1. County of Pittsylvania Comprehensive Plan, 1986. Derived from the 1951-1980 monthly normals for Chatham, VA.

2. Ruffner and Bair, 1987. Derived from the 1951-1980 monthly normals for Lynchburg, VA.

3. National Climate Data Center, 1988. Average monthly total pan evaporation derived from the period 1967-1983 for Philpott, VA. Data not available for November through March. Total pan evaporation calculated to be 52 inches. Pan coefficient = 0.77. Lake evaporation = 0.77 pan evaporation.

4. State Climatology Board, 1988. Derived from the 1951-1980 monthly normals for Danville, VA, calculated using Thornthwaite method.

5. Potential moisture deficit excess = Precipitation minus potential evapotranspiration. + = excess, - = deficit.

PITTSYLVANIA COUNTY POPULATION DATA BY AGE BRACKET AND GENDER

AR301100

TABLE 12

PITTSYLVANIA COUNTY POPULATION DATA BY AGE BRACKET AND GENDER

Pre-School Population - Under 5 Years of Age

1970	4,946	2,508 male	2,438 female
1980	4,423	2,250 male	2,171 female
% changed	-10.6 %	-10.2%	-11.0%

School Age Population - 5 to 14 Years of Age

1970	12,811	6,464 male	6,347 female
1980	10,600	5,493 male	5,107 female
% changed	-17.3%	-15.0%	-19.5%

High School - Working Age 15 to 59 Years of Age

1970	33,643	16,576 male	17,076 female
1980	40,892	20,130 male	20,130 female
% changed	+21.5%	+21.4%	21.6%

Pre-Retirement Age - 60 to 64 Years of Age

1970	2,330	1,123 male	1,207 female
1980	3,094	1,399 male	1,695 female
% changed	+32.8	+24.6	+40.4

Retired - Elderly - 65 Years of Age and Older

1970	5,059	2,284 male	2,775 female
1980	7,138	3,145 male	3,993 female
% changed	+41.1%	+37.7 %	+43.9%

Total County Population

1970	58,789
1980	66,147

(from County of Pittsylvania Comprehensive Plan, 1986).

Southern Quarry	0.00407	538	0.1004	0.0054
Internal	0.00224	---	---	---

The mean annual precipitation in Pittsylvania Co. is 43.48-inches (County of Pittsylvania, 1986).

¹U.S. Geological Survey, 1970, Virginia Streamflow Data Program Analysis:
 Unpublished Open File Report.

MAF (Mean Annual Flow, in cubic ft per second) =

$$0.055A^{0.92} \times S^{0.12} \times L^{0.18} \times (P-20)^{0.76}$$

where A = basin area; S = basin slope as measured at 10% and 85% along main drainage line, L = main channel length, and P = mean annual precipitation.

²See Figure 3 and Drawing 1 for drainage basin areas.

TABLE 25
MOST STRINGENT GROUND-WATER AND SURFACE WATER ARARS

AR301167

TABLE 25
Most Stringent Ground Water and Surface Water ARARs

Compound	Ground Water ARAR (mg/l)	Surface Water ARAR (mg/l)
Barium	1	1
Arsenic	0.05	0.0000022
Zinc	0.05	0.047
Nickel	--	1.3×10^{-10}
Cadmium	0.0004	0.0011
Lead	0.05	0.0032
Antimony	--	0.15
Copper	1.0	0.012
Mercury	0.00005	0.000012
Vanadium	--	--
Selenium	0.01	0.01
Benzene	0.005	0.00066

These ARARs consist of the most stringent values from the Federal Safe Drinking Water Act/RCRA values, Clean Water Act's Water Quality Criteria and Virginia Water Quality Standards.

See Appendix N for a complete listing of ARARs.

ASSUMPTIONS and NOTES

Ingested metals are 100% bioavailable; concentrations of leachate are dissolved concentrations.

Exposure averaged over a 1-year period.

Average = Daily ingestion by 70 kg adults of 2 liters of the arithmetic mean concentration of leachate in the quarry and seeping into the North Drainage.

