Data Validation Procedures for Volatile and Semi-Volatile Compounds

Appendix Y

Data Validation Procedures for Volatile Organic Compounds and Semi-Volatile Organic Compounds

I. Introduction

This standard operating procedure (SOP) describes the data validation procedures for a USEPA Region I Tiered review of the data for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) conducted by USEPA methods 8260B and 8270C, respectively. Data review procedures presented in this SOP are from the applicable quality control criteria specified in the following documents:

- *Region I Tiered Organic and Inorganic Data Validation Guidelines*, USEPA Region I, July 1, 1993.
- *Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses*, USEPA Region I, Draft, December 1996.
- *CLP Organics Data Review and Preliminary Review*, USEPA SOP HW-6, Revision 10, October 1995.
- *USEPA Contract Laboratory Program, Statement of Work for the Organics Analysis, Revision OLM0.1.9*, July 1993

II. Tier I Validation Procedures

Tier I validation of a data package consists of verifying that all raw data and forms are included and complete. All Form Is or laboratory equivalent (presented in Attachment Y-1) are copied and a data validation summary spreadsheet (presented in Attachment Y-2) is prepared to document the data review. The following steps are taken to complete a Tier I review:

Step 1 - The laboratory case narrative is reviewed. During review of the case narrative, if there are any deviations that warrant a more extensive validation procedure, a Tier II review would be initiated to evaluate potential data use limitations.

Step 2 - Compare the chain-of-custody and the sample traffic reports. If there are any inconsistencies or if they are incomplete, then contact laboratory for resolution.

Step 3 - Verify that all forms presented in Attachment Y-1 or laboratory equivalent forms are present and complete. If any of the forms are not in the data package contact the laboratory for a resubmission.

Note: If frequent or severe quality control deviations are present on the above-mentioned forms, this would warrant a more extensive validation procedure may be warranted. Based on the reviewer's judgement, Tier II or Tier III review may be warranted to fully evaluate the usability of the data.

Step 4 - Make a copy of the all sample data Form Is or laboratory equivalent for inclusion in the validation report.

Step 5 - Verify that the following raw data is provided for each sample and associated QA/QC samples in the data package. Contact the laboratory to obtain missing data:

- Case Narrative
- Chain-of-Custody Forms
- Traffic Reports
- QA Sample Summary Forms
- Instrument Calibration Summary Forms
- Instrument Run Logs
- Sample Preparation Logs
- Instrument/Method Detection Limits
- Standards Preparation Logs
- Supporting (raw) Data

Step 6 - With a blue ink pen record on the first page of the data package: the validation level, date, and reviewer's initials.

III. Tier II Validation Procedures

Tier II validation of a data package consists of the steps mentioned above for a Tier I review plus review of the data package for identification of QA/QC deviations. Tier II validation does not include review of the "raw data" or recalculation of sample results. Sample qualification is performed (if required) following USEPA Region I Guidelines.

A. Data Qualifiers

All data qualified due to QA/QC deviations will be clearly recorded on a copy of the Form Is or laboratory equivalent with a blue ink pen. The laboratory qualification is lined out and the reviewer's qualification placed next to it. The date and the initials of the reviewer will also be placed on the Form I. Below is a list of qualifiers to be used.

U The compound or analyte was analyzed for, but was not detected. The sample quantitation limit is presented and adjusted for dilution and (for solid samples only) percent moisture. For consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) as presented in Attachment Y-2.

J The compound or analyte was positively identified, but the associated numerical value is an estimated concentration. This qualifier is used when the data evaluation procedure identifies a deficiency in the data generation process. This qualifier is also used when a compound or analyte is detected at estimated concentrations less than the contract-required detection limit (CRDL) for inorganic analyses or the contract-required quantitation limit (CRQL) for organic analyses.

UJ The compound or analyte was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual level of quantitation. For consistency

with the database and summary tables prepared from the data, Non-detected sample results are displayed as ND(CRQL) J as presented in Attachment Y-2.

R Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data should not be used for any qualitative or quantitative purposes.

B. Holding Times

Criteria

1.0 Purgeables: Water samples are preserved to pH of less than two with HCl, H_2SO_4, or solid $NaHSO_4$ and stored at 4 degrees centigrade. Samples must be analyzed within 14 days. Soil are preserved per SW-846 method 5035 and must be analyzed within 14 days.

1.1 Extractables: (Includes Base/Neutrals and Acids): Samples (waters or soils) and extracts must be preserved at 4 degrees centigrade. Soil and water samples must be extracted within seven days and the extract must be analyzed within 40 days.

Action

Specific holding times for each analysis and sample type are presented in Table 1 of the SAP/DCAQAP. The following steps are performed for the validation of data due to holding times:

Step 1 - Establish the holding time by comparing the sampling date on the chain-of-custody with the dates of analysis and/or extraction on the Form Is or laboratory equivalent. The chain-of-custody is also reviewed to determine if the samples were properly preserved.

Step 2 - If the holding times are exceeded by less than 24 hours, then no qualification of data is needed.

Step 3 - If the holding times are exceeded by more than 24 hours, but less than 14 days then, all the positive results are qualified as estimated (J) and the non-detected compounds are qualified as estimated (UJ).

Step 4 - If the holding times are exceeded by more than twice the specified holding time, then all the results are qualified as unusable (R).

C. GC/MS Tuning

Criteria The following criteria must be met at all times:

1.0 Decafluorotriphenylphosphine (DFTPP)

m/z	Ion Abundance Criteria
51	30.0 - 60.0% of m/z 198
68	less than 2.0% of m/z 69
70	less than 2.0% of m/z 69
127	40.0 - 60.0% of m/z 198
197	less than 1.0% of m/z 198
198	base peak, 100% relative abundance
199	5.0 - 9.0% of m/z 198
275	10.0 - 30.0% of m/z 198
365	greater than 1.00% of m/z 198
441	present, but not less than m/z 443
442	greater than 40.0% of m/z 198
443	17.0 - 23.0% of m/Z 442

1.1 Bromofluorobenzene (BFB)

m/z	Ion Abundance Criteria
50	15.0 - 40.0% of the base peak
75	30.0 - 60.0% of the base peak
95	base peak, 100% relative abundance
96	5.0 - 9.0% of the base peak
173	less than 2.0% of m/z 174
174	greater than 50.0% of the base peak
175	5.0 - 9.0% of m/z 174
176	greater than 95.0%, but <101.0% of m/z 174
177	5.0 - 9.0% of m/z 176

Action

Review Form V or laboratory equivalent to determine if a mass calibration is in error. If an error is identified, then all data associated with the evaluated spectra are qualified as unusable (R).

D. Calibration

Criteria

1.0 Initial Calibration Volatile and Semi-Volatile

1.0.1 All average Relative Response Factors (RRFs) for TCL compounds must be greater than or equal to 0.05.

1.0.2 All Percent Relative Standard Deviation (%RSD) values must be less than or equal to 30 percent.

1.1 Continuing Calibration Volatile and Semi-Volatile

1.1.1 All daily RRFs for TCL compounds must be greater than or equal to 0.05.

1.1.2 All Percent Difference (%D) values must be less than or equal to 25 percent.

Action

The following steps are performed by reviewing Form VI and Form VII or laboratory equivalents during the validation of calibration data:

Step 1 - Verify that all the average RRFs for the TCL compounds in the initial calibration are greater than 0.05. If any average RRF is not in control then:

A. All positive sample results for that compound related to the initial and succeeding continuing calibrations are qualified as estimated (J).

B. All non-detected sample results for that compound related to the initial and succeeding continuing calibrations are qualified as unusable (R).

Step 2 - Verify that all the %RSD values for the TCL compounds in the initial calibration are greater than 30 percent. If any %RSD is not in control then:

A. All positive sample results for that compound related to the initial and succeeding continuing calibrations are qualified as estimated (J).

B. All non-detected sample results for that compound that have a %RSD value greater than 50 percent related to the initial and succeeding continuing calibrations are qualified as estimated (UJ).

Step 3 - Verify that all the RRF values for the TCL compounds in the continuing calibration are greater than 0.05. If any average RRF is not in control then:

A. All positive sample results for that compound related to that continuing calibrations are qualified as estimated (J).

B. All non-detected sample results for that compound related to that continuing calibrations are qualified as unusable (R).

Step 4 - Verify that all the %D values for the TCL compounds in the continuing calibration are greater than 25 percent. If any %D is not in control then:

A. All positive sample results for that compound related to that continuing calibrations are qualified as estimated (J).

B. All non-detected sample results for that compound that have a %D greater than 50 percent related to continuing calibrations are qualified as estimated (UJ).

E. Blanks

Criteria

1.0 No contaminants should be present in the blank(s).

1.1 For each matrix and for each twelve hour window a method blank must be analyzed for volatile analysis.

1.2 For each matrix and each extracted batch, a method blank must be analyzed for semi-volatile analysis.

Action

Qualification of sample results due to blank contamination is dependent on the conditions and the origin of the blank. No sample results are reported unless the concentration of the compound in the sample exceeds ten times the amount in the blank for the compounds listed below, or five times the blank amount for all other compounds. No sample results are corrected by subtracting blank values. Specific qualifications of sample data is as follows:

Step 1 - Review the Form IV or laboratory equivalent within the data package to ensure that criteria III.E.1.1 and III.E.1.2 are in compliance. If they are not, the laboratory will be contacted by the reviewer for a written explanation.

Step 2 - Review the Form I or laboratory equivalent of all the blanks within the data package.

Step 3 - If a compound is found in the blank but not in the sample then the data are not qualified.

Step 4 - When any compound (other than the five listed below) is detected in the sample and the sample concentration is less than five times the concentration detected in the associated blank, the data are qualified. For the following five compounds, the sample results are qualified if the sample concentration is less than ten times the concentration detected in the blank.

Common laboratory contaminants:

a. Methylene chloride
b. Acetone
c. Toluene
d. 2-Butanone
e. Common phthalate esters

Note: Any difference between the sample analyses and the related blank analyses which involve weights, volumes, or dilution factors are taken into account when the 5-times or 10-times criteria are used.

The following are examples of how qualifications apply to blank data:

A: When the sample result is greater than the Contract Required Quantitation Limit (CRQL), but less than the action level (5-times or 10-times) from the blank, the sample results are qualified as non-detects. As in the example below, the sample result for the 10-times rule is less than 70 (or 10 x 7) and for the 5-times rule the result is less than 35 (or 5 x 7), therefore they are qualified as described.

Factor	10-times	5-times
Blank Result	7	7
CRQL	5	5
Action Level	70	35
Sample Result	60	30
Qualified Sample Result	60 U	30 U

B: When the sample result is less than the CRQL and is also less than the action level (5-times or 10-times) from the blank result, the sample results are qualified as non-detected by using the CRQL as the detection limit. As in the example below, the sample result is less than the CRQL in both instances and the sample results are qualified as described.

Factor	10-times	5-times
Blank Result	6	6
CRQL	5	5
Action Level	60	25
Sample Result	4 J	4 J
Qualified Sample Result	5 U	5 U

C: When the sample result is greater than the blank action level (5-times or 10-times), the sample results are not qualified. As in the example below, the sample results are greater than the blank action level and the sample results are not qualified.

Factor	10-times	5-times
Blank Result	10	10
CRQL	5	5
Action Level	50	50
Sample Result	120	60
Qualified Sample Result	120	60

Step 5 - When excessive amounts of contamination exists (i.e., saturated peaks by GC/MS), all compounds affected are qualified as unusable (R).

Note: As mentioned above, similar consideration is given to Tentatively Identified Compounds (TIC) which are found in both the sample and the associated blank(s).

F. Surrogate Recovery

Criteria

Sample and blank surrogates recoveries for volatile and semi-volatile must be within control limits listed in Table 5 of the SAP/DCAQAP.

Action

Qualification of the data due to surrogate recoveries being out of control is based on the evaluation of all data provided in the data package, especially considering the complexity of the effect of sample matrices. These qualifications are completed in the following steps:

Step 1 - Surrogate recoveries tabulated on Form II or laboratory equivalent for each fraction are evaluated against the control limits provided in Table 5.

Step 2 - No qualification of the data is needed if less than two surrogates are out of control for the base/neutral or acid fraction, or one in the volatile fraction, or unless any surrogate has a recovery less than 10 percent.

Step 3 - If at least two surrogates in a base/neutral or acid fraction or one surrogate in the volatile fraction are out of control, but the surrogate recoveries are greater than 10 percent then:

A. All positive results for that fraction are qualified as estimated (J).

B. All non-detected results are qualified as estimated (UJ).

Step 4 - If any surrogate recoveries in a fraction are less than 10 percent then:

A. All positive results for that fraction are qualified as estimated (J).

B. All non-detected results for that fraction are qualified as unusable (R).

Step 5 - When the blank analysis involves surrogate recoveries out of control, the related sample data are reviewed and qualified in the following manner:

A. If the sample data does not contain any surrogate out of control, then the data are not qualified.

B. If the sample data does contain any surrogate out of control then the sample data are qualified as mentioned above in steps two through four.

Note: In this special circumstance the problem is considered to be within the laboratory control and is so noted in the validation report.

G. Matrix Spike/Matrix Spike Duplicate

Criteria

1.0 Spike recoveries must be within the control limits in Table 5 of the SAP/DCAQAP.

1.1 Relative Percent Difference (RPD) values between matrix spike and matrix spike duplicate recoveries must be within the control limits in Table 5.

Action

If recovery results are not within the control limits, the following steps are taken to qualify the data:

Step 1 - If the recovery results are not within the control limits presented in Table 5, the positive results for this compound in the unspiked sample are qualified as estimated (J).

Step 2 - If the recovery result is less than 10 percent, the non-detects for that compound in the unspiked sample are qualified as rejected (R). This is the only instance that a non-detect is qualified due to recovery result being out of control.

Step 3 - If any of the RPD values are greater than the limits presented in Table 5, then positive results for that compound are qualified as estimated (J) in the unspiked sample.

H. Field Duplicates

Criteria

1.0 For water matrices, each compound with a detectable concentration must have a RPD value that is less than 30 percent.

1.1 For soil matrices, each compound with a detectable concentration must have a RPD value that is less than 50 percent.

Action

Step 1 - Calculate all the RPD values for positive results between the sample and the field duplicate.

$$\text{Calculation: } RPD = \frac{\text{Sample Result - Field Duplicate}}{(\text{Sample Result + Field Duplicate})/2} \times 100$$

Step 2 - If the RPD value is greater than 30 percent in water matrix, the result for that compound in both samples are qualified as estimated (J).

Step 3 - If the RPD value is greater than 50 percent in soil matrix, the result for that compound in both samples are qualified as estimated (J).

I. Internal Standards Performance

Criteria

1.0 Internal standard area counts must not vary by more than a factor of two (-50 to 100 percent) from the associated continuing calibration standard.

1.1 The retention time of the internal standard must not vary by more than +/- 30 seconds from the associated continuing calibration standard.

Action

Step 1 - Review the tabulated results for the comparison of the internal standard (IS) areas of the samples and the related continuing calibration standard on Form VIII or laboratory equivalent. If an IS area is outside of the -50 to +100 percent criteria, the data are qualified in the following manner:

A. Positive sample results quantitated using that IS are qualified as estimated (J) for that sample fraction.

B. Non-detected samples results quantitated using that IS are qualified with the sample quantitation limit classified as estimated (UJ) for that sample fraction.

Step 2 - If there is a severe loss in sensitivity causing the IS area counts to be extremely low or if there is an immediate drop off in area counts, then non-detected sample results are qualified as unusable (R).

