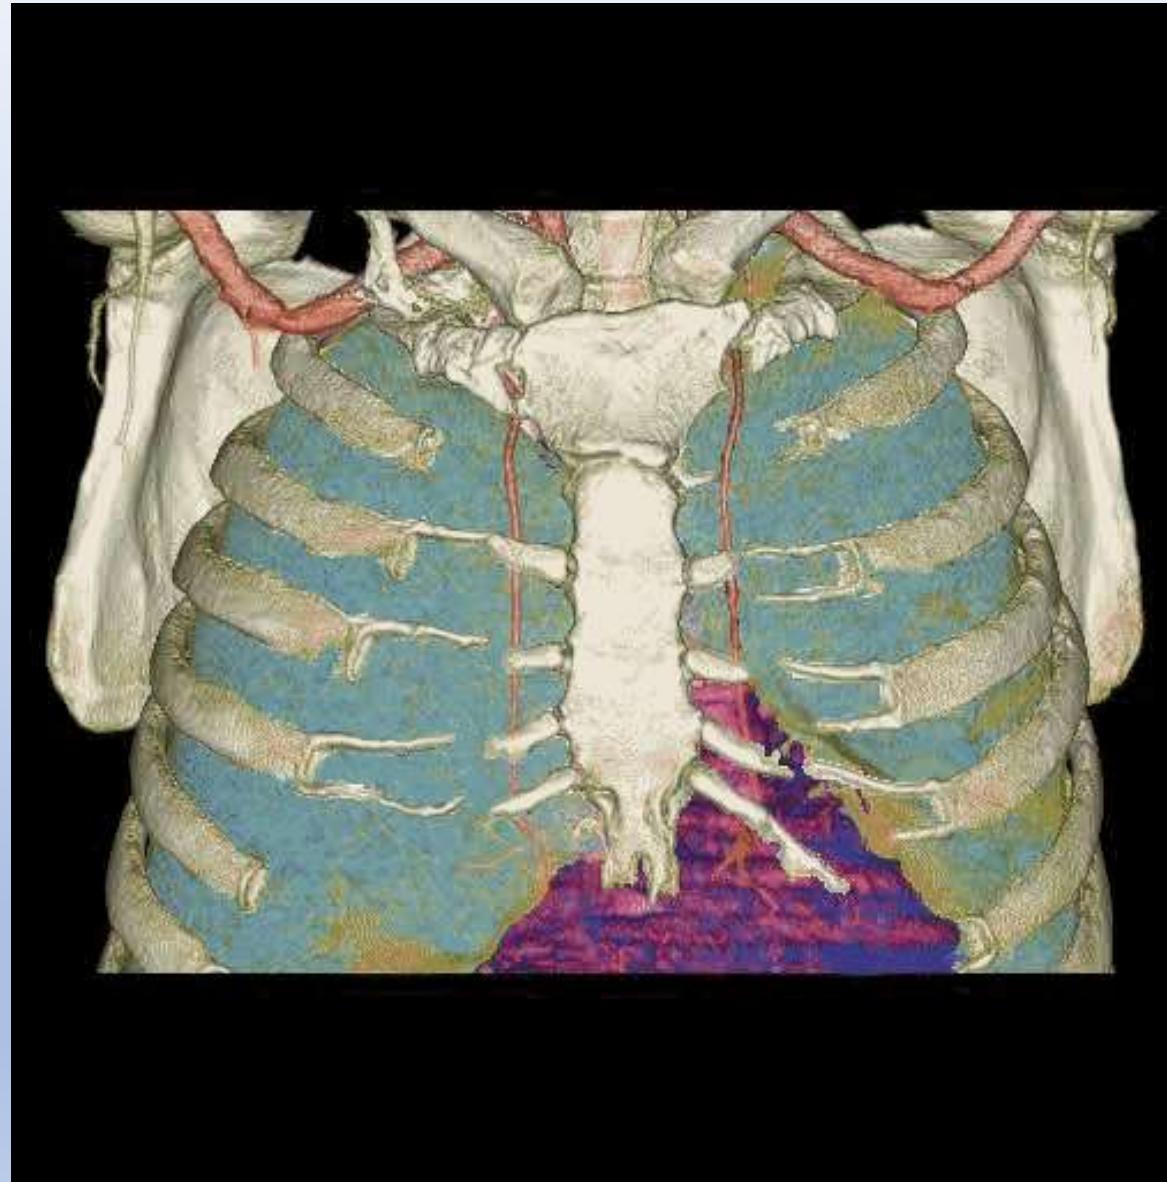

- **POSTERIOR**
- Bordered by posterior heart and trachea and vertebrae
- Contains esophagus, descending aorta, azygous and hemiazygous veins, paravertebral LN, sympathetic chain and thoracic duct

posterior

lateral

lateral

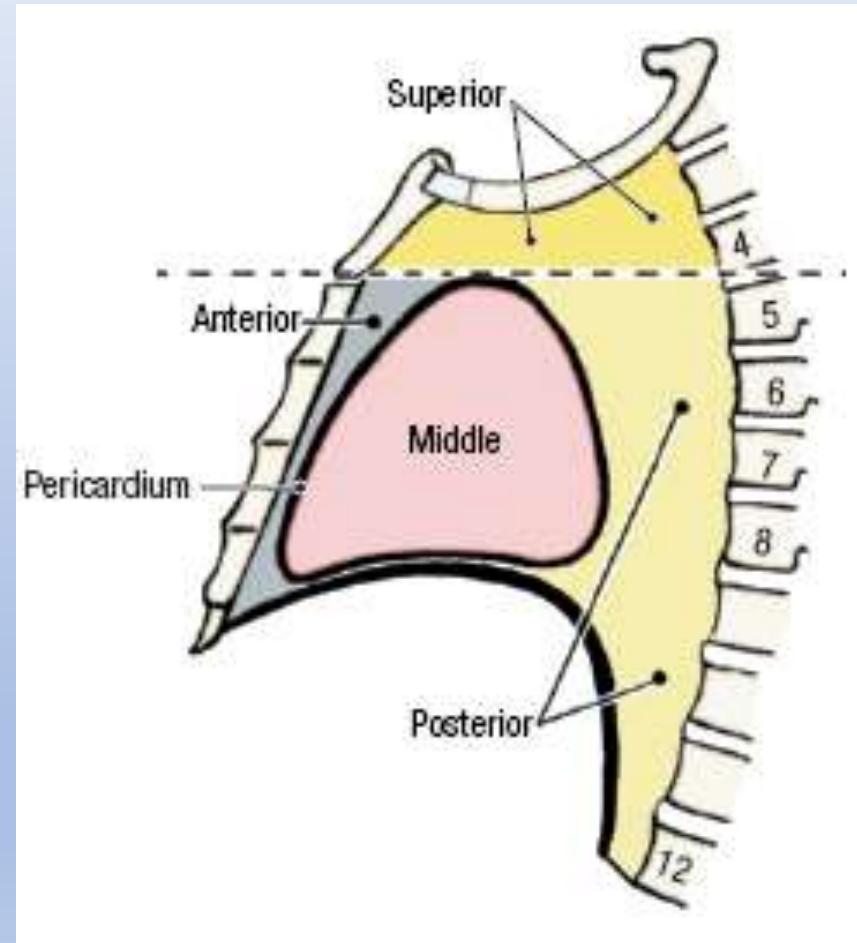

The region between the two pleural cavities is the mediastinum.

The boundaries of the mediastinum are:

- **Superior boundary** – superior thoracic aperture
- **Inferior boundary** – diaphragm
- **Anterior boundary** – sternum
- **Posterior boundary** – bodies of vertebrae T1 to T12
- **Lateral boundaries** – mediastinal parietal pleura (left and right)

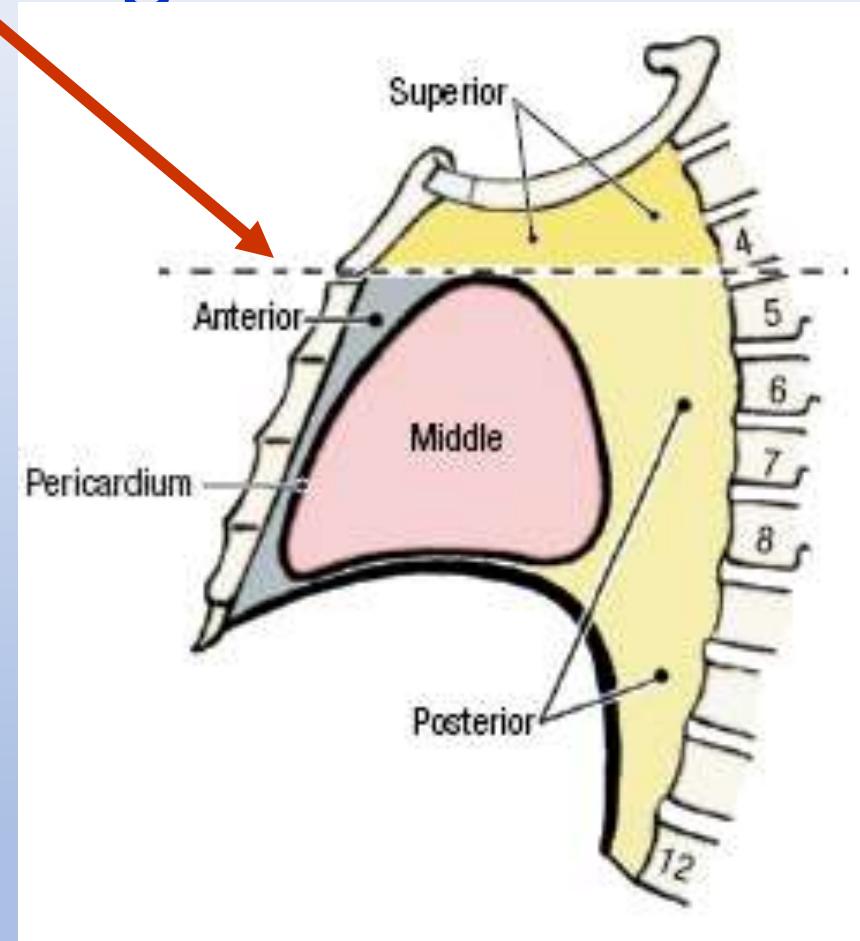

For descriptive purposes, the mediastinum is divided into four parts.

