The SE Series loudspeaker systems from Inter-M provide both high power and high sensitivity output. The accurate sound reproduction from the SE Series makes them ideal for a wide variety of applications such as houses of worship, night clubs, performing arts facilities, fitness centres, auditoriums and educational establishments for both portable and installed systems.

Trapezoidal in shape, the optimised enclosure design is constructed from high density MDF reducing internal resonance and optimising sound output. Each model is equipped with a heavy duty woofer providing distortion-free low frequency reproduction and 1" titanium diaphragm for smooth extended high frequency response, with in-built protection circuitry preventing the HF unit being overdriven.

The sub bass further enhances the SE Series by providing support for the lower level frequencies required in today's demanding performance environments.

Also included are 35mm top hat pole mounts in the base of each cabinet and multiple embedded M8 fixing points allow the fitting of appropriate bracket work or flying hardware.

#### Features:

- Trapezoidal two-way speaker system
- HF driver protection circuitry
- Titanium compression drivers
- Pole mount top hat and M8 rigging points for suspension / mounting hardware
- Optimised enclosure designed for smooth and extended response

## Honda Brand Centre

Honda Brand Centre is a £12 million transformation of their former headquarters into a state-of-the-art, modern showroom for their complete range of products. With Armstrong suspended ceilings already specified throughout all UK Honda showrooms, the application of i-ceilings Sound Panels was ideal in achieving fantastic background music and PA results with a loudspeaker solution which would not spoil the clean architectural lines of the interior.

## SOUND SYSTEMS

### • Ceiling speakers without seeing speakers

i-ceilings 'invisible' integrated Sound Panel loudspeakers from the world leaders in ceiling development.

In providing the ideal environment, the consideration of both acoustics and aesthetics is essential.

i-ceilings, the latest generation of integrated sound panels, uses state-of-the-art NXT technology to provide exceptional sound qualities without spoiling the aesthetic consistency of the ceiling plane.

Combining the innovation of the world's leading designers and suppliers of ceiling systems with the unique sound qualities of NXT technology, Armstrong have produced a unique concept in acoustic ceilings to provide an unparalleled sound system for foreground and background music, voice reinforcement, public address and active acoustics such as sound masking.

#### Features:

- New generation product design
- Completely 'unidentifiable' loudspeaker solution
- Matches over 90% of Armstrong suspended ceiling systems
- Installed up to 75% faster than standard ceiling speakers
- Unparalleled levels of intelligibility and dispersion of sound
- New 'Powered' & 'Surface-mount' versions also available

#### Education

### The concept of i-ceilings

A unique concept in integrated acoustic ceiling systems, i-ceilings utilises NXT flat panel audio technology to provide a loudspeaker system designed to match Armstrong's market-leading range of suspended ceilings.

The i-ceilings concept allows for 'invisible' loudspeaker solutions which benefit from greatly increased sound dispersion, providing incredibly even levels of sound reproduction compared with the 'hot and cold spots' associated with traditional 'cone' loudspeaker technology.

Due to their aesthetic and acoustic qualities, i-ceilings Sound Panels are ideal in education, retail, boardrooms, offices, call centres, healthcare, hospitality and leisure, ensuring even coverage of high quality music and voice reproduction without compromise to the architectural environment.

### The technology

The Armstrong i-ceilings range of Sound Panels utilises the unique loudspeaker technology 'NXT™'. Unlike conventional cone speakers which operate with a piston-like action, NXT technology introduces resonant vibrations to the entire surface of a lightweight flat panel via an electronic transducer system.

In effect, the panel within the ceiling tile is vibrating in much the same way as a piano or acoustic guitar. Like these musical instruments, i-ceilings panels generate highly diffuse and disperse sound energy (similar in nature to the light emitted from a fluorescent lamp).

Sound, therefore, is radiated in all directions to ensure highly intelligible voice and music reproduction and even sound coverage. This is different to the results of a conventional piston-like cone speaker which can cause highly directional and often unintelligible speech in large open spaces.

- **AIW1X:** 20W Plastered In-Wall Loudspeaker
- **AIW3X:** 40W Plastered In-Wall Loudspeaker
- **AIW5X:** 80W Plastered In-Wall Loudspeaker

The advent of high power vibrational element flat panel loudspeakers has given birth to the truly unseen loudspeaker.

This plastered in-wall (or in-ceiling) product type reproduces high definition sound with zero visual interference to room aesthetics. Entertainment systems can now be employed in every room of the home, whilst avoiding all the usual techno clutter.

This technology has the additional advantage of improving dispersion characteristics over a conventional loudspeaker, making speaker location and listening position much more flexible.

The width of an AIW product allows it to fit well within the centre spacing commonly used in modern wood or metal studwork construction methods (400mm space).

**Applications:**

- The **AIW1X** is an affordable, concealed sound source for use in all parts of the home where more modest sound levels are called for. From bedrooms and bathrooms to kitchens and hallways, it reproduces high quality audio without compromising style or design.
- The **AIW3X** is for use in all parts of the home including the main listening areas of home cinema, where good high levels of sound are required.
- The **AIW5X** can be reserved for those special areas of the home (e.g. home cinema rooms) where very loud, highly dynamic, high performance reproduction is required. In home cinema and other extended frequency range listening applications the addition of a sub woofer to your system is recommended. For those with monster taste in music or movie loudness, simply apply more than one AIW5 per channel.

## • SONET4: Cat5 Audio Distribution System - 4 in / 4 out

The highly successful 'So.net' Sound-over-Ethernet System has been designed to simplify and speed up installations where multiple microphone or line level inputs need to be situated a distance from the amplifier equipment.

Types of installation include churches, schools, theatres and corporate boardrooms.

This extremely versatile and cost effective installation device removes the need for multiple cable runs from remote audio inputs to the amplifier equipment. The SONET4 System can transmit up to four microphone or line level signals down one screened Cat5e cable for up to 1000m.

Each input and output can be independently configured for balanced or unbalanced signals as well as line level or microphone level. There is also an option to provide phantom power to the microphone inputs independently.

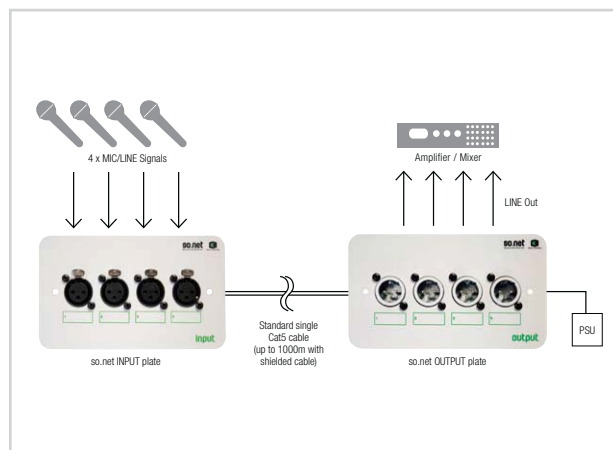

Each unit fits neatly into a standard UK double-gang back box and only requires a power supply at the output or amplifier end (PSU supplied as part of system).

