INTRODUCTION

A rapid plant survey was conducted in around the proposed Cheyyur 4000MW Ultra Mega Power Project in Kanchipuram District, Tamil Nadu, on 01.12.13, 23.12.13 and 30.3.2013. The surveys were conducted along Vilambur, Buckingham Canal, Vanjimodu, and the Palaiyur Reserve Forest within the project site and the portion of Palaiyur R.F. along which the said project's ash slurry pipeline will reportedly run. During the study, three different vegetation types were observed – namely sand dune vegetation, coastal wetland vegetation and Tropical Dry Evergreen vegetation. This survey has recorded a total of 294 plant species from all the three vegetational types.

SAND DUNE VEGETATION

Sand dune vegetation was seen in two localities namely Vilambur and Vaanjimodu in Gangadevankuppam. These two sand dunes harbour species of Tropical Dry Evergreen Forest (TDEF). One of the important findings of this survey is the collection of *Solena angulata*, which was first described in 1952 and subsequently collected 1967. It has never been collected since. Occurrence of this species in the Vilambur/Buckingham Canal and Vaanjimodu dune complexes make the sand dune an area of conservation importance. Other important plant species include *Garcinia spicata* and *Syzygium alternifolium*. *Garcinia spicata* is the only *Garcinia* species that occurs on the East Coast and is a characteristic species of Tropical Dry Evergreen Forests (TDEFs). Rest of the *Garcinia* species are found in the Western Ghats. *Garcinia spicata* is currently present only in small protected patches along the Coast either in Reserved Forests or in Sacred groves. These populations are highly fragmented, and clearing any one of the patches will make the species

more genetic vulnerable. *Syzygium alternifolium* is a typical species of coastal sandy habitats and its population is critically low.

Sand dunes are a crucial habitat of utmost ecological importance. They serve as shields during coastal calamities such as cyclones and tsunamis. Tourism development and urbanization has flattened vast structures of sand dunes from Chennai to Pondicherry. Studies conducted after the 2004 tsunami indicate that sand dunes played a great protective role in shielding the villages near the coast.

The Cheyyur UMPP proposes to transport coal, raw seawater and effluent through a conveyor belt and pipelines traversing these sensitive sand dunes, including the densely wooded dune complexes on either side of the Buckingham Canal, and the Vaanjimodu. The EIA reports do not anywhere assess the impact of such interference on the integrity of the sand dunes, and on rich flora present in these habitats.

COASTAL WETLANDS

The proposed site has many seasonal and semi-permanent pools, ponds, backwaters and irrigation tanks. These are home to a wide variety of aquatic species. Coastal wetlands are crucial habitat for several plant species belonging to Scrophulariaceae, Commelinaceae, Cyperaceae and Poaceae families. A wild relative of rice - *Leersia hexandra* - was recorded during our research. These wetlands are also important habitat for birds and other animal lives.

*Sand dune vegetation along the Buckingham Canal.
Proposed route for coal conveyor belt.*

CHEYYUR UMPP'S ENVIRONMENTAL DUE DILIGENCE

As part of the study, the project proponent's EIA for power plant and captive port were perused. The report makes no mention of the rich plant biodiversity of the area, including the project sites. The coal conveyor corridor will traverse several sand dunes, including along the Buckingham Canal in Vilambur and the Vaanijimodu dunes in Gangadevankuppam. It would have, therefore, been important to acknowledge the presence of these dunes, develop baseline for resident vegetation and assess impacts. The EIA does not mention the presence of these dunes. Therefore, the question of mentioning the presence of rare vegetation types such as TDEFs or rare plant species on these dunes does not arise.

The EIA for the power plant mentions a road link to NH45 and a railway corridor. But it does not present any details about the land use, flora of the road and rail corridor and likely impacts. Given the rich flora observed in the region, this

THE TROPICAL DRY EVERGREEN FOREST (TDEF)

The Palaiyur Reserve Forest is a Tropical Dry Evergreen Forest patch measuring about 347.58 acres. TDEFs are an rare vegetational type and are highly fragmented. TDEF plays an important role from the coastal production, livelihood, life support and ecological points of views. Several rare species such as *Adenia wightiana*, *Dyschoriste dipressa*, *Osbeckia zeylanica*, *Polygala rosmarinifolia*, *Polygala telephiooides* and *Pleurostylia wightii* were recorded during our visit. We also observed forest department efforts in promoting the diversity of the area by planting *Terminalia bellerica*, *Terminalia chebula* and *Semicarpus anacardium*. Many of these trees have grown to reasonably good size. Interfering with such TDEF forest patch is detrimental to coastal ecology.

The area adjoining Palaiyur R.F. is very fertile where paddy is cultivated at least two times a year.

The Comprehensive EIA for the power plant mentions that 9.83 hectares of Reserved Forest will be acquired. The absence of an impact assessment is incorrectly justified by an unsubstantiated statement that "The forest land to be acquired has mainly plantations of consuarina, and dense forest is not observed. No endemic, rare or threatened species are observed on the forest land to be acquired for the project. As a part of the project, greenbelt will be developed, which will improve the vegetal cover in the area."

As noted earlier, this survey has found a number of rare, species of plants in the project area of the power plant, port and conveyor corridor.