An imaginary horizontal plane at the level of the sternal angle (**plane of the sternal angle**) intersects the intervertebral disk between vertebrae T4 and T5. The plane of the sternal angle separates the **superior mediastinum (or supracardiac mediastinum)** from the **inferior mediastinum**. The pericardium divides the inferior mediastinum into three parts:

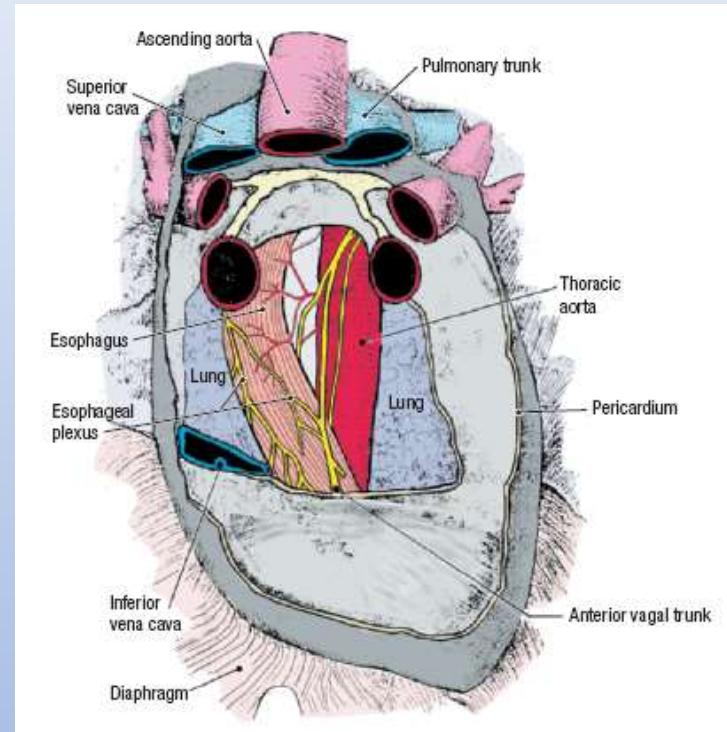

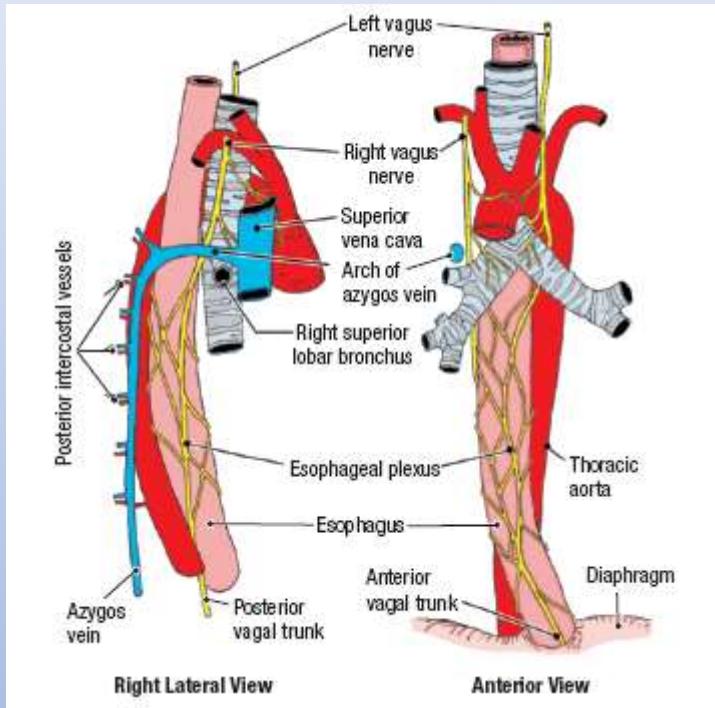

The plane of the sternal angle:

- marks the level of the
- superior border of the pericardium,
 - bifurcation of the trachea and the
 - beginning and ending of the arch of the aorta.

