150Mbps Wireless N Router

COPYRIGHT & TRADEMARKS

FCC STATEMENT

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.

- Increase the separation between the equipment and receiver.

- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

- Consult the dealer or an experienced radio/ TV technician for help.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

1） This device may not cause harmful interference.

2） This device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Note: The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user's authority to operate the equipment.

FCC RF Radiation Exposure Statement:

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This device and its antenna must not be co-located or operating in conjunction with any other antenna or transmitter.

"To comply with FCC RF exposure compliance requirements, this grant is applicable to only Mobile Configurations. The antennas used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in

conjunction with any other antenna or transmitter."

CE Mark Warning

CE1588

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

RF Exposure Information

This device meets the EU requirements (1999/5/EC Article 3.1a) on the limitation of exposure of the general public to electromagnetic fields by way of health protection.

Canadian Compliance Statement

This device complies with Industry Canada license-exempt RSSs. Operation is subject to the following two conditions:

1） This device may not cause interference, and

2） This device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes :

3） l'appareil ne doit pas produire de brouillage;

4） l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, meme si le brouillage est susceptible d'en compromettre le fonctionnement.

This radio transmitter (IC: 8853A- TL-WR741ND / Model: TL-WR741ND) has been approved by Industry Canada to operate with the antenna types listed below with the maximum permissible gain indicated. Antenna types not included in this list (Appendix C), having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Le présent émetteur radio (IC: 8853A- TL-WR741ND / Model: TL-WR741ND) a été approuvé par Industrie Canada pour fonctionner avec les types d'antenne énumérés ci-dessous et ayant un gain admissible maximal. Les types d'antenne non inclus dans cette liste (AnnexeC), et dont le gain est supérieur au gain maximal indiqué, sont strictement interdits pour l'exploitation de l'émetteur.

Radiation Exposure Statement:

This equipment complies with IC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm

between the radiator & your body.

Declaration d'exposition aux radiations:

Cet équipement est conforme aux limites d'exposition aux rayonnements IC établies pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20 cm de distance entre la source de rayonnement et votre corps.

安全諮詢及注意事項

• 請使用原裝電源供應器或只能按照本產品注明的電源類型使用本產品。

• 清潔本產品之前請先拔掉電源線。請勿使用液體、噴霧清潔劑或濕布進行清潔。

• 注意防潮，請勿將水或其他液體潑灑到本產品上。

• 插槽與開口供通風使用，以確保本產品的操作可靠並防止過熱，請勿堵塞或覆蓋開口。

• 請勿將本產品置放於靠近熱源的地方。除非有正常的通風，否則不可放在密閉位置中。

• 請不要私自打開機殼，不要嘗試自行維修本產品，請由授權的專業人士進行此項工作。

Продукт сертифіковано згідно с правилами системи УкрСЕПРО на відповідність вимогам нормативних документів та вимогам, що передбачені чинними законодавчими актами України.

Safety Information

- When product has power button, the power button is one of the way to shut off the product; when there is no power button, the only way to completely shut off power is to disconnect the product or the power adapter from the power source.

- Don't disassemble the product, or make repairs yourself. You run the risk of electric shock and voiding the limited warranty. If you need service, please contact us.

- Avoid water and wet locations.

- Adapter shall be installed near the equipment and shall be easily accessible.

- The plug considered as disconnect device of adapter.

- Use only power supplies which are provided by manufacturer and in the original packing of this product. If you have any questions, please don't hesitate to contact us.

Explanation of the symbols on the product label

Symbol	Explanation
	DC voltage
	RECYCLING This product bears the selective sorting symbol for Waste electrical and electronic equipment (WEEE). This means that this product must be handled pursuant to European directive 2012/19/EU in order to be recycled or dismantled to minimize its impact on the environment. User has the choice to give his product to a competent recycling organization or to the retailer when he buys a new electrical or electronic equipment.

TP-LINK TP-LINK TECHNOLOGIES CO., LTD

DECLARATION OF CONFORMITY

For the following equipment:

Product Description: **150Mbps Wireless N Router**

Model No.: **TL-WR740N/TL-WR741ND**

Trademark: **TP-LINK**

We declare under our own responsibility that the above products satisfy all the technical regulations applicable to the product within the scope of Council Directives:
Directive 1999/5/EC, Directive 2004/108/EC, Directive 2006/95/EC, Directive 2011/65/EU, Directive 2009 /125 /EC
The above product is in conformity with the following standards or other normative documents
EN 300328 V1.9.1
EN 301489-1 V1.9.2 & EN 301489-17 V2.2.1
EN 55022: 2010+AC: 2011

CONTENTS

Package Contents

The following items should be found in your package:

➢ TL-WR740N/TL-WR741ND 150Mbps Wireless N Router

➢ DC Power Adapter for 150Mbps Wireless N Router

➢ Quick Installation Guide

➢ Ethernet Cable

☞ **Note:**

Make sure that the package contains the above items. If any of the listed items is damaged or missing, please contact your distributor.

Chapter 1. Introduction

1.1   Overview of the Router

The TL-WR740N/TL-WR741ND Router integrates 4-port Switch, Firewall, NAT-Router and Wireless AP. The router delivers exceptional range and speed, which can fully meet the need of Small Office/Home Office (SOHO) networks and the users demanding higher networking performance.

Incredible Speed

The TL-WR740N/TL-WR741ND Router provides up to 150Mbps wireless connection with other 802.11n wireless clients. The incredible speed makes it ideal for handling multiple data streams at the same time, which ensures your network stable and smooth. The performance of this 802.11n wireless Router will give you the unexpected networking experience at speed 650% faster than 802.11g. It is also compatible with all IEEE 802.11g and IEEE 802.11b products.

Multiple Security Protections

With multiple protection measures, including SSID broadcast control and wireless LAN 64/128/152-bit WEP encryption, Wi-Fi protected Access (WPA2-PSK, WPA-PSK), as well as advanced Firewall protections, The TL-WR740N/TL-WR741ND Router provides complete data privacy.

Flexible Access Control

  The TL-WR740N/TL-WR741ND Router provides flexible access control, so that parents or network administrators can establish restricted access policies for children or staff. It also supports Virtual Server and DMZ host for Port Triggering, and then the network administrators can manage and monitor the network in real time with the remote management function.

Simple Installation

Since the Router is compatible with virtually all the major operating systems, it is very easy to manage. Quick Setup Wizard is supported and detailed instructions are provided step by step in this user guide. Before installing the Router, please look through this guide to know all the Router's functions.

1.2   Conventions

The router mentioned in this guide stands for TL-WR740N/TL-WR741ND150Mbps Wireless N Router without any explanation.

☞ **Note:**

The two devices of   and   share this User Guide.

Main Features

➢ Complies with IEEE 802.11n to provide a wireless data rate of up to 150Mbps

➢ One 10/100M Auto-Negotiation RJ45 WAN port, four 10/100M Auto-Negotiation RJ45 LAN ports, supporting Auto MDI/MDIX

➢ Provides WPA/WPA2, WPA-PSK/WPA2-PSK authentication, TKIP/AES encryption security

➢ Shares data and Internet access for users, supporting Dynamic IP/Static IP/PPPoE Internet access

➢ Supports Virtual Server, Special Application and DMZ host

➢ Supports UPnP, Dynamic DNS, Static Routing

➢ Provides Automatic-connection and Scheduled Connection on certain time to the Internet

➢ Built-in NAT and DHCP server supporting static IP address distributing

➢ Built-in firewall supporting IP address filtering, Domain Name filtering, and MAC address filtering

➢ Connects Internet on demand and disconnects from the Internet when idle for PPPoE

➢ Provides 64/128/152-bit WEP encryption security and wireless LAN ACL (Access Control List)

➢ Supports Flow Statistics

➢ Supports firmware upgrade and Web management

➢ Supports Tether App management

➢ Supports Guest Network

➢ Supports IPV6 Internet Connection

1.3   Panel Layout

1.3.1   The Front Panel

The Router's LEDs and the WPS button are located on the front panel (View from left to right).

Name	Status	Indication
⏻ (Power)	Off	Power is off.
	On	Power is on.
	Flash	The device is initializing or upgrading.
📶 (WLAN)	Off	The Wireless function is disabled.
	On	The Wireless function is working properly.
🖥 (LAN4-1)	Off	No device are connected to the corresponding port.
	On	A device is connected to the corresponding port.
⊘ (WAN)	Off	The WAN port is not connected.
	Orange	The WAN port is connected, but there is no Internet connection.
	Green	The router is connected to the Internet.
🔒 (WPS)	Slow Flash	WPS function is in progress. The device is trying to connect or to be connected. This process may take up to 2 minutes.
	On	A device is successfully added to the network by WPS function.
	Quick Flash	A wireless device failed to be added to the network by WPS function.

☞ **Note:**
After a device is successfully added to the network by WPS function, the WPS LED will keep on for about 5 minutes and then turn off.

4
1.3.2 The Rear Panel

The following parts are located on the rear panel (View from left to right).

➢ **POWER:** The Power socket is where you will connect the power adapter. Please use the power adapter provided with this The TL-WR740N/TL-WR741ND Router.

➢ **WAN:** This WAN port is where you will connect the DSL/cable Modem, or Ethernet.

➢ **1/2/3/4(LAN):** These ports connect the Router to the local PC(s).

➢ **WPS/Wi-Fi:**

Press this button for less than 2 seconds to enable the WPS function. If your client devices, such as wireless adapters, that support Wi-Fi Protected Setup, then you can press this button to quickly establish a connection between the router and client devices and automatically configure wireless security for your wireless network.

Press this button for 2 seconds to turn on or turn off the Wi-Fi. With the router powered on, press and hold the **WPS/Wi-Fi** button (approximately 2 seconds) until the WLAN LED turns on or off.

There are two ways to reset to the Router's factory defaults:

1) Use the **Factory Defaults** function on **System Tools** -> **Factory Defaults** page in the Router's Web-based Utility.

2) Use the Factory Default Reset button: Press the WPS/RESET button for more than 5 seconds and then wait for the Router to reboot.

➢ **Reset:**

Press this button for more than 5 seconds to enable the Reset function. With the router powered on, use a pin to press and hold the Reset button (approximately 8 seconds). And then release the button and wait the router to reboot to its factory default settings.

➢ **Wireless antenna:** To receive and transmit the wireless data.

Chapter 2. Connecting the Router

2.1 System Requirements

➢ Broadband Internet Access Service (DSL/Cable/Ethernet)

➢ One DSL/Cable Modem that has an RJ45 connector (which is not necessary if the Router is connected directly to the Ethernet.)

➢ PCs with a working Ethernet Adapter and an Ethernet cable with RJ45 connectors

➢ TCP/IP protocol on each PC

➢ Web browser, such as Microsoft Internet Explorer, Mozilla Firefox or Apple Safari

2.2 Installation Environment Requirements

➢ Place the Router in a well ventilated place far from any heater or heating vent

➢ Avoid direct irradiation of any strong light (such as sunlight)

➢ Keep at least 2 inches (5 cm) of clear space around the Router

➢ Operating Temperature: 0℃~40℃ (32℉~104℉)

➢ Operating Humidity: 10%~90%RH, Non-condensing

2.3 Connecting the Router

If your Internet connection is through an Ethernet cable from the wall instead of through a DSL / Cable / Satellite modem, connect the Ethernet cable directly to the router's Internet port, then follow steps 4 and 5 to complete the hardware connection.

1. Turn off the modem and remove the backup battery if it has one.

2. Connect the modem to the Internet port on your router with an Ethernet cable.

3. Turn on the modem, and then wait about 2 minutes for it to restart.

4. Turn on the router.

Power adapter

Router

Internet

Modem

Power adapter

1 Turn off the modem and remove the backup battery if it has one.

2 Connect the modem to the Internet port on your router with an Ethernet cable.

3 Turn on the modem and then wait about 2 minutes for it to restart.
5.   Verify that the hardware connection is correct by checking these LEDs.

Chapter 3. Quick Installation Guide

This chapter will show you how to configure the basic functions of your   The TL-WR740N/TL-WR741ND Router using **Quick Setup Wizard** within minutes.

3.1   TCP/IP Configuration

The default domain name of the   The TL-WR740N/TL-WR741ND Router is http://tplinkwifi.net, the default IP address is 192.168.0.1, and the default Subnet Mask is 255.255.255.0. These values can be changed as you desire. In this guide, we all use the default values for description.
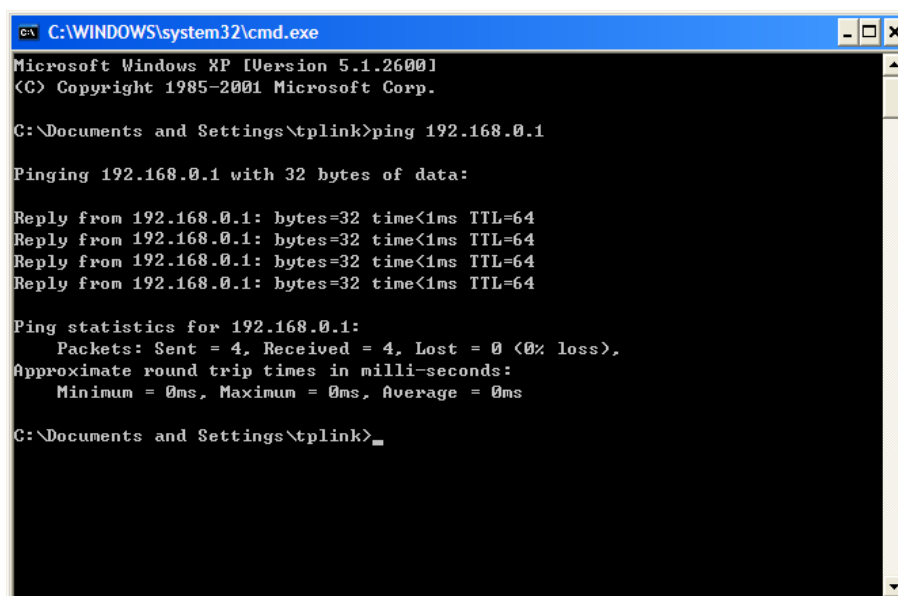

Connect the local PC to the LAN ports of the Router, and then you can configure the IP address for your PC by following the steps below:

1) Set up the TCP/IP Protocol in "**Obtain an IP address automatically**" mode on your PC. If you need instructions as to how to do this, please refer to Appendix B: Configuring the PC.