Worst Case = Daily ingestion by 20 kg child of 1 liter of the lower of the 95% confidence limits of the mean or the highest observed concentration of leachate in the quarry or seeping into the North Drainage.

ASSUMPTIONS and NOTES

Assumptions for exposure to non-carcinogenic compounds apply.

NA = Non-carcinogenic by the oral route.

Life-time exposure assumes 10 years of childhood (20 kg, 1 liter/d), 5 years adolescence (36 kg, 2 liter/d), and 55 years of adulthood (70 kg, 2 liter/d) with exposure averaged over 70 years.

AR301198

TABLE 28-1 (Continued)

HUMAN INGESTION OF LEACHATE

FORMULAE

EXPOSURE TO NON-CARCINOGENS

$$\text{Exposure Dose} = \frac{\text{Ca} \times \text{I}}{\text{W}}$$

where:

- Ca - Contaminant concentration in mg/l
 I - ingestion rate in liters/day
 W - weight of human in kg

EXPOSURE TO CARCINOGENS

$$\frac{\text{ED}(\alpha) \times \text{Ca} \times \text{I}(\alpha)}{\text{W}(\alpha)}$$

$$\text{Exposure Dose} = \frac{}{\text{LT}}$$

where:

- ED(α) - exposure duration
 Ca - Contaminant concentration in mg/l
 I(α) - ingestion rate in liters/day for each ED
 W(α) - weight of human in kg for each ED
 LT - lifetime in years

ASSUMPTIONS and NOTES

Ingested metals in soil matrix are 50 (average case) to 100% (worst case) bioavailable; exposures averaged over 1 year. Average = Ingestion by a 20 kg child of 200 mg of soil per play day, child plays 2 days per week for 26 weeks per year in source material at the site. Ingested concentrations are arithmetic mean of site source samples.

Worst = Ingestion by a 20 kg child of 400 mg of soil per play day, child plays 4 days per week for 40 weeks per year in source material at the site. Ingested concentrations are the lower of the 95% confidence limits of the mean or the highest observed concentration of site source samples.

ASSUMPTIONS and NOTES

Ingested metals in water are 100% bioavailable; exposures averaged over 1 year.
 Average = Ingestion by a 20 kg child of 25 ml of water per play day while wading in water, child plays 2 days per week for 26 weeks per year in water at the site. Ingested concentrations are arithmetic mean of site samples.
 Worst = Ingestion by a 20 kg child of 50 ml of water per play day, child plays 4 days per week for 40 weeks per year in water at the site. Ingested concentrations are the lower of the 95% confidence limits of the mean or the highest observed concentration of site samples.

ASSUMPTIONS AND NOTES

NA = Non-carcinogenic by the oral route. Assumptions for exposure to non-carcinogenic compounds apply.
 Life-time exposure assumes 15 years of childhood (20 kg), exposures averaged over 70 years. Adults ingest no water.
 Average = Assumes child ingests 25 ml per play day for 15 years. Play occurs 2 days per week for 26 weeks per year.
 Worst = Assumes child ingests 50 ml per play day for 15 years, play occurs 4 days per week, 40 weeks per year.

ASSUMPTIONS and NOTES

Ingested metals are 100% bioavailable; concentrations are dissolved concentrations.

Exposure averaged over a 1-year period.

Average = Daily ingestion by 70 kg adults of 2 liters of the arithmetic mean concentration of material in Lawless Creek.

Worst Case = Daily ingestion by 20 kg child of 1 liter of the lower of the 95% confidence limits of the mean or the highest observed concentration of contaminants in Lawless Creek.

ASSUMPTIONS AND NOTES

Ingested metals in soil matrix are 50 (average case) to 100% (worst case) bioavailable; exposures averaged over 1 year. Average = Ingestion by a 70 kg adult of 60 mg of soil per activity day, adult gardens 2 days per week for 26 weeks per year in quarry soil. Ingested concentrations are arithmetic mean of quarry soil samples.