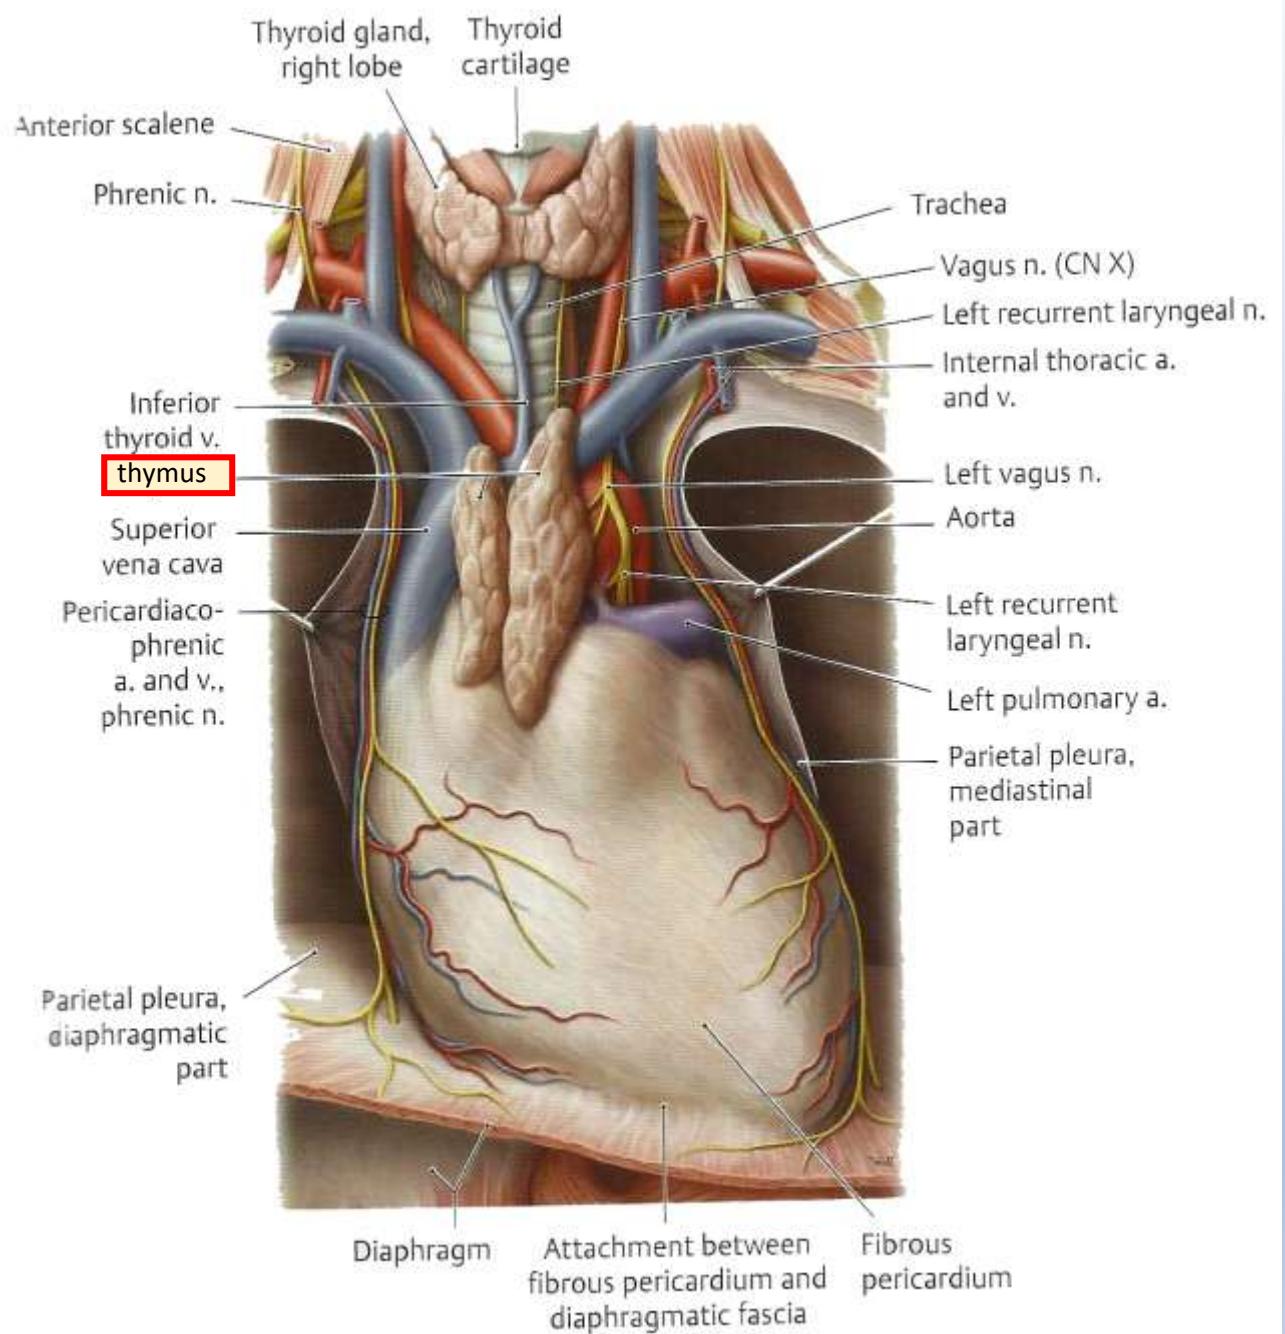

Level of the sternal angle

Some structures that course through the posterior mediastinum

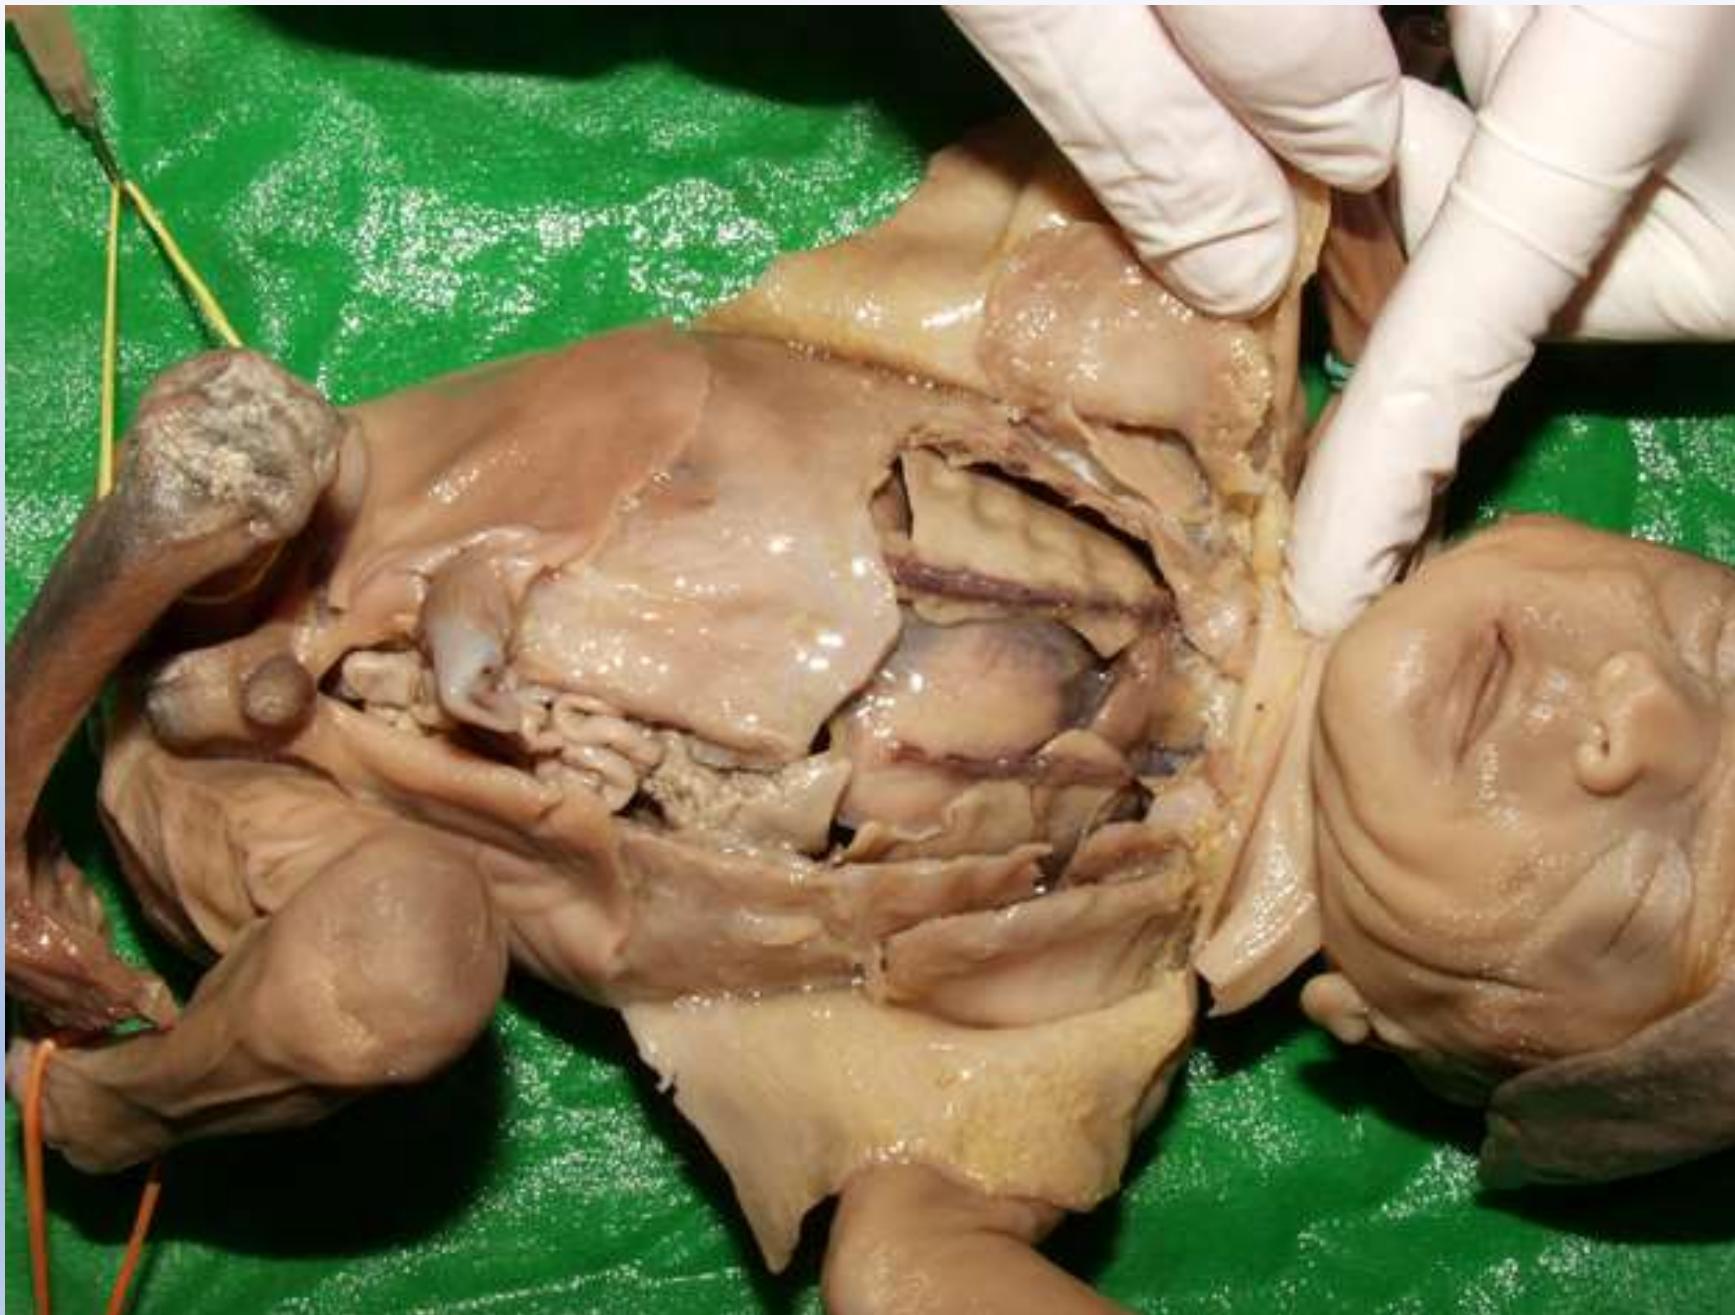

Esophagus, vagus nerve, phrenic nerve, thoracic duct pass through more than one mediastinal subdivision.

Superior mediastinum with the thymus

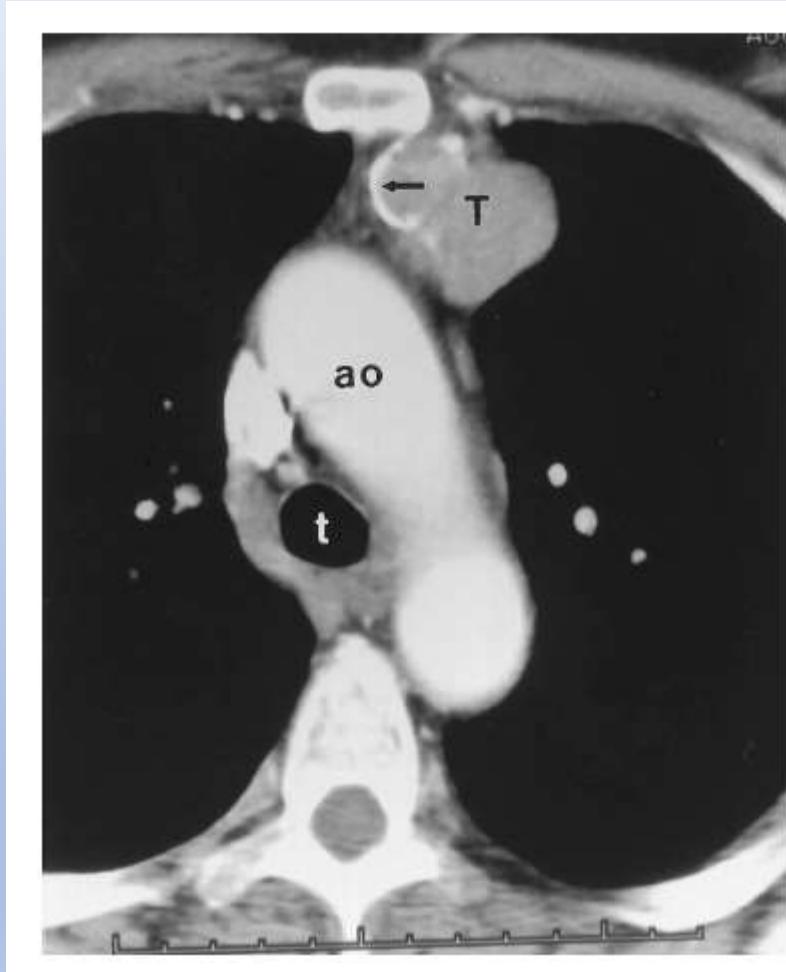

Thymus (med. supraccardiacum)

- Thymic trigone
- Caudally it reaches the pericardium;
- In most the cases it lies in front of the brachiocephalic v.;
- In adult: retrosternal corpus adiposum

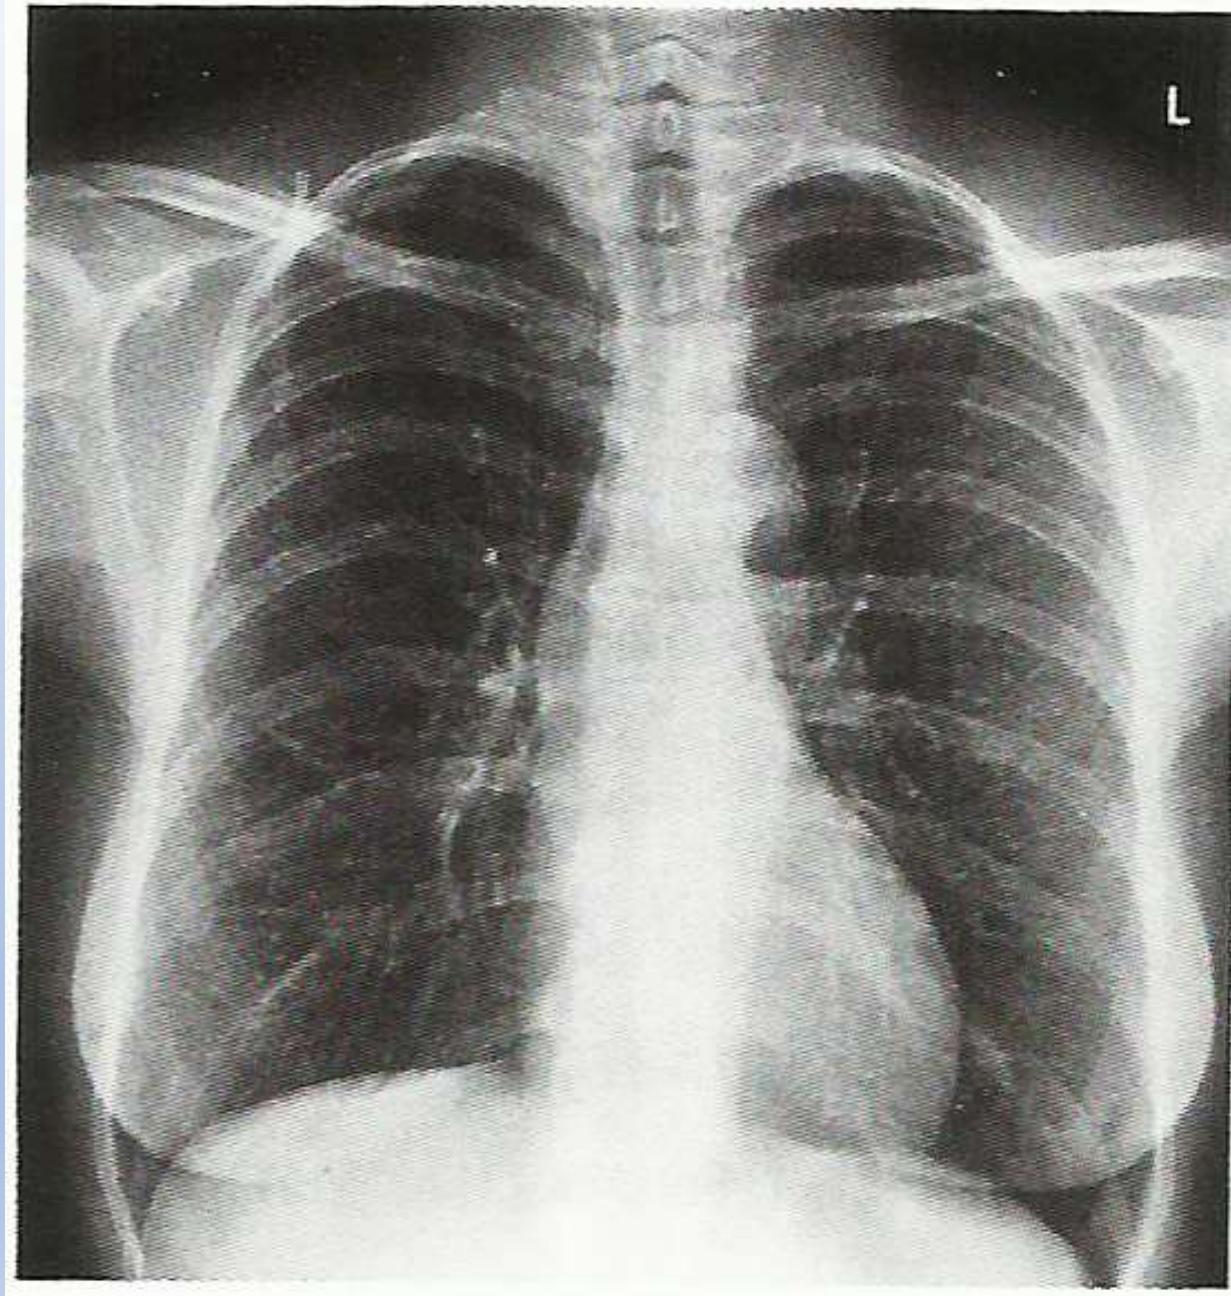

Dissected by Sandra Schmidt (exam dissection in 2008)