### Features:

## • EPA100: Telephone/PA Paging Interface

Public address access from a telephone extension can benefit most fast-moving enterprises.

Ezi-Page is designed to allow an analogue telephone extension port to which it is connected to be dialled from any other on the same PBX switch system, providing a paging announcement over a public address system. The user simply dials the extension number designated for Ezi-Page, waits for the ring tone to cease and then makes the required announcement.

### Features:

- VOX access electronics maintain the line connection until the end of the announcement, approximately 5 seconds after Ezi-Page automatically clears down
- Connected to a PA system using either a designated microphone or line level amplifier input, this input can be VOX or electronic gate accessed
- Fully approved, it includes an optically isolated barrier transformer input and uses standard BT 4/500 interface plug connections
- Requires 24v regulated DC powering from the host PA system or plug-top power supply PSU24V
- Provided with a wall-mounting facility; interface connection is from below or can be housed within the PA system rack
- Installation is made simple; all terminations use standard interface connections

### Specifications:

Model:	EPA100
Designated Extension	Analogue via BT 4/500 interface, 3m BT cable supplied

Dimensions	120(W) 180(H) x 70(D) mm

## • ANS-1: Ambient Noise Sensor/Level Regulating Module

This level regulating/ambient noise-following module is designed to receive audio signals from an ambient sensing microphone and, where required, adjust signal levels to the power amplifier of the public address installation.

The output level of the module will automatically and constantly adjust to follow the average rise and fall in the ambient noise in the area served by the host amplifier (airports, hotel reception areas, transport terminals, sports stadiums, etc). The ambient noise will be continuously sampled by the sensing microphone/s, sited as close to the source of change as possible.

Where large areas have various localised sources of variable 'ambient' noise, it may be desirable to cover each with a separate sensor, (for example, an underground railway would benefit from having one sensor at each end to detect the noise of trains arriving from either direction).

### Features:

- Microphone input (sensor)
  - a. 200µv balanced low impedance
  - b. 150mv unbalanced high impedance
- Audio In/Out - 500mV, unbalanced

- **SLA50:** 50W 100v Line Volume Control
- **SLA100:** 100W 100v Line Volume Control

The SLA range of 100v Line Attenuators (volume controls) offer the ability to control the level of individual loudspeaker lines via an elegant, flush-mounting wall control plate.

Both Models - SLA50 (50W) and SLA100 (100W) - feature 10-step plus off-position notched control knobs, connected to high quality audio transformer and fitted to attractive single gang (SLA50) or double gang (SLA100) faceplates with contemporary screwless finish.

As well as volume adjustment, the units incorporate volume restoration facility, which will override the setting of the control knob and output the volume to full, when presented with a 24v DC control voltage.

Adding the SLA to your loudspeaker network as shown will allow control of the loudspeakers located after the insertion point.

- **TW1010:** TRI-Wire Override Interface
- **TVC25:** 25W 100v Line Volume Control

TRI-WIRE TW1010 is an interface between the amplifier and loudspeaker(s) to allow low cost overall paging override and volume restoration, where a number of individual loudspeaker line volume controls are to be installed.

Without TRI-WIRE, each volume control would need to be fitted with an override relay requiring centrally sourced powering, involving 4 wire cabling. As the name suggests, the TRI-WIRE system uses only three wires linked to the volume controls, enabling a lower cost of installation.

A special TRI-WIRE line volume control, TVC25 is recommended for use with this system, though any of the Communication Technology Volume Control range is compatible.

TW1010 has the advantage of being low profile and suitable for all back boxes of at least 20mm depth, supplied standard with an ivory white plastic front panel. For installation in close proximity to the host amplifier.

**Features:**

- No remote relay powering necessary

• **AVB5: Audio-via-Bluetooth Wireless Receiver**

The new AVB5 is a low cost, simple, yet effective unit which allows wireless connection between any amplifier (or any device with a line input) and Bluetooth enabled devices, such as:

- MP3 Players
- Mobile Phones
- PC/Laptop Computers
- Microphone/Headsets

Each AVB5 unit has a unique pairing code to identify it, which is especially useful if operating multiple devices within a small area or location, the maximum operational range being 80 metres (dependent on the environmental conditions). A simple blue LED identifies when a connection to the AVB5 is successfully made.

Once paired, the unit streams the audio signal via a secure 2.4GHz A2DP protocol, avoiding any other Bluetooth enabled device within range.

Power is supplied by a 5vDC plugtop PSU (supplied) or via a USB A connection, which may be via a computer or other source with USB facility.

**Features:**

- Bluetooth Wireless link to amplifiers, pre-amps, HiFi, etc
- Unique pairing code to each unit
- Operating range up to 10 metres
- Powered via PSU or USB

**Order Codes:**

Model:	AVB5
Inputs	2.4GHz A2DP Bluetooth Protocol
Outputs	3.5mm Stereo Jack or 2 x Phono Connectors

## Switchcraft®

- **SC700:** AV Direct Box - Fully-shielded Jensen Isolation Transformer
- **SC700CT:** AV Direct Box - Fully-shielded Isolation Transformer

The SC700 Series gives you all the inputs and outputs you need to connect MP3 players, PCs, laptops, CD players and other audio devices to audio consoles, mic preamps, effects processors, house sound systems and other equipment with 3-pin XLR inputs.

Both the SC700 and SC700CT convert the outputs of your high-impedance stereo or mono line level audio devices and musical instrument to low-impedance, balanced and isolated mic level signals. All stereo inputs are summed to mono and output to a single 3-pin XLR connector.

The SC700 AV Direct Box from Switchcraft comes loaded with genuine Jensen transformers, which provide optimal impedance and an impressively extended frequency range (10Hz ~ 40kHz).

### Features:

- Left and right RCA inputs
- Left and right RCA thruputs
- 3.5mm stereo input
- Left and right 1/4" TS (unbalanced) inputs
- 20dB pad

- **SC800:** Instrument Direct Box - Fully-shielded Jensen Isolation Transformer
- **SC800CT:** Instrument Direct Box - Fully- shielded Isolation Transformer

Switchcraft's SC800 Direct Box Series efficiently converts your instrument's high-impedance line-level signal to a balanced and isolated microphone-level signal. That way, you can put an SC800 between your audio devices or instruments, then connect your line-level equipment to other equipment, such as audio consoles, preamplifiers, effects processors and recording gear.

The Switchcraft SC800 even employs Jensen transformers, for a high-quality design.