Step 3 - Review the tabulated results for comparison of the IS retention time (RT) of the samples and the related continuing calibration standard on Form VIII or laboratory equivalent. If an IS retention time varies by more than 30 seconds, the data are qualified as unusable (R).

IV. Tier III Validation Procedures

Tier III validation of a data package consists of the steps mentioned above for a Tier I and Tier II validation plus review of the "raw data" and recalculation of approximately ten percent of the sample results. The confirmation of TCL compounds and tentatively identified compounds is also reviewed.

A. Compound Quantitation and Reported Detection Limits

Criteria

1.0 The quantitation of the compounds and the adjustment of the CRDL, must be recalculated for 10 percent of the data.

1.2 The compound's RRF and sample result quantitation must be calculated based on the IS specified in Tables Y-1 and Y-2.

Action

If the criteria above has not been followed, then the laboratory will be contacted by the reviewer and the laboratory will be responsible for a correction of the quantitation and resubmission of the reported data.

B. TCL Compounds Identification

Criteria

1.0 Compounds must be within + or - 0.06 Relative Retention Time (RRT) units of the continuing calibration standard RRT.

1.1 Mass spectra of the sample compound and of the current reference spectra must match the following criteria:

1.1.1 All the ions present in the reference spectra must be at a relative intensity greater than 10 percent and must be present in the sample spectrum.

1.1.2 The relative intensities of the ions specified above must agree within +/- 20 percent (absolute) between the reference and sample spectrum (example: for an ion with an abundance of 50 percent in the reference spectrum, the corresponding sample ion abundance must be between 30 percent and 70 percent).

1.1.3 Ions greater than 10 percent in the sample spectrum, but not present in the reference spectrum must be considered and accounted for.

1.1.3 If a compound cannot be verified by all of the above criteria, but in the technical judgement of the mass spectral interpretation specialist the identification is correct, the laboratory will report the identification and continue with the quantitation.

Action

Professional judgment is used for the qualitative criteria for GC/MS analysis of TCL compounds. If it is determined that the wrong identification was made, all such data are qualified as not detected (U).

C. Tentatively Identified Compounds (TICs)

Criteria

1.0 For each sample, the laboratory may conduct a mass spectral search of the NBS library. Report the possible identity of the 10 largest VOA Fraction peaks and the 20 largest BNA fraction peaks which are not surrogate, internal standard, or TCL compounds, but which have an area/height that is greater than 10 percent of the size of the nearest internal standard. TIC results, if reported by the laboratory, will be reported for each sample on Organic Analyses Data Sheet (Form I, TIC) or laboratory equivalent.

1.1 Requirements for the tentative identification are as follows:

1.1.1 Major ions (greater than 10 percent relative intensity) in the reference spectrum should be present in the sample spectrum.

1.1.2 Relative intensities of the major ions should agree within +/- 20 percent between the sample and the reference spectra.

1.1.3 Molecular ions present in the reference spectrum should be present in the sample spectrum.

1.1.4 Ions present in the sample spectrum but not in the reference spectrum should be reviewed for possible background contamination, interference, or coelution of additional TIC or TCL compounds.

1.2 When the above criteria are not met, but in the technical judgement of the data reviewer or the mass spectral interpretation specialist the identification is correct, the data reviewer may report the identification.

Action

The following steps are taken in qualifying the TICs if they are reported by the laboratory:

Step 1 - Review the Form I or laboratory equivalent to verify that all TIC results are qualified as estimated concentrations (J).

Step 2 - If it is determined that the tentative identification of a compound is not acceptable, the tentative identification is changed to "unknown" or the correct compound identification.

Step 3 - If all of the required peaks are not searched, then the laboratory is contacted to complete the library search of that sample.

Step 4 - Any TIC results that are not sufficiently above the level in the blank are not reported.

Note: Dilutions and sample size must be taken into account when comparing the amounts present in the blanks and samples.

Step 5 - When a compound is not found in the blanks, but is a suspected artifact of a common laboratory contaminant, the sample result is qualified as unusable (R).

Step 6 - In the identification of TICs professional judgement is used. In the case that there is more than one reasonable match, the result will be reported as "either compound X or compound Y". If the results lack isomer specificity, the TIC result is changed to a nonspecific isomer result (e.g., 1,3,5-trimethyl benzene to trimethyl benzene isomer) or to the class of compound (e.g., 2-methyl-3-ethyl benzene to substituted aromatic).

Step 7 - If a sample's TIC match is poor, but other samples from the data package have the same TIC with an acceptable match, that identification information is used to identify the TIC result.

Volatile Internal Standards with Corresponding Target Compounds Assigned for Quantitation

TABLE Y-1

VOLATILE INTERNAL STANDARDS WITH CORRESPONDING TARGET COMPOUNDS ASSIGNED FOR QUANTITATION

Option 1: Four Internals

1) Pentafluorobenzene

Acetone
Acetonitrile
Acrolein
Acrylonitrile
Allyl Chloride
Carbon Disulfide
Chloroethane
Chloroform
Chloroprene
Dichlorodifluoromethane
1,1-Dichloroethane
1,1-Dichloroethene
trans-1,2-Dichloroethene
Isobutyl Alcohol
Methacrylonitrile
Methyl Bromide
Methyl Chloride
Methyl Ethyl Ketone
Methyl Iodide
Methylene Chloride
Propionitrile
1,1,1-Trichloroethane
Trichlorofluoromethane
Vinyl Acetate
Vinyl Chloride

2) 1,4-Difluorobenzene

Benzene
Bromodichloromethane
Carbon Tetrachloride
2-Chloroethylvinylether
1,2-Dibromoethane
1,2-Dichloroethane
1,2-Dichloropropane
cis-1,3-Dichloropropene
trans-1,3-Dichloropropene
1,4-Dioxane
Ethyl Methacrylate
Methyl Methacrylate
4-Methyl-2-pentanone
Methylene Bromide
Toluene
1,1,2-Trichloroethane
Trichloroethene

3) Chlorobenzene-d_5

Bromoform
Chlorobenzene
Dibromochloromethane
trans-1,4-Dichloro-2-butene
Ethylbenzene
2-Hexanone
Styrene
1,1,1,2-Tetrachloroethane
Tetrachloroethene
Xylene

4) 1,4-Dichlorobenzene-d_4

1,2-Dibromo-3-chloropropane
1,1,2,2-Tetrachloroethane
1,2,3-Trichloropropane

VOLATILE INTERNAL STANDARDS WITH CORRESPONDING TARGET COMPOUNDS ASSIGNED FOR QUANTITATION

Option 2: Three Internals

1) Fluorobenzene

Acetone
Acetonitrile
Acrolein
Acrylonitrile
Allyl Chloride
Benzene
Bromodichloromethane
Carbon Disulfide
Carbon Tetrachloride
Chloroethane
2-Chloroethylvinylether
Chloroform
Chloroprene
Dichlorodifluoromethane
1,1-Dichloroethane
1,2-Dichloroethane
1,1-Dichloroethene
trans-1,2-Dichloroethene
1,2-Dichloropropane
cis-1,3-Dichloropropene
Ethylbenzene
Isobutyl Alcohol
Methacrylonitrile
Methyl Bromide
Methyl Chloride
Methylene Bromide
Methylene Chloride
Methyl Ethyl Ketone
Methyl Iodide
Methyl Methacrylate
4-Methyl-2-pentanone
Propionitrile
1,1,1-Trichloroethane
Trichloroethene
Trichlorofluoromethane
Vinyl Acetate
Vinyl Chloride

2) Chlorobenzene-d_5

Bromoform
Chlorobenzene
1,4-Dioxane
Dibromochloromethane
1,2-Dibromoethane
trans-1,3-Dichloropropene
Ethyl Methacrylate
2-Hexanone
Styrene
1,1,1,2-Tetrachloroethane
Tetrachloroethene
Toluene
1,1,2-Trichloroethane
Xylene

3) 1,2-Dichlorobenzene-d4

trans-1,4-Dichloro-2-butene
1,1,2,2-Tetrachloroethane
1,2,3-Trichloropropane
1,2-Dibromo-3-chloropropane

Semi-Volatile Internal Standards with Corresponding Target Compounds Assigned for Quantitation

TABLE Y-2

SEMIVOLATILE INTERNAL STANDARDS WITH CORRESPONDING TARGET COMPOUNDS ASSIGNED FOR QUANTITATION

1) 1,4-Dichlorobenzene-d_4

Aniline
Benzyl Alcohol
bis(2-chloro-1-methylethyl)ether
bis(2-chloroethyl)ether
2-Chlorophenol
m-Cresol
o-Cresol
p-Cresol
m-Dichlorobenzene
o-Dichlorobenzene
p-Dichlorobenzene
Ethyl Methanesulfonate
Hexachloroethane
Methyl methanesulfonate
N-Nitrosodi-n-propylamine
N-Nitrosodiethylamine
N-Nitrosodimethylamine
N-Nitrosomethylethylamine
N-Nitrosomorpholine
N-Nitrosopyrrolidine
Pentachloroethane
Phenol
2-Picoline
Pyridine
o-Toluidine
o,o,o-Triethyl phosphorothioate

2) Naphthalene-d_8

Acetophenone
bis(2-chloroethoxy)methane
p-Chloro-m-cresol
p-Chloroaniline
2,4-Dichlorophenol
2,6-Dichlorophenol
a,a-Dimethylphenethylamine
2,4-Dimethylphenol
Hexachlorobutadiene
Hexachlorophene
Hexachloropropene
Isophorone
Isosafrole
2-Methylnaphthalene
Naphthalene
Nitrobenzene
o-Nitrophenol
N-Nitrosodi-n-butylamine
N-Nitrosopiperidine
p-Phenylenediamine
1,2,4-Trichlorobenzene

3) Acenaphthene-d_{10}

Acenaphthene
Acenaphthylene
2-Chloronaphthalene
4-Chlorophenyl-phenylether
Dibenzofuran
Diethyl phthalate
Dimethyl phthalate
m-Dinitrobenzene
2,4-Dinitrophenol
2,4-Dinitrotoluene
2,6-Dinitrotoluene
Fluorene
Hexachlorocyclopentadiene
1,4-Naphthoquinone
1-Naphthylamine
2-Naphthylamine
5-Nitro-o-toluidine
m-Nitroaniline
o-Nitroaniline
p-Nitroaniline
p-Nitrophenol
Pentachlorobenzene
Safrole
1,2,4,5-Tetrachlorobenzene
2,3,4,6-Tetrachlorophenol
2,4,5-Trichlorophenol
2,4,6-Trichlorophenol

4) Phenanthrene-d_{10}

4-Aminobiphenyl
Anthracene
4-Bromophenyl phenyl ether
Di-n-butylphthalate
Diallate
O,O-Diethyl-O-2-pyrazinyl phosphorothioate
4,6-Dinitro-o-cresol
Diphenylamine
1,2-Diphenylhydrazine
Fluoranthene
Hexachlorobenzene
4-Nitroquinoline-1-oxide
N-Nitrosodiphenylamine
Pentachloronitrobenzene
Pentachlorophenol
Phenacetin
Phenanthrene
Pronamide
sym-Trinitrobenzene

5) Chrysene-d_{12}

2-Acetylaminofluorene
Aramite
Benzidine
Benzo(a)anthracene
bis(2-ethylhexyl)phthalate
Butyl benzyl phthalate
Chlorobenzilate
Chrysene
3,3'-Dichlorobenzidine
p-(Dimethylamino)azobenzene
3,3'-Dimethylbenzidine
Isodrin
Methapyrilene
Pyrene

6) Perylene-d_{12}

Benzo(a)pyrene
Benzo(b)fluoranthene
Benzo(g,h,i)perylene
Benzo(k)fluoranthene
Di-n-octylphthalate
Dibenz(a,h)anthracene
7,12-Dimethylbenz(a)anthracene
Indeno(1,2,3-cd)pyrene
3-Methylcholanthrene

Data Validation Procedures for Polychlorinated Biphenyls/Pesticides

Appendix Z

Data Validation Procedures for Pesticides and Polychlorinated biphenyls (PCBs)

I. Introduction

This standard operating procedure (SOP) describes the data validation procedures for a USEPA Region I Tiered review of data for pesticides and polychlorinated biphenyls (PCBs) analyzed by USEPA methods 8081A and 8082, respectively. Data review procedures presented in this SOP were developed from the applicable quality control criteria specified in the following documents:

- *Region I Tiered Organic and Inorganic Data Validation Guidelines*, USEPA Region I, July 1, 1993.
- *Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses*, USEPA Region I, Draft, December 1996.
- *CLP Organics Data Review and Preliminary Review*, USEPA SOP HW-6, Revision 10, October 1995.
- *USEPA Contract Laboratory Program, Statement of Work for the Organics Analysis, Revision OLM0.1.9*, July 1993

II. Tier I Validation Procedures

Tier I validation of a data package consists of verifying that all raw data and forms are included and complete. All Form Is or laboratory equivalent (presented in Attachment Z-1) are copied and a data validation summary spreadsheet presented in Attachment Z-2 is prepared to document the data review. The following steps are taken to complete a Tier I validation:

Step 1 - The laboratory case narrative is reviewed. During review of the case narrative, if there are any deviations that warrant a more extensive validation procedure, a Tier II review would be initiated to evaluate potential data use limitations.

Step 2 - Compare the chain-of-custody and the sample traffic reports. If there are any inconsistencies or if they are incomplete, then contact laboratory for an explanation.

Step 3 - Verify that all forms presented in Attachment Z-1 or laboratory equivalent forms are present and complete. If any of the forms are not in the data package, contact the laboratory for a resubmission.

Note: If frequent or severe quality control deviations are present on the above-mentioned forms, a more extensive validation procedure may be warranted. Based on the reviewer's judgement, Tier II or Tier III review may be warranted to fully evaluate the usability of the data.

Step 4 - Make a copy of the all sample data Form Is or laboratory equivalent for inclusion in the validation report.

Step 5 - Verify that the following raw data is provided for each sample and associated QA/QC samples in the data package. Contact the laboratory to obtain missing data:

- Case Narrative
- Chain-of-Custody Forms
- Traffic Reports
- QA Sample Summary Forms
- Instrument Calibration Summary Forms
- Instrument Run Logs
- Sample Preparation Logs
- Instrument/Method Detection Limits
- Standards Preparation Logs
- Supporting (raw) Data

Step 6 - With a blue ink pen, record on the first page of the data package: the validation level, date, and reviewer's initials.

III. Tier II Validation Procedures

Tier II validation of a data package consists of the steps mentioned above for a Tier I review plus review of the data package for identification of QA/QC deviations. Tier II validation does not include review of the "raw data" or recalculation of sample results. Sample qualification is performed (if required) following USEPA Region I Guidelines.

A. Data Qualifiers

All data qualified due to QA/QC deviations will be clearly marked on a copy of the Form Is or laboratory equivalent with a blue ink pen. The laboratory qualification is lined out and the reviewer's qualification placed next to it. The date and the initials of the reviewer will also be placed on the Form I. Below is a list of qualifiers to be used.

U The compound or analyte was analyzed for, but was not detected. The sample quantitation limit is presented and adjusted for dilution and (for solid samples only) percent moisture. For consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) as presented in Attachment Z-2.

J The compound or analyte was positively identified, but the associated numerical value is an estimated concentration. This qualifier is used when the data evaluation procedure identifies a deficiency in the data generation process. This qualifier is also used when a compound or analyte is detected at estimated concentrations less than the contract-required detection limit (CRDL) for inorganic analyses or the contract-required quantitation limit (CRQL) for organic analyses.

UJ The compound or analyte was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual level of quantitation. For consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) J as presented in Attachment Z-2.

R Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data should not be used for any qualitative or quantitative purposes.

B. Holding Times

Criteria

Samples (waters or soils) and extracts must be preserved at 4 degrees centigrade. Soil and water samples must be extracted within seven days and extracts must be analyzed within 40 days.

Action

Specific holding times for each analysis and sample type are presented in Table 1 of the SAP/DCAQAP. The following steps are performed for the validation of data due to holding times:

Step 1 - Establish the holding time by comparing the sampling date on the chain-of-custody with the dates of analysis and/or extraction on the Form I. The chain-of-custody is also reviewed to determine if the samples were properly preserved.

Step 2 - If the holding times are exceeded by less than 24 hours, then no qualification of data is needed.

Step 3 - If the holding times are exceeded by more than 24 hours, but less than 14 days, then all the positive results are qualified as estimated (J) and the non-detected compounds are qualified as estimated (UJ).

Step 4 - If the holding times are exceeded by more than twice the specified holding time, then all the results are qualified as unusable (R).

C. Pesticides and PCBs Instrument Performance

Criteria

1.0 The laboratory must report retention time window data on the pesticide/PCBs Standards Summary (Form X Pest-1 or Form X Pest-2) or laboratory equivalent for each GC column used to analyze samples. Compounds must be within these retention time windows.

1.1 The total percent breakdown for neither DDT nor endrin may exceed 20 percent. The percent breakdown is the amount of decomposition that endrin and 4,4'-DDT undergo when analyzed by the chromatograph.

1.2 The retention time of DCB and TCMX in each analysis of PCBs must be compared to the retention time of the DCB and TCMX in Evaluation Standard Mix A. The percent difference (%D) must not exceed 0.3 percent for narrow-bore capillary columns, and 1.5 percent if wide-bore capillary columns are used.

Action

2.0 If any compound is outside the retention time window listed on Form X Pest-1, Form X Pest-2, or laboratory equivalent, a Tier III validation is warranted.

2.1 DDT and Endrin degradation deviations are qualified in the following manner:

Step 1 - Review DDT breakdown data presented on Form X Pest-1 or laboratory equivalent to determine if it is greater than 20 percent. Beginning with the sample following the last in-control standard qualify the data in the following manner:

A. All positive results for DDT are qualified as estimated (J).

B. If DDT was not detected, but DDD and DDE are positive, then the quantitation limit for DDT is qualified as unusable (R).

C. All positive results for DDD and/or DDE are qualified as estimated (J).

Step 2 - Review endrin breakdown data presented on Form X Pest-1 or laboratory equivalent to determine if it is greater than 20 percent. Beginning with the sample following the last in-control standard and qualify the data in the following manner:

A. All positive results for endrin are qualified as estimated (J).

B. If endrin was not detected, but endrin aldehyde and endrin ketone are positive, then the quantitation limit for endrin is qualified as unusable (R).

C. All positive results for endrin ketone are qualified as estimated (J).

2.2 Review the retention time percent difference presented on Form X Pest-1 or laboratory equivalent. The following steps outline the qualification of data for retention time shifts of DCB and TCMX:

Step 1 - If the retention time shift for DCB and TCMX is greater than 0.3 percent for a narrow-bore capillary column, or 1.5 percent for a wide-bore capillary column, the data are qualified as unusable (R).

Step 2 - If DCB and TCMX are absent, then the retention time shift cannot be evaluated (i.e., if it is diluted out due to high concentration of a target compound or matrix interference.)

D . Calibration

Criteria

1.0 Initial Calibration Pesticides

The percent Relative Standard Deviation (%RSD) of calibration factors for aldrin, endrin, DDT, and dibutylchlorendate must not be greater than 10 percent. When toxaphene is identified, a three-point calibration is required for quantification. If the calibration factor %RSD for DDT or toxaphene is greater than 10 percent, calibration curves must be used for the quantitation of DDT, DDE, DDD, or toxaphene.

Note: The %RSD linearity check is required only for columns that are used for quantitation of sample and surrogate results. Columns used only to provide qualitative verification are not required to meet this criterion.

1.1 Initial Calibration PCBs

The %RSD for each PCB standard must not be greater than 20 percent.

1.2 Analytical Sequence

1.2.1 Primary Analysis

At the beginning of each 72-hour period all standards must be analyzed.

1.2.2 Confirmation Analysis

1.2.3 Evaluation Standard Mix A, B, and C are required for the curve.

1.2.4 Only the standards containing the compounds to be confirmed are required. These standards must be repeated after every five samples.

1.2.5 Evaluation Mix B is required after every ten samples.

1.3 Continuing Calibration

The calibration factor for each standard must be within 15 percent of the standard at the beginning of the analytical sequence on quantitation columns (20 percent on the confirmation columns).

Action

The following steps are performed during the validation of data due to calibration deviation:

Step 1 - Verify that the criterion for the initial calibration linearity has been met by reviewing Form VI Pest-2 and Form VI Pest-3 or laboratory equivalents. If the criteria in sections III.C.1.1 and III.C.1.2 are not met, then all associated positive results are qualified as estimated (J).

Step 2 - Verify by reviewing Form VII Pest-1 and Form VII Pest-2 or laboratory equivalents, that the percent difference (%D) between calibration factors is not greater than 15 percent for the compound(s) being quantitated (20 percent for compound(s) being confirmed). If the %D is greater than this criterion then all associated positive results are qualified as estimated (J).

E. Blanks

Criteria

1.0 No contaminants should be present in the blank(s).

1.1 For each matrix, and each extracted batch, a method blank must be analyzed.

Action

Qualification of sample results due to blank contamination is dependent on the conditions and the origin of the blank. No positive sample results are reported unless the concentration of the compound in the sample exceeds five times the amount in the blank. No sample results are corrected by subtracting blank values. Specific qualifications of sample data is as follows:

Step 1 - Review the Form IVS or laboratory equivalent within the data package to ensure that criteria III.D.1.2 is in compliance. If they are not, the laboratory will be contacted by the reviewer for a written explanation.

Step 2 - Review the Form I of all the blanks within the data package.

Step 3 - When any pesticide/PCB is detected in the sample and the sample concentration is less than five times the concentration detected in the associated blank, the data are qualified as a non-detect (U).

Step 4 - If a compound is found in the blank, but not in the sample, then the data are not qualified.

Note: Any difference between the sample analyses and the related blank analyses which involve weights, volumes or dilution factors are taken into account when the 5-times criteria is used.

The following are examples of how qualifications apply to blank data:

Example (Step 3): When the sample result is greater than the contract required quantitation limit (CRQL), but less than the blank action level, the sample results are qualified as non-detects. As in the example below, the result is less than the blank action level (or 5 x 1), therefore the sample result is qualified as non-detected.

Factor	5-times
Blank Result	1.0
CRQL	0.5
Action Level	5.0
Sample Result	4.0
Qualified Sample Result	4.0 U

Example (Step 4): When the sample result is greater than the blank action level the sample results are not qualified. As in the example below, the sample result is greater than the blank action level and the sample result is not qualified.

Factor	5-times
Blank Result	1.0
CRQL	0.5
Action Level	5.0
Sample Result	6.0
Qualified Sample Result	6.0

Step 5 - When excessive amounts of contamination exists (i.e., saturated peaks by ECD), all compounds affected are qualified as unusable (R).

F. Surrogate Recovery

Criteria

Sample and blank surrogates recoveries for TCMX and DCB must be within control limits listed in Table 5 of the SAP/DCAQAP.

Action

Qualification of the data because of surrogate recoveries being out of control is based on the evaluation of all data provided in the data package, especially considering the complexity of the effect of sample matrices. These qualifications are completed in the following steps:

Step 1 - Surrogate recoveries tabulated on Form II or laboratory equivalent of each fraction are evaluated against the control limits provided in Table 5 of the SAP/DCAQAP.

Step 2 - If both TCMX and DCB recoveries are low and are out of control:

A. All positive results for that fraction are qualified as estimated (J).

B. All non-detected results are qualified as estimated (UJ).

Step 3 - In the case where both TCMX and DCB recoveries are zero, the data are qualified as unusable (R).

Step 4 - When the blank analysis involves both surrogate recoveries out of control, the related sample data are reviewed and qualified in the following manner:

A. If the sample data does not contain any out of control surrogates, then the data are not qualified.

B. If the sample data does contain a surrogate that is out of control, then the sample data are qualified as mentioned above in steps 2A and 2B.

Note: In this special circumstance the problem is considered to be within the laboratory control and is so noted in the validation report.

G. Matrix Spike / Matrix Spike Duplicate

Criteria

1.0 Spike recoveries must be within the control limits in Table 5 of the SAP/DCAQAP.

1.1 The relative percent difference (RPD) between matrix spike and matrix spike duplicate recoveries must be within the control limits specified in Table 5.

Action

If recovery results are not within the control limits, the following steps are taken to qualify the data:

Step 1 - If the recovery results are not within the control limits presented in Table 5, the positive results for the compound in the unspiked sample are qualified as estimated (J).

Step 2 - If the recovery result is less than 10 percent, the non-detects for that compound in the unspiked sample are qualified as rejected (R). This is the only instance that a non-detect is qualified due to a recovery being out of control.

Step 3 - If any of the RPDs are greater than the limits presented in Table 5, then positive results for that compound are flagged as estimated (J) in the unspiked sample.

H. Field Duplicates

Criteria

1.0 For water matrices, each compound's RPD must be less than 30 percent.

1.1 For soil matrices, each compound's RPD must be less than 50 percent.

Action

Step 1 - Calculate all the RPD values for positive results between the sample and the field duplicate.

$$\text{Calculation: } RPD = \frac{\text{Sample Result - Field Duplicate}}{\text{(Sample Result + Field Duplicate)/2}} \times 100$$

Step 2 - If the RPD is greater than 30 percent in water matrix, the results for that compound in both samples are qualified as estimated (J).

Step 3 - If the RPD is greater than 50 percent in soil matrix, the results for that compound in both samples are qualified as estimated (J).

IV. Tier III Validation Procedures

Tier III validation of a data package consists of the steps mentioned above for a Tier I and Tier II validation plus review of the "raw data" and recalculation of approximately ten percent of the sample results. The compound identification, instrument performance, quantitation and detection limits are also evaluated.

A. Compound Quantitation and Reported Detection Limits

Criteria

The quantitation of detected compounds and the adjustment of the CRDL for dilutions and percent solids are recalculated for 10 percent of the data.

Action

Step 1 - If the criteria above have not been followed, then the laboratory will be contacted by the reviewer and the laboratory will be responsible for a correction of the quantitation and a resubmission of the reported data.

Step 2 - Quantitation limits affected by large, off-scale peaks are qualified as unusable (R).

Step 3 - If the interference is on-scale, the quantitation limit is qualified as estimated (J).

B. Instrument Performance

Criteria

The laboratory must report retention time window data on the pesticide/PCBs standards summary (Form X Pest-1 or Form X Pest-2) or laboratory equivalent for each GC column used to analyze samples. Compounds must be within these retention time windows.

Action

Retention time windows are used in qualitative identification. If the sample results are not within the retention time windows, the following steps are taken to evaluate the data:

Step 1 - The chromatogram is reviewed to see if there are any peaks within an expanded window surrounding the expected retention time window of the pesticide of interest.

Step 2 - If there are no peaks present either within or close to the retention time window of the out of control targeted pesticide, then there is no qualification of the data. Non-detected results are considered valid.

Step 3 - If there are peaks present above or close to the CRDL and either within or close to the retention time window of the out of control targeted pesticide, all positive data are qualified as unusable (R).

C. Compound Identification

Criteria

Reported compounds must be within calculated retention time windows for both chromatographic columns.

Action

The following steps are taken during the compound identification:

Step 1 - When the qualitative criteria for two-column confirmation are not met, all reported positive detects are reported as non-detects. The reviewer uses professional judgment and the following steps to report the appropriate quantitation limit:

A. If the misidentified peak was sufficiently outside the target pesticide retention time window, then the CRQL is reported.

B. If the misidentified peak poses an interference with potential detection of a target peak, the reported value is qualified as the estimated (J) quantitation limit.

Step 2 - When PCBs or multipeak pesticides exhibit marginal pattern-matching quality, the reviewer's professional judgment is used to confirm whether the differences are credited to environmental

"weathering". If the presence of a PCB/multipeak pesticide is strongly suggested, results are reported as being present.

Step 3 - When an observed pattern closely matches more than one Aroclor, professional judgement is used to decide whether the neighboring Aroclor is a better match, or if multiple Aroclors are present.

Data packages validated under Tier III procedures consist of the steps mentioned above for a Tier I and Tier II validation. In addition to review of the "raw data", approximately ten percent of the data results are recalculated. Furnace atomic absorption analysis and calibration raw data are also reviewed.

A. Calibration

Criteria

1.0 The initial calibration for atomic absorption analysis must contain three standards, one of which must be at the CRDL.

1.1 The correlation coefficient must be greater than or equal to 0.995 for the calibration of atomic absorption, mercury, and cyanide or other photometric determinations.

Action

The following steps are taken when verifying inorganic calibration for Tier III validation:

Step 1 - Review the calibration raw data and Form XIII or laboratory equivalent to confirm that the curve for the analysis did include a standard at the CRDL. If there is not a standard at the CRDL, all positive sample results up to 2 times the CRDL and non-detected results are qualified as estimated (J) and (UJ), respectively.

Step 2 - Evaluate the raw data of atomic absorption, mercury, and cyanide or other photometric determination and calculate the correlation coefficient. If the correlation coefficient is less than 0.995, then all results greater than the IDL and non-detects are qualified estimated (J) and (UJ), respectively.

B Furnace Atomic Absorption

Criteria

1.0 For sample concentrations greater than the CRDL, duplicate injections must agree within +/- 20 percent RSD, or Coefficient of Variation (CV), otherwise the sample must be reanalyzed once (two additional injections).

1.1 Spike recoveries must be within the control limits of 85 to 115 percent.

1.2 If the post-digestion spike recovery is not within the control limits of 85 to 115 percent and the sample absorbance is greater than 50 percent of the spike absorbance, the Method of Standard Additions is required. The sample must be spiked at 50, 100, and 150 percent of the sample absorbance.

Action

The following steps are taken when reviewing the Furnace Atomic Absorption data:

Step 1 - Review the duplicate injection values for RSD or CV. If they are outside the required criteria specified in Section IV.A.1.0 and the sample was not reanalyzed once as required, all positive results are qualified as estimated (J).

Step 2 - Review the spike recoveries. If they are outside the required criteria mentioned in section IV.A.1.1, all positive results are qualified as estimated (J).

Step 3 - Review the sample absorbance of the post-digestion spike and if the spike absorbance is greater than 50 percent the data are qualified as follows:

A. If the furnace post-digestion spike recovery is not within 85 to 115 percent and the sample result is greater than the IDL, then the data are qualified as estimated (J).

B. If the sample result is non-detected and the furnace post-digestion spike recovery is greater than 10 percent but less than 85 percent, then the data are qualified as estimated (UJ).

C. If the furnace post-digestion spike recovery is less than 10 percent, then positive and non-detected results are qualified as unusable (R).

Step 4 - If the Method of Standard Additions (MSA) is required, but was not performed, then the positive sample results are qualified as estimated (J).

Step 5 - If any samples analyzed by MSA were not spiked at the correct levels, then the positive sample results are qualified as estimated (J).

Step 6 - If the MSA correlation coefficient is less than 0.995, then the positive sample results are qualified as estimated (J).

C. Sample Result Verification

Criteria

The quantitation of the analytes and the adjustment of the CRDL for dilution and percent solids, must be recalculated for 10 percent of the data.