Thymoma

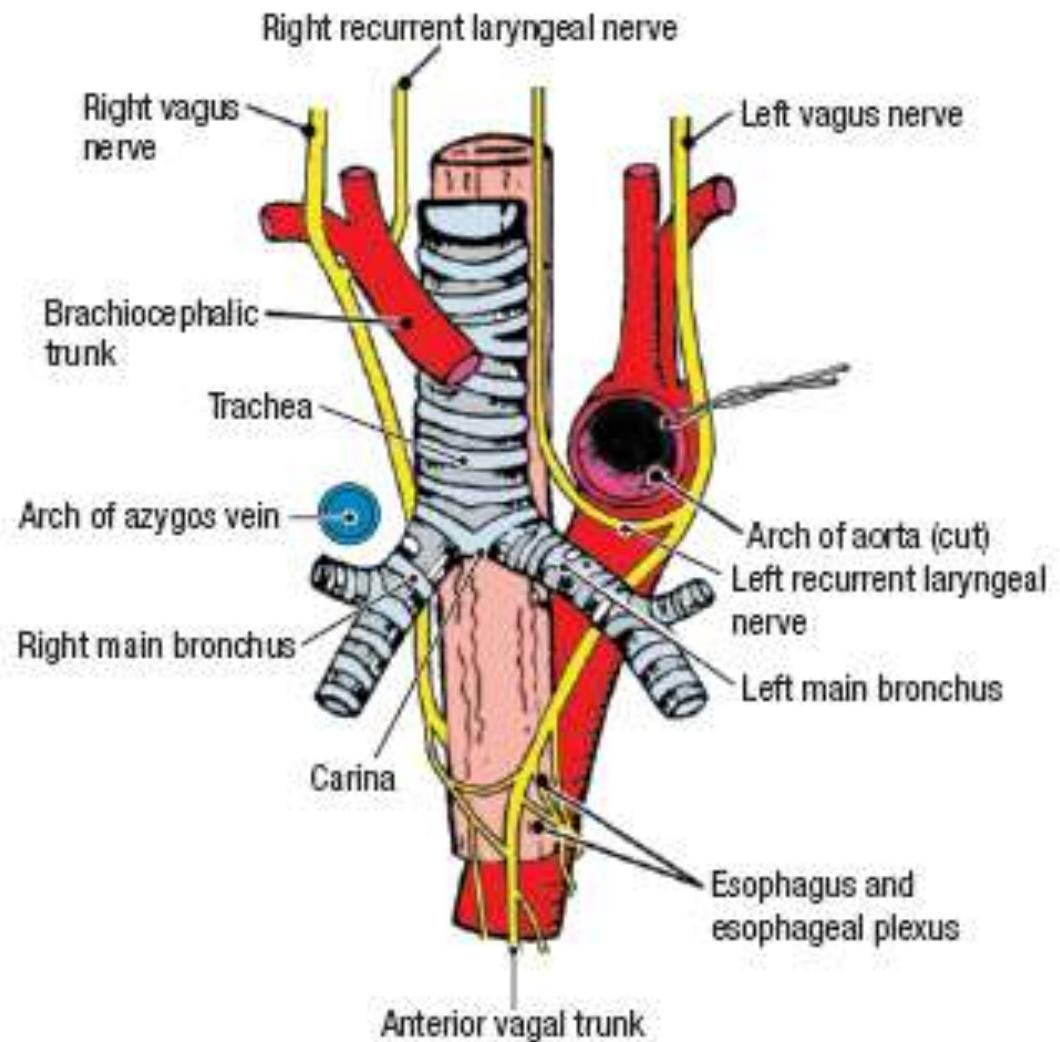

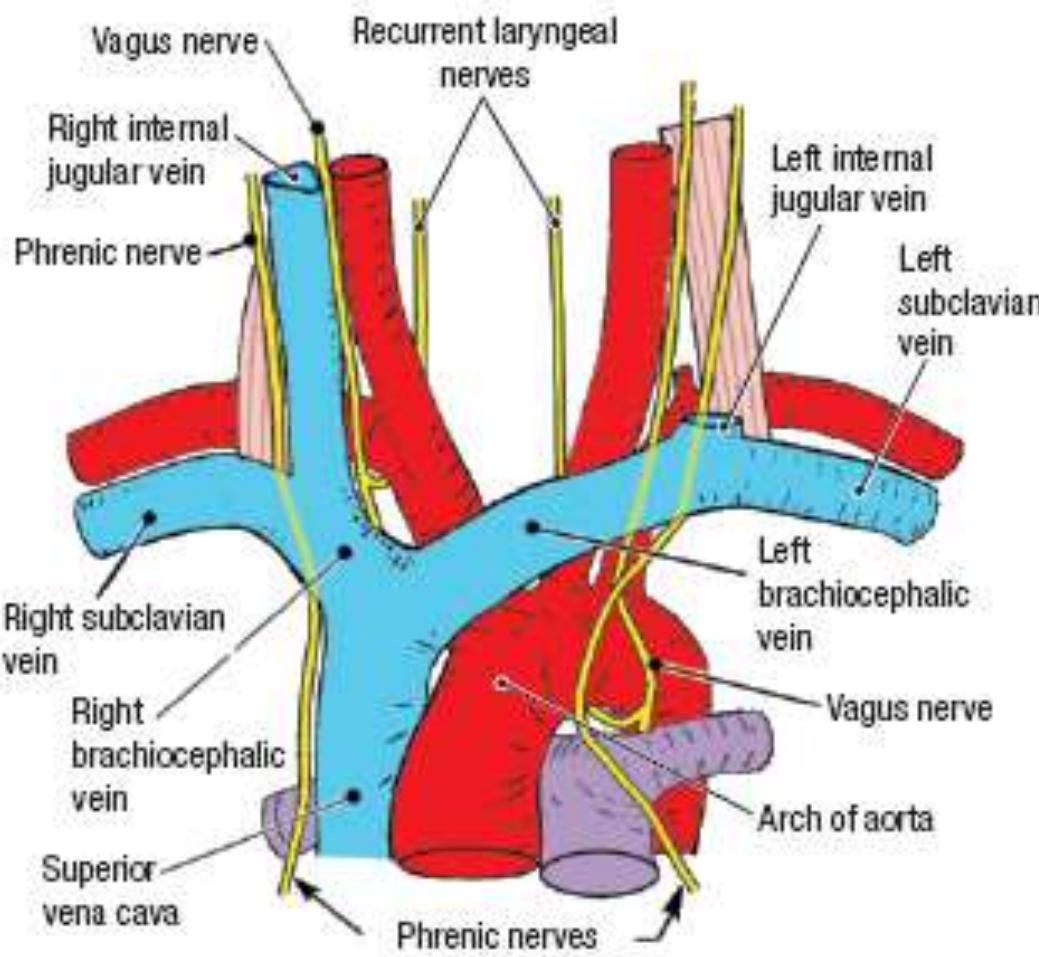

Strollo, Chest 1997; 112: 514

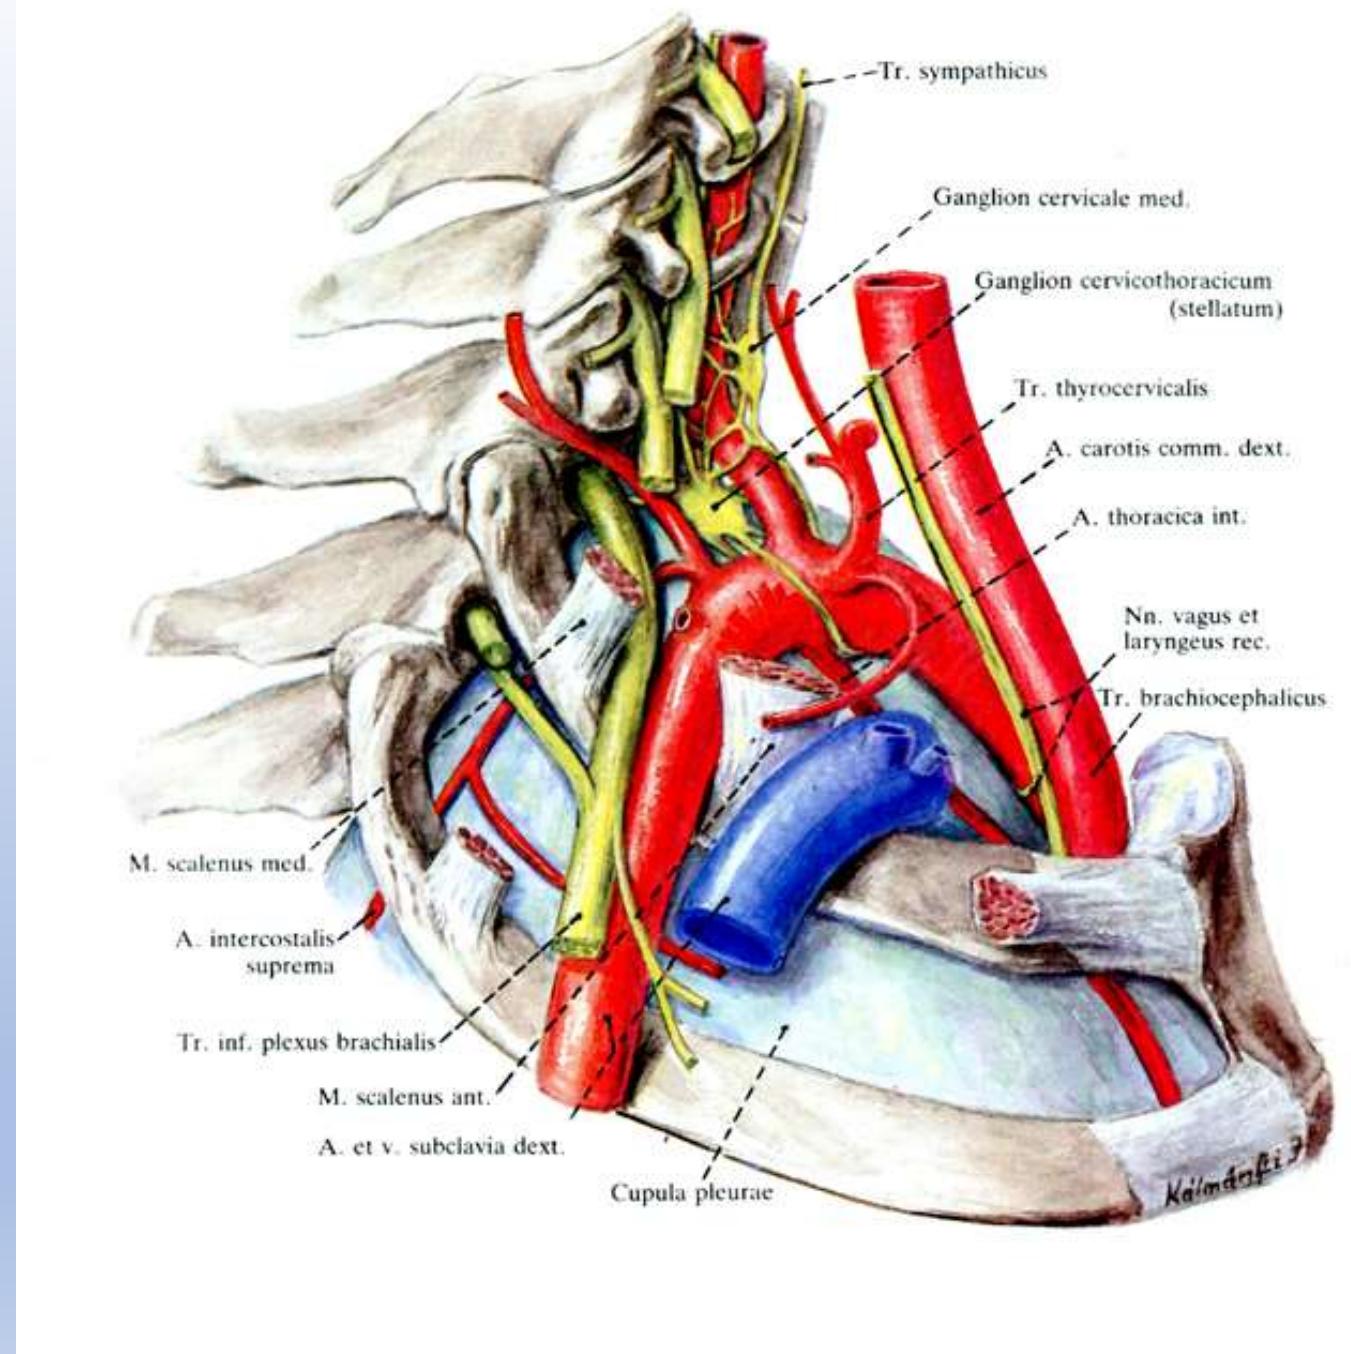

**X ray picture of
the hearth**

Main blood vessels and nerves of the superior mediastinum

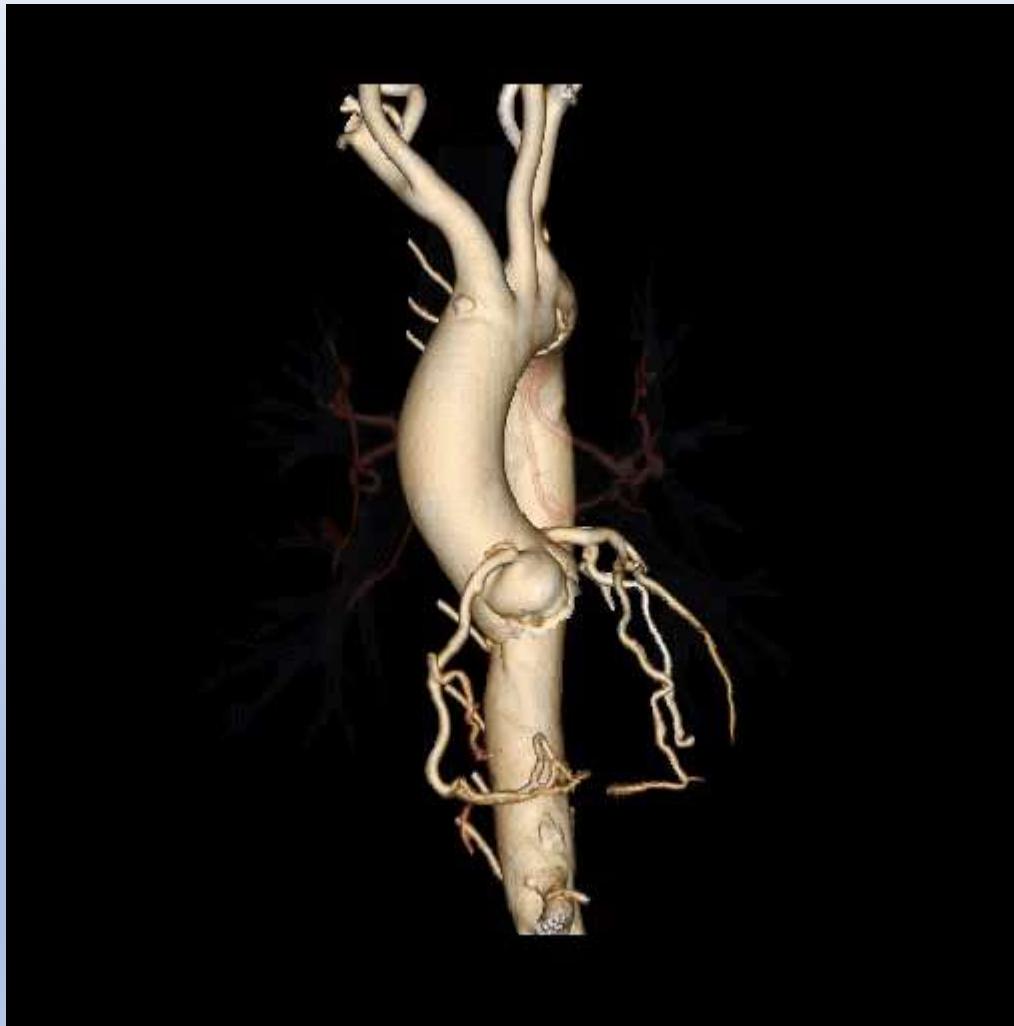

Cupula pleurae

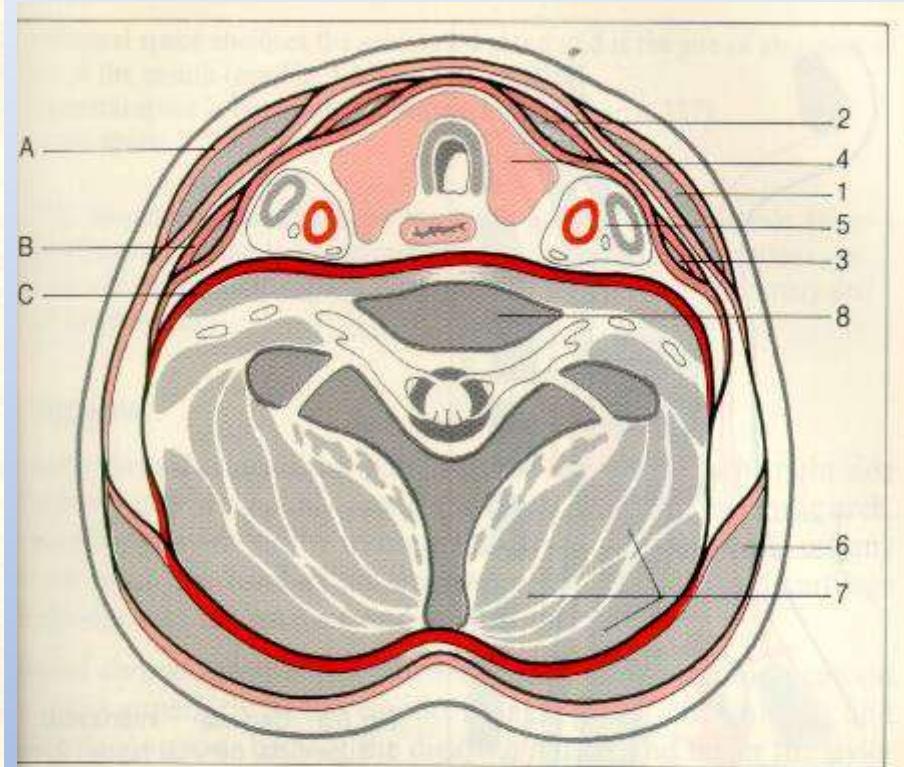