2) Then the built-in DHCP server will assign IP address for the PC.

Now, you can run the Ping command in the **command prompt** to verify the network connection between your PC and the Router. The following example is in Windows XP.

Open a command prompt, and type *ping 192.168.0.1*, and then press **Enter**.

➢ If the result displayed is similar to the figure below, it means the connection between your PC and the Router has been established well.

➢ If the result displayed is similar to figure below, it means the connection between your PC and the Router failed.

Please check the connection following these steps:

1. Is the connection between your PC and the Router correct?

☞ **Note:**

The 1/2/3/4 LEDs of LAN ports which you link to on the Router and LEDs on your PC's adapter should be lit.

2. Is the TCP/IP configuration for your PC correct?

☞ **Note:**

If the Router's IP address is 192.168.0.1, your PC's IP address must be within the range of 192.168.0.2 ~ 192.168.0.254.

3. Try the IP address 192.168.1.1.

☞ **Note:**

If the LAN IP of the modem connected with your router is 192.168.0.x, the default LAN IP of the Router will automatically switch from 192.168.0.1 to 192.168.1.1 to avoid IP conflict. Therefore, in order to verify the network connection between your PC and the Router, you can open a command prompt, and type *ping 192.168.1.1*, and then press **Enter**.

3.2   Quick Installation Guide

With a Web-based (Internet Explorer or Netscape® Navigator) utility, it is easy to configure and manage the   AC1750 Wireless Dual Band Gigabit Router. The Web-based utility can be used on any Windows, Macintosh or UNIX OS with a Web browser.

1. To access the configuration utility, open a web-browser and type the default address http://tplinkwifi.net in the address field of the browser.
After a moment, a login window will appear, similar to the figure below. Enter **admin** for the User Name and Password, both in lower case letters. Then click the **Login** button or press the **Enter** key.
☞ **Note:**

2. After successful login, click **Next** on the **Quick Setup** page and then you can go to quickly configure your router.
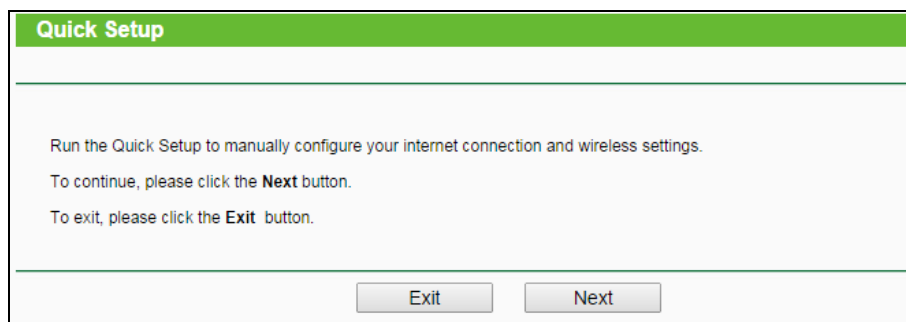

3. **WAN Connection Type** page will appear as shown below, select a proper type and then click **Next**.

The router provides **Auto-Detect** function and supports five popular ways **PPPoE, Dynamic IP**, **Static IP**, **L2TP** and **PPTP** to connect to the Internet. It's recommended that you make use of the **Auto-Detect** function. If you are sure of what kind of connection type your ISP provides, you can select the very type and click **Next** to go on configuring.

If you select **Auto-Detect**, the router will automatically detect the connection type your ISP provides. Make sure the cable is securely plugged into the Internet port before detection. The appropriate configuration page will be displayed when an active Internet service is successfully detected by the router.

a) If the connection type detected is **Dynamic IP**, the next screen will appear as shown below. Please select to clone the MAC address or not, according to your situation.

b) If the connection type detected is **Static IP**, the next screen will appear as shown below. Configure the following parameters and then click **Next** to continue.

- ➢ **IP Address -** This is the WAN IP address as seen by external users on the Internet (including your ISP). Your ISP will provide you with the IP address you need to enter here. Enter the IP address into the field.

- ➢ **Subnet Mask -** The Subnet Mask is used for the WAN IP address. Your IPS will provide you with the subnet mask which is usually 255.255.255.0.

- ➢ **Default Gateway -** Your ISP will provide you with the Gateway address which is the ISP server's address. Enter the gateway IP address into the box if required.

- ➢ **Primary DNS -** Enter the DNS Server IP address into the box if required.

- ➢ **Secondary DNS -** （Optional）If your ISP provides another DNS server, enter it into this field.

c) If the connection type detected is **PPPoE/Russian PPPoE**, the next screen will appear as shown below. Configure the following parameters and then click **Next** to continue.

- ➢ **User Name/Password -** Enter the **User Name** and **Password** provided by your ISP. These fields are case-sensitive. If you have difficulty with this process, please contact your ISP.

- ➢ **Confirm Password -** Enter the password again to make sure that the password is correct.

Check the radio button of **Dynamic/Static IP** to activate the secondary connection if your ISP provides an extra Connection type such as Dynamic/Static IP to connect to a local area network.

d) If the connection type detected is **L2TP/ Russian L2TP**, the next screen will appear as shown below Configure the following parameters and then click **Next** to continue.

➢ **User Name/Password -** Enter the **User Name** and **Password** provided by your ISP. These fields are case-sensitive. If you have difficulty with this process, please contact your ISP.

Select **Static IP** if IP Address/ Subnet Mask/ Gateway and DNS server address have been provided by your ISP. Then please enter server IP address or domain name provided by your ISP, and also enter the corresponding parameters.

Select **Dynamic IP** if none of the above parameters are provided. Then you just need to enter server IP address or domain name provided by your ISP.

e) If the connection type detected is **PPTP/Russian PPTP**, the next screen will appear as shown below. Configure the following parameters and then click **Next** to continue.

> **User Name/Password -** Enter the **User Name** and **Password** provided by your ISP. These fields are case-sensitive. If you have difficulty with this process, please contact your ISP.

Select **Static IP** if IP Address/ Subnet Mask/ Gateway and DNS server address have been provided by your ISP. Then please enter server IP address or domain name provided by your ISP, and also enter the corresponding parameters.

Select **Dynamic IP** if none of the above parameters are provided. Then you just need to enter server IP address or domain name provided by your ISP.

4. **Wireless** settings page will appear as shown below. Please configure the parameters and then click **Next**.

> ➢ **Wireless Radio -** Enable or disable the wireless radio by choosing from the drop-down list.

> ➢ **Wireless Network Name (also called SSID) -** Enter a value of up to 32 characters. The same name of SSID (Service Set Identification) must be assigned to all wireless devices in your network. Considering your wireless network security, the default SSID is set to be TP-LINK_XXXX (XXXX indicates the last unique four numbers of each Router's MAC address). This value is case-sensitive. For example, *TEST* is NOT the same as *test*.

> ➢ **Region -** Select your region from the drop-down list. This field specifies the region where the wireless function of the Router can be used. It may be illegal to use the wireless function of the Router in a region other than one of those specified in this field. If your country or region is not listed, please contact your local government agency for assistance.

> ➢ **Disable Security -** The wireless security function can be enabled or disabled. If disabled, the wireless stations will be able to connect the Router without encryption. It is strongly recommended that you choose one of following options to enable security.

> ➢ **WPA-PSK/WPA2-PSK -** Select WPA based on pre-shared passphrase.

> ➢ **Wireless Password** - You can enter **ASCII** or **Hexadecimal** characters.

For **ASCII**, the key can be made up of any numbers from 0 to 9 and any letters from A to Z, and the length should be between 8 and 63 characters.
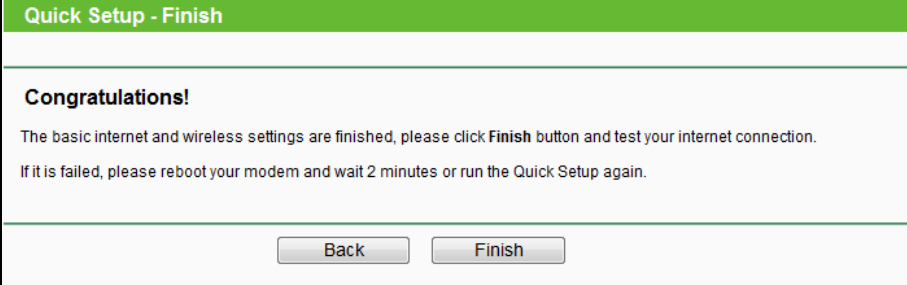

For **Hexadecimal**, the key can be made up of any numbers from 0 to 9 and letters from A to F, and the length should be between 8 and 64 characters.

Please also note the key is case sensitive, which means that upper and lower case keys will affect the outcome. It would also be a good idea to write down the key and all related wireless security settings.

> ➤ **No Change -** If you choose this option, wireless security configuration will not change!

These settings are only for basic wireless parameters. For advanced settings, please refer to 4.6 Wireless".

5.   Click the **Finish** button to complete the **Quick Setup**.

Chapter 4.   Configuring the Router

This chapter will show each Web page's key functions and the configuration way.

4.1   Login

After your successful login, you will see the main menus on the left of the Web-based utility. On the right, there are the corresponding explanations and instructions.

Status
Quick Setup
WPS
Network
Wireless
Guest Network
DHCP
Forwarding
Security
Parental Control
Access Control
Advanced Routing
Bandwidth Control
IP & MAC Binding
Dynamic DNS
IPv6 Support
System Tools
Logout

The detailed explanations for each Web page's key function are listed below.

4.2   Status

The Status page provides the current status information about the Router. All information is read-only.

4.3 Quick Setup

Please refer to 3.2 Quick Installation Guide.

4.4 WPS

This section will guide you to add a new wireless device to an existing network quickly by **WPS (Wi-Fi Protected Setup)** function.

Choose menu "**WPS**", and you will see the next screen as shown below.

WPS (Wi-Fi Protected Setup)

WPS Status: Enabled   Disable WPS

Current PIN: 12345670   Restore PIN   Gen New PIN
☐ Disable PIN of this device

Add a new device: Add Device

➢ **WPS Status -** Enable or disable the WPS function here.

➢ **Current PIN -** The current value of the Router's PIN displayed here. The default PIN of the Router can be found in the label or User Guide.

➢ **Restore PIN -** Restore the PIN of the Router to its default.

➢ **Gen New PIN -** Click this button, and then you can get a new random value for the Router's PIN. You can ensure the network security by generating a new PIN.

➢ **Disable PIN of this device -** WPS external registrar of entering this device's PIN can be disabled or enabled manually. If this device receives multiple failed attempts to authenticate an external registrar, this function will be disabled automatically.

➢ **Add Device -** You can add the new device to the existing network manually by clicking this button.

If the wireless adapter supports Wi-Fi Protected Setup (WPS), you can establish a wireless connection between wireless adapter and router using either Push Button Configuration (PBC) method or PIN method.

☞ **Note:**

To build a successful connection by WPS, you should also do the corresponding configuration of the new device for WPS function meanwhile.

I.   Use the Wi-Fi Protected Setup Button

Use this method if your client device has a WPS button.

Step 1: Press the **WPS/Wi-Fi** button on the back panel of the router. You can also keep the default WPS status as **Enabled** and click the **Add device** button in the figure above. Then choose "**Press the button of the new device in two minutes**" and click **Connect**, as shown below.

Step 2: Press and hold the **WPS** button of the client device.

Step 3: The Wi-Fi Protected Setup LED flashes for two minutes during the Wi-Fi Protected Setup process.

Step 4: When the WPS LED is on, the client device has successfully connected to the router.

II. Enter the client device's PIN on the router

Use this method if your client device does not have the WPS button, but has a Wi-Fi Protected Setup PIN number.

Step 1: Keep the default WPS status as **Enabled** and click the **Add device** button as shown below, then the figure below will appear.

Step 2: Enter the PIN number from the client device in the field on the WPS screen above. Then click **Connect** button.

Step 3: "**Connect successfully**" will appear on the screen of the figure above, which means the client device has successfully connected to the router.

III. Enter the router's PIN on your client device

Use this method if your client device asks for the router's PIN number.

20

Step 1: On the client device, enter the PIN number listed on the router's Wi-Fi Protected Setup screen, shown below (It is also labeled on the bottom of the router).

Step 2: The Wi-Fi Protected Setup LED flashes for two minutes during the Wi-Fi Protected Setup process.

Step 3: When the WPS LED is on, the client device has successfully connected to the router.

☞ **Note:**

1) The WPS LED on the router will light green for five minutes if the device has been successfully added to the network.

2) The WPS function cannot be configured if the Wireless Function of the router is disabled. Please make sure the Wireless Function is enabled before configuring the WPS.

4.5 Network
There are three submenus under the Network menu: **WAN**, **MAC Clone** and **LAN**. Click any of them, and you will be able to configure the corresponding function.

4.5.1 WAN

Choose menu "**Network→WAN**", and then you can configure the IP parameters of the WAN on the screen below.

1. If your ISP provides the DHCP service, please choose **Dynamic IP** type, and the Router will automatically get IP parameters from your ISP. You can see the page as follows :

This page displays the WAN IP parameters assigned dynamically by your ISP, including IP address, Subnet Mask, Default Gateway, etc. Click the **Renew** button to renew the IP parameters from your ISP. Click the **Release** button to release the IP parameters.

➢ **MTU Size -** The normal **MTU** (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default **MTU Size** unless required by your ISP.

➢ **Use These DNS Servers -** If your ISP gives you one or two DNS addresses, select **Use These DNS Servers** and enter the primary and secondary addresses into the correct fields. Otherwise, the DNS servers will be assigned dynamically from your ISP.

☞ **Note:**

If you find error when you go to a Web site after entering the DNS addresses, it is likely that your DNS servers are set up improperly. You should contact your ISP to get DNS server addresses.

➢ **Get IP with Unicast DHCP -** A few ISPs' DHCP servers do not support the broadcast applications. If you cannot get the IP Address normally, you can choose this option. (It is rarely required.)

2. If your ISP provides a static or fixed IP Address, Subnet Mask, Gateway and DNS setting, select **Static IP**. The Static IP settings page will appear as shown below.

> ➤ **IP Address -** Enter the IP address in dotted-decimal notation provided by your ISP.

> ➤ **Subnet Mask -** Enter the subnet Mask provided by your ISP in dotted-decimal notation. Usually, the Sub Mask is 255.255.255.0.