- **SC900:** Instrument Box with Phantom Lift (Jensen Isolation Transformer)
- **SC900CT:** Instrument Box with Phantom Lift (Switchcraft Isolation Transformer)

Switchcraft SC900 Series are the first passive direct boxes with remote-controllable ground-lift switch. This ground-lift switch (called Phantom Lift) allows you to instantly disconnect the SC900's ground circuit by simply engaging +48v phantom power from the board. That way, if an irritating buzz starts to show up in the middle of the show, you don't have to fight the crowd and appear onstage to fix the issue!

Just flip on phantom power and the SC900CT cuts its ground. It's that simple! The SC900 Series also comes equipped with either Pro grade Jensen or Switchcraft's own custom transformers, so you get amazing isolation, impedance matching and extended frequency response.

### Features:

- Phantom Lift - remote-controllable ground lift uses phantom power to trip ground line
- LED indicator illuminated to show lifted ground
- Two ground lift modes: manual and +48v lift
- Frequency response 20Hz ~ 20kHz
- Super-rugged all-metal design
- Unbalanced ¼" in and through connectors
- Balanced XLR output
- Switchable -20dB pad

## • **CS-RF Series:** Series Boundary Layer Professional Microphones

The CS Series (Consultant Series) was developed as a result of input and recommendations from key consultants in boardroom AV integration. The goal was to minimise the number of microphones on the conference table, but also keeping in mind performance, ease of installation and aesthetics, essential considerations in such projects.

The results of these discussions are the CS2-RF, CS3-RF and CS4-RF microphones.

### Features:

- Half cardioid polar pattern
- Fully balanced
- High quality engineering in solid brass
- Non-reflective black Nextel or satin nickel

## • **CS2-RF:** Dual Element Boundary Microphone

The CS2-RF is a dual element boundary layer condenser microphone, with a half-cardioid polar pattern. It is designed to be placed in the middle of the conference table, with each element facing the participants.

This microphone accommodates bottom cable exit, for permanent mounting in boardroom situations.

These microphones are made of solid brass and include a 2m cable with open-ended termination. The Phantom Power Adaptor (PPA) is incorporated in the brass housing and will accept 9 ~ 48v DC (Phantom Power).

## • **CS3-RF:** Triple Element Boundary Microphone

The CS3-RF microphone has the same characteristics as the CS2-RF with the addition of a third element.

This microphone is to be positioned closer to the end of the conference table in order to capture the participants facing each other and also the participant sitting at the extremity of the table.

If the participant at the end of the table is further away, it is then possible to use a combination of a CS2-RF and CS1-RF (single element version) to accommodate this situation.

## • **CS4-RF:** Quadruple Element Boundary Microphone

The CS4-RF is a new addition that completes the CS-RF Series microphone family, offering a 4-element microphone in a single housing. Like the CS2 and 3, the CS4-RF offers half cardioid polar patterns and a bottom cable exit.

The CS4-RF can be positioned in the centre of a round conference table, giving maximum coverage from a small footprint. Engineered from high quality solid brass and finished in a durable non-reflective black Nextel or satin nickel.

The CS4-RF is also available in other customised colours and special finishes upon request.

- **C98:** Gooseneck Microphone (Cardioid)
- **C100:** Gooseneck Microphone (Omni-directional)

A range of microphones designed for use where voice clarity is an essential requirement and offering both moving coil and electret capsules fitted to fully flexible or part flexible/rigid goosenecks.

Capsules are mounted in a computer-matched acoustic chamber fitted with an 'anti pop' blast screen. A stainless steel mesh protects the capsule from physical damage.

**Moving coil capsule:** With a polar diagram approximating to cardioid, this capsule has a significantly flat frequency response within speech range, with an added 'presence' lift at 3KHz.

**Electret capsule:** The polar diagram is unidirectional in characteristic and has a wide frequency response.

### • Mounting Options:

The mounting options for C98 and C100 are subject to additional cost and require the code suffix to be added to the order code:

- /UMC Circular universal mounting base; for right angled or parallel-with-surface mounting; 3 hole fixing to mounting surface.
- /UBC Block mounting base; providing 2 hole fixing to mounting surface and right angled or parallel-to-surface microphone assembly.

Other mounting accessories for XLR terminated microphones:

- DT37 XLR socket fitted to adjustable angle mount; for desk/lectern top fitting.
- AV260 Desk/lectern mounting anti-vibration mount; gooseneck XLR inserts firmly through centre, with compressing ring lock.

- **DSP350:** Digital Signal Processor

#### Eliminate noise with DSP350 technology:

Digital Signal Processing (DSP) technology is used to electronically remove unwanted background noise from speech which enables announcements to be more easily understood. The technology is self-adapting to changing noise environment, no 'training' of the noise filter is required.

Installers can adjust the level of noise suppression to system requirements; the residual background noise still sounds natural, but up to 30dB lower.

- **DPM105/CAT:** Self-cancelling 5-zone Paging Point
- **DPM110/CAT:** Self-cancelling 10-zone Paging Point
- **ZRU010/CAT:** 1U Rack-mounting Relay/Zone Processor

These new Pro-Range 5 and 10 zone self-cancelling paging points operate exclusively with the rack-mounted ZRU010 relay interface and central logic processor for up to 10 zones.

Whilst most system designers will switch zones of loudspeakers, this system is sufficiently versatile to operate between pre-amplifiers, 600Ω signal sources or with individual zone amplifiers.

Each paging point incorporates audio compression; an in-built pre-announcement 'gong' is a link-selectable option.

Communication and digital signalling between the ZRU010 central processor and each paging point uses standard CAT5 cabling - significantly saving on expensive cable installations!

#### Features:

- The system provides fully automatic 'All-Call'
- Pre-selection of zones prior to paging, self-cancelling after use
- Whilst waiting for paging access to the system, users can pre-select (reserve) their zones to be paged
- One paging point can be designated to have overall priority in the system
- Up to 8 paging points can comprise a multizone system (mixed 5 & 10 zones)
- 'Press-to-Talk'/'All-Call': momentary action button with LED indicating 'All-Call' or system occupied
- Zone selection: momentary action, electronic locking, buttons with individual LED to confirm selection acceptance
- Paging point output: utilises CAT5 cabling technology and is suitable for cabling lengths of up to 300m, unshielded

## • DPS402: Store & Forward Paging Microphone

- Operating as a normal 'live' paging microphone, the paging announcement is made and stored for broadcast
- The delay between paging completion and broadcast is internally pre-set on installation to 5, 15, 30 or 60 seconds
- Announcements may be pre-set on installation to be automatically repeated once, twice, three or four times, after which they are self cancelled
- Announcements can be up to 2 minutes in duration
- An announcement can be manually cancelled at any time, including during the original recording, if an error is made or the operator is interrupted
- An internal chime can be selected to pre-announce any messages. Alternatively, any pre-announcement chime already included in the host system can be triggered by DPS402; the announcement is automatically paused until the chime sequence is completed
- DPS402 works with electronic or VOX accessed amplifiers. The microphone output can be at 'normal' or line level by 'D' pin selection
- If the host system is multi-tasked - various functional inputs - and is equipped with 'system busy' outputs, DPS 02 will not broadcast whilst the system is in another use; if a priority use activates during a DPS402 announcement this will override the announcement which will recommence from its beginning after priority use ceases

Wall Connection Plate:  
WC15W

## • DPS400: 3 Message Store & Forward Paging Microphone

This is identical in function to DPS402 except that a facility to record and store up to 3 announcements that require individual or collective timed repeat is incorporated.