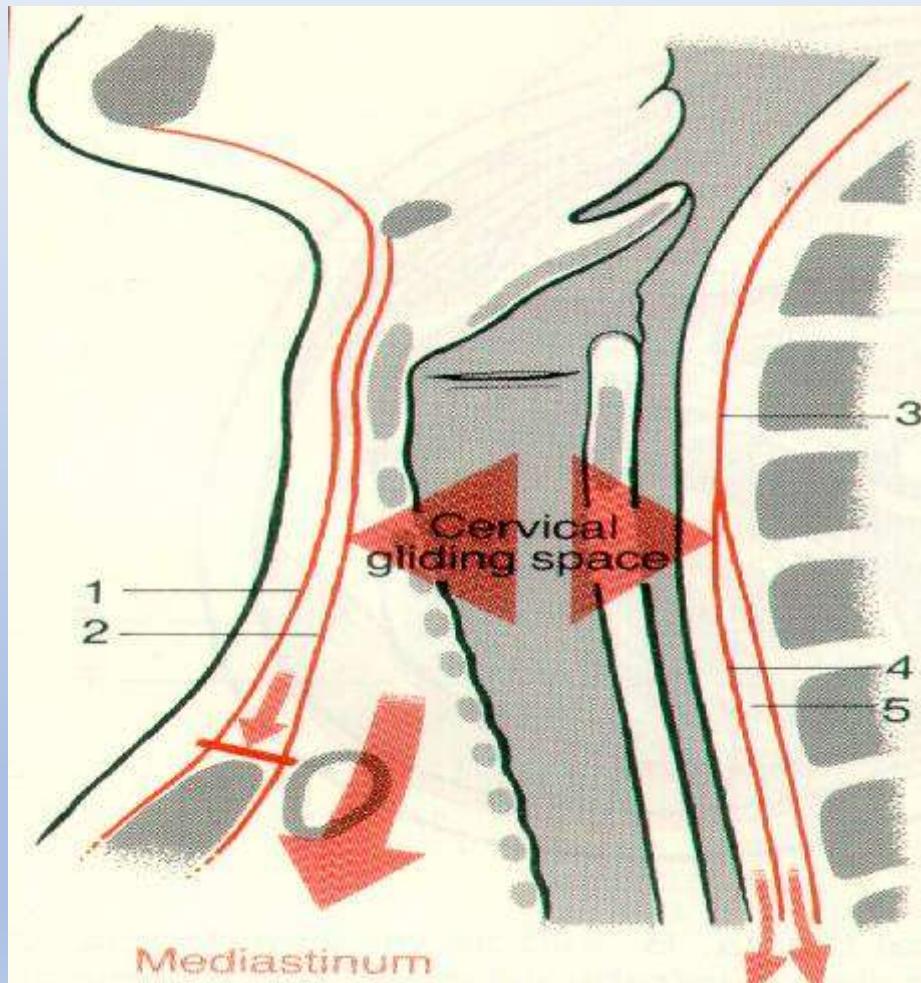

- Surrounded by mm. scaleni; m. long. colli)
- Right side: **ventral**: tr. brachioceph and subclavian a.; vagus n.; left side: left subcl. A.; in front: subclavian a. and internal thoracic a/v.; **medially**: phrenic n.; behind the subclavian a.: truncus inf. (brachial plexus); **posteriorl**: symp. trunc and stellate ganglion