> ➤ **Default Gateway -** Enter the gateway IP address provided by your ISP in dotted-decimal notation.

> ➤ **MTU Size -** The normal **MTU** (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default **MTU Size** unless required by your ISP.

> ➤ **Primary/Secondary DNS -** Enter one or two DNS addresses in dotted-decimal notation provided by your ISP.

3. If your ISP provides a PPPoE connection, select **PPPoE/Russia PPPoE** option. And you should enter the following parameters :

> **User Name/Password -** Enter the User Name and Password provided by your ISP. These fields are case-sensitive.

> **Confirm Password -** Re-enter the Password provided by your ISP to ensure the Password you entered is correct.

> **Secondary Connection -** It's available only for PPPoE Connection. If your ISP provides an extra Connection type such as Dynamic/Static IP to connect to a local area network, then you can check the radio button of Dynamic/Static IP to activate this secondary connection.

- **Disabled -** The Secondary Connection is disabled by default, so there is PPPoE connection only. This is recommended.

- **Dynamic IP -** You can check this radio button to use Dynamic IP as the secondary connection to connect to the local area network provided by ISP.

- **Static IP -** You can check this radio button to use Static IP as the secondary connection to connect to the local area network provided by ISP.

> **Connect on Demand -** In this mode, the Internet connection can be terminated automatically after a specified inactivity period (**Max Idle Time**) and **be** re-established when you attempt to access the Internet again. If you want your Internet connection keeps active all the time, please enter "0" in the **Max Idle Time** field. Otherwise, enter the number of minutes you want to have elapsed before your Internet access disconnects.

> **Connect Automatically -** The connection can be re-established automatically when it was down.

➢ **Time-based Connecting -** The connection will only be established in the period from the start time to the end time (both are in HH:MM format).
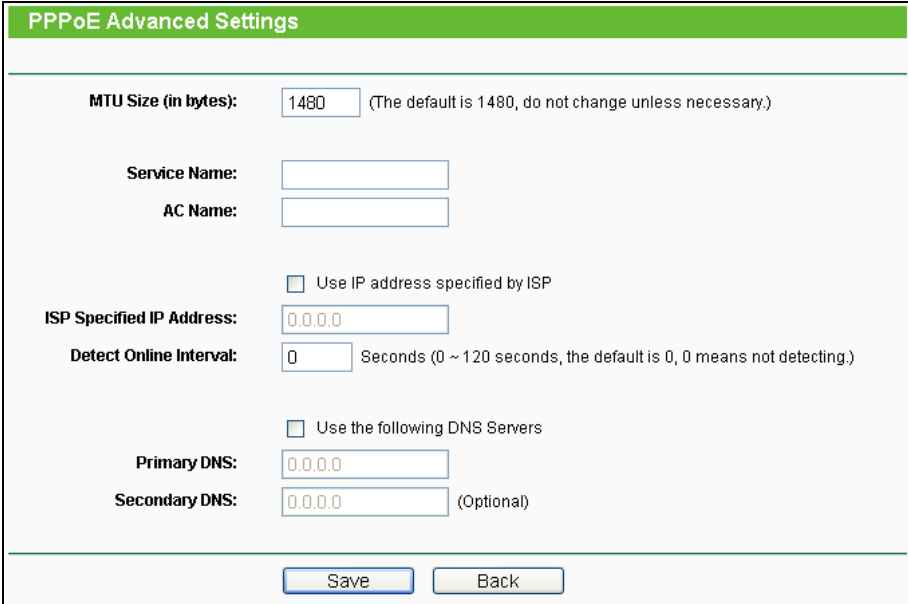

☞ **Note:**

Only when you have configured the system time on **System Tools -> Time** page, will the **Time-based Connecting** function can take effect.

➢ **Connect Manually -** You can click the **Connect/ Disconnect** button to connect/disconnect immediately. This mode also supports the **Max Idle Time** function as **Connect on Demand** mode. The Internet connection can be disconnected automatically after a specified inactivity period and re-established when you attempt to access the Internet again.

Caution: Sometimes the connection cannot be terminated although you specify a time to Max Idle Time, since some applications are visiting the Internet continually in the background.

If you want to do some advanced configurations, please click the **Advanced** button, and the page shown below will then appear:

➢ **MTU Size -** The default MTU size is "1480" bytes, which is usually fine. It is not recommended that you change the default **MTU Size** unless required by your ISP.

➢ **Service Name/AC Name -** The service name and AC (Access Concentrator) name, which should not be configured unless you are sure it is necessary for your ISP. In most cases, leaving these fields blank will work.

➢ **ISP Specified IP Address -** If your ISP does not automatically assign IP addresses to the Router during login, please click "**Use IP address specified by ISP**" check box and enter the IP address provided by your ISP in dotted-decimal notation.

> **Detect Online Interval -** The Router will detect Access Concentrator online at every interval. The default value is "0". You can input the value between "0"and "120". The value "0" means no detect.

> **DNS IP address -** If your ISP does not automatically assign DNS addresses to the Router during login, please click "**Use the following DNS servers**" check box and enter the IP address in dotted-decimal notation of your ISP's primary DNS server. If a secondary DNS server address is available, enter it as well.

Click the **Save** button to save your settings.

4. If your ISP provides BigPond Cable (or Heart Beat Signal) connection, please select **BigPond Cable**. And you should enter the following parameters :

> **User Name/Password -** Enter the User Name and Password provided by your ISP. These fields are case-sensitive.

> **Auth Server -** Enter the authenticating server IP address or host name.

> **Auth Domain -** Type in the domain suffix server name based on your location.

e.g.

NSW / ACT - **nsw.bigpond.net.au**
VIC / TAS / WA / SA / NT - **vic.bigpond.net.au**
QLD - **qld.bigpond.net.au**

➢ **MTU Size -** The normal **MTU** (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. It is not recommended that you change the default **MTU Size** unless required by your ISP.

➢ **Connect on Demand -** In this mode, the Internet connection can be terminated automatically after a specified inactivity period (**Max Idle Time**) and be re-established when you attempt to access the Internet again. If you want your Internet connection keeps active all the time, please enter "0" in the **Max Idle Time** field. Otherwise, enter the number of minutes you want to have elapsed before your Internet access disconnects.

➢ **Connect Automatically -** The connection can be re-established automatically when it was down.

➢ **Connect Manually -** You can click the **Connect/Disconnect** button to connect/disconnect immediately. This mode also supports the **Max Idle Time** function as **Connect on Demand** mode. The Internet connection can be disconnected automatically after a specified inactivity period and re-established when you attempt to access the Internet again.

Click the **Connect** button to connect immediately. Click the **Disconnect** button to disconnect immediately.

Caution: Sometimes the connection cannot be terminated although you specify a time to Max Idle Time because some applications are visiting the Internet continually in the background.

Click the **Save** button to save your settings.

5. If your ISP provides L2TP connection, please select **L2TP/Russia L2TP** option. And you should enter the following parameters:

> ➢ **User Name/Password -** Enter the User Name and Password provided by your ISP. These fields are case-sensitive.

> ➢ **Dynamic IP/ Static IP -** Choose either as you are given by your ISP. Click the **Connect** button to connect immediately. Click the **Disconnect** button to disconnect immediately.

> ➢ **Connect on Demand -** You can configure the Router to disconnect from your Internet connection after a specified period of inactivity (**Max Idle Time**). If your Internet connection has been terminated due to inactivity, **Connect on Demand** enables the Router to automatically re-establish your connection as soon as you attempt to access the Internet again. If you wish to activate **Connect on Demand**, click the radio button. If you want your Internet connection to remain active at all times, enter 0 in the **Max Idle Time** field. Otherwise, enter the number of minutes you want to have elapsed before your Internet connection terminates.

> ➢ **Connect Automatically -** Connect automatically after the Router is disconnected. To use this option, click the radio button.

> ➢ **Connect Manually -** You can configure the Router to make it connect or disconnect manually. After a specified period of inactivity (**Max Idle Time**), the Router will disconnect from your Internet connection, and you will not be able to re-establish your connection automatically as soon as you attempt to access the Internet again. To use this option, click the radio button. If

you want your Internet connection to remain active at all times, enter "0" in the **Max Idle Time** field. Otherwise, enter the number in minutes that you wish to have the Internet connecting last unless a new link is requested.

Caution: Sometimes the connection cannot be disconnected although you specify a time to **Max Idle Time**, since some applications is visiting the Internet continually in the background.

6. If your ISP provides PPTP connection, please select **PPTP/Russia PPTP** option. And you should enter the following parameters:

➢   **User Name/Password -** Enter the User Name and Password provided by your ISP. These fields are case-sensitive.

➢   **Dynamic IP/ Static IP -** Choose either as you are given by your ISP and enter the ISP's IP address or the domain name.

  If you choose static IP and enter the domain name, you should also enter the DNS assigned by your ISP. And click the **Save** button.

  Click the **Connect** button to connect immediately. Click the **Disconnect** button to disconnect immediately.

➢   **Connect on Demand -** You can configure the Router to disconnect from your Internet connection after a specified period of inactivity (**Max Idle Time**). If your Internet connection

has been terminated due to inactivity, **Connect on Demand** enables the Router to automatically re-establish your connection as soon as you attempt to access the Internet again. If you wish to activate **Connect on Demand**, click the radio button. If you want your Internet connection to remain active at all times, enter 0 in the **Max Idle Time** field. Otherwise, enter the number of minutes you want to have elapsed before your Internet connection terminates.

➢ **Connect Automatically -** Connect automatically after the Router is disconnected. To use this option, click the radio button.

➢ **Connect Manually -** You can configure the Router to make it connect or disconnect manually. After a specified period of inactivity (**Max Idle Time**), the Router will disconnect from your Internet connection, and you will not be able to re-establish your connection automatically as soon as you attempt to access the Internet again. To use this option, click the radio button. If you want your Internet connection to remain active at all times, enter "0" in the **Max Idle Time** field. Otherwise, enter the number in minutes that you wish to have the Internet connecting last unless a new link is requested.

Caution: Sometimes the connection cannot be disconnected although you specify a time to Max Idle Time, since some applications are visiting the Internet continually in the background.

☞ **Note:**

If you don't know how to choose the appropriate connection type, click the **Detect** button to allow the Router to automatically search your Internet connection for servers and protocols. The connection type will be reported when an active Internet service is successfully detected by the Router. This report is for your reference only. To make sure the connection type your ISP provides, please refer to the ISP. The various types of Internet connections that the Router can detect are as follows:

- **PPPoE -** Connections which use PPPoE that requires a user name and password.

- **Dynamic IP -** Connections which use dynamic IP address assignment.

- **Static IP -** Connections which use static IP address assignment.

The Router can not detect PPTP/L2TP/BigPond connections with your ISP. If your ISP uses one of these protocols, then you must configure your connection manually.

4.5.2 MAC Clone

Choose menu "**Network→MAC Clone**", and then you can configure the MAC address of the WAN on the screen below:

Some ISPs require that you register the MAC Address of your adapter. Changes are rarely needed here.

➢ **WAN MAC Address -** This field displays the current MAC address of the WAN port. If your ISP requires you to register the MAC address, please enter the correct MAC address into this field in XX-XX-XX-XX-XX-XX format(X is any hexadecimal digit).

➢ **Your PC's MAC Address -** This field displays the MAC address of the PC that is managing the Router. If the MAC address is required, you can click the **Clone MAC Address** button and this MAC address will fill in the **WAN MAC Address** field.

Click **Restore Factory MAC** to restore the MAC address of WAN port to the factory default value.

Click the **Save** button to save your settings.

☞ **Note:**
Only the PC on your LAN can use the **MAC Address Clone** function.

4.5.3 LAN

Choose menu "**Network→LAN**", and then you can configure the IP parameters of the LAN on the screen as below.

➢ **MAC Address -** The physical address of the Router, as seen from the LAN. The value can't be changed.

➢ **IP Address -** Enter the IP address of your Router or reset it in dotted-decimal notation (factory default: 192.168.0.1).

➢ **Subnet Mask -** An address code that determines the size of the network. Normally use 255.255.255.0 as the subnet mask.

➢ **IGMP Proxy** - If you want to watch TV through IGMP, please Enable it.

☞ Note:
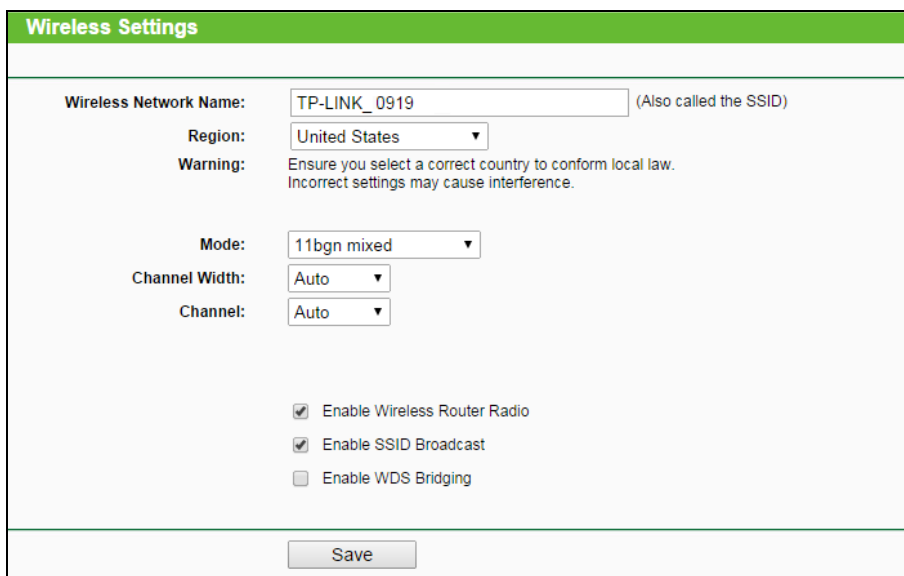

4.6   Wireless

There are five submenus under the Wireless menu as shown above: **Wireless Settings**, **Wireless Security**, **Wireless MAC Filtering**, **Wireless Advanced** and **Wireless Statistics**. Click any of them, and you will be able to configure the corresponding function.

4.6.1   Wireless Settings

Choose menu "**Wireless→Wireless Setting**", and then you can configure the basic settings for the wireless network on this page.