Examples would be to advertise 'special offers' in stores and supermarkets or to announce a delay in flight departure at an airport.

- Timed repeats - The user can select a repeat time of 5, 15, 30 or 45 minutes between replays or they can be remotely triggered at any time, for an evacuation message for example.
- Simple to operate - To record an announcement for repeated use, the user simply selects 'ENABLE' mode and proceeds with the announcement, which can be up to 1 minute in duration and manually cancelled at any time

## Classroom Voice Reinforcement

### • Soundfield Classroom Voice Reinforcement Systems

Young people spend at least 45% of their school day engaged in active listening activities, with today's classroom serving as a primarily auditory verbal environment.

However, a study in the journal of the American Medical Association showed that 14.9% of children aged 6 ~ 19 suffer from some degree of hearing impairment, either permanently or temporarily due to illness, infection or allergies.

Studies estimate that 80% of school children will have some form of hearing loss during an academic year and, with the importance of auditory learning in the classroom, the use of technology to enhance listening performance ultimately allows children to learn more efficiently.

One of the simplest and most effective solutions is an i-ceilings 'Soundfield Voice Reinforcement System'. Functioning as a mini public address system, it features an infrared wireless microphone, receiver, amplifier and either one or two 'i-ceilings Sound Panel' loudspeakers (dependent upon the size of classroom).

Thorn Grove Primary School's SEN inclusion scheme ensures that both its mainstream and hard of hearing pupils benefit from clear, effective communication using i-ceilings Soundfield Systems in all its classrooms.

### • What is a Soundfield System?

'Soundfield' or a 'Soundfield Voice Reinforcement System' is essentially the integration of a 'mini-PA system' in the classroom.

#### Teachers' normal voice coverage

Without Soundfield, the clarity and volume of a teacher's voice will be less effective toward the back of the room.

#### Using Soundfield Voice Reinforcement

Using i-ceilings Soundfield Voice Reinforcement, the teacher's amplified voice will be heard at the same clear, effective level by all pupils in the room.

Under quiet classroom conditions, most teachers have enough natural volume in their voice to communicate effectively with a standard sized class. However, a number of acoustic factors (lively/noisy classes, reverberant room conditions, ambient noise from equipment and outdoor activities, hearing difficulties, etc.) can have a significant effect on clear, effective teacher/pupil communication.

The inclusion of a Soundfield System in the classroom will raise the teacher's voice above this ambient noise level, to give even voice coverage throughout the room and without the need to shout or raise one's voice. This will provide significant benefits for teacher/pupil communication and understanding.

• **The benefits of Soundfield in the classroom...**

All children benefit from the improved speech clarity of a Soundfield System. Academic improvements are consistently noted in:

- Task behaviour
- Reduced voice strain
- Attentiveness
- Better attendance
- Less repetition required
- Understanding of instructions
- Improved verbal recognition

The inclusion of Soundfield Voice Reinforcement in the classroom provides wide ranging benefits not only to pupils and hard of hearing students, but also to teachers and acoustic/architectural designers and specifiers.

In addition to the above outstanding benefits, pupils also benefit from:

**Pupils:**

- More effective deciphering of language in early learning years
- Better understanding of teacher's voice for 'second language' learning
- Assists temporary hearing deficiency, common in early learning years

Teacher wears lightweight 'pendant' infrared wireless microphone

**Teachers:**

- Improved clarity of voice and understanding
- Reduced voice strain, illness and stress
- Less repetition required
- Assists inclusive teaching for SEN students

**SEN students:**

- Assists inclusive learning
- Easily integrates with induction loop systems
- Proven learning improvements for pupils with ADHD
- Many children with Down syndrome who have fluctuating conductive hearing loss perceive significantly more speech

**Specifiers and Installers:**

- Unparalleled even sound coverage
- Reduced number of loudspeakers required
- Reduced microphone feedback
- Reduced loudspeaker theft or damage
- Secure wireless signal for privacy rooms

● **The i-ceilings Soundfield Solution**

In its simplest form, a Soundfield System consists of the following components:

- Wireless microphone worn by the teacher
- Wireless microphone receiver
- Amplifier
- Loudspeakers
- Connection cables

The i-ceilings Soundfield Solution benefits from further unique component features to provide what we truly believe is the most advanced and effective system on the market.

**The unique i-ceilings Soundfield System features:**

● **i-ceilings Sound Panel Loudspeakers**

Our 'i-ceilings Sound Panel' is a unique loudspeaker which fits into a suspended ceiling in the same manner as a standard ceiling tile.

This revolutionary Sound Panel loudspeaker provides unparalleled levels of even sound coverage, ensuring all students hear an equal volume level of the teacher's voice. Furthermore, i-ceilings panels are virtually unidentifiable in the ceiling ensuring aesthetic consistency and greatly reducing any problems of loudspeaker theft or vandalism.

● **Infrared Wireless Microphone Technology**

The i-ceilings Soundfield System also benefits from the use of an 'infrared' microphone system.

Many systems on the market use 'RF' (radio frequency) wireless microphone systems, which have many operational limitations such as the number of available frequency channels, license costs and signal overspill.

Our IR wireless system overcomes these limitations, being license-free and, by using light to transmit the microphone signal (just like your TV remote control), the signal cannot 'overspill' into adjoining classrooms; providing the ideal multi-room solution.

For more information on the benefits and application of Soundfield in the classroom, go online to:

**[www.soundfield.uk.com](http://www.soundfield.uk.com)**

• **i-ceilings 'in-ceiling' Soundfield Systems**

Our flagship i-ceilings infrared Soundfield systems are arguably the most technically advanced and acoustically effective systems on the market.

**System Benefits:**

- Unobtrusive, yet highly effective voice reinforcement in the classroom
- Unidentifiable loudspeaker solution reduces damage or loss due to theft or vandalism
- Infrared wireless microphone technology allows unlimited adjacent room systems without licensing issues
- Easily integrated with other classroom/teaching technologies such as induction loops, personal FM hearing assistance systems, interactive whiteboards, laptops, etc,...

## • 'Surface-mount' Soundfield Systems

Though much of the success of our Soundfield systems has been based on our unique i-ceiling Sound Panel Loudspeakers, there are an increasing number of systems being installed into classrooms which do not feature a suspended ceiling.