Action

If the criteria above have not been followed, then the laboratory will be contacted by the reviewer and the laboratory will be responsible for resolving any discrepancies and resubmission of results, if needed.

Appendix AA

BLASLAND, BOUCK & LEE, INC.

Data Validation Procedures for Inorganics

Appendix AA

Data Validation Procedures for Inorganic Analytes

I. Introduction

This standard operating procedure (SOP) describes the data validation procedures for a USEPA Region I Tiered review of the data for inorganic analytes by USEPA methods 5000, 6000, and 9000 series. Data review procedures presented in this SOP were developed from the applicable quality control criteria specified in the following documents:

- *Region I Tiered Organic and Inorganic Data Validation Guidelines*, USEPA Region I, July 1, 1993.
- *Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses*, USEPA Region I, June 13, 1988 (Modified February 1989).
- *Evaluation of Metals Data for the Contract Laboratory Program*, USEPA SOP HW-2, Revision 11, January 1992.
- *USEPA Contract Laboratory Program, Statement of Work for the Inorganics Analysis, Revision OLM0.1.9*, July 1993

II. Tier I Validation Procedures

Tier I validation of a data package consists of verifying that all raw data and forms are included and complete. All Form Is or laboratory equivalent (presented in Attachment AA-1) are copied and a data validation summary spreadsheet (presented in Attachment AA-2) is prepared to document the data review. The following steps are taken to complete a Tier I validation:

Step 1 - The laboratory case narrative is reviewed. During review of the case narrative, if there are any deviations that warrant a more extensive validation procedure, a Tier II review would be initiated to evaluate potential data use limitations.

Step 2 - Compare the chain-of-custody and the sample traffic reports. If there are any inconsistencies or if they are incomplete, then contact laboratory for resolution.

Step 3 - Verify that all forms presented in Attachment AA-1 or laboratory equivalent forms are present and complete. If any of the forms are not in the data package, contact the laboratory for a resubmission.

Note: If frequent or severe quality control deviations are present on the above-mentioned forms, a more extensive validation procedure may be warranted. Based on the reviewer's judgement, Tier II or Tier III review may be warranted to fully evaluate the usability of the data.

Step 4 - Make a copy of all sample data Form I's or laboratory equivalent for inclusion in the validation report.

Step 5 - Verify that the following raw data is provided for each sample and associated QA/QC samples in the data package. Contact the laboratory to obtain missing data:

- Case Narrative
- Chain-of-Custody Forms
- Traffic Reports
- QA Sample Summary Forms
- Instrument Calibration Summary Forms
- Instrument Run Logs
- Sample Preparation Logs
- Instrument/Method Detection Limits
- Standards Preparation Logs
- Supporting (raw) Data

Step 6 - With a blue ink pen, record on the first page of the data package: the validation level, date, and reviewer's initials.

III. Tier II Validation Procedures

Tier II validation of a data package consists of the steps mentioned above for a Tier I review plus review of the data package for identification of QA/QC deviations. Tier II validation does not include review of the "raw data" or recalculation of sample results. Sample qualification is performed (if required) following USEPA Region I Guidelines.

A. Data Qualifiers

All data qualified due to QA/QC deviations will be clearly marked on a copy of the Form Is or laboratory equivalent with a blue ink pen. The laboratory qualification is lined out and the reviewer's qualification placed next to it. The date and the initials of the reviewer will also be placed on the Form I. Below is a list of qualifiers to be used.

U The compound or analyte was analyzed for, but was not detected. The sample quantitation limit is presented and adjusted for dilution and (for solid samples only) percent moisture. For consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) as presented in Attachment AA-2.

J The compound or analyte was positively identified, but the associated numerical value is an estimated concentration. This qualifier is used when the data evaluation procedure identifies a deficiency in the data generation process. This qualifier is also used when a compound or analyte is detected at estimated concentrations less than the contract-required detection limit (CRDL) for inorganic analyses or the contract-required quantitation limit (CRQL) for organic analyses.

UJ The compound or analyte was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual level of quantitation. For

consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) J as presented in Attachment AA-2.

R Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data should not be used for any qualitative or quantitative purposes.

B. Holding Times

Criteria

The holding times present in Table 1 of the SAP/DCAQAP for the inorganic analysis must be not exceeded.

Action

The following steps are performed to review holding times for Tier II validation:

Step 1 - Establish the holding time by comparing the sampling date on the chain-of-custody with the dates of analysis and/or digestion on the Form I. The chain-of-custody is also reviewed to decide if the samples were properly preserved.

Step 2 - If the holding times are exceeded by less than 24 hours, then no qualification of data is needed.

Step 3 - If the holding times are exceeded by more than 24 hours but less than 14 days, then all the positive results are flagged as estimated (J) and the non-detected compounds are flagged as estimated (UJ).

Step 4 - If the holding times are exceeded by more than twice the specified holding time, then all the results are flagged as unusable (R).

C. Calibration

Criteria

1.0 Instruments must be calibrated daily and each time the instrument is set up for analysis.

1.1 Initial Calibration ICP

A blank and at least one standard must be used in establishing the analytical curve.

1.2 Initial Calibration Atomic Absorption Analysis (AA)

A blank and at least three standards must be used in establishing the analytical curve.

1.3 Initial Calibration-Mercury

A blank and at least four standards must be used in establishing the analytical curve.

1.4 Initial Calibration-Cyanide

1.4.1 A blank and at least three standards must be used in establishing the analytical curve.

1.4.2 At least one mid-point standard must be distilled before analysis.

1.5 Initial and Continuing Calibration Verification (ICV and CCV)

1.5.1 A certified standard must be used for the initial Calibration Verification (ICV) and must be analyzed for each wavelength used for analysis.

1.5.2 All percent recoveries of the ICVs and CCVs for all the analytes must be within 90 to 110 percent except for mercury and cyanide.

1.5.3 All percent recoveries of all the ICVs and CCVs for mercury must be within 85 to 120 percent.

1.5.4 All percent recoveries of all the ICVs and CCVs for cyanide must be within 85 to 115 percent.

1.5.5 A CCV must be analyzed every ten samples or every 2 hours whichever is more frequent.

1.5.6 To verify linearity near the CRDL for ICP analysis, the standard at two times the CRDL or two times the IDL (whichever is greater) must be analyzed. The results for the analytes must be within +\- 20%.

Action

The following steps are performed to review inorganic calibration for Tier II validation:

Step 1 - Verify that the instrument was calibrated daily and every time it was set up by reviewing Form XIV or laboratory equivalent. Also, that the correct number of standards were used for the initial calibration for each analyte reported. If any of these are not completed by the laboratory, the data are qualified as unusable (R).

Step 2 - Verify that a mid range standard was distilled by reviewing Form XIII or laboratory equivalent. If a mid range standard for cyanide was not distilled or did not meet the 85 to 115 percent criteria, all positive and non-detected results are qualified as estimated (J) and (UJ), respectively.

Step 3 - Review Form II (Part 1) or laboratory equivalent for the identification of the source of the ICV and CCV. If they are not from different sources, all positive and non-detected results are qualified as estimated (J) and (UJ), respectively.

Step 4 - ICV and CCV percent recovery Form II (Part 1) or laboratory equivalent are reviewed against the above mentioned criteria. If the ICV or CCV percent recovery are outside the acceptance criteria, the following steps are taken to qualify the data:

A. If the ICV and CCV percent recovery are not within the control limits but are within the ranges of 75-89%, or 111-125% (CN, 70-84% or 116-130%; Hg, 65-79% or 121-135%), all results greater than the IDL are qualified as estimated (J).

B. If the ICV and CCV percent recovery are not within the control limits but are within the ranges of 111-125 % (CN, 116-130%; Hg, (121-135%), all non-detected results are not qualified.

C. If the ICV and CCV percent recovery are not within the control limits but are within the ranges of 75-89% (CN, 70-84%; Hg, 65-79%), all non-detected results are qualified as estimated (UJ).

D. If the ICV and CCV percent recovery are not within the control limits ranges of 75-89% (CN, 70-84%; Hg, 65 to 79%), all non-detected results are qualified as unusable (R).

Step 5 - Form XIV or laboratory equivalent is reviewed to verify that the CCVs were analyzed in the required intervals. If they were not analyzed at the required intervals, all positive and non-detected results are qualified as estimated (J) and (UJ), respectively.

Step 6 - Form II (Part 2) or laboratory equivalent is reviewed to verify that the CRDL standards are within the required control limits of +/-20% of the true value. If the CRDL standard for ICP is not within +/-20% of the true value, positive results less than 3 times the CRDL and non-detects are qualified as estimated (J) and (UJ), respectively.

D. Blanks

Criteria

1.0 No contaminants should be present in the blank(s).

1.1 For each matrix, for every 20 samples digested, or for each batch digested, a preparation blank must be analyzed.

1.2 A calibration blank (CCB) must be analyzed after every ten samples or every 2 hours, whichever is more frequent.

Action Qualification of sample results due to blank contamination is dependent on the conditions and the origin of the blank. No sample results are reported unless the concentration of the analyte in the sample exceeds five times the amount detected in any blank. No sample results are corrected by subtracting blank values. Specific qualifications of sample data are as follows:

Step 1 - Review the Form III or laboratory equivalent for all blanks within the data package.

Step 2 - If a blank result is greater than 2 times the negative IDL, all non-detects are qualified as estimated (UJ).

Step 3 - If an analyte is found in the blank but not in the sample, then the data are not qualified.

Step 4 - When an analyte is detected in the sample and the sample concentration is less than five times the concentration detected in the associated blank, the data are qualified as non-detected (U).

Step 5 - When a positive result is greater than the action level, the result is not qualified.

Note: Any difference between the sample analyses and the related blank analyses which involve weights, volumes or dilution factors must be taken into account when the 5-times criteria are used.

The following are examples of how qualifications apply to blank data:

Example 1(Step 4): When the sample result is less than the IDL but greater than the action level. Positive results less than 35 are qualified as non-detects.

Factor	5X
Blank Result	7
CRQL	5
Action level	35
Sample Result	22
Qualified Sample Result	22 U

Example 2 (Step 5): When the sample result is greater than the IDL and the action level, no qualification is used.

Factor	5X
Blank Result	10
CRQL	8
Action level	50
Sample Result	70
Qualified Sample Result	70

E. ICP Interference Check Sample (ICS)

Criteria

1.0 The ICS must be analyzed at the beginning and the end of each sample analysis run or a minimum of twice per 8 hour working shift, whichever is more frequent.

1.1 The percent recovery for the ICS solution AB must be within the control limits of +/- 20 percent of the true value.

Note: Interferant Element Concentration used for ICP Interference Check Sample

Element	Concentration (mg/L)
Al	500
Ca	500
Fe	200
Mg	500

Action

The following steps are performed to review the ICS for Tier II validation:

Step 1 - Review Form XIV or laboratory equivalent to ensure the ICS is analyzed at the proper frequency. If the ICS is not analyzed at the correct frequency, detect and non-detect sample results are qualified as estimated (J) or (UJ), respectively.

Step 2 - Verify on the ICS recovery Form IV or laboratory equivalent that the percent recovery results for the ICS solution AB are within the control limits of 80 to 120 percent. Also review Form Is for concentrations of As Ca, Mg, and Fe to confirm that they are 50 percent or more than their respective levels in the ICS. The following steps are taken in reviewing the data:

A. If the ICS recovery for an element is greater than 120 percent and the reported sample results are non-detect, then no qualification of the data is needed.

B. If the ICS recovery for an element is greater than 120 percent and the reported sample results are greater than the IDL, the affected data are qualified as an estimate (J).

C. If the ICS recovery for an element is between 50 and 79 percent and the reported results are greater than the IDL, the affected data are qualified as an estimated (J).

D. If the ICS recovery for an element is between 50 and 79 percent and the reported results are non-detected, the affected data are qualified as an estimated (UJ).

E. If the ICS recovery for an element is less than 50 percent, the sample results are qualified as unusable (R).

Step 3 - When sample results greater than the IDL are reported for elements which are not present in the ICS solution, there is the possibility of false positives. Sample results greater than 2 times the IDL with levels of interferents that are 50 percent or more of the levels found in the ICS solution, the results are qualified as estimated (J).

Step 4 - When negative sample results with an absolute value greater than 2 times the IDL are reported for elements which are not present in the ICS solution, there is the possibility of false negatives. In these instances when the levels of interferents that are 50 percent or more of the levels found in the ICS solution, the sample results are qualified as estimated (UJ).

F. Matrix Spike Sample Analysis

Criteria

1.0 Samples identified as field blanks cannot be used for spiked sample analysis.

1.1 Spike recoveries must be within the control limits of 75 to 125 percent. However, the control limits do not apply when the sample concentration surpasses the spike concentration by a factor of four or more.

1.2 If the matrix spike recovery does not meet criteria, a post-digestion spike is required and reported on Form 5B or laboratory equivalent for ICP, Flame, Mercury, and Cyanide. Post-digestion spikes are also required for all furnace analyses, but recoveries are reported on the raw data and are reviewed in a Tier III evaluation.

Action

The following steps are performed to review inorganic matrix spike analysis for Tier II validation:

Step 1 - Matrix spike recoveries are reviewed on Form V (Part 1) or laboratory equivalent. If they are out of the control limits of 75 to 125 percent the following steps are taken:

A. When the spike recovery is greater than 125 percent and the reported sample results are non-detected, no qualification of data is needed.

B. When the spike recovery is greater than 125 percent or less than 75 percent and the reported sample results are greater than the IDL, the data are qualified as estimated (J).

C. If the spike recovery is within the range of 30 to 74 percent and the sample results are non-detected, the data are qualified as estimated (UJ).

D. If the spike recovery is less than 30 percent and the sample results are non-detected, the data are qualified as unusable (R).

G. Duplicate Sample Analysis

Criteria

1.0 Samples identified as field blanks cannot be used for duplicate sample analysis.

1.1 A control limit of +/- 20 percent for waters and +/- 35 percent for soils for the Relative Percent Difference (RPD) are used for sample results greater than five times the CRDL as presented in Table 5 of the SAP/DCAQAP.

1.2 A control limit of +/- the CRDL for waters and +/- 2 times the CRDL for soils are used for sample values less than five times the CRDL, including when only one sample value is greater than 5 times the CRDL or when one sample is above the IDL and one is non-detected.

1.3 Duplicate sample analysis must be prepared and analyzed for every 20 samples, for every batch digested, or for every matrix, which ever is more frequent.

Action

Verify on the Duplicates Form V (Part 2) or laboratory equivalent that the RPD for the duplicate samples analysis is within the above mentioned criteria. If duplicate analysis results are outside the appropriate control windows, all sample results greater than the IDL for that analyte and the same matrix are qualified as estimated (J).

H. Field Duplicates

Criteria

1.0 For sample values greater than 5 times the CRDL, the control limit for the RPD for water matrices is +/- 30 percent and +/- 50 percent for soils matrices.

1.1 For sample values less than 5 times the CRDL, the control limit of +/-2 times the CRDL for waters and +/- 4 times the CRDL for soils will be used.

Action

Step 1 - Calculate all the RPD values for positive results between the sample and the field duplicate.

$$\text{Calculation: } RPD = \frac{\text{Sample Result - Field Duplicate}}{(\text{Sample Result + Field Duplicate})/2} \times 100$$

Step 2 - If duplicate analysis results are outside the appropriate control limits, all sample results greater than the IDL for that analyte and the same matrix are qualified as estimated (J).

I. Laboratory Control Limits Sample Analysis (LCS)

Criteria

1.0 Aqueous LCS results must fall within the control limits of 80 to 120 percent. For validation of the data the +/-20 percent limit will also apply to both antimony and silver.