> **Wireless Network Name (also called SSID) -** Enter a value of up to 32 characters. The same name of SSID (Service Set Identification) must be assigned to all wireless devices in your network. Considering your wireless network security, the default SSID is set to be TP-LINK_XXXX (XXXX indicates the last unique four numbers of each Router's MAC address). This value is case-sensitive. For example, *TEST* is NOT the same as *test*.

➢ **Region -** Select your region from the drop-down list. This field specifies the region where the wireless function of the Router can be used. It may be illegal to use the wireless function of the Router in a region other than one of those specified in this field. If your country or region is not listed, please contact your local government agency for assistance.

When you select your local region from the drop-down list, click the **Save** button, and then the Note Dialog will appear. Click **OK**.

Microsoft Internet Explorer	✕
⚠ Selecting the incorrect country may cause interference to other devices and violate the applicable law.	
OK	
Note Dialog

☞ **Note:**

Limited by local law regulations, version for North America does not have region selection option.

➢ **Mode -** Select the desired mode. The default setting is 11bgn mixed.

11bg mixed - Select if you are using both 802.11b and 802.11g wireless clients.

11bgn mixed - Select if you are using a mix of 802.11b, 11g, and 11n wireless clients.

Select the desired wireless mode. When 802.11g mode is selected, only 802.11g wireless stations can connect to the Router. When 802.11n mode is selected, only 802.11n wireless stations can connect to the AP. It is strongly recommended that you set the Mode to **802.11b&g&n**, and all of 802.11b, 802.11g, and 802.11n wireless stations can connect to the Router.

➢ **Channel width -** Select any channel width from the drop-down list. The default setting is automatic, which can automatically adjust the channel width for your clients.

☞ **Note:**

If **11bg mixed** is selected in the **Mode** field, the **Channel Width** selecting field will turn grey and the value will become 20M, which is unable to be changed.

➢ **Channel -** This field determines which operating frequency will be used. The default channel is set to **Auto**, so the AP will choose the best channel automatically. It is not necessary to change the wireless channel unless you notice interference problems with another nearby access point.

➢ **Enable Wireless Router Radio -** The wireless radio of this Router can be enabled or disabled to allow wireless stations access.

➢ **Enable SSID Broadcast -** When wireless clients survey the local area for wireless networks to associate with, they will detect the SSID broadcast by the Router. If you select the **Enable SSID Broadcast** checkbox, the Wireless Router will broadcast its name (SSID) on the air.

➢ **Enable WDS Bridging -** Check this box to enable WDS. With this function, the Router can bridge two or more WLANs. If this checkbox is selected, you will have to set the following parameters as shown below. Make sure the following settings are correct.

- **SSID (to be bridged)** - The SSID of the AP your Router is going to connect to as a client. You can also use the search function to select the SSID to join.

- **BSSID (to be bridged)** - The BSSID of the AP your Router is going to connect to as a client. You can also use the search function to select the BSSID to join.

- **Survey** - Click this button, you can search the AP which runs in the current channel.

- **WDS Mode** - This field determines which WDS Mode will be used. It is not necessary to change the WDS Mode unless you notice network communication problems with root AP. If you select Auto, then Router will choose the appropriate WDS Mode automatically.

- **Key type** - This option should be chosen according to the AP's security configuration. It is recommended that the security type is the same as your AP's security type

- **WEP Index** - This option should be chosen if the key type is WEP (ASCII) or WEP (HEX).It indicates the index of the WEP key.

- **Auth Type** - This option should be chosen if the key type is WEP (ASCII) or WEP (HEX).It indicates the authorization type of the Root AP.

- **Password** - If the AP your Router is going to connect needs password, you need to fill the password in this blank.

4.6.2 Wireless Security

Choose menu "**Wireless→Wireless Security**", and then you can configure the security settings of your wireless network.

There are five wireless security modes supported by the Router: WPA/WPA2-Personal, WPA/WPA2-Enterprise and WEP.

➢ **Disable Security -** If you do not want to use wireless security, select this check box, but it's strongly recommended to choose one of the following modes to enable security.

➢ **WPA/WPA2-Personal(Recommended) -** It's the WPA/WPA2 authentication type based on pre-shared passphrase.

- **Version -** you can choose the version of the WPA-PSK security on the drop-down list. The default setting is **Automatic**, which can select **WPA-PSK** (Pre-shared key of WPA) or **WPA2-PSK** (Pre-shared key of WPA) automatically based on the wireless station's capability and request.

- **Encryption -** When **WPA-PSK** or **WPA** is set as the Authentication Type, you can select either **Automatic**, or **TKIP** or **AES** as Encryption.

☞ **Note:**

If you check the **WPA/WPA2-Personal (Recommended)** radio button and choose TKIP encryption, you will find a notice in red as shown below.

4-1

- **Password -** You can enter ASCII characters between 8 and 63 characters or 8 to 64 Hexadecimal characters.

- **Group Key Update Period -** Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.

➢ **WPA/WPA2-Enterprise -** It's based on Radius Server.

- **Version -** you can choose the version of the WPA security on the drop-down list. The default setting is **Automatic**, which can select **WPA** (Wi-Fi Protected Access) or **WPA2** (WPA version 2) automatically based on the wireless station's capability and request.

- **Encryption -** You can select either **Automatic**, or **TKIP** or **AES.**

☞ **Note:**
If you check the **WPA/WPA2-Enterprise** radio button and choose TKIP encryption, you will find a notice in red as shown below :
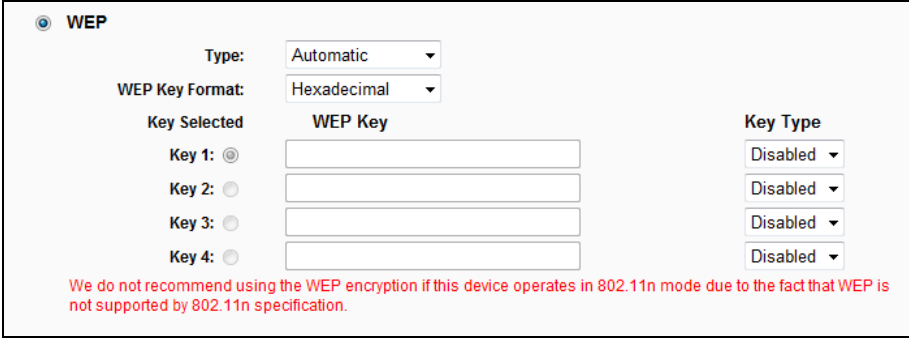

- **Radius Server IP -** Enter the IP address of the Radius Server.

- **Radius Port -** Enter the port that radius service used.

- **Radius Password -** Enter the password for the Radius Server.

- **Group Key Update Period -** Specify the group key update interval in seconds. The value should be 30 or above. Enter 0 to disable the update.

➢ **WEP -** It is based on the IEEE 802.11 standard. If you select this check box, you will find a notice in red as show below.

- **Type -** you can choose the type for the WEP security on the drop-down list. The default setting is **Automatic**, which can select **Open System** or **Shared Key** authentication type automatically based on the wireless station's capability and request.

- **WEP Key Format - Hexadecimal** and **ASCII** formats are provided. **Hexadecimal** format stands for any combination of hexadecimal digits (0-9, a-f, A-F) in the specified length. **ASCII** format stands for any combination of keyboard characters in the specified length.

- **WEP Key-** Select which of the four keys will be used and enter the matching WEP key that you create. Make sure these values are identical on all wireless stations in your network.

- **Key Typ**e **-** You can select the WEP key length (64-bit, or 128-bit, or 152-bit.) for encryption. "Disabled" means this WEP key entry is invalid.

   64-bit - You can enter 10 hexadecimal digits (any combination of 0-9, a-f, A-F, zero key is not promoted) or 5 ASCII characters.

   128-bit - You can enter 26 hexadecimal digits (any combination of 0-9, a-f, A-F, zero key is not promoted) or 13 ASCII characters.

   152-bit - You can enter 32 hexadecimal digits (any combination of 0-9, a-f, A-F, zero key is not promoted) or 16 ASCII characters.

   ☞ **Note:**

   If you do not set the key, the wireless security function is still disabled even if you have selected Shared Key as Authentication Type.

Be sure to click the **Save** button to save your settings on this page.

4.6.3   Wireless MAC Filtering

Choose menu "**Wireless→Wireless MAC Filtering**", and then you can control the wireless access by configuring the Wireless MAC Address Filtering function, shown below.

To filter wireless users by MAC Address, click **Enable**. The default setting is **Disable**.

➢ **MAC Address -** The wireless station's MAC address that you want to filter.

➢ **Status -** The status of this entry either **Enabled** or **Disabled**.

➢ **Description -** A simple description of the wireless station.

To Add a Wireless MAC Address filtering entry, click the **Add New…** button. The "**Add or Modify Wireless MAC Address Filtering entry**" page will appear as shown below:

To add or modify a MAC Address Filtering entry, follow these instructions:

1. Enter the appropriate MAC Address into the **MAC Address** field. The format of the MAC Address is XX-XX-XX-XX-XX-XX (X is any hexadecimal digit). For example: 00-0A-EB-00-07-8A.

2. Enter a simple description of the wireless station in the **Description** field. For example: Wireless station A.

3. **Status -** Select **Enabled** or **Disabled** for this entry on the **Status** drop-down list.

4. Click the **Save** button to save this entry.

To modify or delete an existing entry:

1. Click the **Modify** in the entry you want to modify. If you want to delete the entry, click the **Delete**.

2. Modify the information.

3. Click the **Save** button.

Click the **Enable All** button to make all entries enabled.

Click the **Disable All** button to make all entries disabled.

Click the **Delete All** button to delete all entries.

Click the **Next** button to go to the next page

Click the **Previous** button to return to the previous page.

For example: If you desire that the wireless station A with MAC address 00-0A-EB-00-07-8A and the wireless station B with MAC address 00-0A-EB-00-23-11 are able to access the Router, but all the other wireless stations cannot access the Router, you can configure the **Wireless MAC Address Filtering** list by following these steps:
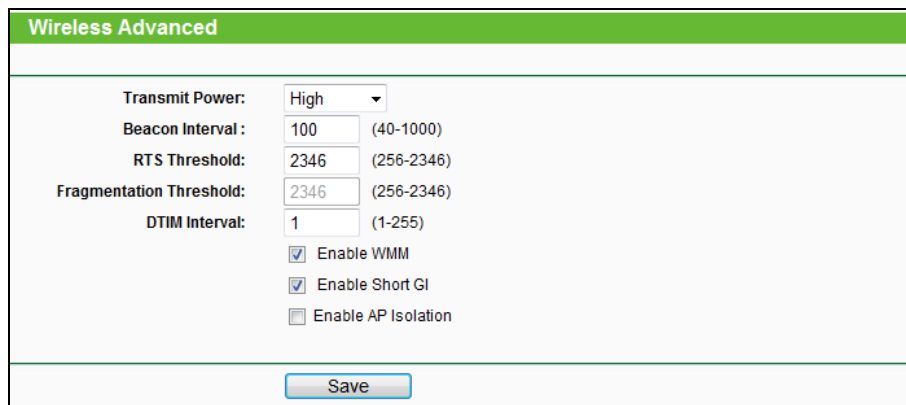

1. Click the **Enable** button to enable this function.

2. Select the radio button: **Deny the stations specified by any enabled entries in the list to access** for **Filtering Rules.**

3. Delete all or disable all entries if there are any entries already.

4. Click the **Add New...** button and enter the MAC address 00-0A-EB-00-07-8A /00-0A-EB-00-23-11 in the **MAC Address** field, then enter wireless station A/B in the **Description** field, while select **Enabled** in the **Status** drop-down list. Finally, click the **Save** and the **Back** button.

The filtering rules that configured should be similar to the following list:

4.6.4   Wireless Advanced

Choose menu "**Wireless**→**Wireless Advanced**", and then you can configure the advanced settings of your wireless network.

> ➢ **Transmit Power -** Here you can specify the transmit power of router. You can select High, Middle or Low which you would like. High is the default setting and is recommended.

> ➢ **Beacon Interval -** Enter a value between 20-1000 milliseconds for Beacon Interval here. The beacons are the packets sent by the router to synchronize a wireless network. Beacon Interval value determines the time interval of the beacons. The default value is 100.

> ➢ **RTS Threshold -** Here you can specify the RTS (Request to Send) Threshold. If the packet is larger than the specified RTS Threshold size, the router will send RTS frames to a particular receiving station and negotiate the sending of a data frame. The default value is 2346.

> ➢ **Fragmentation Threshold -** This value is the maximum size determining whether packets will be fragmented. Setting the Fragmentation Threshold too low may result in poor network performance since excessive packets. 2346 is the default setting and is recommended.

> ➢ **DTIM Interval -** This value determines the interval of the Delivery Traffic Indication Message (DTIM). A DTIM field is a countdown field informing clients of the next window for listening to broadcast and multicast messages. When the Router has buffered broadcast or multicast messages for associated clients, it sends the next DTIM with a DTIM Interval value. You can specify the value between 1-255 Beacon Intervals. The default value is 1, which indicates the DTIM Interval is the same as Beacon Interval.

> ➢ **Enable WMM - WMM** function can guarantee the packets with high- priority messages being transmitted preferentially. It is strongly recommended enabled.

> ➢ **Enable Short GI -** This function is recommended for it will increase the data capacity by reducing the guard interval time.

> **Enabled AP Isolation -** This function can isolate wireless stations on your network from each other. Wireless devices will be able to communicate with the Router but not with each other. To use this function, check this box. AP Isolation is disabled by default.

☞ **Note:**

If you are not familiar with the setting items in this page, it's strongly recommended to keep the provided default values; otherwise it may result in lower wireless network performance.

4.6.5   Wireless Statistics

Choose menu "**Wireless→Wireless Statistics**", and then you can see the MAC Address, Current Status, Received Packets and Sent Packets for each connected wireless station.

Wireless Statistics				
Current Connected Wireless Stations numbers:		1	Refresh	
ID	MAC Address	Current Status	Received Packets	Sent Packets
1	00-0A-EB-88-34-75	STA-ASSOC	416	2
		Previous	Next	

> **MAC Address -** The connected wireless station's MAC address

> **Current Status -** The connected wireless station's running status, one of **STA-AUTH / STA-ASSOC / STA-JOINED / WPA / WPA-PSK / WPA2 / WPA2-PSK / AP-UP / AP-DOWN / Disconnected**

> **Received Packets -** Packets received by the station

> **Sent Packets -** Packets sent by the station

You cannot change any of the values on this page. To update this page and to show the current connected wireless stations, click on the **Refresh** button.