Our Packs F & G have been developed for either wall-mounting (PACK F) or surface mounting to a solid or plasterboard ceiling (PACK G). Both systems feature our own UK designed and built IRX Wallmount Integrated Amplifier/Infrared Receiver, developed specifically for Soundfield classroom voice reinforcement.

Designed to be completely safe and child-friendly, the IRX features 20W amplifier, infrared wireless microphone technology, microphone & line inputs (for integration of laptop, MP3, DVD, etc) and level/tone control, whilst remaining extremely tamper-proof against potential 'wandering hands'.

## • Which Induction Loop System should I use?

The PDA range of induction loop equipment is one of the most comprehensive in the UK. It comprises a huge range of amplifiers, microphones, connector plates and test equipment covering virtually every conceivable AFILS application.

Before deciding which induction loop system to use, you first need to ascertain the size of the area to be covered in square metres (m<sup>2</sup>). Bear in mind it may not be necessary to cover the whole of the area, for example in a church only the pews may require coverage.

To calculate the size of the area in square metres, multiply the length by the width. For example, a room 6m x 6m in size would equal 36m<sup>2</sup>. The coverage provided by an AFILS amplifier is also quoted in square metres. The chart below, and information in the rest of this section, will help you select the best PDA Range product(s) for the job.

Designed to meet or exceed the requirements of BS7594 and EN60118-4 when correctly installed, all of the amplifiers in the PDA range offer excellent intelligibility, true current mode amplification, phantom power (for electret microphones) and full compatibility with the 'outreach plate' audio input extension system (except the PL1, VL1 and DL50). Many are also available in kit format for ease of specification, purchase and installation.

## • FPROK: Fosmeter Induction Loop Test Kit

SigNET's new FPROK Fosmeter Pro induction loop test kit is designed to simplify the setup of an induction loop system and ensure its compliance with the latest version of BS EN 60118-4 (Magnetic field strength in audio-frequency induction loops for hearing aid purposes).

The kit includes the FPRO Fosmeter Pro induction loop tester (pictured right), an MP3 player c/w pre-loaded test tones and a set of headphones.

The Fosmeter Pro is a 400mA magnetic field strength meter and loop listener, complete with circuitry for measuring background noise, frequency response and metal compensation. It includes:

- A digital LCD display with a user-friendly interface to simplify testing
- Two 'soft' buttons which dynamically change their functions to suit the menu options being accessed
- Battery low indication and an auto-power off function that kicks in after 10 minutes of Fosmeter inactivity
- A 3.5mm headphone jack socket allowing users to listen to the loop signal using a set of HEAD1 headphones (supplied in FPROK kit)

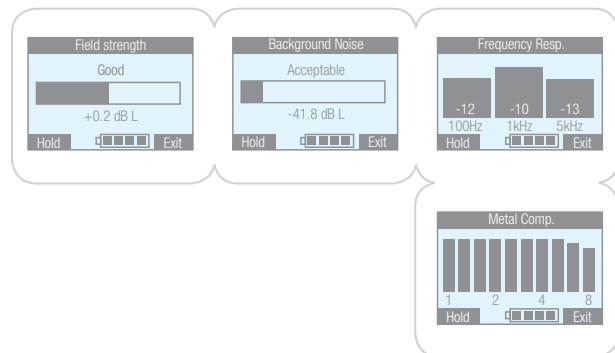

The unit is powered from a 9v PP3 battery (provided) and is supplied in a protective canvas carrying case.

One FPROK Kit (plus ancillaries such as MP3 player/amplifier connection leads) is all it takes to ensure your loop installations comply with current British Standards.

### Test Menus:

The Fosmeter Pro's test results are typically shown on its LCD as shown right. A summary of these tests appears below:

- **Field Strength Test:** Detects a pulsed 1kHz signal in accordance with BS EN 60118-4, calibrated at 400mA/m = 0dB L.
- **Background Noise Test:** Advises if the signal is acceptable, tolerable or too high in accordance with BS EN 60118-4.
- **Frequency Response Test:** Detects 100Hz, 1kHz and 5kHz in accordance with BS EN 60118-4. All three frequency readings are displayed on the same screen allowing you tell at a glance if the setup is within the +/- 3dB L required by the standard.
- **Metal Compensation Test:** This test goes beyond the scope of BS EN 60118-4 but adheres to the 3rd octave frequency spectrum advised in the standard, measuring 1kHz through 8kHz. For use with amplifiers with metal compensation controls/functions such as the PDA200/2, 500/2 & 1000/2.
- **Subjective Listening Test:** This test is designed to ensure hearing aid users receive an undistorted and clear signal in the covered area and is performed using a set of headphones (supplied) plugged into the unit's headphone socket.

## • RXti2: Induction Loop Receiver

The RXti2 Induction Loop Receiver picks up audio signals from the loop through a pair of headphones (not supplied) and allows the signal quality to be assessed for testing purposes.

Designed to allow installers and the non hard of hearing to test and assess the quality and availability of a loop system. The RXti2 may also be used in non hard of hearing applications such as multi-lingual translations, museum talk-through systems and stage talk-back systems.

### Features:

- Soft start function
- 50Hz filter (to cut out mains hum pick up)
- Compact size
- 3.5mm headphone socket (for headset / earbud)
- Powered by 2 x AAA batteries

**CAUTION:** The audio output from the RXti2 can exceed 100mW into 8Ω. This may cause hearing damage with long term exposure. Care should be taken not to use excessive volume when testing loop systems.

## • Outreach Plates: Audio Input Extension System

A range of wall, ceiling and desk mountable single gang audio input plates specifically designed to increase the audio input capability of any audio system. A total of six plates are available - one to suit virtually every conceivable variant of audio input connector - and each featuring a built-in mixer, pre-amp, input level control and balancing output.

Up to ten plates of any mix can be daisy-chained to one balanced line level input with cable lengths in excess of 100m easily achievable using standard two-pair audio cable (i.e. Belden 8723) with no recognisable degradation of audio signal quality.

All plates are surface mountable on 25mm single-gang back boxes and can be installed at the most convenient point on an installation, thus overcoming the need for long and potentially hazardous microphone/audio leads.

The system is ideal for conference centres, schools, leisure complexes, etc., where the need to have separate and spatially distributed audio inputs is a must.