CT angiography

The anatomic base of deep cervical soft tissue infections

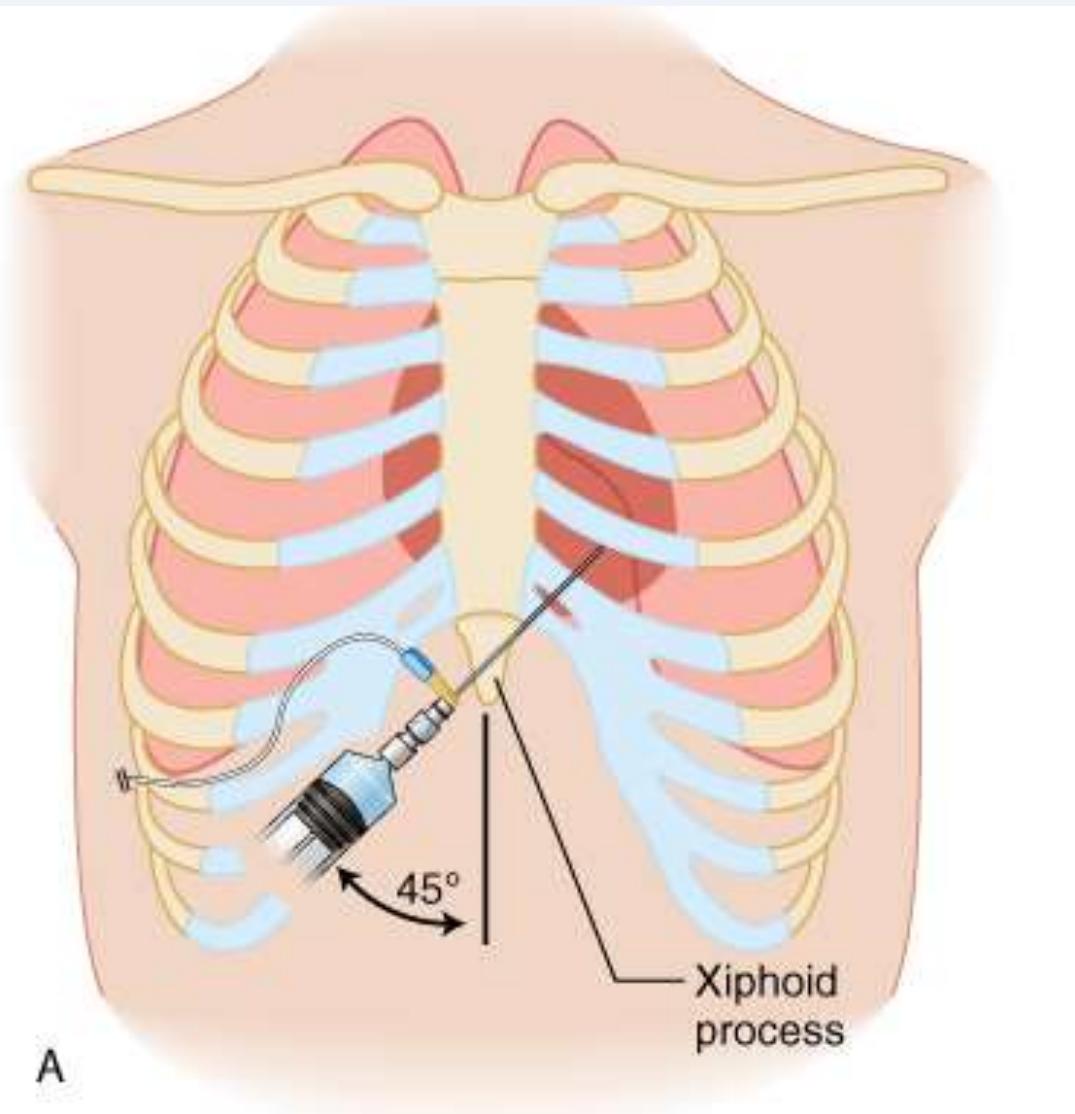

Fascial envelopes. A, superficial cervical fascia; B, middle cervical fascia; C, deep cervical fascia. 1, Sternocleidomastoid muscle; 2, infrahyoid muscles; 3, omohyoid; 4, thyroid gland; 5, carotid sheath with common carotid artery, internal jugular vein, vagus nerve, and cervical sympathetic trunk; 6, trapezius muscle; 7, deep cervical fascia; 8, cervical vertebral body.

Abscess of the neck- dental origin

Pericardiocentesis

A

To take off any fluid from the pericardiac cavity (content:10-20 ml; in pathological cases can be as much as 250 ml)

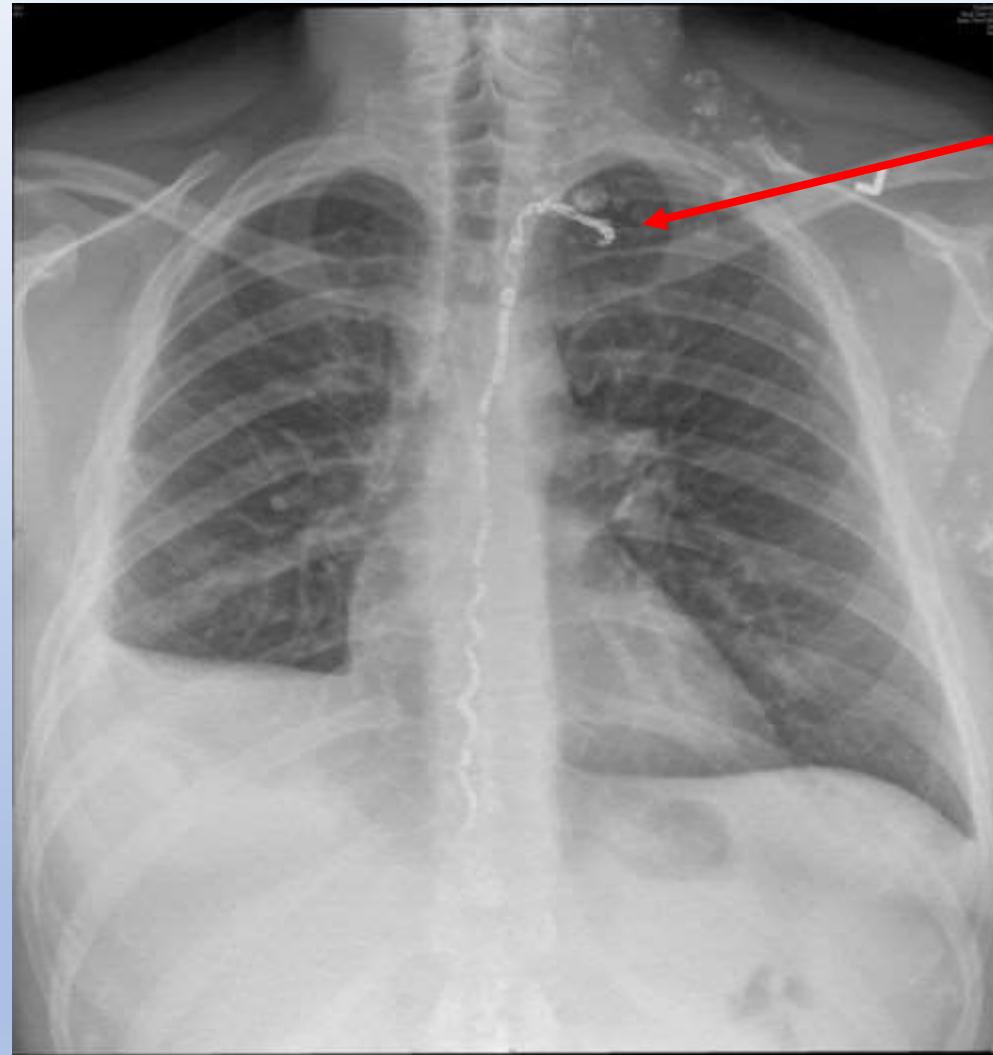

Place and position of the needle: between **xiphoidprocess and left costal arch**; it must be in an angle between 30-45° toward the middle part of left clavicle.