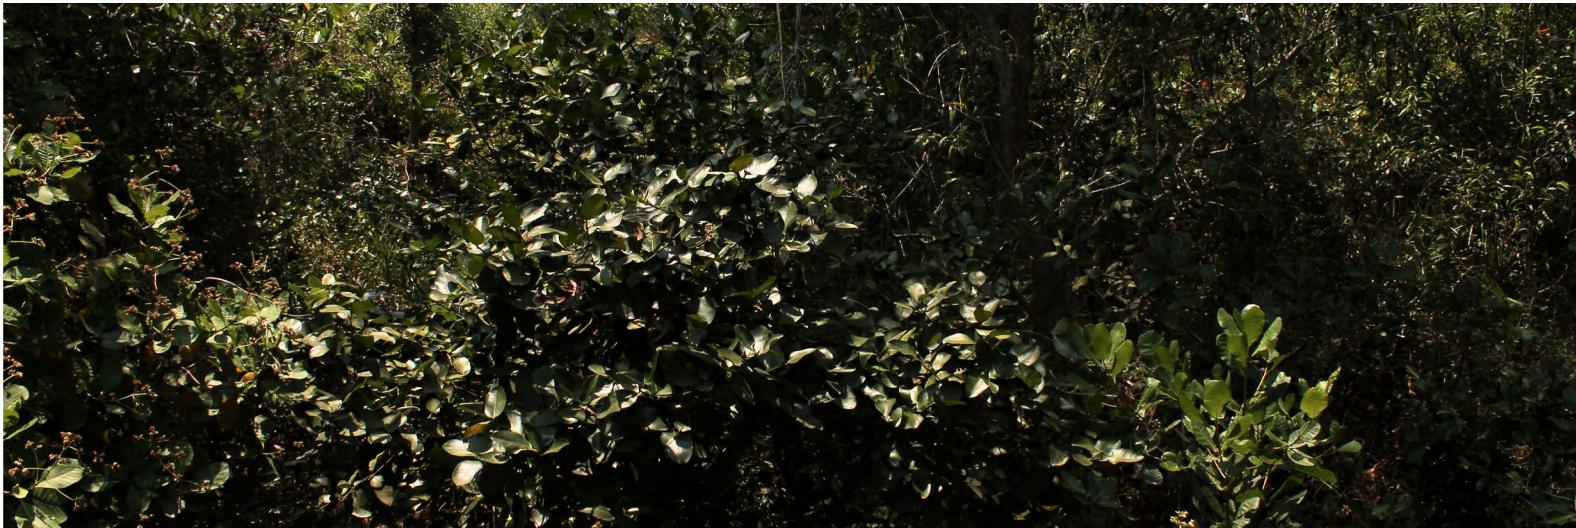

The project documents do not contain an assessment of impacts on vegetation – including the TDEF, wetland vegetation, agricultural crops and sand dune vegetation – and assumes that

effects will be nil as pollution control measures will be implemented. This is particularly problematic as a coal fired thermal plant of this size can be expected to have significant impacts on the botanical resources of the region. Further, critical components such as the conveyor corridor and the ash slurry pipeline traverse ecologically sensitive and vulnerable plant diversity hotspots such as the dunes and the TDEF.

The project documents and the Environmental Clearance issued by the Ministry of Environment & Forests do not appreciate the botanical importance of the project and study areas. The diversion of such forests to non-forest uses without as much as an inventory of plant species to assess the diversity and health of the ecosystem is ill-advised.

The EIA reports' approach to conservation and livelihood is most ceremonial – such as by setting up Green Endowment Fund and Fishermen Endowment Welfare Fund. These funds will be of little value when the coastal ecology and livelihood of coastal people is damaged, and such funds cannot be of any help when the last remaining natural habitats of rare plant species is threatened by land-use change and pollution.

The gaps in data and analyses in the project documents and the silence of the Environmental Clearance on critical issues relating to health of the botanical resources in the region throw into question the robustness of environmental due diligence for the project.

Garcinia population

DISCUSSION

The wetlands on and around which the plant is located, the sand dunes traversed by the coal conveyor pipeline and the TDEF patches traversed by the proposed ash slurry pipeline are all ecologically sensitive and integral to the natural resilience of the region in terms of weathering extreme climate events and of biodiversity. The special ecological and botanical credentials of this area makes it an area of conservation importance.

The location of the power plant, captive port and the alignment of the coal corridor is inappropriate from a botanical perspective, and will lead to irreversible losses of plant genetic diversity.

RECOMMENDATIONS

It is advisable to locate the plant in a non-ecologically sensitive site in line with siting guidelines of the Ministry of Environment & Forests.

The presence of rare species of plants such as *Solena angulata* qualifies this area to be protected as an area of conservation importance.

PLANTS ON VILAMBUR SAND DUNE

	LIST OF THE PLANT	FAMILY
1	<i>Acacia auriculiformis</i>	Fabaceae
2	<i>Anacardium occidentale</i>	Anacardiaceae
3	<i>Aristida setacea</i>	Poaceae
4	<i>Asparagus racemosus</i>	Asparagaceae
5	<i>Azadirachta indica</i>	Meliaceae
6	<i>Boerhavia diffusa</i>	Nyctaginaceae
7	<i>Borassus flabellifer</i>	Arecaceae

PLANTS IN BUCKINGHAM CANAL

	LIST OF THE PLANT	FAMILY
1	<i>Abrus precatorius</i>	Fabaceae
2	<i>Acacia auriculiformis</i>	Fabaceae
3	<i>Achyranthes aspera</i>	Amaranthaceae
4	<i>Allophylus serratus</i>	Sapindaceae
5	<i>Anacardium occidentale</i>	Anacardiaceae
6	<i>Aristida setacea</i>	Poaceae
7	<i>Asparagus racemosus</i>	Asparagaceae
8	<i>Azadirachta indica</i>	Meliaceae
9	<i>Boerhavia diffusa</i>	Nyctaginaceae
10	<i>Borassus flabellifer</i>	Arecaceae
11	<i>Buchanania axillaris</i>	Anacardiaceae
12	<i>Bulbostylis barbata</i>	Cyperaceae
13	<i>Bulbostylis pulchella</i>	Cyperaceae
14	<i>Canthium coromandelicum</i>	Rubiaceae