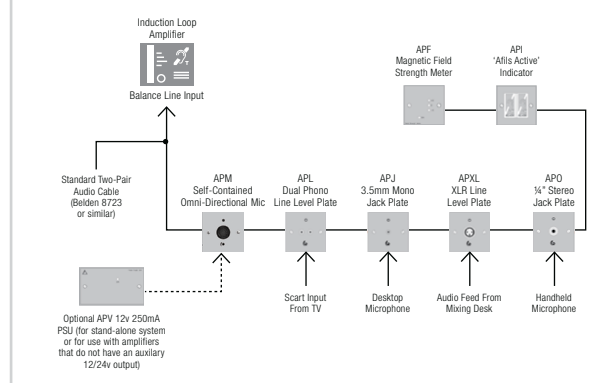

An external DC power supply (Part No. APV) is available for stand-alone systems or for use with audio equipment that does not have a 12/24v auxiliary output.

### Features:

- Can be connected to the balanced line level input of any audio system
- Fully cascable – up to ten outreach plates can be daisy-chained to one balanced line level input
- Plates can be located at any convenient point on an installation
- Standard two-pair audio cable is ideal for most applications
- Network lengths of 100m easily achievable with no degradation of sound quality
- Built-in pre-amp, mixer and level controls included on all variants
- Overcomes the need for excessively long microphone and audio leads
- 12 ~ 32v DC operation
- +6dB overload capability
- Surface mountable on 25mm UK single gang back boxes
- Effectively acts as a multi-point distributed mixer with individual level controls
- Optional wall-mounting 'AFILS ACTIVE' and magnetic field strength indicators available for use with audio-frequency induction loop systems

## • System Overview

The system normally has two inputs per outreach plate - a balanced line level input from the previous outreach plate and its own adjustable input. These inputs are mixed in a way that ensures the input from the previous stage is virtually unaffected whilst generating a composite signal for the output in the form of a balanced line level signal.

As very low levels of insertion loss and signal-to noise ratios can be guaranteed and the inherent interference advantage of having balanced and floating line level inputs and outputs, very long lengths of interconnecting cable may be used without significantly degrading the signal.

This, coupled with the system's cascading ability, allows the designer to effectively 'tailor make' a distributed multiple input mixer that is compatible with virtually any audio system.

## The Outreach Plate range:

Up to ten of the following outreach plates (any mix) can be daisy-chained to an audio system's balanced line level input:

### • APJ: 3.5mm Jack Outreach Plate

Accepts balanced or unbalanced microphones with 3.5mm mono jack plugs. Includes an onboard mic-to-line level converter, high gain pre-amplifier and 8v phantom power.

## Ancillary Devices:

Should the Outreach network be connected to an induction loop system, any of the following ancillary devices can be added:

### • API: 'AFILS Active' Outreach Plate

Includes two ultra-bright LEDs in a translucent diffuser overprinted with the induction loop 'ear' symbol. The LEDs illuminate when the outreach network is powered to indicate that an AFILS system is installed. Current consumption is 30mA max.

### • APF: Field Strength Meter Outreach Plate

# Dedicated Rack Design & Build Facility

For many years, CIE-Group customers have also benefited from our comprehensive Audio Rack System Design & Build Service, to provide 'ready to install' PA, VA and AV Racks in some of the UK's largest and most successful installations.

Using our extensive portfolio of professional audio products, our highly skilled, UK-based Technical Services have a reputation for consistently producing some of the UK's highest quality, ready-to-install PA rack systems to customers' specifications.

There is no set limit to the size of system we can produce; anything from a small single zone speech-only system, to a multi-zone system combining speech and music. Monitoring and battery back-up can also be accommodated by our in-house Technical Services Facility.

To ensure that we build your system to your specific requirements, we have produced a technical questionnaire which, once completed by yourselves or with our assistance, outlines requirements such as number of zones, music sources, number of microphones, etc.

Each system is supplied assembled, wired and fully tested before leaving our workshops. As part of the Build Package, each System is supplied with a comprehensive operations manual incorporating user instructions for each individual piece of equipment, a schematic drawing of the System, a visual of the Rack layout and easy to use connection details. Finally, each System is given a unique identification number specific to your installation which allows our Technical Services Team to easily identify any system we have assembled, to efficiently assist with any after sales service requirements.

**Call the CIE-Group sales desk or your area representative on +44 (0)115 9770075 for advice, free UK site surveys and a highly competitive quotation.**

• **Luminis 3D: Auto-Stereoscopic, Glasses-Free 3D Digital Signage**

Using the same Windows-based digital signage platform as our 2D 'Luminis AIO', Luminis 3D combines all the functionality and ease of use of 'standard' digital signage with state-of-the-art lenticular screen technology, to provide what are the most truly 'outstanding' signage results you can imagine!!

Luminis 3D can be operated as a stand-alone unit, or can be configured in a network as 'Server' or 'Client' (same Model configurable). Individual Client units in stand-alone mode can be controlled directly or on the local network via a web interface. Alternatively, if a number of units are networked, they can be controlled and updated over a wide area network.

Featuring fully-controllable templates and schedules, the Luminis signage platform supports a combination of both 3D and 2D media content, supporting video, Flash, RSS, streamed images, web pages, PowerPoint, tickertape, plus much more!

Adopting lenticular screen technology provides the only true solution to glasses-free 3D – essential, of course, for public signage where there is no control over the audience (and certainly no chance to hand-out free spectacles to every passer-by!)

## • How does 3D Auto-stereoscopic screen technology work?..

Also known as 'lenticular', this glasses-free system is regarded as the ideal long-term 3D solution. A sheet of transparent, cylindrical lenses (known as 'lenticules') is fixed to a professional-grade, high definition LCD screen. These lenticules reflect light in specific, duplex acute angles to generate different images to each eye.

### • Ancillary Devices:

Should the Outreach network be connected to an induction loop system, any of the following ancillary devices can be added:

#### • API: 'AFILS Active' Outreach Plate

Includes two ultra-bright LEDs in a translucent diffuser overprinted with the induction loop 'ear' symbol. The LEDs illuminate when the outreach network is powered to indicate that an AFILS system is installed. Current consumption is 30mA max.

#### • APF: Field Strength Meter Outreach Plate

Indicates the magnetic field strength generated by an induction loop system via three LEDs, labelled +6dB, 0dB and -6dB. The LEDs illuminate as appropriate whenever a signal is present and can be easily set up to indicate the magnetic field strength in the room centre.

## • SONET4: Cat5 Audio Distribution System - 4 in / 4 out

The highly successful 'Sonet' Sound-over-Ethernet System has been designed to simplify and speed up installations where multiple microphone or line level inputs need to be situated a distance from the amplifier equipment.

Types of installation include churches, schools, theatres and corporate boardrooms.

This extremely versatile and cost effective installation device removes the need for multiple cable runs from remote audio inputs to the amplifier equipment. The SONET4 System can transmit up to four microphone or line level signals down one screened Cat5e cable for up to 1000m.

Each input and output can be independently configured for balanced or unbalanced signals as well as line level or microphone level. There is also an option to provide phantom power to the microphone inputs independently.