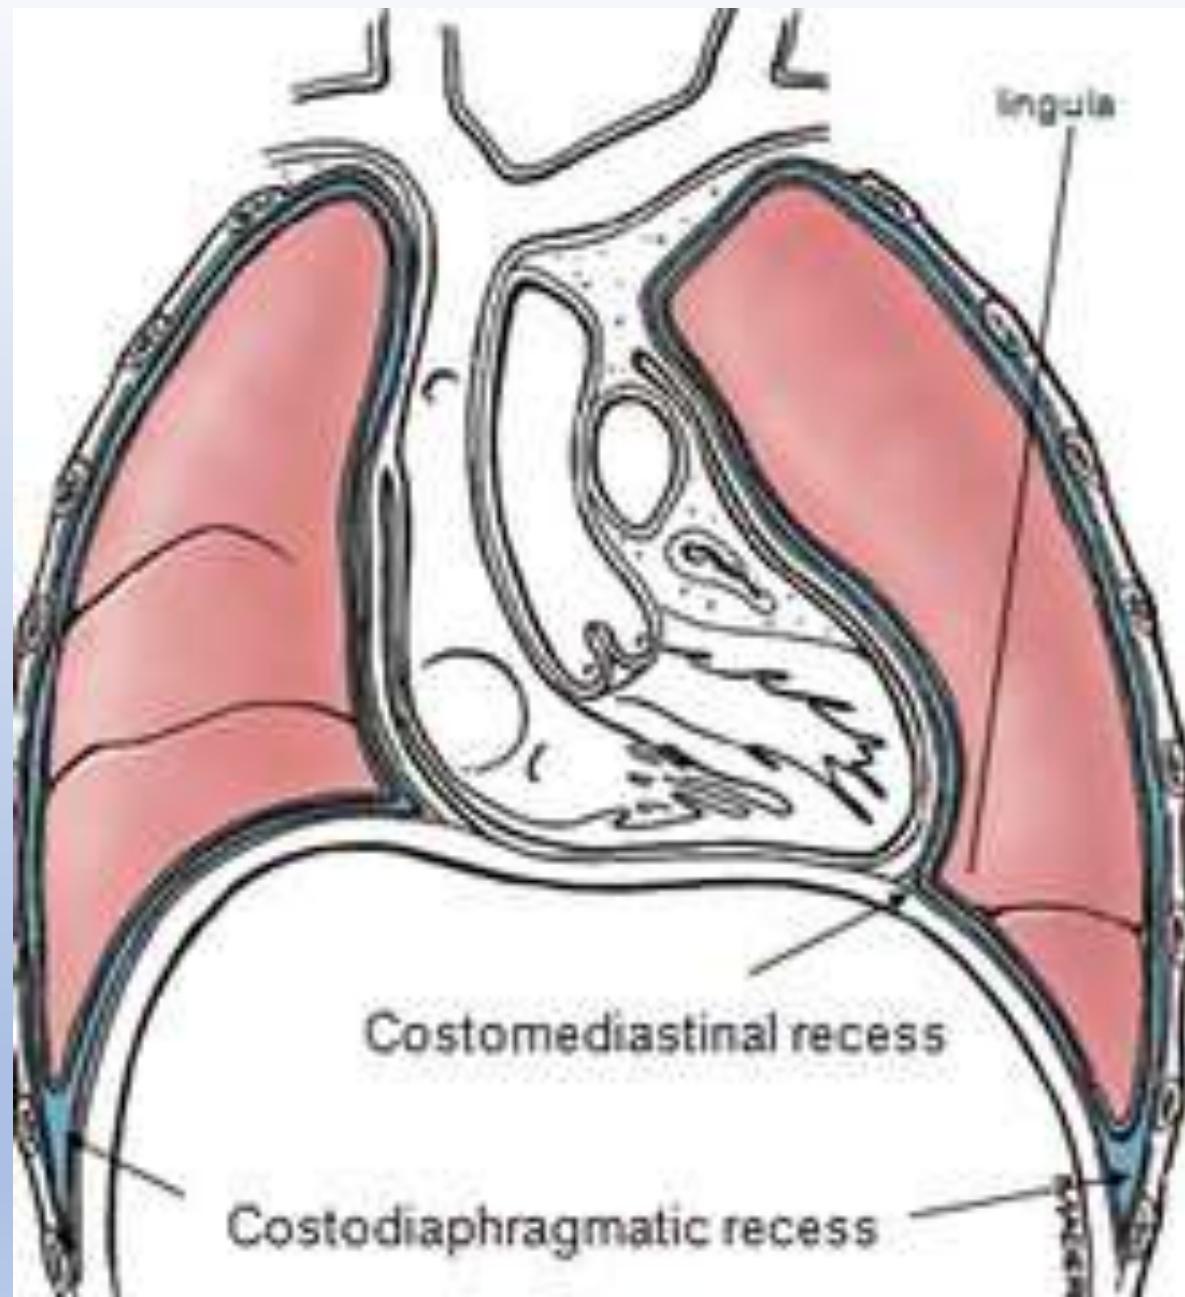

CLINICAL CORRELATION

Pericardium

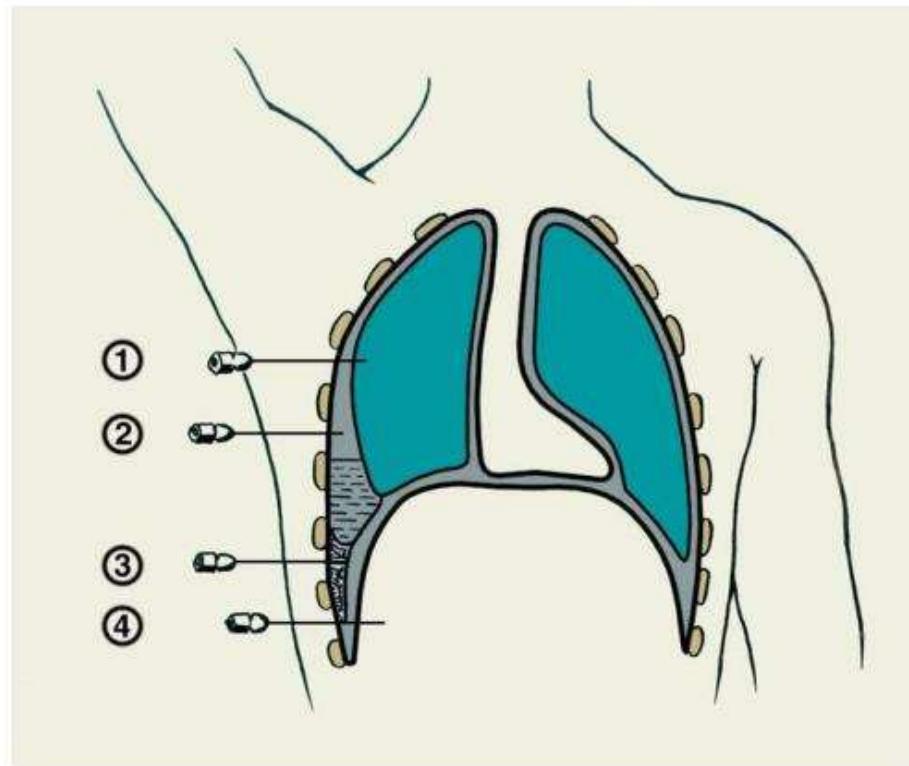

Inflammatory diseases can cause fluid to accumulate in the pericardial cavity (pericardial effusion). Bleeding into the pericardial cavity (hemopericardium) may result from penetrating heart wounds or perforation of a weakened heart muscle after myocardial infarction. Because the pericardium is composed of fibrous connective tissue, it cannot stretch, and fluids collected in the pericardial cavity compresses the heart (cardiac tamponade).

Thoracic duct

Places for pleural puncture

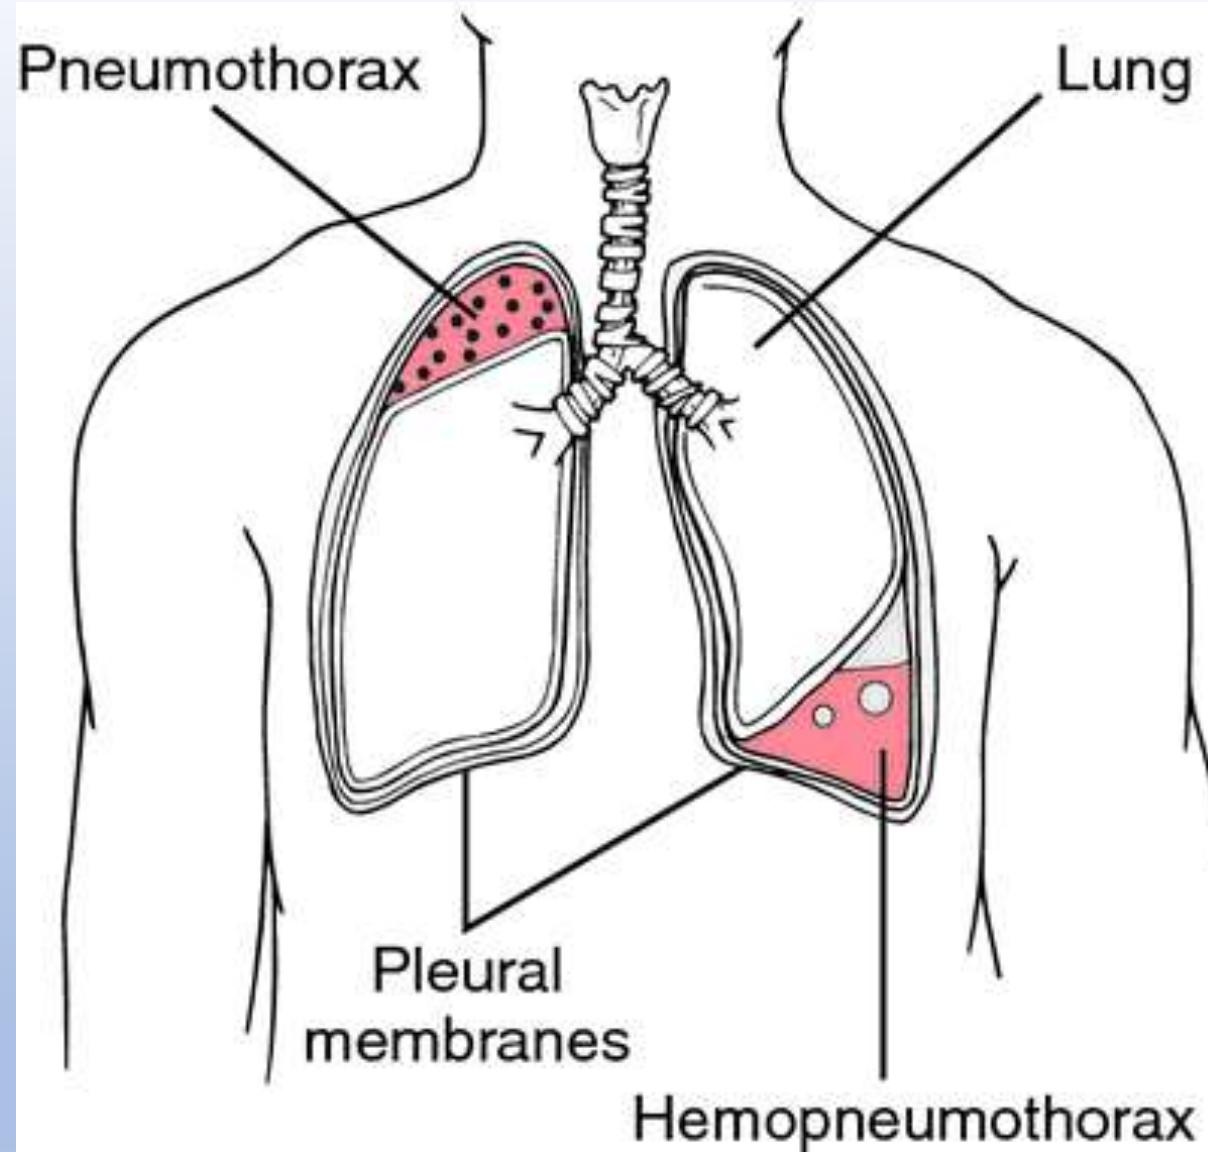

Thoracocentesis

- From Greek, thorax + centesis, puncture) also known as **pleural tap**,
- It is an invasive procedure to remove fluid or air from the pleural space for diagnostic or therapeutic purposes. A cannula, or hollow needle, is carefully introduced into the thorax, generally after administration of local anesthesia. The procedure was first described in 1852.
- The recommended location varies.
- midaxillary line, in the eighth, ninth, or tenth intercostal space.
- Whenever possible, the procedure should be performed under ultrasound guidance, which has shown to reduce complications.