1.1 Solid LCS results must fall within the control limits established by the laboratory as presented on Form VII or the laboratory equivalent.

1.2 LCS must be prepared and analyzed for every 20 samples, for every batch digested, or for every matrix, whichever is more frequent.

Action

2.0 The following steps are taken to evaluate the aqueous LCS:

Step 1 - Review the Form VII or the laboratory equivalent for any analyte that is outside the control limits of 80 to 120 percent.

Step 2 - If the LCS recovery for any analyte is within the control limit of 50 to 79 percent or greater than 120 percent, results greater than the IDL are qualified as estimated (J).

Step 3 - If the sample results are non-detects and the LCS recovery is greater than 120 percent, no qualification of the data is performed.

Step 4 - If the sample results are non-detects and the LCS recoveries are within the control limits of 50 to 79 percent, the data are qualified as estimated (UJ).

Step 5 - If the LCS recoveries for any analyte are less than 50 percent, the data for that analyte are qualified as unusable (R).

2.1 The following steps are taken to evaluate the soil LCS:

Step 1 - Review the Form VII or laboratory equivalent to identify any analyte that is outside the control limits established by the laboratory.

Step 2 - If any solid LCS recoveries for any analyte are outside the laboratory established control limits, all results greater than the IDL are qualified as estimated (J).

Step 3 - If the LCS results are greater than the control limits and the sample results are non-detected, no qualification of the data is needed.

Step 4 - If the LCS results are less than the control limits and the sample results are non-detected, the data are qualified as estimated (UJ).

J. ICP Serial Dilution Analysis

Criteria

1.0 If the analyte concentration is sufficiently high (concentration in the original sample is at a minimum a factor of 50 times the IDL) the laboratory is required to report the results of a five fold dilution. Results that do not agree within 10 percent of the original results are qualified with an "E" by the laboratory. For the purposes of validation the criterion is 15 percent.

1.1 A serial dilution is required for each matrix analyzed.

1.2 If the sample used for the serial dilution had to be diluted for any elements to bring the result within the linear range of the instrument, another five-fold dilution is required for the evaluation of matrix interferences for that specific element.

Action

The following steps are performed to review ICP serial dilution for Tier II validation:

Step 1 - Review the ICP serial dilution results on Form IX or the laboratory equivalent. If the percent difference between the results is greater than 15 percent and the serial dilution results are greater than the initial sample results the, data are qualified. The detected and non-detected results are qualified as estimated (J) and (UJ), respectively.

Step 2 - If there is evidence of a negative interference, all positive sample results are qualified as estimated (J).

K. Detection Limits

Criteria

1.1 IDLs must be less than the CRDL for all analytes.

1.2 ICP or other methods may be used that do not have IDLs that are less than the CRDLs only if all the sample results are greater than 5 times the IDL for that instrument.

1.3 IDLs must be multiplied by the dilution factors and prep factors before being reported on the Form Is or laboratory equivalent.

Action

The following steps are taken when verifying detection limits for Tier II validation:

Step 1 - On the Form I or laboratory equivalent, correct any sample results that are not reported to the IDL or do not use the correct dilution/preparation factors.

Step 2 - Any positive or non-detected results for As, Tl, Se, or Pb analyzed by ICP, but are not greater than 5 times the IDL are qualified as estimated (J).

IV. Tier III Validation Procedures

Tier III validation of a data package consists of the steps mentioned above for a Tier I and Tier II validation plus review of the "raw data"and recalculation of approximately ten percent of the data results. Furnace atomic absorption analysis and calibration raw data are also reviewed.

A. Calibration

Criteria

1.0 The initial calibration for atomic absorption analysis must contain three standards, one of which must be at the CRDL.

1.1 The correlation coefficient must be greater than or equal to 0.995 for the calibration of atomic absorption, mercury, and cyanide or other photometric determinations.

Action

The following steps are taken when verifying inorganic calibration for Tier III validation:

Step 1 - Review the calibration raw data and Form XIII or laboratory equivalent to confirm that the curve for the analysis did include a standard at the CRDL. If there is not a standard at the CRDL, all positive sample results up to 2 times the CRDL and non-detected results are qualified as estimated (J) and (UJ), respectively.

Step 2 - Evaluate the raw data of atomic absorption, mercury, and cyanide or other photometric determination and calculate the correlation coefficient. If the correlation coefficient is less than 0.995, then all results greater than the IDL and non-detects are qualified estimated (J) and (UJ), respectively.

B. Furnace Atomic Absorption

Criteria

1.0 For sample concentrations greater than the CRDL, duplicate injections must agree within +/- 20 percent RSD, or Coefficient of Variation (CV), otherwise the sample must be reanalyzed once (two additional injections).

1.1 Spike recoveries must be within the control limits of 85 to 115 percent.

1.2 If the post-digestion spike recovery is not within the control limits of 85 to 115 percent and the sample absorbance is greater than 50 percent of the spike absorbance, the Method of Standard Additions is required. The sample must be spiked at 50, 100, and 150 percent of the sample absorbance.

Action

The following steps are taken when reviewing the Furnace Atomic Absorption data:

Step 1 - Review the duplicate injection values for RSD or CV. If they are outside the required criteria specified in Section IV.A.1.0 and the sample was not reanalyzed once as required, all positive results are qualified as estimated (J).

Step 2 - Review the spike recoveries. If they are outside the required criteria mentioned in section IV.A.1.1, all positive results are qualified as estimated (J).

Step 3 - Review the sample absorbance of the post-digestion spike and if the spike absorbance is greater than 50 percent the data are qualified as follows:

A. If the furnace post-digestion spike recovery is not within 85 to 115 percent and the sample result is greater than the IDL, then the data are qualified as estimated (J).

B. If the sample result is non-detected and the furnace post-digestion spike recovery is greater than 10 percent but less than 85 percent, then the data are qualified as estimated (UJ).

C. If the furnace post-digestion spike recovery is less than 10 percent, then positive and non-detected results are qualified as unusable (R).

Step 4 - If the Method of Standard Additions (MSA) is required, but was not performed, then the positive sample results are qualified as estimated (J).

Step 5 - If any samples analyzed by MSA were not spiked at the correct levels, then the positive sample results are qualified as estimated (J).

Step 6 - If the MSA correlation coefficient is less than 0.995, then the positive sample results are qualified as estimated (J).

C. Sample Result Verification

Criteria

The quantitation of the analytes and the adjustment of the CRDL for dilution and percent solids, must be recalculated for 10 percent of the data.

Action

If the criteria above have not been followed, then the laboratory will be contacted by the reviewer and the laboratory will be responsible for resolving any discrepancies and resubmission of results, if needed.

Data Validation Procedures for Polychlorinated Dibenzo-p-Dioxins/Polychlorinated Dibenzofurans

Appendix BB

Data Validation Procedures for Polychlorinated Dibenzo-p-Dioxins and Polychlorinated Dibenzofurans

I. Introduction

This standard operating procedure (SOP) describes the data validation procedures for a USEPA Region I Tiered review of the data for Polychlorinated dibenzo-p-dioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) analyzed by USEPA method 8280 and 8290. Data review procedures presented in this SOP are from the applicable quality control criteria specified in the following documents:

- *Region I Tiered Organic and Inorganic Data Validation Guidelines*, USEPA Region I, July 1, 1993.
- *The Analysis of Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans by High Resolution Gas Chromatography/High Resolution Mass Spectrometry (HRGC/HRMS),* USEPA Method 8290.
- *National Functional Guidelines for Dioxin/Furans Data Validation, Draft Revision DFLM01.1, January, 1996*
- *USEPA Contract Laboratory Program, Statement of Work for the Analysis of PCDDs/PCDFs, Revision DFLM01.1*, September 1991

II. Tier I Validation Procedures

Tier I validation of a data package consists of verifying that all raw data and forms are included and complete. All Form Is or laboratory equivalent (presented in Attachment BB-1) are copied and a data validation summary spreadsheet (presented in Attachment BB-2) is prepared to document the data review. The following steps are taken to complete a Tier I validation:

Step 1 - The laboratory case narrative is reviewed. During review of the case narrative, if any deviations warrant a more extensive validation procedure, a Tier II review would be initiated to evaluated potential data use limitations.

Step 2 - Compare the chain-of-custody and the sample traffic reports. If there are any inconsistencies or if they are incomplete, then contact the laboratory for resolution.

Step 3: Verify that all forms presented in Attachment BB-1 or laboratory equivalent forms are present and complete. If any of the forms are not in the data package contact the laboratory for a resubmission.

Note: If frequent or severe quality control deviations are present on the above-mentioned forms, a more extensive validation procedure may be warranted. Based on the reviewer's judgement, Tier II or Tier III review may be warranted to fully evaluate the usability of the data.

Step 4 - Make a copy of the all sample data Form Is or laboratory equivalent for inclusion in the validation report.

Step 5 - Verify that the following raw data is provided for each sample and associated QA/QC samples in the data package. Contact the laboratory to obtain missing data:

- Case Narrative
- Chain-of-Custody Forms
- Traffic Reports
- QA Sample Summary Forms
- Instrument Calibration Summary Forms
- Instrument Run Logs
- Sample Preparation Logs
- Instrument/Method Detection Limits
- Standards Preparation Logs
- Supporting (raw) Data

Step 6 - With a blue ink pen, record on the first page of the data package: the validation level, date, and reviewer's initials.

III. Tier II Validation Procedures

Tier II validation of a data package consists of the steps mentioned above for a Tier I review plus review of the data package for identification of QA/QC deviations. Tier II validation does not include review of the "raw data" or recalculation of sample results. Sample qualification is performed (if required) following USEPA Guidelines.

A. Data Qualifiers

All data qualified due to QA/QC deviations will be clearly marked on a copy of the Form Is or laboratory equivalent with a blue ink pen. The laboratory qualification is lined out and the reviewer's qualification placed next to it. The date and the initials of the reviewer will also be placed on the Form I. Below is a list of qualifiers to be used.

U The compound or analyte was analyzed for, but was not detected. The sample quantitation limit is presented and adjusted for dilution and (for solid samples only) percent moisture. For consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) as presented in Attachment BB-2.

J The compound or analyte was positively identified, but the associated numerical value is an estimated concentration. This qualifier is used when the data evaluation procedure identifies a deficiency in the data generation process. This qualifier is also used when a compound or analyte is detected at estimated concentrations less than the contract-required detection limit (CRDL) for inorganic analyses or the contract-required quantitation limit (CRQL) for organic analyses.

UJ The compound or analyte was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual level of quantitation. For

consistency with the database and summary tables prepared from the data, non-detected sample results are displayed as ND(CRQL) J as presented in Attachment BB-2.

R Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data should not be used for any qualitative or quantitative purposes.

B The compound or analyte was positively identified in the sample as well as in the associated blank sample. The detected sample concentration may be due in part or whole to contamination that occurred during sample handling and preparation.

B. Holding Times

Criteria

Samples (waters or soils) and extracts must be preserved at 4 degrees centigrade. Specific holding times for each analysis and sample type are presented in Table 1 of the SAP/DCAQAP.

Action

The following steps are performed for the validation of data due to holding times:

Step 1 - Establish the holding time by comparing the sampling date on the chain-of-custody with the dates of analysis and/or extraction on the Form I. The chain-of-custody is also reviewed to determine if the samples were properly preserved.

Step 2 - If the holding times are exceeded by less than 24 hours, then no qualification of data is needed.

Step 3 - If the holding times are exceeded more than 24 hours but less than 14 days then, all the positive results are qualified as estimated (J) and the non-detected compounds are qualified as estimated (UJ).

Step 4 - If the holding times are exceeded by more than twice the specified holding time, then all the results are qualified as unusable (R).

C. Window Defining Mix (WDM)

Criteria

The WDM must be analyzed at the following frequency:

1.0 Before an initial calibration on each instrument and GC column used for analysis.

1.1 Each time adjustments or instrument maintenance activities are performed that may affect retention times.

1.2 Any time retention times of either the $^{13}C_{12}$-1234-TCDD or $^{13}C_{12}$-123789-HxCDD recovery standards in any analysis vary by more than 10 seconds from its retention time in the most recent continuing calibration standard.

Action

The following steps are performed to review WDM for Tier II validation:

Step 1 - Review Form V PCDD-3 or laboratory equivalent and verify the WMD was analyzed at the correct frequency.

Step 2 - If the WMD was not analyzed at the mandated frequency, yet the calibration standards meet the specifications, the data are not qualified. If the initial and continuing calibration meet the specified criteria, it is assumed that this deviation has not affected the data.

D. Chromatographic Resolution

Criteria

The resolution criteria must be evaluated using measurements made on the Selected Ion Current Profile (SICP) for the appropriate ions for each isomers.

1.0 For analyses on a DB-5 (or equivalent) GC column, the chromatographic resolution is evaluated by the analysis of the CC3 standard during both the initial and the continuing calibration procedures.

1.1 The isomers $^{13}C_{12}$-2378-TCDD and $^{13}C_{12}$-1234-TCDD chromatographic peak separation must be resolved with a valley less than or equal to 25 percent.

1.2 The isomers 123478-HxCDD and 123678-HxCDD chromatographic peak separation must be resolved with a valley less than or equal to 50 percent.

1.3 For analyses on an SP-2331 (or equivalent) GC column, the chromatographic resolution is evaluated before the analysis of any calibration standards by the analysis of a commercially available standard.

1.4 The isomers 1478-TCDD and 2378-TCDD chromatographic peak separation must be resolved with a valley less than or equal to 25 percent.

1.5 The isomers 2378-TCDD and (1237/1238)-TCDD chromatographic peak separation must be resolved with a valley less than or equal to 25 percent.

Action

The following steps are performed in evaluating chromatographic resolution for Tier II validation:

Step 1 - Review Form V PCDD-2 or laboratory equivalent to verify that the percent valley criterion has been met.

Step 2 - If the resolution criteria for TCDD are not met, all positive results for Tetras, Pentas, and Hexas (both dioxin and furan) are qualified as estimated (J). No qualification is needed for non-detected results.

Step 3 - If the resolution criteria for HxCDD are not met, all positive results for Hexas (both dioxin and furan) are qualified as estimated (J). No qualification is needed for non-detected results.

E. GC/MS Initial Calibration

Criteria

1.0 Before any sample analysis is conducted, a five-point calibration must be performed.

1.1 All PCDD/PCDF peaks, including the labeled internal and recovery standards, in all solutions must meet the +/- 15 percent theoretical abundance ratio criteria, listed on Form VI PCDD-2 or laboratory equivalent.

1.2 The percent Relative Standard deviation (%RSD) calculated from the five relative response factors (RRFs) for the unlabeled and labeled PCDDs/PCDFs must not be greater than 15 percent.

Action

The following steps are performed in evaluating the initial calibration for Tier II validation:

Step 1 - Review Form VI PCDD-1 and Form VI PCDD-2 or laboratory equivalents to verify that the initial calibration criteria mentioned above as been satisfied.

Step 2 - If there was no five point calibration preceding sample analysis, then all the results are rejected (R).

Step 3 - Review Form VI PCDD-2 or laboratory equivalent to determine if any labeled or unlabeled isomer is outside the ion abundance ratio, theoretical window.

A. If the ion ratio falls between 16 and 20 percent, all non-detected results associated with that initial calibration are qualified as estimated (UJ).

B. If the ion ratio greater than +/- 20 percent, all non-detected results associated with that initial calibration are qualified as unusable (R).

Step 4 - Review Form VI PCDD-1 or laboratory equivalent to determine if the %RSD criterion has not been met:

A. If the %RSD is greater than 20 percent but less than 30 percent, positive and non-detected sample results are qualified as estimated (J) and (UJ), respectively.