Worst = Ingestion by a 70 kg adult of 100 mg of soil per activity day, adult gardens 4 days per week for 40 weeks per year in quarry soil. Ingested concentrations are the lower of the 95% confidence limits of the mean or the highest observed concentration of site samples.

EXPOSURE TO CARCINOGENS

$$\frac{\text{ED}(\alpha) \times \text{P} \times \text{Ca} \times \text{I}(\alpha) \times \text{F} \times \text{A}}{\text{W}(\alpha)}$$

$$\text{Exposure Dose} = \frac{\text{ED}(\alpha)}{\text{LT}}$$

where:

- ED(α) = exposure duration
- P = proportion of year exposed
- Ca = contaminant concentration in mg/kg
- I(α) = soil ingestion rate in mg/day for each ED
- F = daily frequency
- W(α) = weight in kg for each ED
- LT = lifetime in years
- A = bioavailability in percent

ASSUMPTIONS and NOTES

For constituents marked with "*", oral chronic health standards are used to account for swallowing particulates, since there are no inhalation standards for chronic inhalation.

Inhaled metals in soil matrix are 100% bioavailable.

Average = Inhalation by a 70 kg adult of 1.4 cubic meters of air per hour, containing 1.37x10E-6 ug per cubic meter of dust for 16 hours per day.

Worst = Inhalation by a 70 kg adult of 3.0 cubic meters of air per hour, containing 2.22x10-3 ug per cubic meter of dust for 16 hours per day.

ASSUMPTIONS and NOTES

Assumptions for exposure to non-carcinogenic compounds apply.

Life-time exposure assumes a 70 kg person with exposure averaged over 70 years.

Average = Assumes lifetime inhalation for 204,400 hours (8 hours per day, 70 years).

Worst = Assumes lifetime inhalation for 408,800 hours (16 hours per day, 70 years).

TABLE 6-17 (Continued)
INHALATION OF AIR-BORNE CONTAMINANTS ON SITE

FORMULAE

EXPOSURE TO NON-CARCINOGENS

$$\text{Exposure Dose} = \frac{\text{Ca} \times \text{Cb} \times \text{I} \times \text{D} \times \text{CF}}{\text{W}}$$

where:

- Ca = contaminant concentration in mg/kg
- Cb = dust concentration in mg/cubic meter
- I = inhalation rate in cubic meters/day
- D = daily duration in hours
- CF = correction factor to convert to mg
- W = weight in kg

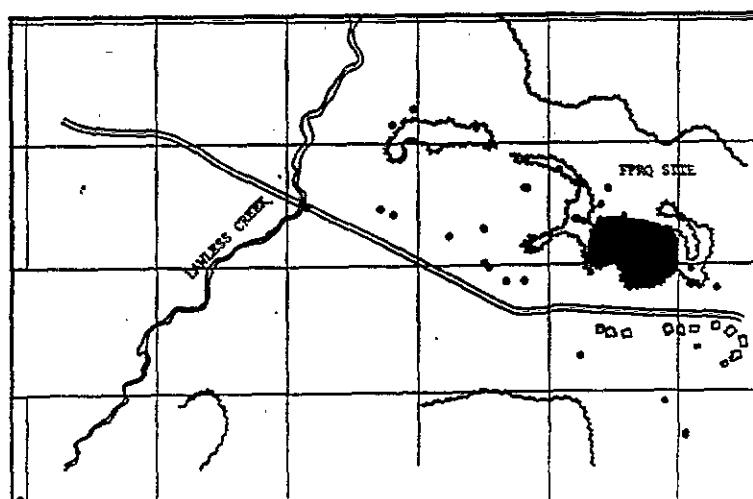

EXPOSURE TO CARCINOGENS

$$\text{Exposure Dose} = \frac{\text{Ca} \times \text{Cb} \times \text{I} \times \text{ED} \times \text{CF}}{\text{W} \times \text{LT} \times \text{D}}$$

where:

- Ca = contaminant concentration in mg/kg
- Cb = dust concentration in mg/cubic meter
- I = inhalation rate in cubic meters/day
- ED = exposure duration in total lifetime hours
- CF = correction factor to convert to mg
- W = weight in kg
- LT = lifetime in years
- D = 365 days per year

INORGANIC ANALYSES
CASE NARRATIVE

CASE: 637-12 and 637-14

SDG No.: FP_132

SAMPLES: FP_132, FP_133, FP_136, FP_230, FP_231, FP_232, FP_234,
FP_235, FP_233

Nine samples were received for CLP metals and cyanide analysis on 1/25/90. All samples were received in good condition. Upon receipt at IEA, samples were assigned an "EPA" 6-character sample number for simplicity in forms generation. Also, the two cases were run as one Sample Delivery Group (SDG) for simplicity in forms generation. The client ID's for these samples are located at the top of each data sheet (Form 1) and on the IEA Assigned Number Index (page 1). The analyses took place with no deviations from CLP protocol.

Dear Mr. Fraser,

Transmitted herewith are the results of analyses on four samples submitted to our laboratory on January 25, 1990.

Please see the enclosed reports for your results.

Very truly yours,

INDUSTRIAL & ENVIRONMENTAL ANALYSTS, INC.

Linda F. Mitchell
Director, Technical Support Services

Sample Preservation

Samples collected in conjunction with the remedial investigation of the First Piedmont Rock Quarry were preserved in accordance with the guidelines presented in the EPA reference methods for each sample constituent. Samples of soil and solid matrix materials were preserved by cooling the sample as quickly as possible and maintaining the temperature at 4°C using refreezable ice packs. Liquid samples were preserved as follows:

<u>Analysis</u>	<u>Preservative</u>
Metals	ph<2 with nitric acid & refrigerated
Cyanide	ph>12 with NaOH and refrigerated
TOC	ph<2 with H ₂ SO ₄ and refrigerated
CLP Organics	Cool and maintain at 4°C
VOA	Cool and maintain at 4°C
Simi Volatiles	Cool and maintain at 4°C

Attention: Mr. Andrew Palestini
Mail Code: 3HW24

Reference: First Piedmont Rock Quarry/Route 719 Site,
Phase III Feasibility Study
Westinghouse Job No. 1079-89-103B/4112-88-930

Dear Mr. Palestini:

On behalf of Goodyear Tire and Rubber Company, Corning Glass Works, and First Piedmont Corporation (Respondents), Westinghouse Environmental and Geotechnical Services, Inc. (Westinghouse) is pleased to present the results of the Phase III Feasibility Study (FS) sampling and analysis efforts at the First Piedmont Rock Quarry/Route 719 Site (FPRQ). These site activities were based on the results of the Remedial Investigation (RI), Risk Assessment (RA), and our correspondence and meetings in December, 1989.

INTRODUCTION

The objectives of the Phase III FS sampling and analysis were to:

Mr. Palestini
April 12, 1990
Page 2

1. determine the source of zinc to the southern drainage, and
2. provide additional data on the chemical characteristics of the waste pile and carbon black pile in order to better define remedial options.

The RI efforts indicated that the elevated zinc concentrations found in the southern drainage and its tributary, the southern quarry drainage, were not resulting from the quarry disposal area. It was hypothesized that the zinc may be coming from either the waste pile, carbon black pile, or the old disposal area located between the quarry and the southern drainage (Figure 1). It should be noted that the respondents had no involvement with the old disposal area at which disposal occurred 20 to 30 years prior to landfilling at the First Piedmont quarry, and that the old disposal area is not considered to be part of the FPRQ site.