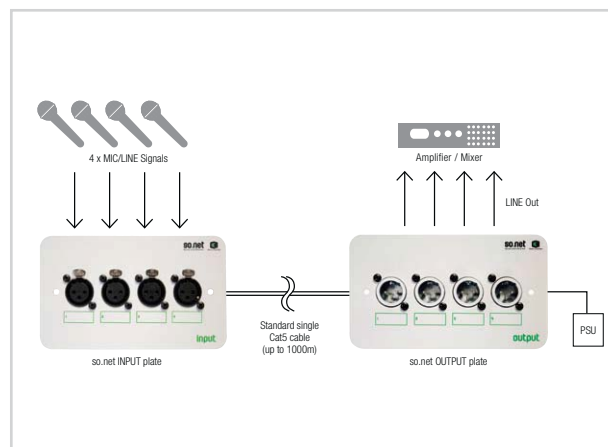

Each unit fits neatly into a standard UK double-gang back box and only requires a power supply at the output or amplifier end (PSU supplied as part of system).

### Features:

- Reduces installation time
- Up to 1000m between Input and Output plates achievable
- Very high interference immunity
- Balanced or unbalanced inputs & outputs
- Line or Microphone level inputs & outputs
- Phantom power (max. 15v DC)
- Four XLR sockets on standard 2 gang plates
- No power required at input module
- Power Supply included as part of system

### Please Note:

- When using Cat5 UTP (unshielded) cable, the So.Net system is only capable of transferring up to 3 channels. STP (shielded) Cat5 cable will allow for the maximum 4 channels.

• **EH Series: AV Panel Mount Connectors**

**1. Choose any combination of EH Series connectors.**

The EH Series by Switchcraft is a complete line of audio, video and data connectors built into standard panel-mount XLR housings.

Custom combinations of EH Series connectors can be quickly loaded into any of our Q-G Series panels. Once mounted, connecting your equipment to the back of an EH Series connector is fast and easy.

Most connectors are feedthru, which means standard cabling is simply plugged into the back of your gear, then plugged into the back of the EH Series connector. For those EH Series connectors that are not feedthru, solder lugs are clearly marked for simple, secure solder connections.

All EH Series connectors are available individually bagged with mounting screws.

**2. Choose a blank Q-G Series panel.**

Q-G Series panels come standard as 1U (1x16), 1.5U (1x16), or 2U (2x16). 1U and 1.5U versions allow for any combination of up to 16 EH Series connectors to be loaded into the panel. The 2U version can accommodate up to 32 EH Series connectors. Every Q-G Series panel includes quick change designation strips for easy connector identification.

**3. Populate EH Series connectors into Q-G Series panel to create custom I/O solution for all of your audio, video and data connections.**

Switchcraft's EH Series is the fastest and most versatile way to create a custom panel or wall plate perfectly suited to meet the needs of any studio, broadcast facility, or systems integrator. Customise your studio, make it easy to access your I/O's, and increase the lifespan of expensive pieces of equipment using EH Series connectors and Q-G Series Panels from Switchcraft.

AV Signal Distribution Installation Advice

# Audio Installation Advice

## The basic principles of effective surface-mount ceiling loudspeaker installation

The first priority of a high quality sound reproduction system is that of providing listeners with an acoustic level higher than that of any possible background noise. The system must simultaneously ensure a wide frequency range and maximum intelligibility. It should also guarantee a flat frequency response and uniform sound pressure level to give optimum listening pleasure and clarity. To meet these criteria, the hypothetical ideal solution would be to place each sound source at an equal distance from all required listening points.

## Ceiling-mounted Loudspeakers

In environments offering suitable ceiling height, this 'hypothetical' ideal standard can be approximated by using loudspeakers with very wide frequency response and dispersion angles which remain consistent at different frequencies, arranged in a ceiling or 'shower'-type configuration.

### This provides the following acoustic benefits:

- Maximum sound distribution uniformity
- Maximum speech intelligibility
- Constant quality of music reproduction
- Reduced reverberation in the environment
- Sound source remains at a constant distance from the listening position

Once the required loudspeaker type has been chosen and the characteristic parameters considered (eg. dispersion angle, room shape and size), the number of loudspeaker units needed to obtain constant and uniform sound dispersion can easily be calculated. The required speaker quantity is calculated by dividing the floor area in square metres by the area of coverage of each loudspeaker on the listening plane.

[Figure 1 illustrates this concept]

Figure 1

Figure 2

## Wall-mounted Loudspeakers

If the architectural features of the room are not compatible with ceiling-mounted loudspeakers or if a wall-mounted solution is preferred, it is essential to observe a few basic rules to obtain the most effective sound distribution. In order to maintain the most efficient listening point inside the direct signal area, both in-wall and surface mounted loudspeakers with power from 6 to 20W should be installed at a height between 2 and 2.5 metres.

The maximum distance between adjacent loudspeakers must be no more than 5~6 metres along the length of the room, where the room is no wider than 4~5 metres.

For wider rooms (eg, 8~10 metres), it is recommended to install loudspeakers in an alternate pattern along both opposite walls, to provide adequate coverage and maintain sound pressure at the best possible constant level throughout the area for coverage.

[see Figures 2 and 3]

Figure 3

## Corridor/Tunnel: Area Coverage

For effective sound distribution in corridors, tunnels or passenger platforms in railway/underground stations, horn speakers (A) are normally specified for increased voice clarity in these high ambient noise conditions. For higher quality sound reproduction, 'sound projectors' can be used as an alternative.

In all cases, these loudspeakers must be installed at a maximum distance of 15 metres from one another, mounted all in the same direction and in observance with the phase of each loudspeaker. Alternatively, bi-directional versions (B) of these loudspeakers can be considered, positioned at a maximum of 30 metres apart (again observing phasing).

## A few basic rules must always be observed

### 1. When the load is on 'constant impedance'; it must be connected to the relative socket.

For example, a load of 4W must be connected to a socket marked 4W, and so on. The power that the load can withstand must always be greater than the amplifier's rated power.

For example in the case of a load of 100W, the amplifier must have a power equal to or less than 100W.

### 2. When the load is at 'constant voltage'; it must be connected to the sockets indicating output at constant voltage - 50, 70 or 100v; the power that the load can withstand must always be less than or equal to the amplifier rated power. For example, with a load of 100W, the amplifier must have a power equal to or greater than 100W.

To calculate the required value of a 100v line amplifier power, simply add together the power of each loudspeaker. (See Figure 5).

However, on a constant impedance system, the load must have an equivalent impedance (series/parallel) equal to or greater than the minimum value indicated on the amplifier output (See Figure 6).

The loudspeaker power supply lines, with no connected attenuator, must be with 2 sheathed wires; cables with 3 sheathed wires are required in the case of lines using attenuators which can be disabled if an emergency is activated. Adequate wire sections are required:

1.5mm<sup>2</sup> for lines up to 500W power, 2.5mm<sup>2</sup> for lines with power over 500W. The following general standards must also be observed:

- Never use a single cable (lead) for loudspeaker connections: this would cause disturbance producing a loud 'HUM'
- Never use shielded cables for the loudspeaker connections: this would cause serious damage to the power units.