B. If the %RSD is greater than 30 percent, positive and non-detected results are rejected (R).

F. GC/MS Continuing Calibration

Criteria

1.0 The continuing calibration standard should be analyzed at the beginning of each 12-hour period.

1.1 All PCDD/PCDF peaks, including the labeled internal and recovery standards, in all solutions must meet the +/- 15 percent theoretical abundance ratio criteria, listed on Form VII PCDD-1 or laboratory equivalent.

1.2 The measured RRF of each analyte and internal standard in the continuing calibration standard must be within +/- 30 percent of the mean RRF from the initial calibration.

Action

The following steps are performed in evaluating the initial calibration for Tier II validation:

Step 1 - Review Form VII PCDD-1 and Form VII PCDD-2 or laboratory equivalents to verify that the continuing calibration criteria mentioned above has been satisfied.

Step 2 - Verify that continuing calibrations were analyzed at the required frequency by reviewing Form V PCDD-3 or laboratory equivalent.

Step 3 - If any analyte(s) failed the ion abundance ratio for the continuing calibration standard, all non-detected results are qualified as rejected (R) and all positive results are qualified as estimated (J).

Step 4 - Review Form VII PCDD-1 or laboratory equivalent to determine if the percent difference (%D) criterion has not been met.

A. If the %D is between 30 and 50 percent, positive and non-detected sample results are qualified as estimated (J) and (UJ), respectively.

B. If the %D is greater than 50 percent, all positive and non-detected results are qualified as rejected (R).

G. Method Blank Analysis

Criteria

1.0 No contaminants should be present in the blank(s).

1.1 A method blank must be analyzed for each GC/MS system used to analyze that specific group or set of samples.

1.2 Internal standard recovery must be between 25 to 150 percent.

Action

The following steps are performed in evaluating the method blank analysis for Tier II validation:

Step 1 - Review Forms I and IV PCDD or laboratory equivalent and verify that blanks were analyzed at the appropriate frequency described above and that the blanks were free of contamination.

Step 2 - If a target compound is found in the blank, but not in the sample, no qualification of the data is performed.

Step 3 - Any compound that is detected in the sample (except OCDD and OCDF) and in the related method blank, is qualified with a "B" if the sample concentration is less than the five times the blank concentration. OCDD and OCDF are qualified with a "B" when the sample result is less than ten times the blank concentration.

Step 4 - When the blank analysis involves internal standards recoveries out of control, the related sample data is reviewed and qualified in the following manner:

A. If the sample data does not contain any internal standards out of control, then the data are not qualified.

B. If the sample data does contain internal standards out of control, then all sample data positive and non-detected sample results for compounds quantitated using that internal standard are qualified as estimated (J) and (UJ), respectively.

H. Matrix Spike Analysis

Criteria

1.0 For each SDG, the laboratory must prepare a spiked sample for each matrix and concentration level that occur in the SDG.

1.1 The recovery of each spiked analyte must be between 50-150 percent.

Action

The following steps are performed in evaluating the matrix spike analysis for Tier II validation:

Step 1 - Review the extraction log and the Form V PCDD-3 or laboratory equivalent, verify that matrix spike analysis was analyzed at the appropriate frequency described above. If the frequency was not in compliance, the laboratory will be contacted for a written explanation.

Step 2 - Evaluate the Form III PCDD-1 or laboratory equivalent if the recovery results are not within the control limits, the following steps are taken to qualify the data:

A. If the recovery results are not within the control limits, the positive results for that class of compounds in the unspiked sample are qualified as estimated (J).

B. If the recovery result is less than 10 percent, the non-detects for that class of compound in the unspiked sample are qualified as rejected (R).

I. Duplicate Analysis

Criteria

1.0 For each SDG, the laboratory must prepare a duplicate sample for each matrix in the SDG.

1.1 The Relative Percent Difference (RPD) of any detected analyte must be less than or equal to 50 percent.

Action

The following steps are performed in evaluating the duplicate analysis for Tier II validation:

Step 1 - Review the extraction log and the Form V PCDD-3 or laboratory equivalent, verify that duplicate analyses were extracted and analyzed at the appropriate frequency as described above. If the frequency was not in compliance, the laboratory will be for contacted a written explanation.

Step 2 - Evaluate the Form IV PCDD-1 or laboratory equivalent if RPD results are greater than 50 percent. Qualify all positive sample results for that compound in the SDG as estimated (J).

J. Internal Standard and Cleanup Standard Recoveries

Criteria

The percent recovery of any internal standard in the original sample, prior to any dilutions, must be within 25 to 150 percent. When the percent recovery is not within these control limits, reextraction and reanalysis of the affected sample is required.

Action

The following steps are performed in evaluating the internal standard and cleanup standard recoveries analysis for Tier II validation:

Step 1 - Review the extraction log and the Form I or laboratory equivalent, verify that the internal standard recoveries are within the control limits of 25 to 150 percent.

Step 2 - If internal standard and/or cleanup standard recoveries are outside the control limits and reanalysis was not completed, the laboratory will be contacted for a written explanation.

Step 3 - If an internal standard recovery is greater than 150 percent, then all positive results associated with that internal standard are qualified as estimated (J).

Step 4 - If an internal standard recovery is within the control limits of 10 to 25 percent, then all positive and non-detected sample results associated with that internal standard are qualified as estimated (J) and (UJ), respectively.

Step 5 - If an internal standard recovery is less than 10 percent, then the following qualification is performed:

A. All positive sample results associated with that internal standard are qualified as estimated (J).

B. All non-detected sample results associated with that internal standard are qualified as unusable (R).

K. Sample Dilutions

Criteria

A dilution is required when the concentration of any PCDD/PCDF is greater than the calibration range.

Action

Review the Form I PCDD-1 or laboratory equivalent to determine if any of the sample results are greater than the calibration range, the sample results are qualified as estimated (J).

IV Tier III Validation Procedures

Tier III validation of a data package consists of the steps mentioned above for a Tier I and Tier II validation plus review of the "raw data" and recalculation of approximately ten percent of the data results. The Instrument Sensitivity, Initial and Continuing Calibration, Compound identification, Toxicity Equivalency Factor, Column Confirmation, Sample Dilution, Sample Reanalysis, Estimated Detection Limits, Estimated Maximum Possible Concentration, are also reviewed.

A. Instrument Sensitivity

Criteria

The CC1 solution analyzed at the end of the twelve-hour period must meet the following criteria:

1.0 The absolute retention time of the recovery standards, $^{13}C_{12}$-1234-TCDD and $^{13}C_{12}$-123678-HxCDD, must not change more than 10 seconds between the initial CC3 analysis and the analysis of the CC1 at the end of the sequence.

1.1 All the analytes in the CC1 solution must meet the ion abundance ratio criteria listed below:

Table BB-1

Analyte	Selected Ions	Theoretical Ion Abundance	Control Limits
TCDD	320/322	0.77	0.65 - 0.89
PeCDD	356/358	1.55	1.24 -1.86
HxCDD	390/392	1.24	1.05 - 1.43
HpCDD	424/426	1.04	0.88 - 1.20
OCDD	458/460	0.89	0.76 - 1.02
TCDF	304/306	0.77	0.65 - 0.89
PeCDF	340/342	1.55	1.24 - 1.86
HxCDF	374/376	1.24	1.05 - 1.43
HpCDF	408/410	1.04	0.88 - 1.20
OCDF	442/444	0.89	0.76 - 1.02
Internal Standards			
$^{13}C_{12}$-1234-TCDD	332/334	0.77	0.65 - 0.89
$^{13}C_{12}$-123678-HxCDD	402/404	1.24	1.05 - 1.43
$^{13}C_{12}$-OCDD	470/472	0.89	0.76 - 1.01
$^{13}C_{12}$-2378-TCDF	316/318	0.77	0.65 - 0.89
$^{13}C_{12}$-1234678-HpCDF	420/422	1.04	0.88 - 1.20
Recovery Standard			
$^{13}C_{12}$-1234-TCDD	332/334	0.77	0.65 - 0.89
$^{13}C_{12}$-123789-HxCDD	402/404	1.24	1.05 - 1.43

1.2 The CC1 solution signal to noise (S/N) ratio of the chromatogram shall be greater than 2.5 for the unlabeled PCDD/PCDF and greater than 10.0 for the labeled internal and recovery standards. The percent recovery of the internal standards should be within the control limits of 25 to 150 percent.

Action

The following steps are performed in evaluating the instrument sensitivity for Tier III validation:

Step 1 - Compare the retention time (RT) of the recovery standards from the chromatographs and quantitation reports of CC3 and CC1. If the RT changes more than +/- 10 seconds, samples analyzed since the last acceptable CC3 standard will be reanalyzed, if the sample has not been destroyed. If the sample has been destroyed, the sample results are qualified as rejected (R).

Step 2 - If the standard's ion abundance ratios are not within the control limits in the Table BB-1, then all non-detected sample results since the last acceptable CC3 are qualified as rejected (R).

Step 3 - If the S/N is less than 2.5 for the two quantitation ions, then all non-detected sample results analyzed since the last acceptable CC1 are qualified as rejected (R).

B. GC/MS Initial Calibration

Criteria

1.0 All calibration solution retention times for each isomer must fall within the appropriate retention time windows established by the window defining mix. The absolute retention time of the recovery standards, $^{13}C_{12}$-1234-TCDD and $^{13}C_{12}$-123678-HxCDD, must not change more than 10 seconds between the initial CC3 analysis and the analysis of the CC1 at the end of the sequence.

1.1 All calibration solution S/N ratios must be greater than 2.5 for the unlabeled PCDD/PCDF ions, and greater than 10 for the internal standard and recovery standard ions.

Action

The following steps are completed when evaluating the initial calibration by reviewing the raw data for each standard for Tier III validation:

Step 1 - If the recovery standards drift more than +/-10 seconds from the initial CC3 analysis, all positive and non-detected sample results are qualified as rejected (R).

Step 2 - If the quantitation ions and the confirmation ion do not maximize within +/-2 seconds for the labeled and unlabeled standards, non-detected sample results are qualified as rejected (R).

Step 3 - For instrument sensitivity evaluation, follow the steps in Section IV.A.

C. GC/MS Continuing Calibration

Criteria

1.0 Retention times of each isomer must fall within the appropriate retention time windows established by the window defining mix. The absolute retention time of the recovery standards, $^{13}C_{12}$-1234-TCDD and

$^{13}C_{12}$-123678-HxCDD, must not change more than 10 seconds between the initial CC3 analysis and the analysis of the CC1 at the end of the sequence.

1.1 For the CC3 calibration solution the S/N ratio must be greater than 2.5 for the unlabeled PCDD/PCDF ions, and greater than 10 for the internal standard and recovery standard ions.

1.2 The percent recovery of the internal standards should be within 25 to 150 percent.

Action

The following steps are done in evaluating the continuing calibration by reviewing all the raw data of the CC3 standard for Tier III validation:

Step 1 - If the recovery standards drift more than +/-10 seconds from the CC3 analysis, all positive and non-detected sample results are qualified as rejected (R).

Step 2 - If the quantitation ions and the confirmation ion do not maximize within +/-2 seconds for the labeled and unlabeled standards, non-detected sample results are qualified as rejected (R).

Step 3 - For instrument sensitivity evaluation, follow the steps in Section IV.A.

Step 4 - If the percent recovery of the internal standards are not within the control limits of 25 to 150 percent, all positive and non-detected sample results are qualified as estimated (J) and (UJ), respectively.

D. Identification Criteria

Criteria

1.0 The absolute retention times (RTs)of the recovery standards must not shift more than +/- 10 seconds form their retention times in the continuing calibration standard.

1.1 The absolute RT at the maximum peak height of the 2378 substituted isomer must be within -1 to +3 seconds of the RT of the corresponding labeled internal or recovery standard.

1.2 The relative retention time (RRT) of the 2378 isomer must be within 0.005 RRT units of the RRT established during the continuing calibration.

1.3 The retention time of non-2378-substituted compounds (tetra - hepta), must be within the RT windows established by the window defining mix for the corresponding homologue, +/- 10 seconds.

1.4 The two quantitation ions and the conformation ion for the analytes detected must maximize concurrently (+/- 2 seconds). This also is a requirement for the internal standards and recovery standards.

1.5. The sample peak areas for quantitation ions must meet the +/- 15 percent theoretical abundance ratio criteria listed in Table BB-1.

1.6 The integrated ion current for each analyte must be at least 2.5 times background noise and the detector must not be saturated. The internal standard ions must be at least 10 times background noise and must not have saturated the detector. The percent recovery of the internal standards should be within 25 to 150 percent.

Action

The following steps are taken in evaluating the identification of the compounds by reviewing all the sample raw data for Tier III validation:

Step 1 - If the retention time criteria is not met and a positive result has been reported, then the result is lined out and a non-detected result will be recorded.

Step 2 - If the quantitation ions and confirmation ion do not maximize within +/- 2 seconds, then the result is lined out and a non-detected result will be recorded.

Step 3 - If the quantitation ions do not meet the signal-to-noise criteria, then the result is lined out and a non-detected result will be recorded.

Step 4 - If the ion abundance criteria are not met, but the abundances are within the +/- 15 percent to 25 percent ion ratio window, the sample results are qualified as estimated (J). Any sample result with an ion abundance greater than +/- 25 percent is qualified as rejected (R).

E. Toxicity Equivalency Factor and second Column Confirmation

Criteria

1.0 For each 2378-substituted isomer positively identified in the sample, the TEF from Form I PCDD-2 is multiplied by the concentration to give the TEF-adjusted concentration.

1.1 When the TEQ is greater than 0.7 ppb in soil/sediment or 7 ppt in water, secondary column confirmation is required.

Action

The following steps are taken in evaluating the Toxicity Equivalency Factor and second Column Confirmation by reviewing Form I PCDD-2, Form II PCDD-3, or laboratory equivalent, and sample raw data for Tier III validation:

Step 1 - Review approximately 10 percent of the TEF calculations. If any discrepancies in the calculations are found, then the laboratory will be contacted and the sample results will be resubmitted.

Step 2 - Verify that secondary column confirmation has been performed when needed. If it has not been done, the laboratory is contacted to conduct the secondary column confirmation if the sample has not been destroyed.

F. Sample Dilution

Criteria

1.0 When a sample is diluted, the sample results are quantified using the internal standard if the recovery is greater than or equal to 10 percent.

1.1 When a sample is diluted, the sample results are quantified using the recovery standards for target compounds associated with the internal standard, if the recovery is less than 10 percent.

Action

The following steps are taken in evaluating the sample dilution raw data for Tier III validation:

Step 1 - Review the diluted sample data. If the recovery of the internal standard is less than 10 percent yet all the other internal standard criteria is met, then the sample results are recalculated using the internal standards.

G. Sample Reanalysis

Criteria

1.0 If any internal standard or the cleanup standard is outside the control limits of 25 to 150 percent, then reextraction and reanalysis are required.

1.1 In the instance, were the internal standards and cleanup standard are not present with at least a 10:1 S/N ratio at their respective m/z, then reextraction and reanalysis are required.

1.2 Samples with positive results that are associated with a contaminated method blank and any samples that contain peaks that do not meet all qualitative identification criteria related to the method blank should be re-extracted and re-analyzed.

Action

The following steps are taken in evaluating the sample reanalysis raw data for Tier III validation:

Step 1 - If sample reanalysis is required by the criteria above, the original sample analysis and reanalysis will be compared and the best analysis will be reported.