In order to evaluate the source of zinc, the following activities were performed:

1. One composite sample (FP-132) of the soil material below the waste pile and one sample (FP-133) of carbon black were collected and analyzed for target analytical constituents (TAL). A matrix spike/matrix spike duplicate (MS/MSD) sample (FP-136) was also collected from the carbon black pile.
2. Water samples were collected along the southern quarry drainage from downstream of the waste pile (FP-230), downstream of the carbon black pile (FP-231), within the old disposal area (FP-232), and downstream of these areas above the confluence of the southern quarry and southern

AR301287

Mr. Palestini
April 12, 1990
Page 3

drainages (FP-233). An MS/MSD sample (FP-235) was also collected at location FP-231. Sample location FP-233 is equivalent to station FP-306 at which two rounds of water and sediment samples were collected during the RI.

In the Phase II FS, both onsite and offsite disposal options for the carbon black and waste piles (Figure 1) were retained for further evaluation. In order to further evaluate the remedial options, two composite samples of the soil material below the waste pile and of carbon black were collected and analyzed to determine RCRA waste characteristics.

Table 1 summarizes the sampling and analysis efforts. Sample locations are shown on Figure 2. Field sampling forms are presented in Appendix A. Laboratory results are given in Appendix B.

METHODS OF INVESTIGATION

The following summarizes the field and laboratory methods for the Phase III activities. All field techniques were in accordance with the Project Operation Plans. IEA, the project laboratory, performed all analyses in accordance with the most recent Contract Laboratory Program (CLP) Statement of Work (SOW), or for the RCRA waste characterization, SW-846, Third Edition. Split samples were collected by the EPA contractor, CDM Federal Programs, Inc.

AR301288

Mr. Palestini
April 12, 1990
Page 4

Waste Pile Soil Sampling

Samples from the waste pile were collected on January 24, 1990. The pile was divided in half from east to west, and five locations within each half were cleared of surface debris to expose the underlying soil. From each half of the waste pile, a portion of soil from each cleared area was collected in an aluminum foil pan and thoroughly mixed prior to being placed in the sample containers. This process was repeated for each half of the pile.

One composite sample from each half of the waste pile was placed in the appropriate sample containers and submitted for RCRA characterization analysis. Following the collection of the two RCRA samples (FP-130 and FP-131), the remaining soil from each half of the pile was combined and mixed into a single composite sample (FP-132) for TAL analysis.

Carbon Black Pile Soil Sampling

The carbon black pile was sampled by dividing the pile in half from north to south. A composite of the soil from each half was collected in an aluminum foil pan and thoroughly mixed. Samples (FP-134 and FP-135) from each portion of this pile were placed in laboratory supplied sample containers for RCRA characterization. Following the collection of the RCRA characterization samples, the remaining material from each area was combined and mixed into a single composite sample (FP-133) for TAL analysis.

AR301289

Mr. Palestini
April 12, 1990
Page 5

A sample from the carbon black pile was also submitted as a MS/MSD sample (FP-136).

Water Samples

Four water samples were collected on January 25, 1990, following an overnight rainfall event of one inch as measured in the site rain gage. Samples FP-230 and FP-231 from below the waste pile and carbon black pile, respectively, were collected from shallow excavations made in the drainage path the day prior to sampling. These excavations were made to assure adequate depth in the drainage way for the sample bottles to be emersed to collect the sample. Samples FP-232 from within the old disposal area, and FP-233 just above the confluence of the southern quarry and southern drainages were obtained along the drainage path by placing the bottle under the falling water and allowing the bottles to fill. A MS/MSD sample (FP-235) was collected at station FP-231. A field blank (FP-234) was also collected at the carbon black pile by pouring laboratory supplied water into the sample container.

DATA QUALITY

This section presents an evaluation of the quality of data collected during surface-water and waste material sampling. The data quality objectives for the project are specified in the project Sampling and Analysis Plan (SAP) and the Quality Assurance Project Plan (QAPP). The U.S. EPA Functional Guidelines for Evaluating Inorganics Analyses (modified for Region III), and the

AR301290

Mr. Palestini
April 12, 1990
Page 6

current Contract Laboratory Program - Statement of Work (CLP-SOW) for inorganics were used to perform the data validation and QC checks presented in the following sections.