If the numbers of connected wireless stations go beyond one page, click the **Next** button to go to the next page and click the **Previous** button to return to the previous page.

☞ **Note:**
This page will be refreshed automatically every 5 seconds.

4.7   Guest Network

Guest Network
- Wireless Settings

4.7.1   Wireless Settings

Choose menu "**Guest Network → Wireless Settings**", you can configure the Guest Network Wireless Settings on the page as shown below.

➢ **Allow Guest To Access My Local Network** - If enabled, guests can communicate with hosts.

➢ **Enable Guest Network Bandwidth Control** - If enabled, the Guest Network Bandwidth Control rules will take effect.

➢ **Egress Bandwidth For Guest Network** - The upload speed through the WAN port for Guest Network.

➢ **Ingress Bandwidth For Guest Network** - The download speed through the WAN port for Guest Network.

➢ **Guest Network** - Enabled or disable the Guest Network function here.

➢ **Network Name** - Enter a value of up to 32 characters. The same Name (SSID) must be assigned to all wireless devices in your Guest Network.

➢ **Wireless Security** - You can configure the security of Guest Network here.

➢ **Access Time** - During this time the wireless stations could accessing the AP.

☞ **Note:**

The range of bandwidth for Guest Network is calculated according to the setting of Bandwidth Control on the page "Bandwidth Control->Control Settings".
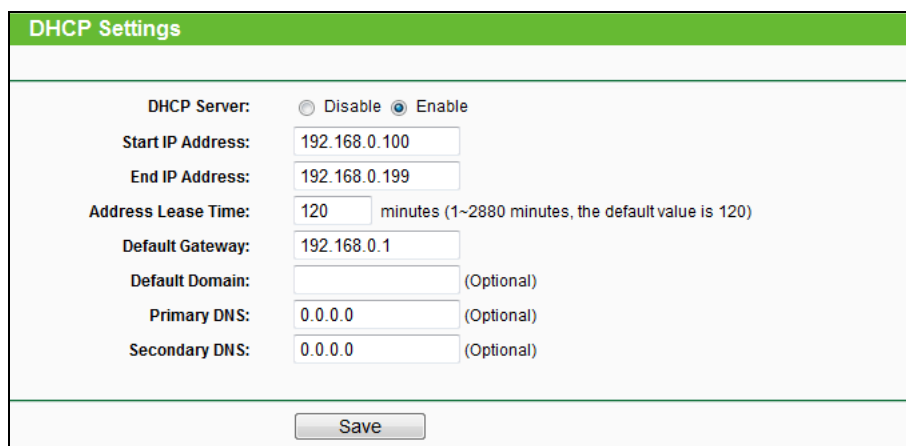

4.8　DHCP
There are three submenus under the DHCP menu as shown above: **DHCP Settings**, **DHCP Client List** and **Address Reservation**. Click any of them, and you will be able to configure the corresponding function.

4.8.1　DHCP Settings

Choose menu "**DHCP→DHCP Settings**", and then you can configure the DHCP Server on the page as shown below.The Router is set up by default as a DHCP (Dynamic Host Configuration Protocol) server, which provides the TCP/IP configuration for all the PC(s) that are connected to the Router on the LAN.

➢ **DHCP Server - Enable** or **Disable** the DHCP server. If you disable the Server, you must have another DHCP server within your network or else you must configure the computer manually.

➢ **Start IP Address -** Specify an IP address for the DHCP Server to start with when assigning IP addresses. 192.168.0.100 is the default start address.

➢ **End IP Address -** Specify an IP address for the DHCP Server to end with when assigning IP addresses. 192.168.0.199 is the default end address.

➢ **Address Lease Time -** The **Address Lease Time** is the amount of time a network user will be allowed connection to the Router with their current dynamic IP Address. Enter the amount of time in minutes and the user will be "leased" this dynamic IP Address. After the time is up, the user will be automatically assigned a new dynamic IP address. The range of the time is 1 ~ 2880 minutes. The default value is 120 minutes.

➤ **Default Gateway -** Suggest to input the IP address of the LAN port of the Router, default value is 192.168.0.1

➤ **Default Domain -** (Optional.) Input the domain name of your network.

➤ **Primary DNS -** (Optional.) Input the DNS IP address provided by your ISP. Or consult your ISP.

➤ **Secondary DNS -** (Optional.) Input the IP address of another DNS server if your ISP provides two DNS servers.

☞ **Note:**

To use the DHCP server function of the Router, you must configure all computers on the LAN as "Obtain an IP Address automatically".

4.8.2 DHCP Clients List

Choose menu "**DHCP→DHCP Clients List**", and then you can view the information about the clients attached to the Router in the next screen as shown below.

➤ **ID -** The index of the DHCP Client.

➤ **Client Name -** The name of the DHCP client.

➤ **MAC Address -** The MAC address of the DHCP client.

➤ **Assigned IP -** The IP address that the Router has allocated to the DHCP client.

➤ **Lease Time -** The time of the DHCP client leased. After the dynamic IP address has expired, a new dynamic IP address will be automatically assigned to the user.

You cannot change any of the values on this page. To update this page and to show the current attached devices, click the **Refresh** button.

4.8.3 Address Reservation

Choose menu "**DHCP→Address Reservation**", and then you can view and add a reserved address for clients via the next screen as shown below. When you specify a reserved IP address for a PC on the LAN, that PC will always receive the same IP address each time when it accesses the DHCP server. Reserved IP addresses should be assigned to the servers that require permanent IP settings.

Address Reservation				
ID	MAC Address	Reserved IP Address	Status	Modify
1	40-61-86-C4-98-43	192.168.0.100	Enabled	Modify Delete

[Add New...] [Enable All] [Disable All] [Delete All]

[Previous] [Next]

➢ **MAC Address -** The MAC address of the PC for which you want to reserve IP address.
➢ **Reserved IP Address -** The IP address of the Router reserved.
➢ **Status -** The status of this entry, either **Enabled** or **Disabled**.

To Reserve IP addresses:

1. Click the **Add New …** button. (Pop-up the figure below)

2. Enter the MAC address (in XX-XX-XX-XX-XX-XX format) and IP address of the computer you wish to add in dotted-decimal notation.

3. Click the **Save** button when finished.

Add or Modify an Address Reservation Entry	
MAC Address:	[ ]
Reserved IP Address:	[ ]
Status:	Enabled ▾

[Save] [Back]

To modify or delete an existing entry:

1. Click the **Modify** in the entry you want to modify. If you want to delete the entry, click the **Delete**.
2. Modify the information.
3. Click the **Save** button.

Click the **Enable/ Disable All** button to make all entries enabled/disabled
Click the **Delete All** button to delete all entries

Click the **Next** button to go to the next page and Click the **Previous** button to return to the previous page.

4.9   Forwarding
There are four submenus under the Forwarding menu as shown above: **Virtual Servers**, **Port Triggering**, **DMZ** and **UPnP**. Click any of them, and you will be able to configure the corresponding function.

4.9.1   Virtual Servers

Choose menu "**Forwarding→Virtual Servers**", and then you can view and add virtual servers in the next screen as shown below. Virtual servers can be used for setting up public services on your LAN. A virtual server is defined as a service port, and all requests from Internet to this service port will be redirected to the computer specified by the server IP. Any PC that was used for a virtual server must have a static or reserved IP address because its IP address may change when using the DHCP function.

- ➢ **Service Port** - The numbers of External Service Ports. You can enter a service port or a range of service ports (the format is XXX – YYY; XXX is the Start port and YYY is the End port).
- ➢ **Internal Port** - The Internal Service Port number of the PC running the service application. You can leave it blank if the **Internal Port** is the same as the **Service Port**, or enter a specific port number when **Service Port** is a single one.
- ➢ **IP Address** - The IP address of the PC running the service application.
- ➢ **Protocol** - The protocol used for this application, either **TCP**, **UDP**, or **All** (all protocols supported by the Router).
- ➢ **Status** - The status of this entry, "Enabled" means the virtual server entry is enabled.
- ➢ **Modify** - To modify or delete an existing entry.

To setup a virtual server entry:

1. Click the **Add New...** button. (pop-up the figure below)

2. Select the service you want to use from the **Common Service Port** list. If the **Common Service Port** menu does not list the service that you want to use, enter the number of the service port or service port range in the **Service Port** field.

3. Enter the IP address of the computer running the service application in the **IP Address** field.

4. Select the protocol used for this application in the **Protocol** drop-down list, either **TCP**, **UDP**, or **All**.

5. Select the **Enabled** option in the **Status** drop-down list.

6. Click the **Save** button.

Add or Modify a Virtual Server Entry	
Service Port:	[ ] (XX-XX or XX)
Internal Port:	[ ] (XX, Only valid for single Service Port or leave a blank)
IP Address:	[ ]
Protocol:	ALL
Status:	Enabled
Common Service Port:	--Select One--
	Save Back

☞ **Note:**

It is possible that you have a computer or server that has more than one type of available service. If so, select another service, and type the same IP address for that computer or server.

To modify or delete an existing entry:

1. Find the desired entry in the table.

2. Click **Modify** or **Delete** as desired on the **Modify** column.

Click the **Enable/ Disable All** button to make all entries enabled/ disabled.

Click the **Delete All** button to delete all entries.

Click the **Next** button to go to the next page and click the **Previous** button to return to the previous page.

☞ **Note:**

If you set the service port of the virtual server as 80, you must set the Web management port on **Security –> Remote Management** page to be any other value except 80 such as 8080. Otherwise there will be a conflict to disable the virtual server.

4.9.2   Port Triggering

Choose menu "**Forwarding→Port Triggering**", you can view and add port triggering in the next screen as shown below. Some applications require multiple connections, like Internet games, video conferencing, Internet telephoning and so on. Port Triggering is used for some of these applications that cannot work with a pure NAT Router.

To add a new rule, follow the steps below.

1. Click the **Add New…** button, the next screen will pop-up as shown below.

2. Select a common application from the **Common Applications** drop-down list, then the **Trigger Port** field and the **Incoming Ports** field will be automatically filled. If the **Common Applications** do not have the application you need, enter the **Trigger Port** and the **Incoming Ports** manually.

3. Select the protocol used for Trigger Port from the **Trigger Protocol** drop-down list, either **TCP**, **UDP**, or **All**.

4. Select the protocol used for Incoming Ports from the **Incoming Protocol** drop-down list, either **TCP** or **UDP**, or **All.**

5. Select **Enable** in **Status** field.

6. Click the **Save** button to save the new rule.

➢ **Trigger Port** - The port for outgoing traffic. An outgoing connection using this port will trigger this rule.

48

➢ **Trigger Protocol** - The protocol used for Trigger Ports, either **TCP**, **UDP**, or **All** (all protocols supported by the Router).

➢ **Incoming Port** - The port or port range used by the remote system when it responds to the outgoing request. A response using one of these ports will be forwarded to the PC which triggered this rule. You can input at most 5 groups of ports (or port sections). Every group of ports must be separated with ",", for example, 2000-2038, 2046, 2050-2051, 2085, 3010-3030.

➢ **Incoming Protocol** - The protocol used for **Incoming Port**, either **TCP**, **UDP**, or **ALL** (all protocols supported by the Router).

➢ **Status** - The status of this entry, Enabled means the Port Triggering entry is enabled.

➢ **Common Applications** - Some popular applications already listed in the drop-down list of **Incoming Protocol**.

To modify or delete an existing entry:

1. Find the desired entry in the table.

2. Click **Modify** or **Delete** as desired on the **Modify** column.

Click the **Enable All** button to make all entries enabled.

Click the **Disable All** button to make all entries disabled.

Click the **Delete All** button to delete all entries

Once the Router is configured, the operation is as follows:

1. A local host makes an outgoing connection to an external host using a destination port number defined in the **Trigger Port** field.

2. The Router records this connection, opens the incoming port or ports associated with this entry in the **Port Triggering** table, and associates them with the local host.

3. When necessary, the external host will be able to connect to the local host using one of the ports defined in the **Incoming Ports** field.

☞ **Note:**

1. When the trigger connection is released, the corresponding opened ports will be closed.

2. Each rule can only be used by one host on the LAN at a time. The trigger connection of other hosts on the LAN will be refused.

3. **Incoming Ports** ranges cannot overlap each other.

4.9.3 DMZ

Choose menu "**Forwarding→DMZ**", and then you can view and configure DMZ host in the screen as shown below. The DMZ host feature allows one local host to be exposed to the Internet for a special-purpose service such as Internet gaming or videoconferencing. The Router forwards packets of all services to the DMZ host. Any PC whose port is being forwarded must have its

DHCP client function disabled and should have a new static IP Address assigned to it because its IP Address may be changed when using the DHCP function.

To assign a computer or server to be a DMZ server:

1. Click the **Enable** button.
2. Enter the IP address of a local PC that is set to be DMZ host in the **DMZ Host IP Address** field.
3. Click the **Save** button.

4.9.4   UPnP

Choose menu "**Forwarding→UPnP**", and then you can view the information about **UPnP** in the screen as shown below. The **Universal Plug and Play (UPnP)** feature allows the devices, such as Internet computers, to access the local host resources or devices as needed. UPnP devices can be automatically discovered by the UPnP service application on the LAN.

➢ **Current UPnP Status -** UPnP can be enabled or disabled by clicking the **Enable** or **Disable** button. This feature is enabled by default.

➢ **Current UPnP Settings List -** This table displays the current UPnP information.

- **App Description** - The description about the application which initiates the UPnP request.
- **External Port** - The port which the Router opened for the application.
- **Protocol** - The type of protocol which is opened.
- **Internal Port** - The port which the Router opened for local host.

- **IP Address** - The IP address of the local host which initiates the UPnP request.
- **Status** - Either Enabled or Disabled. "Enabled" means that the port is still active; otherwise, the port is inactive.

Click the **Enable** button to enable UPnP.

Click the **Disable** button to disable UPnP.

Click the **Refresh** button to update the Current UPnP Settings List.

4.10 Security

There are four submenus under the Security menu as shown above: **Basic Security**, **Advanced Security**, **Local Management** and **Remote Management.** Click any of them, and you will be able to configure the corresponding function.