H. Estimated Detection Limit (EDL) and Estimated Maximum Possible Concentration (EMPC)

Criteria

For each non-detected sample result, an EDL is calculated. The EMPC is a value applied to a sample when the S/N ratio is at least 2.5 for both quantitation ions, but the ion abundance is not met. Approximately 10 percent of these sample results are recalculated.

Action

If the EDL and EMPC are calculated incorrectly, the laboratory will be contacted and the laboratory will be responsible for resubmission of the reported sample results.

Laboratory Qualifications for Northeast Analytical Services, Inc.

NEW YORK STATE DEPARTMENT OF HEALTH

BARBARA A. DEBUONO, M.D., M.P.H. Commissioner

Expires 12:01 AM April 1, 1999
ISSUED April 1, 1998
REVISED August 6, 1998

CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE

Issued in accordance with and pursuant to section 502 Public Health Law of New York State

Lab ID No.: 11078

Director: MR. ROBERT WAGNER
Lab Name: NORTHEAST ANALYTICAL INC
Address : 301 NOTT STREET
SCHENECTADY NY 12305

is hereby APPROVED as an Environmental Laboratory for the category

ENVIRONMENTAL ANALYSES/SOLID AND HAZARDOUS WASTE

All approved subcategories and/or analytes are listed below:

Characteristic Testing :
- Ignitability
- Reactivity
- TCLP
- E.P. Toxicity

Miscellaneous :
- Lead in Paint
- Hydrogen Ion (pH)

Polynuclear Aron. Hydrocarbon (ALL)
Priority Pollutant Phenols (ALL)

Chlor. Hydrocarbon Pesticides (ALL)
Haloethers (ALL)
Metals II (ALL)
Polychlorinated Biphenyls (ALL)
Purgeable Aromatics (ALL)

Chlorinated Hydrocarbons (ALL)
Metals I (ALL)
Nitroaromatics Isophorone (ALL)
Phthalate Esters (ALL)
Purgeable Halocarbons (ALL)

Serial No.: 103672

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.
Must be conspicuously posted. Valid certificate has a red serial number.

DOH-3317 (3/97)

NEW YORK STATE DEPARTMENT OF HEALTH

BARBARA A. DEBUONO, M.D., M.P.H. Commissioner

Expires 12:01 AM April 1, 1999
ISSUED April 1, 1998
REVISED June 26, 1998

CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE

Issued in accordance with and pursuant to section 502 Public Health Law of New York State

Lab ID No.: 11078

Director: MR. ROBERT WAGNER
Lab Name: NORTHEAST ANALYTICAL INC
Address : 301 NOTT STREET
SCHENECTADY NY 12305

is hereby APPROVED as an Environmental Laboratory for the category

ENVIRONMENTAL ANALYSES/ POTABLE WATER

All approved subcategories and/or analytes are listed below:

Drinking Water Non-Metals : Hydrogen Ion (pH)
Drinking Water Trihalomethane (ALL) Volatile Aromatics (ALL)
Drinking Water Metals I (ALL) Volatile Halocarbons (ALL)
Drinking Water Metals II (ALL)

Serial No.: 102894

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.
Must be conspicuously posted. Valid certificate has a red serial number.

DOH-3317 (3/97)

Lab ID No.: 11078

Director: MR. ROBERT WAGNER
Lab Name: NORTHEAST ANALYTICAL INC
Address : 301 NOTT STREET
SCHENECTADY NY 12305

is hereby APPROVED as an Environmental Laboratory for the category

ENVIRONMENTAL ANALYSES NON POTABLE WATER

All approved subcategories and/or analytes are listed below:

Chlor. Hydrocarbon Pesticides :
- *4,4'-DDD*
- *4,4'-DDE*
- *4,4'-DDT*
- *alpha-BHC*
- *Aldrin*
- *beta-BHC*
- *Chlordane Total*
- *delta-BHC*
- *Dieldrin*
- *Endrin aldehyde*
- *Endrin*
- *Endosulfan I*
- *Endosulfan II*
- *Endosulfan sulfate*
- *Heptachlor*
- *Heptachlor epoxide*
- *Lindane*
- *Methoxychlor*
- *Toxaphene*

Wastewater Metals III :
- *Cobalt, Total*
- *Molybdenum, Total*
- *Tin, Total*
- *Titanium, Total*
- *Thallium, Total*

Chlorinated Hydrocarbons (ALL)
Wastewater Metals II (ALL)
Polynuclear Aromatics (ALL)
Priority Pollutant Phenols (ALL)
Residue (ALL)

Wastewater Miscellaneous :
- *Boron, Total*
- *Oil & Grease Total Recoverable*
- *Hydrogen Ion (pH)*
- *Organic Carbon, Total*

Benzidines (ALL)
Haloethers (ALL)
Nitroaromatics and Isophorone (ALL)
Polychlorinated Biphenyls (ALL)
Purgeable Aromatics (ALL)
TCLP Additional Compounds (ALL)

Chlorophenoxy Acid Pesticides :
- *2,4-D*
- *2,4,5-TP (Silvex)*

Mineral :
- *Calcium Hardness*
- *Hardness, Total*

Wastewater Metals I (ALL)
Nitrosoamines (ALL)
Phthalate Esters (ALL)
Purgeable Halocarbons (ALL)

Serial No.: 102893

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.
Must be conspicuously posted. Valid certificate has a red serial number.

Environmental Laboratory Certification Program

In accordance with the provisions of Regulation 61-81, entitled "State Environmental Laboratory Certification Regulation,"

NORTHEAST ANALYTICAL, INC. (91008)
301 NOTT STREET
SCHENECTADY, NY 12305-1039

is hereby certified to perform analyses as documented on the attached parameter list(s). This certification does not guarantee validity of data generated, but indicates the laboratory's adherence to prescribed methodology, quality control, records keeping, and reporting procedures. This certificate is the property of S.C. DHEC and must be surrendered upon demand. This certificate is non-transferable and is valid only for the parameters and methodology listed on the attached parameter lists(s).

Certifying Authority: NY
Date of Issue: 07/13/1998

Laboratory Qualifications for CT & E Environmental Services, Inc.

Colorado Department of Public Health and Environment

under Primacy Agreement with the
United States Environmental Protection Agency
Pursuant to the Safe Drinking Water Regulations, 40CFR, Part 141

Certifies

CT&E ENVIRONMENTAL SERVICES, INC.
1258 Greenbrier Street
Charleston, WV 25311

is in compliance with the criteria and procedures of the EPA, Manual for the Certification of Laboratories Analyzing Drinking Water.
The laboratory may perform **Chemistry Analysis** on public drinking water for the following analyte groups:

Trace Metals(TM1,TM2), Nitrate, Nitrite
Pesticides(P1,P2), Herbicides(H1,H2),
Carbamates, PAH, Cyanide
Trihalomethanes(THM), Volatile Organic Chemicals(V1-V2-V3)

Approved analytes and methods are delineated on certification list of June 24, 1998

Certificate of Laboratory Certification for the Chemical Analysis of Drinking Water

in accordance with 401 KAR Chapter 8, issued to:

CT&E Environmental Services
1258 Greenbrier Street
Charleston, West Virginia 25311

for the analytes listed on the most current certified parameter list.

Scott Bays

Gleason L. Wheatley

Certification Officers

Laboratory ID # 90032

Expires December 31, 1998

№ 087

STATE OF MARYLAND

DEPARTMENT OF HEALTH AND MENTAL HYGIENE
LABORATORIES ADMINISTRATION

Certifies That

CT&E ENVIRONMENTAL SERVICES, INC.
1258 Greenbrier Street, Charleston, West Virginia 25311

having duly met the requirements of the

Regulations Governing Laboratory Certification
And Standards Of Performance In Accordance With
The Annotated Code of Maryland,
is hereby approved as a

State Certified Water Quality Laboratory

To perform the analyses indicated on the Annual Certified Parameter List,
which must accompany this certificate.

Approved Analyses: **Trace Metals 1,2; Inorganics 1,2,3,5; Pesticides 1,2,3; Herbicides; THM; VOCs 1,2; Benzo(a)pyrene.**

Certification # 211

Date Issued June 30, 1998

Expiration Date June 30, 1999
(Not Transferable)

J. Melissen Joseph
Director, Laboratories Administration

This certification is subject to unannounced laboratory inspections

CONSPICUOUSLY DISPLAY IN THE LABORATORY WITH THE ANNUAL CERTIFIED PARAMETER LIST.

CERTIFIED MAIL NO. P 282 636 781

Mr. Paul P. Painter
Commercial Testing & Engineering Co.
1258 Greenbrier Street
Charleston, West Virginia 25311

Re: Laboratory Certification Status, WS039
DEP 68-512, EPA WV00032

Dear Mr. Painter:

Recently, a set of Chemical Performance Evaluation Samples was sent to you for analysis through EPA's Quality Assurance Program. The results of your analysis, the true values, and acceptance limits are provided on the enclosed data report. Your current status in the Laboratory Certification Program in Pennsylvania is as shown below:

Category of Analysis	Certification Status
TM1,TM2,F,CN,C P1,P3,H1,H2,SOC1,SOC3 TTHM,VOC1,VOC2,VOC3	Classified as "Certified"
TM3*,N/N,P2	Classified as "Provisionally Certified" You must follow the procedures in Appendix A of the "Critical Elements of Chemistry" and/or correct the deviations listed on your laboratory's on-site report in order to be upgraded to "Certified". Classified as "Not Certified" No drinking water analysis data will be accepted by the Department or its Designee in the category listed until satisfactory Performance Evaluation results have been achieved.

COMMENTS: * Lab did not use an approved method for Thallium.

Any person aggrieved by this Action may appeal, pursuant to Section 4 of the Environmental Hearing Board Act, 35 P.S. Section 7514, and the Administrative Agency Law, 2 Pa. C.S. Chapter 5A, to the Environmental Hearing Board, Second Floor, Rachel Carson State Office Building, P.O. Box 8457, Harrisburg, PA 17105-8457, 717-787-3483. TDD users may contact the Board through the Pennsylvania Relay Service 800-654-5984. Appeals must be filed with the Environmental Hearing Board within 30 days of receipt of written notice of this action unless the appropriate statute provides a different time period. Copies of the appeal form and the Board's rules of practice and procedures may be obtained from the Board. The appeal form and the Board's rules of practice and procedure are also available in braille or on audiotape from the Section to the Board at 717-787-3483. This paragraph does not, in and of itself, create any right of appeal beyond that permitted by applicable statutes and decisional law.

If you have any questions regarding your laboratory certification status, please contact James Yoder at 717-783-7150.

Sincerely,

Richard Sheibley
Chief
Quality Assurance and
Laboratory Certification Section

FIELD PARAMETERS: Chlorine [Cl_2-*total* residual-Hach DR-100], Hydrogen Ion [pH-4500-H^+ B], Oxygen [*dissolved*-DO-4500-O G], Specific Conductance 2510 B, Sulfite [SO_3^{2-}], Temperature [*field*-2550 B].***

SPECIFIC ION ELECTRODE: Fluoride [*total*-4500-F^- B & C], Hydrogen Ion [pH-4500-H^+ B], Oxygen [*dissolved*-DO-4500-O G].***

NUTRIENTS: Ammonia [NH_3 as N-4500-NH_3 B & E], Nitrogen [Kjeldahl-TKN-N_{org} as N-4500-N_{org} B & 4500-NH_3 E], Nitrate-Nitrite [NO_3^--NO_2^- as N-353.2 LaChat], Phosphate [*ortho*-PO_4^{3-} as P-4500-P E, *total*-PO_4^{3-} as P-4500-P B.5. & E].***

METALS-COLORIMETRIC 3500: Chromium [Cr^{6+}-*hexavalent*-3500-Cr D].***

METALS-FLAME/AA 3111: Mercury [*cold vapor*-3112 B].***

METALS-FURNACE/AA 3113: Antimony, Arsenic, Cadmium, Chromium, Copper, Lead, Nickel, Selenium, Silver, Thallium.***

METALS-ICP/AES-ATOMIC EMISSION SPECTROMETRY 200.7 - 6010: Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Hardness [Mg+Ca], Iron, Lead, Magnesium, Manganese, Molybdenum, Nickel, Potassium, Selenium, Silicon, Silver, Sodium, Thallium, Tin, Titanium, Vanadium, Zinc.***

MICROBIOLOGY: Coliform [*fecal*-MF-9222 D & MPN-9221 C , *total*-MF-9222 B & MPN-9221], Heterotrophic Plate Count [*HPC*-9215 B].***

DEMANDS: Biochemical Oxygen Demand [BOD_5 & $CBOD_5$-5 day-5210 B], Chemical Oxygen Demand [COD-410.4-5220 D], Total Organic Carbon [TOC-415.1-9060].***

This Certification Expires on May 31, 1999.

David F. Wolfe

David F. Wolfe, PhD
Quality Assurance Officer

4/5/98

Certificate No. **020** .

State of West Virginia

Department of Health and Human Resources
Bureau For Public Health

Office of Laboratory Services

This is to certify that the following laboratory has been approved to perform the indicated procedures on drinking water in accordance with West Virginia §64CSR 13-3:

CT&E Environmental Services, Inc.
1258 Greenbrier Street
Charleston, WV 25311

Certified Parameter List

METALS I, II
INORGANICS I, II, III, V
PESTICIDES I, II, III
HERBICIDES
THM
VOC I, II
SOC I

*Indicates Provisional Certification for Parameter or Group

Certificate expires December 31, 1998 unless sooner withdrawn.

Certificate Number: 00202 C Date of Issue: January 1, 1998

Laboratory Director: Paul P. Painter

Precision and Accuracy Statement Method SW8081
for Polychlorinated Biphenyls (PCB's)
Soil Matrix
30 grams initial weight conc. to aprox. 5 mL

Instrument: GC7 **Analyst: RRR/KPP**

Channel: A

Laboratory Qualifications for Columbia Analytical Services, Inc.

State of Connecticut, Department of Public Health

Approved Environmental Laboratory

THIS IS TO CERTIFY THAT THE LABORATORY DESCRIBED BELOW HAS BEEN APPROVED BY THE STATE DEPARTMENT OF PUBLIC HEALTH PURSUANT TO APPLICABLE PROVISIONS OF THE PUBLIC HEALTH CODE AND GENERAL STATUTES OF CONNECTICUT, FOR MAKING THE EXAMINATIONS, DETERMINATIONS OR TESTS SPECIFIED BELOW WHICH HAVE BEEN AUTHORIZED IN WRITING BY THAT DEPARTMENT.

COLUMBIA ANALYTICAL SERVICES, INC.

LOCATED AT 1 MUSTARD STREET, SUITE 250 IN ROCHESTER, NEW YORK 14609
AND REGISTERED IN THE NAME OF MICHAEL K. PERRY
THIS CERTIFICATE IS ISSUED IN THE NAME OF MICHAEL K. PERRY WHO HAS BEEN DESIGNATED

BY THE REGISTRANT TO BE IN CHARGE OF THE LABORATORY WORK COVERED BY THIS CERTIFICATE OF APPROVAL AS FOLLOWS:

POTABLE WATER, WASTEWATER AND/OR TRADE WASTE, SEWAGE AND/OR EFFLUENT, SOIL

Examination for:
INORGANIC CHEMICALS
ORGANIC CHEMICALS

SEE COMPUTER PRINT-OUT FOR SPECIFIC TESTS APPROVED

THIS CERTIFICATE EXPIRES JUNE 30, 2000 AND IS REVOCABLE FOR CAUSE BY THE STATE DEPARTMENT OF PUBLIC HEALTH
DATED AT HARTFORD, CONNECTICUT, THIS 21st DAY OF JULY 1998

PH-0556

Thomas K. Sturgeon

DIRECTOR, DIVISION OF ENVIRONMENTAL HEALTH

The American Industrial Hygiene Association

is proud to acknowledge that

Columbia Analytical Services, Inc.