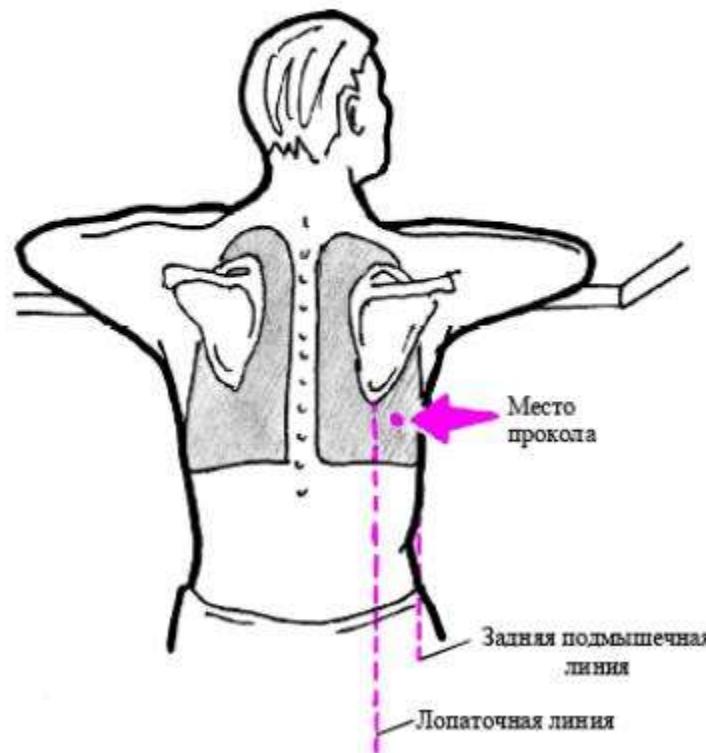

Some difficult medical condition requires urgent and adequate rapid response a surgeon, and resident too.

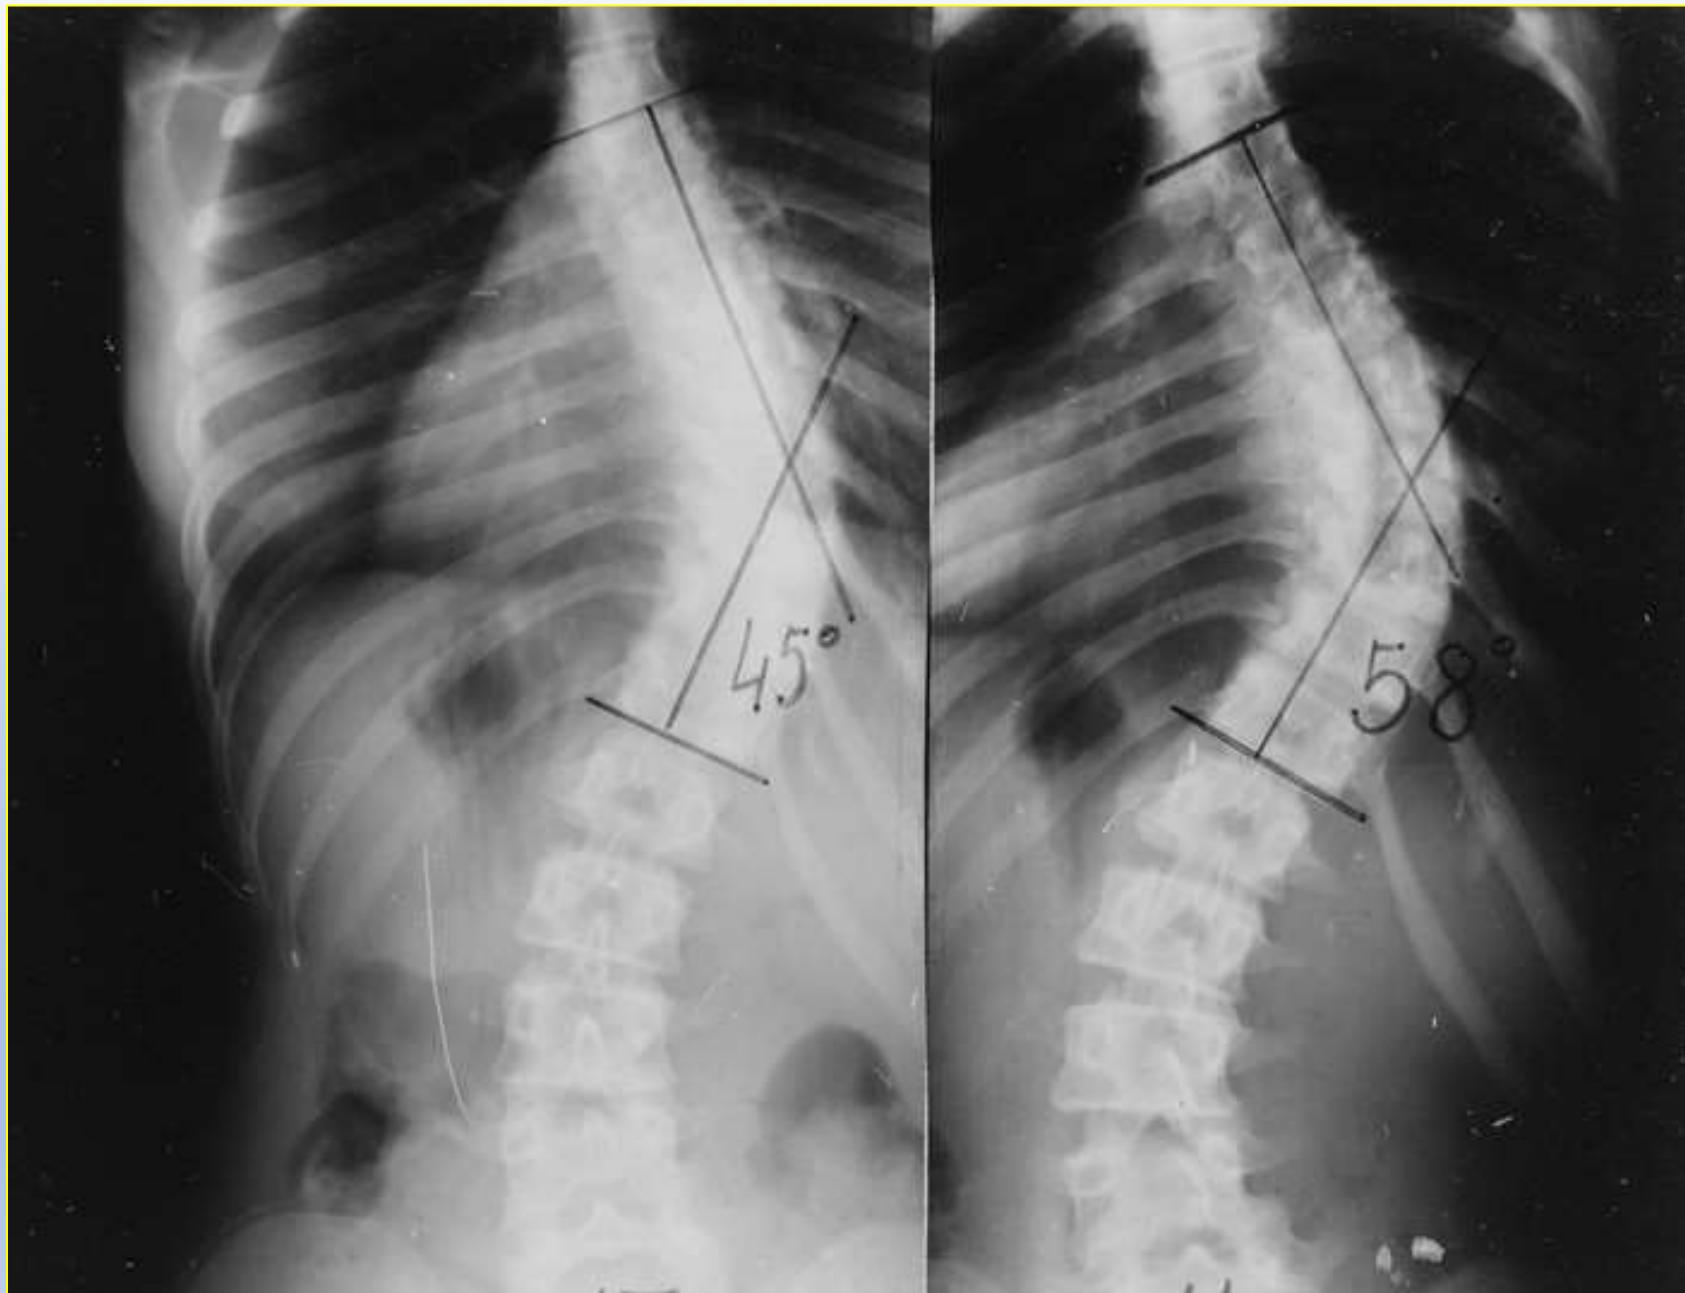

- Pleural puncture.
- Drainage of the pleural cavity (thoracentesis).
- Drainage of the mediastinum.
- Puncture and drainage of the cavity of tense cyst of a lung.
- Therapeutic bronchoscopy and temporary occlusion of the bronchus.
- Urgent radical surgery.

Anatomical landmarks for pleural puncture

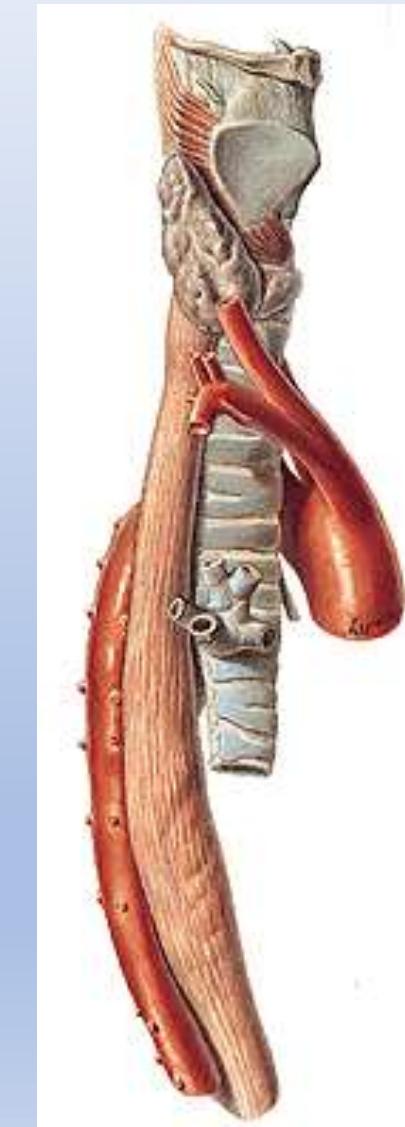

Oesophagus

- 1.) *Cervical part:* C 6. vertebral level,
lower border of cricoid cartilage
- 2.) *Thoracic part:* mediastinum post.
up to oesophageal hiatus of the diaphragm m.
(Th 10 vertebral level)
- 3.) *Abdominal part*

Relations of the oesophagus and trachea