4.10.1 Basic Security

Choose menu "**Security** → **Basic Security**", and then you can configure the basic security in the screen as shown below.

➢ **Firewall -** A firewall protects your network from the outside world. Here you can enable or disable the Router's firewall.

- **SPI Firewall** - SPI (Stateful Packet Inspection, also known as dynamic packet filtering) helps to prevent cyber attacks by tracking more state per session. It validates that the

traffic passing through the session conforms to the protocol. SPI Firewall is enabled by factory default. If you want all the computers on the LAN exposed to the outside world, you can disable it.

➢   **VPN -** VPN Passthrough must be enabled if you want to allow VPN tunnels using VPN protocols to pass through the Router.

- **PPTP Passthrough** - Point-to-Point Tunneling Protocol (PPTP) allows the Point-to-Point Protocol (PPP) to be tunneled through an IP network. To allow PPTP tunnels to pass through the Router, click **Enable**.

- **L2TP Passthrough** - Layer Two Tunneling Protocol (L2TP) is the method used to enable Point-to-Point sessions via the Internet on the Layer Two level. To allow L2TP tunnels to pass through the Router, click **Enable**.

- **IPSec Passthrough** - Internet Protocol security (IPSec) is a suite of protocols for ensuring private, secure communications over Internet Protocol (IP) networks, through the use of cryptographic security services. To allow IPSec tunnels to pass through the Router, click **Enable**.

➢   **ALG -** It is recommended to enable Application Layer Gateway (ALG) because ALG allows customized Network Address Translation (NAT) traversal filters to be plugged into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, TFTP, H323 etc.

- **FTP ALG** - To allow FTP clients and servers to transfer data across NAT, click **Enable**.

- **TFTP ALG** - To allow TFTP clients and servers to transfer data across NAT, click **Enable**.

- **H323 ALG** - To allow Microsoft NetMeeting clients to communicate across NAT, click **Enable**.

- **RTSP ALG** - To allow some media player clients to communicate with some streaming media servers across NAT, click **Enable**.

- **SIP ALG** - To allow some multimedia clients to communicate across NAT, click **Enable**.

Click the **Save** button to save your settings.

4.10.2 Advanced Security

Choose menu "**Security → Advanced Security**", and then you can protect the Router from being attacked by TCP-SYN Flood, UDP Flood and ICMP-Flood in the screen as shown below.

➢ **Packets Statistics Interval (5~60) -** The default value is 10. Select a value between 5 and 60 seconds from the drop-down list. The Packets Statistics Interval value indicates the time section of the packets statistics. The result of the statistics is used for analysis by SYN Flood, UDP Flood and ICMP-Flood.

➢ **DoS Protection -** Denial of Service protection. Check the Enable or Disable button to enable or disable the DoS protection function. Only when it is enabled, will the flood filters be enabled.

☞ **Note:**

Dos Protection will take effect only when the **Traffic Statistics** in "**System Tool →
Statistics**" is enabled.

➢ **Enable ICMP-FLOOD Attack Filtering -** Enable or Disable the ICMP-FLOOD Attack Filtering.

➢ **ICMP-FLOOD Packets Threshold (5~3600) -** The default value is 50. Enter a value between 5 ～ 3600. When the current ICMP-FLOOD Packets number is beyond the set value, the Router will startup the blocking function immediately.

➢ **Enable UDP-FLOOD Filtering -** Enable or Disable the UDP-FLOOD Filtering.

➢ **UDP-FLOOD Packets Threshold (5~3600) -** The default value is 500. Enter a value between 5 ～ 3600. When the current UPD-FLOOD Packets number is beyond the set value, the Router will startup the blocking function immediately.

➢ **Enable TCP-SYN-FLOOD Attack Filtering -** Enable or Disable the TCP-SYN-FLOOD Attack Filtering.

➤ **TCP-SYN-FLOOD Packets Threshold (5~3600) -** The default value is 50. Enter a value between 5 ~ 3600. When the current TCP-SYN-FLOOD Packets numbers is beyond the set value, the Router will startup the blocking function immediately.

➤ **Ignore Ping Packet from WAN Port to Router** - Enable or Disable Ignore Ping Packet from WAN Port to Router. The default setting is disabled. If enabled, the ping packet from Internet cannot access the Router.

➤ **Forbid Ping Packet from LAN Port to Router** - Enable or Disable Forbid Ping Packet from LAN Port to Router. The default setting is disabled. If enabled, the ping packet from LAN cannot access the Router. (Defends against some viruses).

Click the **Save** button to save the settings.

Click the **Blocked DoS Host List** button to display the DoS host table by blocking.

4.10.3 Local Management

Choose menu "**Security → Local Management**", and then you can configure the management rule in the screen as shown below. The management feature allows you to deny computers in LAN from accessing the Router.

By default, the radio button "**All the PCs on the LAN are allowed to access the Router's Web-Based Utility**" is checked. If you want to allow PCs with specific MAC Addresses to access the Setup page of the Router's Web-Based Utility locally from inside the network, check the radio button "**Only the PCs listed can browse the built-in web pages to perform Administrator tasks**", and then enter each MAC Address in a separate field. The format for the MAC Address is XX-XX-XX-XX-XX-XX (X is any hexadecimal digit). Only the PCs with MAC address listed can use the password to browse the built-in web pages to perform Administrator tasks while all the others will be blocked.

After click the **Add** button, your PC's MAC Address will be placed in the list above.
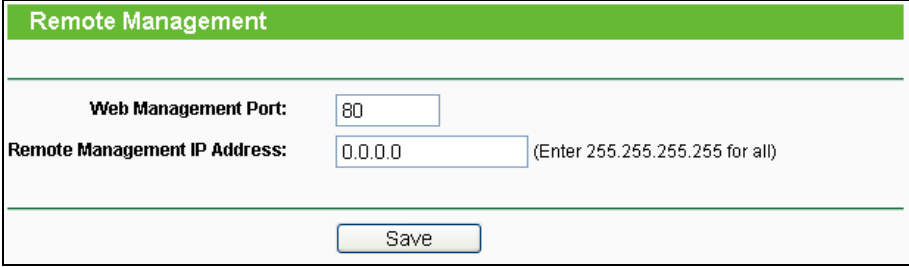

Click the **Save** button to save your settings.

☞ **Note:**

If your PC is blocked but you want to access the Router again, use a pin to press and hold the **WPS/RESET** button on the back panel for about 5 seconds to reset the Router's factory defaults on the Router's Web-Based Utility.

4.10.4 Remote Management

Choose menu "**Security → Remote Management**", and then you can configure the Remote Management function in the screen as shown below. This feature allows you to manage your Router from a remote location via the Internet.

➢ **Web Management Port -** Web browser access normally uses the standard HTTP service port 80. This Router's default remote management web port number is 80. For greater security, you can change the remote management web port to a custom port by entering that number in the box provided. Choose a number between 1 and 65534 but do not use the number of any common service port.

➢ **Remote Management IP Address -** This is the current address you will use when accessing your Router from the Internet. This function is disabled when the IP address is set to the default value of 0.0.0.0. To enable this function change 0.0.0.0 to a valid IP address. If set to 255.255.255.255, then all the hosts can access the Router from internet.

☞ **Note:**

1. To access the Router, you should type your Router's WAN IP address into your browser's address (in IE) or Location (in Navigator) box, followed by a colon and the custom port number. For example, if your Router's WAN address is 202.96.12.8, and the port number used is 8080, please enter http://202.96.12.8:8080 in your browser. Later, you may be asked for the Router's password. After successfully entering the username and password, you will be able to access the Router's web-based utility.

2. Be sure to change the Router's default password to a very secure password.

4.11 Parental Control

Choose menu "**Parental Control**", and then you can configure the parental control in the screen as shown below. The Parental Control function can be used to control the internet activities of the child, limit the child to access certain websites and restrict the time of surfing.

➢ **Parental Control -** Check **Enable** if you want this function to take effect; otherwise, check **Disable**.

➢ **MAC Address of Parental PC -** In this field, enter the MAC address of the controlling PC, or you can make use of the **Copy To Above** button below.

➢ **MAC Address of Your PC -** This field displays the MAC address of the PC that is managing this Router. If the MAC Address of your adapter is registered, you can click the **Copy To Above** button to fill this address to the MAC Address of Parental PC field above.

To add a new entry, please follow the steps below.

1. Click the **Add New…** button and the next screen will pop-up as shown below.

2. Enter the MAC address of the PC (e.g. 00-11-22-33-44-AA) you'd like to control in the **MAC Address of Child PC** field, or you can choose the MAC address from the **All MAC Address in Current LAN** drop-down list.

3. Give a description (e.g. Allow TP-LINK) for the website allowed to be accessed in the **Website Description** field.

4. Enter the allowed domain name of the website, either the full name or the keywords (e.g. tp-link) in the **Allowed Website Name** field.

5. Select from the Effective Time drop-down list the schedule (e.g. Schedule_1) you want. If there are not suitable schedules for you, click the **Schedule** in red below to go to the Advance Schedule Settings page and create the schedule you need.

6. In the **Status** field, you can select "Enabled" or "Disabled" to enable or disable your entry.

7. Click the **Save** button.

Click the **Enable All** button to enable all the rules in the list.

Click the **Disable All** button to disable all the rules in the list.

Click the **Delete All** button to delete all the entries in the table.

Click the **Next** button to go to the next page, or click the **Previous** button to return to the previous page.

For example: If you desire that the child PC with MAC address 00-11-22-33-44-AA can access www.tp-link.com on Saturday only while the parent PC with MAC address 00-11-22-33-44-BB is without any restriction, you should follow the settings below.

1. Click "**Parental Control**" menu on the left to enter the Parental Control Settings page. Check Enable and enter the MAC address 00-11-22-33-44-BB in the MAC Address of Parental PC field.

2. Click "**Access Control → Schedule**" on the left to enter the Schedule Settings page. Click **Add New...** button to create a new schedule with Schedule Description is Schedule_1, Day is Sat and Time is all day-24 hours.

3. Click "**Parental Control**" menu on the left to go back to the Add or Modify Parental Control Entry page:

    1) Click **Add New...** button.
    2) Enter 00-11-22-33-44-AA in the **MAC Address of Child PC** field.
    3) Enter "Allow TP-LINK" in the **Website Description** field.
    4) Enter "www.tp-link.com" in the **Allowed Website Name** field.
    5) Select "Schedule_1" you create just now from the **Effective Time** drop-down list.
    6) In **Status** field, select Enable.

4. Click **Save** to complete the settings.

    Then you will go back to the **Parental Control Settings** page and see the following list, as shown below.

ID	MAC address	Website Description	Schedule	Status	Modify
1	00-11-22-33-44-AA	Allow TP-LINK	Schedule_1	Enabled	Edit Delete

[Add New...] [Enable All] [Disable All] [Delete All]
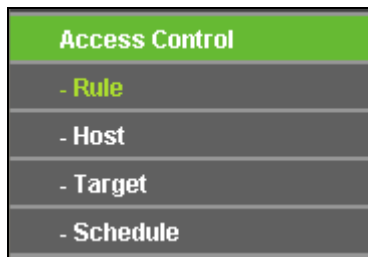

4.12 Access Control

There are four submenus under the Access Control menu as shown below: **Rule**, **Host**, **Target** and **Schedule**. Click any of them, and you will be able to configure the corresponding function.

4.12.1 Rule

Choose menu "**Access Control** → **Rule**", and then you can view and set Access Control rules in the screen as shown below.

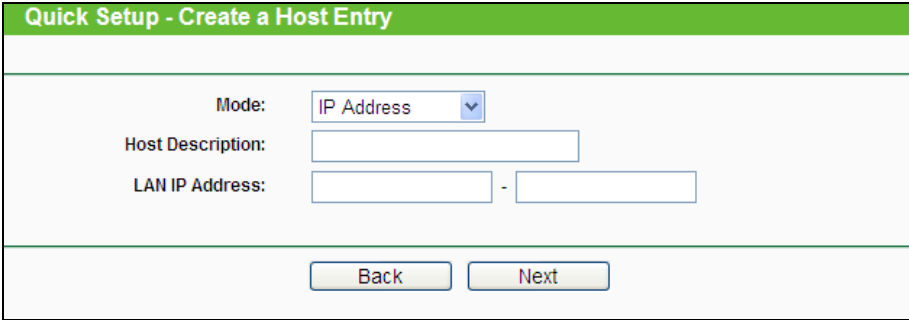

➢ **Enable Internet Access Control -** Select the check box to enable the Internet Access Control function, so the Default Filter Policy can take effect.

➢ **Rule Name -** Here displays the name of the rule and this name is unique.

➢ **Host -** Here displays the host selected in the corresponding rule.

➢ **Target -** Here displays the target selected in the corresponding rule.

➢ **Schedule -** Here displays the schedule selected in the corresponding rule.

➢ **Enable -** Here displays the status of the rule, enabled or not. Check this option to enable a specific entry.

➢ **Modify -** Here you can edit or delete an existing rule.

➢ **Setup Wizard -** Click the **Setup Wizard** button to create a new rule entry.

➢ **Add New...**   - Click the **Add New...** button to add a new rule entry.

➢ **Enable All -** Click the **Enable All** button to enable all the rules in the list.

➢ **Disable All -** Click the **Disable All** button to disable all the rules in the list.

➢ **Delete All -** Click the **Delete All** button to delete all the entries in the table.

➢ **Move -** You can change the entry's order as desired. Enter in the first box the ID number of the entry you want to move and in the second box another ID number, and then click the **Move** button to change the entries' order.

➢ **Next -** Click the **Next** button to go to the next page.

➢ **Previous -** Click the **Previous** button to return to the previous page.

There are two methods to add a new rule.

Method One:

1. Click **Setup Wizard** button and the next screen will appear as shown below.

➢ **Host Description** - In this field, create a unique description for the host (e.g. Host_1).

➢ **Mode** - Here are two options, **IP Address** and **MAC Address**. You can select either of them from the drop-down list.

If the **IP Address** is selected, you can see the following item:

➢ **LAN IP Address** - Enter the IP address or address range of the host in dotted-decimal format (e.g. 192.168.0.23).

If the MAC Address is selected, you can see the following item:

➢ **MAC Address** - Enter the MAC address of the host in XX-XX-XX-XX-XX-XX format (e.g. 00-11-22-33-44-AA).