FIELD DATA

Field data sheets were independently reviewed by senior Westinghouse personnel. These data are 100 percent complete and representative of the materials sampled. The data are also considered to be accurate based on proper instrument calibration.

In field measurements of temperature, pH, and specific conductance were made on aqueous samples immediately following sample collection. Dissolved oxygen was not measured. All field data are included on field sampling and analysis forms in Appendix A.

LABORATORY DATA

Inorganic laboratory data were validated in accordance with the QAPP and the U.S. EPA Functional Guidelines for Evaluating Inorganics Analyses (modified for Region III). Most of the analytical data required no qualification. Validation of the laboratory data indicates that some analyses have a qualified usability. Data are presented by case according to matrix.

Case: Water

Surface-water samples included in this case are: No. FP-230, No. FP-231, No. FP-232, and No. FP-233.

All instrument calibrations met CLP-SOW criteria. Initial and continuing calibration verification (ICV and CCV) percent recoveries (% R) for all analytes were within the 90 - 110 percent control limits. Contract required detection limits (CRDL) and holding times were also met.

Magnesium and calcium were detected in the laboratory blanks. Concentrations of calcium and magnesium greater than the Instrument Detection Limit (IDL) but less than five times the amount in the blank are qualified as not detected substantially above the level reported in any field or laboratory blank.

All Inductively Coupled Plasma (ICP) interference check sample results met the specified criteria.

All laboratory control sample analysis results were within specified control limits.

All duplicate and matrix spike sample analysis results, except for arsenic, were also within specified control limits. In the duplicate sample analysis, the Relative Percent Difference (RPD) value for arsenic exceeded the control limit of plus or minus the CRDL for sample values less than five times the CRDL. Although the detected concentrations of arsenic did not exceed the CRDL, arsenic results are qualified as estimated. In the spike sample analysis,

AR301292

Mr. Palestini
April 12, 1990
Page 8

the spike recovery value for arsenic falls within the 30 - 74 percent criteria for sample results less than the IDL. The results for arsenic are therefore also qualified as not detected, but the quantitation limit is probably higher. The analysis suggests that arsenic was reported at a lower concentration than the true value.

In the ICP serial dilution analysis, zinc exceeded the 10 percent difference criteria. Positive results for zinc are qualified as estimated.

Case: Soil

Soil samples included in this case are: No. FP-132 and No. FP-133.

All instrument calibrations, CRDLS, and holding times met CPL-SOW criteria. No metals were identified in laboratory blanks.

All ICP interference check sample results met specified criteria.

All laboratory control sample analysis results were within specified control limits.

In the duplicate sample analysis, iron and manganese exceeded the 35 percent RPD control limit for sample values greater than five times the CRDL. In addition, beryllium, cadmium, chromium, magnesium, potassium, and vanadium also exceeded the control limit of plus or minus the CRDL for sample values less than five times

AR301293

Mr. Palestini
April 12, 1990
Page 9

the CRDL. Positive results for the above analytes are qualified as estimated.

In the matrix spike sample analysis, lead and zinc were outside the spike recovery control limits. Concentrations of lead greater than the IDL are qualified as biased high. Concentrations of zinc below the IDL are qualified as biased low. In addition antimony is qualified as not detected , but the quantitation limit is probably higher because the percent recovery is within the 30 - 74 percent control limits, and the sample results are less than the IDL.

In the ICP serial dilution analysis, calcium, potassium, sodium, and vanadium exceed the 10 percent difference criteria. Positive results for these analytes are qualified as estimated.

FINDINGS

This section summarizes the results of the sampling and analysis. The results are evaluated independently and compared to previous results. Analytical data are presented in Appendix B.

Waste Pile

The TAL analysis of the waste pile (FP-132) indicate that the concentrations of aluminum, arsenic, cadmium, chromium, lead, and zinc are elevated above background soil levels. Lead and zinc were found in the highest concentration above background.