Figure 5

## Low Impedance and 100v Line Systems

Constant impedance lines (low impedance) are used normally in the case of a low number of loudspeakers, placed at a minimum distance from the amplifier <20m.

The constant voltage connection system (e.g. 100V line) offers a host of advantages making it ideal for sound systems of all sizes, above all in the case of long distance speaker runs. This connection system requires each loudspeaker to be equipped with its own line transformer, which adapts the impedance of the loudspeaker (usually very low) to the much higher level of the line itself. In proportion to power transmitted, the current circulating on a line at 100V is considerably lower than that circulating on wires of a constant impedance system and, consequently, drops along the line are less frequent; therefore the cable gauge can be lower.

The function of the amplifier device is **to raise the signal of a sound source**, such as a microphone, CD player, MP3 player or an AM/FM tuner **to a sufficient level to pilot the transducer LOUDSPEAKER**. The amplifier has several inputs, to which the various sound sources are connected.

The sound sources have to be mixed (mixer) and acoustically modified with tone control and equalisers to optimise listening in relation to the environment's characteristics. A terminal board is also fitted to the power units.

# AV Signal Distribution Installation Advice

Our DataBay and CYP ranges of AV signal distribution equipment are capable of high quality results. This guide is intended to help achieve optimum performance from the equipment by following simple guidelines and good installation practice.

## Cable:

These products range distribute AV signals via various cable types. As with any installation, the type and quality of cable can have a dramatic effect on the resultant performance.

For example, a CCTV system may be installed with all manner of RG59 cable, but the resultant differences in image quality from best to worst can be huge.

Where an AV system is extended via Cat5e / Cat6 cable, we strongly recommend the use of a Low Skew cable. Skew is a measurement (normally in nanoseconds) that measures the time delay between the first and last signal arrival in different twisted pairs. If the time difference is too large, image quality can be affected, possibly manifesting itself in bright vertical lines, ghosting, colour smudging or worst case, no image at all. Low Skew in video terms is cable with Skew rates lower than 15nS per 100m.

The following Cat-X cables should all perform well:

**Belden 7987R**  
**Belden 1700A**  
**Canford 31-953**  
**Mohawk M58813**

## Environmental issues:

The area surrounding an installation can also have an impact on its performance. In particular electrical noise from mains cables, fluorescent lighting or electric motors / installations, etc, could result in interference being induced into the AV cabling system and affecting its performance.

The same applies to airborne radio frequency interference.

Common sense and good installation practice should minimise these effects through careful cable routing, avoiding mains cables or other areas of potential interference. In areas of high susceptibility, it would be sensible to use low skew screened cables.

## Display resolutions and refresh rates:

Higher display resolutions and video refresh rates all require higher bandwidths and data rates. The result of the greater demands on the cable is, consequently, reduced achievable distances.

### For example:

A display running a resolution of 480p may happily work across a 100m link; the same infrastructure running a display @ 1080p may only achieve 30m.

## FAQs:

### Q. What is Low Skew Cat-X cable?

- A. Skew is a measurement (normally in nanoseconds) which measures signal delays between different twisted pairs in a cable. Low Skew in video terms is cable with Skew rates lower than 15nS per 100m.

### Q. Can I extend the distances further than specified?

- A. This could be possible by:
- Reducing the display resolutions
  - Using better quality Cat-X cable (low skew, shielded)
  - Using better quality video cables (e.g. Cat2 HDMI cable)

### Q. I'm only using a 5 metre Cat-X link cable between the transmitter and receiver, but I cannot get a picture...

- A. This can occur when using short cables of maybe 5 or 10 metres with receivers that are optimised to function over much longer distances e.g. 300m. In this case either use a slightly longer Cat-X cable or use a different receiver.

### Q. I'm using a short range HDMI non-powered receiver (p/n HDMI-HR), but cannot see an image; why?

- A. Some flat panel monitors use a slightly non-standard input which requires power at the HDMI input socket to function correctly. Some Samsung and Goodmans monitors are known to suffer from this issue (there may be others). However, the problem can be easily overcome by using our p/n ET-HC0101-Z in place of the non-powered HDMI-HR.

### Q. If I 'mix' transmitters and receivers of different distance capabilities (e.g. AVE-301T 300m and the receiver from the AVE-M180TR 180m), what is the maximum distance achievable?

- A. In all such cases you are limited to the distance of the shortest device (in this case 180m).

### Q. How many levels of cascading can be achieved on HDMI?

- A. Normally two is recommended, although at lower resolutions and with good quality cables further cascading may be perfectly possible.

### Q. Can I use stranded Cat-X patch cord?

- A. Stranded Cat-X cable is not recommended – use solid installation Cat-X cable for best results.

### Q. How should I wire the Cat-X cable?

- A. The cable should be terminated to EIA 568B specifications.

EIA 568B specifications:

The EIA/TIA definition of 568B in the pin assignment is (1) orange white, (2) orange, (3) green white, (4) blue, (5) blue white, (6) green, (7) brown white, and (8) brown

# Hints and Tips

**When commissioning a professional AV system the following tips could help speed up the process and ensure a trouble-free installation:**

## Pre-Installation:

Undertake a full site survey. In addition to standard practice, take particular note of accurate cable lengths required, makes/models of the monitors to be connected and take into account any potential environmental factors that could cause interference. It is also preferential to have all devices powered from the same electrical phase and with common grounding.

Wherever possible, bench test your proposed system set-up at your facility before proceeding to site. Use interconnecting cables as they will be used on site, i.e. the same cable types and lengths.

## During Installation:

Follow the user manuals to assist the installation process.

Firstly, if the first transmitter in the link has a local monitor output, then connect up a monitor to this port to confirm that the transmitter is receiving a valid signal. Use the EQ control (if available) on the transmitter to obtain the optimum picture quality. You can then proceed to setting up the receiver end.

Set-up the system by starting with the lowest video resolution outputs from the video source and establishing a working link. You can then increase the display resolutions in stages to ensure full system compatibility. Ensure the monitor is capable of displaying at the desired resolutions and refresh rates.

Most devices should function correctly with the EQ set to AUTO. However, if this does not give satisfactory results, then the EQ can be set manually. Please note that in manual mode the changes may not be instantaneous and may lag by a second or two. Therefore, adjust the EQ in small stages at a time and check the result on screen.

If a monitor does not appear to be displaying video, check the obvious things like power(!) correct source mode selected (e.g. HDMI, VGA, S-Video) and for correctly engaged connectors. If this fails, completely power down the monitor (not just standby) and then re-apply the power.