2. Click **Next** when finishing creating the host entry, and the next screen will appear as shown below.

> ➢ **Mode** - Here are two options, IP Address and Domain Name. You can choose either of them from the drop-down list.

> ➢ **Target Description** - In this field, create a description for the target. Note that this description should be unique (e.g. Target_1).

If the **IP Address** is selected, you will see the following items:

> ➢ **IP Address** - Enter the IP address (or address range) of the target (targets) in dotted-decimal format (e.g. 192.168.0.23).

> ➢ **Target Port** - Specify the port or port range for the target. For some common service ports, you can make use of the Common Service Port item below.

> ➢ **Protocol** - Here are four options, All, TCP, UDP, and ICMP. Select one of them from the drop-down list for the target.

> ➢ **Common Service Port** - Here lists some common service ports. Select one from the drop-down list and the corresponding port number will be filled in the Target Port field automatically. For example, if you select "FTP", "21" will be filled in the Target Port automatically.

If the **Domain Name** is selected, you will see the following item:

> ➢ **Domain Name** - Here you can enter 4 domain names, either the full name or the keywords (for example, tp-link). Any domain name with keywords in it (www.tp-link.com) will be blocked or allowed.

3. Click **Next** when finishing creating the access target entry, and the next screen will appear as shown below.

> **Schedule Description** - In this field, create a description for the schedule. Note that this description should be unique (e.g. Schedule_1).

> **Day** - Choose Select Days and select the certain day (days), or choose Everyday.

> **Time** - Select "24 hours", or specify the Start Time and Stop Time yourself.

> **Start Time** - Enter the start time in HHMM format (HHMM are 4 numbers). For example 0800 is 8:00.

> **Stop Time** - Enter the stop time in HHMM format (HHMM are 4 numbers). For example 2000 is 20:00.

4. Click **Next** when finishing creating the advanced schedule entry, and the next screen will appear as shown below.

> **Rule Name** - In this field, create a name for the rule. Note that this name should be unique (e.g. Rule_1).

> **Host** - In this field, select a host from the drop-down list for the rule. The default value is the **Host Description** you set just now.

> **Target** - In this filed, select a target from the drop-down list for the rule. The default value is the **Target Description** you set just now.

> ➤ **Schedule** - In this field, select a schedule from the drop-down list for the rule. The default value is the **Schedule Description** you set just now.

> ➤ **Status** - In this field, there are two options, **Enable** or **Disable**. Select **Enable** so that the rule will take effect. Select **Disable** so that the rule won't take effect.

5. Click **Finish** to complete adding a new rule.

Method Two:

1. Click the **Add New…** button and the next screen will pop up as shown below.

2. Give a name (e.g. Rule_1) for the rule in the **Rule Name** field.

3. Select a host from the **Host** drop-down list or choose "**Click Here To Add New Host List**".

4. Select a target from the **Target** drop-sown list or choose "**Click Here To Add New Target List**".

5. Select a schedule from the **Schedule** drop-down list or choose "**Click Here To Add New Schedule**".

6. In the **Status** field, select **Enabled** or **Disabled** to enable or disable your entry.

7. Click the **Save** button.

For example: If you desire to allow the host with MAC address 00-11-22-33-44-AA to access www.tp-link.com only from 18:00 to 20:00 on Saturday and Sunday, and forbid other hosts in the LAN to access the Internet, you should follow the settings below:

1. Click the submenu **Rule of Access Control** in the left to return to the Rule List page. Select Enable Internet Access Control and choose "Allow the packets specified by any enabled access control policy to pass through the Router".

2. We recommend that you click **Setup Wizard** button to finish all the following settings.

3. Click the submenu **Host of Access Control** in the left to enter the Host List page. Add a new entry with the Host Description is Host_1 and MAC Address is 00-11-22-33-44-AA.

4. Click the submenu **Target of Access Control** in the left to enter the Target List page. Add a new entry with the Target Description is Target_1 and Domain Name is www.tp-link.com.

5. Click the submenu **Schedule of Access Control** in the left to enter the Schedule List page. Add a new entry with the Schedule Description is Schedule_1, Day is Sat and Sun, Start Time is 1800 and Stop Time is 2000.

6. Click the submenu **Rule of Access Control** in the left, Click **Add New...** button to add a new rule as follows:

- In Rule Name field, create a name for the rule. Note that this name should be unique, for example Rule_1.

- In Host field, select Host_1.

- In Target field, select Target_1.

- In Schedule field, select Schedule_1.

- In Status field, select Enable.

- Click Save to complete the settings.

Then you will go back to the Access Control Rule Management page and see the following list.

ID	Rule Name	Host	Target	Schedule	Enable	Modify
1	Rule_1	Host_1	Target_1	Schedule_1	☑	Edit Delete

4.12.2 Host

Choose menu "**Access Control → Host**", and then you can view and set a Host list in the screen as shown below. The host list is necessary for the Access Control Rule.

Host Settings

ID	Host Description	Information	Modify
1	Host_1	IP: 192.168.0.1 - 192.168.0.23	Edit Delete

[Add New...]   [Delete All]

[Previous]   [Next]   Current No. 1 ▾ Page

➢ **Host Description -** Here displays the description of the host and this description is unique.

➢ **Information -** Here displays the information about the host. It can be IP or MAC.

➢ **Modify -** To modify or delete an existing entry.

To add a new entry, please follow the steps below.

1. Click the **Add New…** button.

2. In the **Mode** field, select IP Address or MAC Address.

- If you select IP Address, the screen shown is the first figure below.

  1) In **Host Description** field, create a unique description for the host (e.g. Host_1).

  2) In **LAN IP Address** field, enter the IP address.

- If you select MAC Address, the screen shown is the second figure below.

  1) In **Host Description** field, create a unique description for the host (e.g. Host_1).

    2) In **MAC Address** field, enter the MAC address.

3. Click the **Save** button to complete the settings.

Click the **Delete All** button to delete all the entries in the table.

Click the **Next** button to go to the next page, or click the **Previous** button to return to the previous page.

For **example**: If you desire to restrict the internet activities of host with MAC address 00-11-22-33-44-AA, you should first follow the settings below:

1. Click **Add New...** button to enter the Add or Modify a Host Entry page.

2. In **Mode** field, select MAC Address from the drop-down list.

3. In **Host Description** field, create a **unique** description for the host (e.g. Host_1).

4. In **MAC Address** field, enter 00-11-22-33-44-AA.

5. Click **Save** to complete the settings.

Then you will go back to the Host Settings page and see the following list.

4.12.3 Target

Choose menu "**Access Control → Target**", and then you can view and set a Target list in the screen as shown below. The target list is necessary for the Access Control Rule.

➢ **Target Description -** Here displays the description about the target and this description is unique.

➢ **Information -** The target can be IP address, port, or domain name.

➢ **Modify -** To modify or delete an existing entry.

To add a new entry, please follow the steps below.

1. Click the **Add New…** button.

2. In Mode field, select **IP Address** or **Domain Name**.

3. If you select **IP Address**, the screen shows as below.

1) In **Target Description** field, create a unique description for the target (e.g. Target_1).

2) In **IP Address** field, enter the IP address of the target.

3) Select a common service from **Common Service Port** drop-down list, so that the **Target Port** will be automatically filled. If the **Common Service Port** drop-down list doesn't have the service you want, specify the **Target Port** manually.

4) In **Protocol** field, select TCP, UDP, ICMP or ALL from the drop-down list.

4. If you select **Domain Name**, the screen shows as below.

> 1) In **Target Description** field, create a unique description for the target (e.g. Target_1).
>
> 2) In **Domain Name** field, enter the domain name, either the full name or the keywords (for example, tp-link) in the blank. Any domain name with keywords in it (www.tp-link.com) will be blocked or allowed. You can enter 4 domain names.

5. Click the **Save** button.

Click the **Delete All** button to delete all the entries in the table.

Click the **Next** button to go to the next page, or click the **Previous** button to return to the previous page.

For example: If you desire to restrict the internet activities of host with MAC address 00-11-22-33-44-AA in the LAN to access **www.tp-link.com** only, you should first follow the settings below:

1. Click **Add New…** button to enter the Add or Modify an Access Target Entry page.
2. In **Mode** field, select Domain Name from the drop-down list.
3. In **Target Description** field, create a unique description for the target (e.g. Target_1).
4. In **Domain Name** field, enter www.tp-link.com.
5. Click **Save** to complete the settings.

Then you will go back to the Target Settings page and see the following list.

ID	Target Description	Information	Modify
1	Target_1	www.tp-link.com	Edit Delete

4.12.4 Schedule

Choose menu "**Access Control → Schedule**", and then you can view and set a Schedule list in the next screen as shown below. The Schedule list is necessary for the Access Control Rule.

> ➤ **Schedule Description** - Here displays the description of the schedule and this description is unique.

> ➤ **Day** - Here displays the day(s) in a week.

> ➤ **Time** - Here displays the time period in a day.

> ➤ **Modify** - Here you can edit or delete an existing schedule.

To add a new schedule, follow the steps below:

1. Click **Add New...** and the next screen will pop-up as shown below.

2. In **Schedule Description** field, create a unique description for the schedule (e.g. Schedule_1).

3. In **Day** field, select the day or days you need.

4. In **Time** field, you can select all day-24 hours or you may enter the Start Time and Stop Time in the corresponding field.

5. Click **Save** to complete the settings.

Click the **Delete All** button to delete all the entries in the table.

Click the **Next** button to go to the next page, or click the **Previous** button to return to the previous page.

For example: If you desire to restrict the internet activities of host with MAC address 00-11-22-33-44-AA to access www.tp-link.com only from **18:00 to 20:00** on **Saturday** and **Sunday**, you should first follow the settings below:

67

1) Click **Add New...** button to enter the Advanced Schedule Settings page.

2) In **Schedule Description** field, create a unique description for the schedule (e.g. Schedule_1).

3) In **Day** field, check the Select Days radio button and then select Sat and Sun.

4) In **Time** field, enter 1800 in Start Time field and 2000 in Stop Time field.

5) Click **Save** to complete the settings.

Then you will go back to the Schedule Settings page and see the following list.

ID	Schedule Description	Day	Time	Modify
1	Schedule_1	Sat Sun	18:00 - 20:00	Edit Delete

4.13 Advanced Routing

Advanced Routing
- Static Routing List
- System Routing Table
There are two submenus under the Advanced Routing menu as shown above: **Static Routing List** and **System Routing Table**. Click either of them, and you will be able to configure the corresponding function.
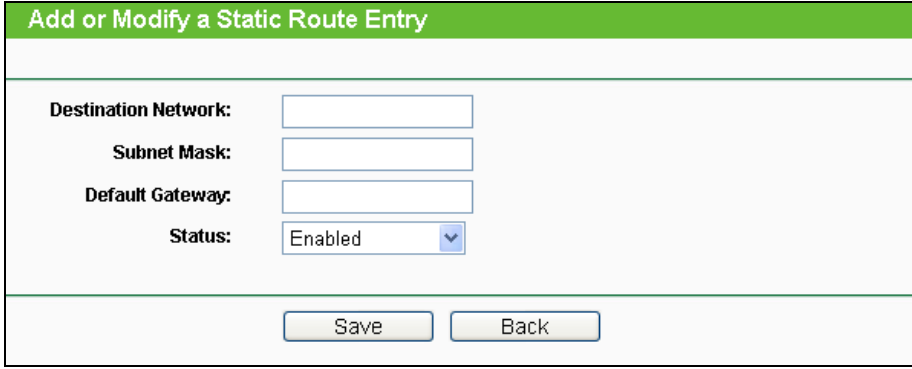

4.13.1 Static Routing List

Choose menu "**Advanced Routing** → **Static Routing List**", and then you can configure the static route in the next screen . A static route is a pre-determined path that network information must travel to reach a specific host or network.

Static Routing

ID	Destination Network	Subnet Mask	Default Gateway	Status	Modify

[Add New...] [Enable All] [Disable All] [Delete All]

[Previous] [Next]

To add static routing entries:

1. Click **Add New…** in the figure shown above, you will see the following screen.

2. Enter the following data:

> **Destination Network** - The Destination Network is the address of the network or host that you want to assign to a static route.

> **Subnet Mask -** The **Subnet Mask** determines which portion of an IP Address is the network portion, and which portion is the host portion.

> **Default Gateway** - This is the IP Address of the gateway device that allows for contact between the Router and the network or host.

3. Select **Enabled** or **Disabled** for this entry on the **Status** drop-down list.

4. Click the **Save** button to make the entry take effect.

Other configurations for the entries:

Click the **Delete** button to delete the entry.

Click the **Enable All** button to enable all the entries.

Click the **Disable All** button to disable all the entries.

Click the **Delete All** button to delete all the entries.

Click the **Previous** button to view the information in the previous screen, click the **Next** button to view the information in the next screen.

4.13.2 System Routing Table

Choose menu "**Advanced Routing   System Routing Table**", and then you can view the System Routing Table in the next screen as shown below System routing table views all of the valid route entries in use. The Destination IP address, Subnet Mask, Gateway, and Interface will be displayed for each entry.

> **Destination Network** - The Destination Network is the address of the network or host to which the static route is assigned.

> **Subnet Mask** - The Subnet Mask determines which portion of an IP address is the network portion, and which portion is the host portion.

> **Gateway** - This is the IP address of the gateway device that allows for contact between the Router and the network or host.

> **Interface** - This interface tells you either the Destination IP Address is on the **LAN & WLAN** (internal wired and wireless networks), or on the **WAN** (Internet).

4.14 Bandwidth Control
There are two submenus under the Bandwidth Control menu as shown above: **Control Settings** and **Rule List**. Click any of them, and you will be able to configure the corresponding function. The detailed explanations for each submenu are provided below.

4.14.1 Control Settings

Choose menu "**Bandwidth Control** → **Control Settings**", and then you can configure the Egress Bandwidth and Ingress Bandwidth in the next screen. Their values you configure should be less than 100000Kbps. For optimal control of the bandwidth, please select the right Line Type and ask your ISP for the total bandwidth of the egress and ingress.

> **Enable Bandwidth Control -** Check this box so that the Bandwidth Control settings can take effect.

70

➢ **Line Type -** Select the right type for you network connection. If you don't know how to choose, please ask your ISP for the information.

➢ **Egress Bandwidth** - The upload speed through the WAN port.

➢ **Ingress Bandwidth -** The download speed through the WAN port.