AR301294

Mr. Palestini
April 12, 1990
Page 10

The results for FP-132 were compared to previous results from samples FP-410, FP-110, FP-111, FP-112, and FP-113. The results for FP-132 are generally higher than the previous results. Aluminum, arsenic, cadmium, and lead were slightly higher than the previous results. Zinc concentrations were significantly higher than the previous results.

In samples FP-130 and FP-131, submitted for RCRA characterization, only very low levels of barium and lead were detected in the EP toxicity analyses at concentrations far below EP toxicity criteria. All other metals were below the detection limits. The waste pile samples had a low pH but were non-reactive. These results confirm that the waste pile material has elevated metal concentrations but is not a characteristic hazardous waste.

Carbon Black Pile

Sample FP-133 from the carbon black pile was analyzed for TAL constituents. The results for this sample indicate very low concentrations for the trace metals cadmium, copper, lead, and zinc. These results are generally consistent with the results of soil samples (FP-117, FP-118, FP-119, and FP-120) previously collected at the carbon black pile. The zinc concentration in sample FP-133 was considerably higher than the previous samples.

In the EP toxicity analyses (FP-134 and FP-135), only very low levels of barium were detected at concentrations well below the EP toxicity criteria. No other metals were detected in the extracts. The carbon black had a low pH but exhibited no reactivity.

AR301295

Mr. Palestini
April 12, 1990.
Page 11

Therefore, the carbon black is not a characteristic hazardous waste.

Southern Quarry Drainage

Surface water in the southern quarry drainage was sampled at four locations (Figure 2). One inch of rainfall was recorded at the onsite rain gauge the night prior to sampling. Flow in the southern quarry drainage was not measured directly; however, it is estimated that about ten gallons per minute (gpm) were flowing in the drainage with slightly increasing flow downstream. For comparison, it should be noted that the flow at FP-306 (equivalent to FP-233) was significantly less than one gpm during the RI sampling efforts. Therefore, flow during the recent sampling was at least ten times greater than during previous sampling efforts.

In general, low concentrations of aluminum, cadmium, calcium, iron, lead, manganese, sodium, and zinc were found in most or all of the water samples. The results from the southern quarry drainage indicate two general trends. The concentrations for aluminum, iron, lead, and sodium increase between the waste pile (FP-230) and the carbon black pile (FP-231) and then decrease downstream at stations FP-232 and FP-233. In contrast, manganese and zinc progressively increase downstream from the waste pile.

Zinc concentrations increase from about 0.05 milligrams per liter (mg/L) at FP-230 below the waste pile to about 0.4 mg/L at FP-231 below the carbon black pile. Below the carbon black pile,

AR301296

Mr. Palestini
April 12, 1990
Page 12

zinc concentrations increased to 7.6 mg/L at FP-232 within the old disposal area, and to 20.4 mg/L at FP-233 (FP-306).

These data indicate that surface water runoff from the waste pile and carbon black pile is not the source of elevated zinc levels in the southern drainage. In addition, the data indicate that the zinc concentrations in the southern quarry drainage are relatively low until the old disposal area.

The data at FP-233 were compared to previous results at FP-306. At FP-306, zinc concentrations were 111 mg/L during Round 1 and 67.6 mg/L during Round 2. These data suggest that the zinc concentrations are inversely proportional to flow (i.e., decreasing zinc levels with increasing flow).

CONCLUSIONS

The waste pile contains elevated levels of several trace metals including zinc. However, the waste pile materials are not a characteristic RCRA waste. Trace metal concentrations in the carbon black pile are low. This material is also not a characteristic RCRA waste. Therefore, these materials may be disposed of within the quarry or offsite at a licensed solid waste facility.

Zinc levels in the southern quarry drainage increase slightly from the waste pile to the carbon black pile and increase significantly at and below the old disposal area. These data

Mr. Palestini
April 12, 1990
Page 13

indicate that the zinc in the southern drainage is not due to surface water runoff from the waste or carbon black piles.

We trust this information meets your needs. If you have any questions, please call us at (804) 346-8498 (or at (804) 264-5068 after March 31, 1990).