Rochester, NY
Laboratory ID# 7889

has fulfilled the requirements for Industrial Hygiene Laboratory Accreditation and has earned distinguished recognition as an

AIHA IH Accredited Laboratory

Originally Accredited July 1, 1997, current certificate effective July 1, 1997 until July 1, 2000, subject to continued compliance with AIHA accreditation criteria.

certifies

M- NY032 Columbia Analytical Services
1 Mustard Street, Suite 250
Rochester, NY 14609

Laboratory Director: **Michael K. Perry**

for the ***Chemical Analysis of Potable and Non-Potable Water***

pursuant to 310 CMR 42.00

This certificate supersedes all previous Massachusetts certificates issued to this laboratory. The laboratory is regulated by and shall be responsible for being in compliance with Massachusetts regulations at 310 CMR 42.00.

This certificate is valid only when accompanied by the latest dated Certified Parameter List as issued by the Massachusetts D.E.P.

Certification is no guarantee of the validity of the data. This certification is subject to unannounced laboratory inspections.

Director, Division of Environmental Analysis

ROCHESTER, NY 14608
Lab ID # 73004
Attn: MICHAEL K. PERRY

July 21, 1997

Dear Laboratory Manager:

The Office of Quality Assurance (OQA) will not be issuing a Certificate or an Annual Certified Parameter List at this time. New Certificates will be issued as soon as they become available. Annual Certified Parameter Lists will be generated and forwarded once our Environmental Laboratory Certification Program completes the development of its computerized data base.

Effective with the receipt of this letter your laboratory's certification status is temporarily extended until December 31, 1997 or until new Certificates and Annual Certified Parameter Lists become available, whichever is earlier. To determine your laboratory's current certification status please use the temporary Annual Certified Parameter List issued August 1, 1996, and all written notices of certifications and suspensions received by your laboratory since that time.

Additionally, laboratories that have submitted an administratively complete application to the OQA by July 1, 1997 for certification in categories SHW1 through SHW12 and CLP1 through CLP7, are given temporary approval. Part III of your Fiscal/Certification Year 1997 Renewal Application should be used to determine your approval status. For those laboratories submitting a completed Fiscal/Certification Year 1998 Renewal Application, Part III of that application should be used in place of the 1997 Renewal Application.

As always, we are available to discuss any comments or questions. Please do not hesitate to contact me or one of the laboratory certification officers.

Sincerely,

Joseph F. Aiello, Chief

NYAAEL CERTIFICATE OF MEMBERSHIP

Columbia Analytical Services

is hereby recognized a member of NYAAEL for the year 1997-98

OUR MISSION:

The New York Association of Approved Environmental Laboratories (NYAAEL) is a non-profit organization of NYS DOH approved laboratories and related industry representatives which takes a leadership role in promoting the advancement of environmental laboratories through:

- Providing educational opportunities, professional development, and dissemination of information to our members;
- Providing a forum for communication among environmental laboratories, regulatory agencies, professional organizations, and related businesses;
- Encouraging quality performance and ethical practices of its members;
- Championing the interests of the environmental laboratory community.

RE: **License Number 158**

Dear Mr. Perry:

This is to acknowledge acceptance of the Analytical Laboratory License Renewal Application for the period of July 1, 1998 until June 30, 2000.

In accordance with the provisions of Chapter 23-16.2-A/LAB of the Rhode Island General Laws 1956, as amended, the Rhode Island Department of Health hereby issues this license renewal for the period as specified above, authorizing the operation and maintenance of this facility known as **Columbia Analytical Services Inc.**

This license covers the premise located at:

1 Mustard St., Suite 250
Rochester, New York 14609

Sincerely,

Wayne I. Farrington

RE: **UST LABORATORY APPROVAL**
Columbia Analytical Services
Rochester, NY Laboratory

Dear Ms. Reyes:

The Tennessee Division of Underground Storage Tanks (the "Division") has received your updated New York Laboratory Certification (July 24, 1998 letter). Your **Rochester, NY** laboratory will remain on our list of Tennessee UST Approved Laboratories for BTX and TPH analyses.

You must submit proper documentation of your laboratory's ability to perform BTX and TPH analyses at least thirty (30) days before your current approval expires. Failure to maintain laboratory approval will result in the REJECTION of sample analyses from your laboratory by the Division. Your laboratory's approval for BTX analysis expires on July 1, 1999 and your laboratory's approval for TPH analysis expires on July 1, 1999.

If you have any questions or comments please call me at (615) 532-0945.

Sincerely,

Michael Langreck/dsp

S = Standard Deviation using n-1 method.

N = number of replicates.

MDL = t x S where t = 3.14 for 7 replicates.

METALS INSTUMENT DETECTION LIMITS

The IDL (ppb) is determined by multiplying the t(n-1) by the standard deviation obtained on three days from the analysis of seven consecutive measurements of a standard solution at a concentration of 3-5 times the IDL on each day.

IDL = t(n-1) X SDev.
When n = 21, t(n-1) = 2.528

Laboratory Qualifications for Quanterra Environmental Services, Inc.

The Commonwealth of Massachusetts

Department of Environmental Protection

Division of Environmental Analysis
Senator William X. Wall Experiment Station

certifies

M- PA164 Quanterra Environmental Services
Pittsburgh Laboratory
450 William Pitt Way
Pittsburgh, PA 15238

Laboratory Director: **Albert Vicinie**

for the ***Chemical Analysis of Potable and Non-Potable Water***

pursuant to 310 CMR 42.00

This certificate supersedes all previous Massachusetts certificates issued to this laboratory. The laboratory is regulated by and shall be responsible for being in compliance with Massachusetts regulations at 310 CMR 42.00.

This certificate is valid only when accompanied by the latest dated Certified Parameter List as issued by the Massachusetts D.E.P.

Certification is no guarantee of the validity of the data. This certification is subject to unannounced laboratory inspections.

Director, Division of Environmental Analysis

101 Antimony
102 Arsenic
103 Barium
104 Beryllium
105 Cadmium
106 Chromium
107 Copper
108 Lead
109 Mercury
110 Nickel
111 Selenium
113 Thallium
114 Nitrate-N
115 Nitrite-N
116 Fluoride
117 Sodium
119 Cyanide
122 Calcium
123 Total Alkalinity
124 Total Dissolved Solids
* 125 pH
128 2,4-D
129 2,4,5-TP
136 Chlordane
137 Endrin
138 Heptachlor
139 Heptachlor Epoxide
140 Hexachlorobenzene
* 141 Hexachlorocyclopentadiene
142 Lindane
143 Methoxychlor
144 Simazine
145 Toxaphene
153 Trihalomethanes
154 Volatile Organic Compounds

*** Provisional Certification**

The State of New Hampshire
Department of Environmental Services

CERTIFICATE OF APPROVAL
Drinking Water Analysis

Issued to
Quanterra Environmental Services

Located at
450 William Pitt Way, Pittsburgh, PA

Under the provisions of the Regulations in Env-C300
for the following analyses:

FULL CERTIFICATION: Metals by Graphite Furnace, Metals by ICP, Nitrate-N, Nitrite-N, Fluoride, Orthophosphate, Residual Free Chlorine, Turbidity, Total Filterable Residue, Calcium, pH, Alkalinity, Corrosivity, Sodium, Sulfate, Total Cyanide, TOC, Insecticides (Compliance List), Trihalomethanes, Volatile Organics, and Vinyl Chloride.

PROVISIONAL CERTIFICATION: Herbicides (Compliance List).

CERTIFICATE NUMBER: 203098-A

DATE OF ISSUE: April 5, 1998

EXPIRATION DATE: April 4, 1999

Charles M. Boyce
Certifying Officer

NEW YORK STATE DEPARTMENT OF HEALTH

BARBARA A. DEBUONO, M.D., M.P.H. Commissioner

Expires 12:01 AM April 1, 1999
ISSUED April 1, 1998
REVISED June 17, 1998

CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE

Issued in accordance with and pursuant to section 502 Public Health Law of New York State

Lab ID No.: 11182

Director: MR. ALBERT VICINIE
Lab Name: QUANTERRA INC
Address : 450 WILLIAM PITT WAY - BLDG 6
PITTSBURGH PA 15238

is hereby APPROVED as an Environmental Laboratory for the category

ENVIRONMENTAL ANALYSES/SOLID AND HAZARDOUS WASTE

All approved subcategories and/or analytes are listed below:

Characteristic Testing :
- Corrosivity
- Ignitability
- Reactivity
- TCLP
- E.P. Toxicity

Volatile Chlorinate Organics (ALL)

Miscellaneous :
- Cyanide, Total
- Hydrogen Ion (pH)
- Sulfide (as S)

Organophosphate Pesticides (ALL)
Phthalate Esters (ALL)

Acrolein and Acrylonitrile (ALL)
Chlor. Hydrocarbon Pesticides (ALL)
Haloethers (ALL)
Metals II (ALL)
Polynuclear Arom. Hydrocarbon (ALL)
Priority Pollutant Phenols (ALL)

Chlorophenoxy Acid Pesticides (ALL)
Chlorinated Hydrocarbons (ALL)
Metals I (ALL)
Nitroaromatics Isophorone (ALL)
Polychlorinated Biphenyls (ALL)
Purgeable Aromatics (ALL)

Serial No.: 102540

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.
Must be conspicuously posted. Valid certificate has a red serial number.

DOH-3317 (3/97)

ENVIRONMENTAL ANALYSES NON POTABLE WATER

All approved subcategories and/or analytes are listed below:

Wastewater Miscellaneous :
- Bromide
- Boron, Total
- Cyanide, Total
- Color
- Corrosivity
- Phenols
- & Grease Total Recoverable
- Hydrogen Ion (pH)
- Specific Conductance
- Silica, Dissolved
- Sulfide (as S)
- Surfactant (MBAS)
- Organic Carbon, Total

Mineral :
- Acidity
- Alkalinity
- Calcium Hardness
- Chloride
- Sulfate (as SO4)
- Hardness, Total

Polynuclear Aromatics (ALL)
Priority Pollutant Phenols (ALL)
Residue (ALL)

Acrolein and Acrylonitrile (ALL)
Chlorophenoxy Acid Pesticides (ALL)
Chlorinated Hydrocarbons (ALL)
Haloethers (ALL)
Wastewater Metals I (ALL)
Nitroaromatics and Isophorone (ALL)
Nutrient (ALL)
Polychlorinated Biphenyls (ALL)
Purgeable Aromatics (ALL)
TCLP Additional Compounds (ALL)

Benzidines (ALL)
Chlor. Hydrocarbon Pesticides (ALL)
Demand (ALL)
Wastewater Metals III (ALL)
Wastewater Metals II (ALL)
Nitrosoamines (ALL)
Organophosphate Pesticides (ALL)
Phthalate Esters (ALL)
Purgeable Halocarbons (ALL)
Volatile Chlorinated Organics (ALL)

Serial No.: 103391

Laboratory Qualifications for CompuChem

NEW YORK STATE DEPARTMENT OF HEALTH

BARBARA A. DEBUONO, M.D., M.P.H. Commissioner

Expires 12:01 AM April 1, 1999
ISSUED April 1, 1998
REVISED August 11, 1998

CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE

Issued in accordance with and pursuant to section 502 Public Health Law of New York State

Lab ID No.: 10065

Director: MR. ROBERT METERER
Lab Name: COMPUCHEM
Address : 501 MADISON AVENUE
CARY NC 27513

is hereby APPROVED as an Environmental Laboratory for the category

ENVIRONMENTAL ANALYSES/SOLID AND HAZARDOUS WASTE

All approved subcategories and/or analytes are listed below:

haracteristic Testing :
Corrosivity
Ignitability
Reactivity
E.P. Toxicity
geable Halocarbons (ALL)

Miscellaneous :
Cyanide, Total
Haloethers (ALL)
Nitroaromatics Isophorone (ALL)
Phthalate Esters (ALL)

Acrolein and Acrylonitrile (ALL)
Chlor. Hydrocarbon Pesticides (ALL)
Metals I (ALL)
Polynuclear Arom. Hydrocarbon (ALL)
Priority Pollutant Phenols (ALL)

Chlorophenoxy Acid Pesticides (ALL)
Chlorinated Hydrocarbons (ALL)
Metals II (ALL)
Polychlorinated Biphenyls (ALL)
Purgeable Aromatics (ALL)

Serial No.: 103698

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.
Must be conspicuously posted. Valid certificate has a red serial number.

DOH-3317 (3/97)

ENVIRONMENTAL ANALYSES NON POTABLE WATER

All approved subcategories and/or analytes are listed below:

Chlor. Hydrocarbon Pesticides :
- 4,4'-DDD
- 4,4'-DDE
- 4,4'-DDT
- alpha-BHC
- Aldrin
- beta-BHC
- Chlordane Total
- delta-BHC
- Dieldrin
- Endrin aldehyde
- Endrin
- Endosulfan I
- Endosulfan II
- Endosulfan sulfate
- Heptachlor
- Heptachlor epoxide
- Lindane
- Methoxychlor
- PCNB
- Toxaphene

Wastewater Metals III :
- Cobalt, Total
- Molybdenum, Total
- Tin, Total
- Titanium, Total
- Thallium, Total

Mineral :
- Alkalinity
- Calcium Hardness
- Chloride
- Fluoride, Total

Wastewater Metals I (ALL)
Nitrosoamines (ALL)
Phthalate Esters (ALL)
Purgeable Halocarbons (ALL)

Wastewater Miscellaneous :
- Boron, Total
- Cyanide, Total
- Oil & Grease Total Recoverable
- Hydrogen Ion (pH)
- Organic Carbon, Total

Residue :
- Solids, Total Dissolved
- Solids, Total

Benzidines (ALL)
Chlorinated Hydrocarbons (ALL)
Wastewater Metals II (ALL)
Polynuclear Aromatics (ALL)
Priority Pollutant Phenols (ALL)

Nutrient :
- Kjeldahl Nitrogen, Total
- Ammonia (as N)
- Nitrate (as N)
- Orthophosphate (as P)
- Phosphorus, Total

TCLP Additional Compounds :
- Methylethyl ketone (2-butanone)

Acrolein and Acrylonitrile (ALL)
Chlorophenoxy Acid Pesticides (ALL)
Haloethers (ALL)
Nitroaromatics and Isophorone (ALL)
Polychlorinated Biphenyls (ALL)
Purgeable Aromatics (ALL)

Serial No.: 103697

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.
Must be conspicuously posted. Valid certificate has a red serial number.

Laboratory Qualifications for Maxymillian Technologies

The Commonwealth of Massachusetts

Department of Environmental Protection

Division of Environmental Analysis
Senator William X. Wall Experiment Station

certifies

M-MA146 Maxymillian Technologies, Inc.
86 South Main St.
Lanesboro, MA 01237

Laboratory Director: **John M. Massimiano**

for the ***Chemical Analysis of Non-Potable Water***

pursuant to 310 CMR 42.00

This certificate supersedes all previous Massachusetts certificates issued to this laboratory. The laboratory is regulated by and shall be responsible for being in compliance with Massachusetts regulations at 310 CMR 42.00.

This certificate is valid only when accompanied by the latest dated Certified Parameter List as issued by the Massachusetts D.E.P.

Certification is no guarantee of the validity of the data. This certification is subject to unannounced laboratory inspections.

Director, Division of Environmental Analysis

Issued: **07/01/98**

Expires: **06/30/99**