4.14.2 Rules List

Choose menu "**Bandwidth Control** → **Rules List**", and then you can view and configure the Bandwidth Control rules in the screen below.

Bandwidth Control Rules List

ID	Description	Egress Bandwidth(Kbps)		Ingress Bandwidth(Kbps)		Enable	Modify
		Min	Max	Min	Max		
1	192.168.0.1 - 192.168.0.23/21/TCP	0	1000	0	4000	☑	Modify Delete

Add New...   Delete All

Previous   Next   Now is the 1 ▼ page

➢ **Description -** This is the information about the rules such as address range.

➢ **Egress bandwidth -** This field displays the max and mix upload bandwidth through the WAN port, the default is 0.

➢ **Ingress bandwidth -** This field displays the max and mix download bandwidth through the WAN port, the default is 0.

➢ **Enable -** This displays the status of the rule.

➢ **Modify -** Click **Modify** to edit the rule. Click **Delete** to delete the rule.

To add/modify a Bandwidth Control rule, follow the steps below.

1.   Click **Add New…**in the figure shown above, you will see a new screen as shown below.

2.   Enter the information like the screen shown below.

Bandwidth Control Rule Settings

Enable:	☑	
IP Range:	192.168.0.1	- 192.168.0.23
Port Range:	21	-
Protocol:	TCP ▼	
	Min Bandwidth(Kbps)	Max Bandwidth(Kbps)
Egress Bandwidth:	0	1000
Ingress Bandwidth:	0	4000

Save   Back

3.   Click the **Save** button.

4.15 IP & MAC Binding Setting
There are two submenus under the IP &MAC Binding menu as shown below: **Binding Settings** and **ARP List**. Click any of them, and you will be able to scan or configure the corresponding function. The detailed explanations for each submenu are provided below.

4.15.1 Binding Settings

This page displays the **IP & MAC Binding Setting** table; you can operate it in accord with your desire as shown below.

➢ **MAC Address -** The MAC address of the controlled computer in the LAN.

➢ **IP Address -** The assigned IP address of the controlled computer in the LAN.

➢ **Bind -** Check this option to enable ARP binding for a specific device.

➢ **Modify -** To modify or delete an existing entry.

When you want to add or modify an IP & MAC Binding entry, you can click the **Add New…** button or **Modify** button, and then you will go to the next page. This page is used for adding or modifying an IP & MAC Binding entry as shown below.

To add IP & MAC Binding entries, follow the steps below.

1. Click the **Add New...** button.

2. Enter the MAC Address and IP Address.

3. Select the Bind checkbox.

4. Click the **Save** button to save it.

To modify or delete an existing entry, follow the steps below.

1. Find the desired entry in the table.

2. Click **Modify** or **Delete** as desired on the **Modify** column.

To find an existing entry, follow the steps below.

1. Click the **Find** button as shown below.

2. Enter the MAC Address or IP Address.

3. Click the **Find** button in the page as shown below.

Click the **Enable All** button to make all entries enabled.

Click the **Delete All** button to delete all entries.

4.15.2 ARP List

To manage the computer, you could observe the computers in the LAN by checking the relationship of MAC address and IP address on the ARP list, and you could also configure the items on the ARP list. This page displays the ARP List; it shows all the existing IP & MAC Binding entries as shown below.

1. **MAC Address -** The MAC address of the controlled computer in the LAN.

2. **IP Address -** The assigned IP address of the controlled computer in the LAN.

73

3. **Status -** Indicates whether or not the MAC and IP addresses are bound.

4. **Configure -** Load or delete an item.

    ➢ **Load -** Load the item to the IP & MAC Binding list.

    ➢ **Delete -** Delete the item.

Click the **Bind All** button to bind all the current items, available after enable.

Click the **Load All** button to load all items to the IP & MAC Binding list.

Click the **Refresh** button to refresh all items.

☞ **Note:**

An item could not be loaded to the IP & MAC Binding list if the IP address of the item has been loaded before. Error warning will prompt as well. Likewise, "Load All" only loads the items without interference to the IP & MAC Binding list.

4.16 Dynamic DNS

Choose menu "**Dynamic DNS**", and you can configure the Dynamic DNS function.

The Router offers the **DDNS** (Dynamic Domain Name System) feature, which allows the hosting of a website, FTP server, or e-mail server with a fixed domain name (named by yourself) and a dynamic IP address, and then your friends can connect to your server by entering your domain name no matter what your IP address is. Before using this feature, you need to sign up for DDNS service providers such as www.comexe.cn, dyn.com/dns../Downloads/www.dyndns.org, or www.noip.com. The Dynamic DNS client service provider will give you a password or key.

4.16.1 Comexe DDNS

If the dynamic DNS **Service Provider** you select is www.comexe.cn, the page will appear as shown below.

To set up for DDNS, follow these instructions:

1. Enter the **Domain Name** your dynamic DNS service provider gave.

2. Enter the **User Name** for your DDNS account.

3. Enter the **Password** for your DDNS account.

4. Click the **Login** button to login the DDNS service.

**Connection Status -**The status of the DDNS service connection is displayed here.

Click **Logout** to log out of the DDNS service.

☞ **Note:**

If you want to login again with another account after a successful login, please click the **Logout** button, then input your new username and password and click the **Login** button.

4.16.2 Dyndns DDNS

If the dynamic DNS **Service Provider** you select is dyn.com/dns, the page will appear as shown below.

To set up for DDNS, follow these instructions:

1. Enter the **User Name** for your DDNS account.

2. Enter the **Password** for your DDNS account.

3. Enter the **Domain Name** you received from dynamic DNS service provider.

4. Click the **Login** button to login to the DDNS service.

**Connection Status -**The status of the DDNS service connection is displayed here.

Click **Logout** to logout of the DDNS service.

☞ **Note:**

If you want to login again with another account after a successful login, please click the **Logout** button, then input your new username and password and click the **Login** button.

4.16.3 No-IP DDNS

If the dynamic DNS **Service Provider** you select is www.noip.com, the page will appear as shown below.

To set up for DDNS, follow these instructions:

1. Enter the **User Name** for your DDNS account.

2. Enter the **Password** for your DDNS account.

3. Enter the **Domain Name** you received from dynamic DNS service provider.

4. Click the **Login** button to login to the DDNS service.

Connection Status - The status of the DDNS service connection is displayed here.

Click **Logout** to log out the DDNS service.

☞ Note:

If you want to login again with another account after a successful login, please click the **Logout** button, then input your new username and password and click the **Login** button.

4.17 IPv6 Support
There are two submenus under the IPv6 Support menu as shown above: **IPv6 Status** and **IPv6 Setup**. Click either of them, and you will be able to scan or configure the corresponding function. The detailed explanations for each submenu are provided below.

4.17.1 IPv6 Status

The **IPv6 Status** page displays the router's current IPv6 status and configuration. All information is read-only.

➢ **WAN**

- **Connection Type** - The IPv6 connection way for WAN.
- **IPv6 Address** - The WAN IPv6 address.

- **IPv6 Default Gateway** - The router's default gateway.

- **Primary IPv6 DNS** - The primary IPv6 DNS address.

- **Secondary IPv6 DNS** - The secondary IPv6 DNS address.

➢ **LAN**

- **IPv6 Address Assign Type** - The way how the router assign IPv6 address for PC in LAN, RADVD (Router Advertisement Daemon) and DHCPv6 (Dynamic Host Configuration Protocol for IPv6) Server.

- **IPv6 Address** - The LAN global IPv6 address of the router.

- **Link-local Address** - The LAN Link-local Address of the router.

4.17.2 IPv6 Setup

➢ **Enable IPv6** - Tick the checkbox to enable the IPv6 function. It's enabled by default.

➢ **WAN Connection Type** - Choose the correct WAN connection type based on your ISP network topology.

- **SLAAC** - Connections which use RADVD IPv6 address assignment.

- **DHCPv6** - Connections which use dynamic IPv6 address assignment.

- **Static IPv6** - Connections which use static IPv6 address assignment.

- **PPPoEv6** - Connections which use PPPoEV6 that requires a user name and password.

- **Tunnel 6to4** - Connections which use 6to4 address assignment.

Different types of WAN connection require you to do different settings. Below are the detailed explanations for the respective type.

1) SLAAC

➢ **IPv6 Address** - The IPv6 address assigned by your ISP dynamically.

➢ **IPv6 Address Prefix** - Display the IPv6 Prefix Length in dotted-decimal notation provided by your ISP.

➢ **Default Gateway** - Display the default gateway in colon-hexadecimal notation provided by your ISP.

Click the **Connect** button to connect immediately.

Click the **Disconnect** button to disconnect immediately.

If your ISP gives you one or two DNS IPv6 addresses, select **Use the following IPv6 DNS Servers** and enter the **Primary IPv6 DNS** and **Secondary IPv6 DNS** into the correct fields. Otherwise, leave the default selection **Get IPv6 DNS Server Automatically**, and the DNS servers will be assigned from ISP dynamically.

➢ **Primary IPv6 DNS** - Enter the DNS IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Secondary IPv6 DNS** - Enter another DNS IPv6 address in dotted-decimal notation provided by your ISP.

☞ **Note:**

If you get Address not found error when you access a Web site, it is likely that your DNS servers are set up improperly. You should contact your ISP to get DNS server addresses.

➢ **Address Autoconfiguration Type**- **RADVD** (Router Advertisement Daemon) and **DHCPv6** (Dynamic Host Configuration Protocol for IPv6) **Server**.

➢ **Site Prefix Configuration Type** - The type of IPv6 address prefix.

  • **Delegated** - Get the IPv6 address prefix from the ISP automatically, and the device will delegate it to the LAN.

  • **Static** - Configure the **Site Prefix** and **Site Prefix Length** manually. Please contact your ISP to get more information before you configure them.

➢ **LAN IPv6 Address** - Display the LAN IPv6 address created by the device.

Click the **Save** button to save your settings.

2) **DHCPv6**

➢ **IPv6 Address** - The IPv6 address assigned by your ISP dynamically.

➢ **Default Gateway** - Display the default gateway in colon-hexadecimal notation provided by your ISP.

Click the **Renew** button to renew the IPv6 parameters from your ISP.

Click the **Release** button to release the IPv6 parameters from your ISP.

If your ISP gives you one or two DNS IPv6 addresses, select **Use the following IPv6 DNS Servers** and enter the **Primary IPv6 DNS** and **Secondary IPv6 DNS** into the correct fields. Otherwise, leave the default selection **Get IPv6 DNS Server Automatically**, and the DNS servers will be assigned from ISP dynamically.

➢ **Primary IPv6 DNS** - Enter the DNS IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Secondary IPv6 DNS** - Enter another DNS IPv6 address in dotted-decimal notation provided by your ISP.

☞ **Note:**

If you get Address not found error when you access a Web site, it is likely that your DNS servers are set up improperly. You should contact your ISP to get DNS server addresses.

➢ **Address Autoconfiguration Type** - **RADVD** (Router Advertisement Daemon) and **DHCPv6** (Dynamic Host Configuration Protocol for IPv6) **Server**.

➢ **Site Prefix Configuration Type** - The type of IPv6 address prefix.

- **Delegated** - Get the IPv6 address prefix from the ISP automatically, and the device will delegate it to the LAN.

- **Static** - Configure the **Site Prefix** and **Site Prefix Length** manually. Please contact your ISP to get more information before you configure them.

➢ **LAN IPv6 Address** - Display the LAN IPv6 address created by the device.

Click the **Save** button to save your settings.

3) Static IPv6

➢ **IPv6 Address** - Enter the IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Default Gateway** - Enter the default gateway in dotted-decimal notation provided by your ISP.

➢ **MTU Size (in bytes)** - The normal MTU (Maximum Transmission Unit) value for most Ethernet networks is 1500 Bytes. For some ISPs, you may need to modify the MTU. But this is rarely required, and should not be done unless you are sure it is necessary for your ISP connection.

➢ **Primary DNS** - Enter the DNS IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Secondary DNS** - Enter another DNS IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Address Autoconfiguration Type** - **RADVD** (Router Advertisement Daemon) and **DHCPv6** (Dynamic Host Configuration Protocol for IPv6) **Server**.

➢ **Site Prefix Configuration Type** - The type of IPv6 address prefix.

- **Delegated** - Get the IPv6 address prefix from the ISP automatically, and the device will delegate it to the LAN.

- **Static** - Configure the **Site Prefix** and **Site Prefix Length** manually. Please contact your ISP to get more information before you configure them.

➢ **LAN IPv6 Address** - Display the LAN IPv6 address created by the device.

Click the **Save** button to save your settings.

4)   PPPoEv6

WAN Setup

Enable IPv6:	☑
WAN Connection Type:	PPPoEv6 ▼
PPPoE Session:	○ Share with PPPoEv4 ◉ Create a new Session
Username:	pppoe
Password:	•••••
Confirm Password:	•••••
IPv6 Address:	2000::7757:264c:fe14:a397

Default Gateway:	fe80::c8a4:7ec7:5a6a:750b
MTU:	1492 Bytes,1492 as default, do not change unless necessary.
◉	Get IPv6 DNS Server Automatically
Primary IPv6 DNS:	2a04:2c00:1:c000::2
Secondary IPv6 DNS:	
○	Use the following IPv6 DNS Servers
Connection Mode:	◉ Alway On ○ Connect Manual
	[Connect] [Disconnect] **Connected**

LAN Setup

Address Autoconfiguration Type:	◉ RADVD ○ DHCPv6 Server
Site Prefix Configuration Type:	◉ Delegated ○ Static
Lan IPV6 Address:	2a04:2c01:0:801e:20a:ebff:fe13:919/64

[Save]

➢ **PPPoE Session** - The PPP session type for IPv6 connection. There are two types:

- **Share with PPPoEv4** - The PPPoEv6 and PPPoEv4 use the same PPP session.

- **Create a new Session** - The PPPoEv6 and PPPoEv4 use different PPP sessions. It is default to select this option.

➢ **User Name/Password** - Enter the User Name and Password provided by your ISP. These fields are case-sensitive.

➢ **IPv6 Address** - Enter the IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Default Gateway** - Enter the default gateway in dotted-decimal notation provided by your ISP.

➢ **MTU Size (in bytes)** - The normal MTU (Maximum Transmission Unit) value is 1492 Bytes. For some ISPs, you may need to modify the MTU. But this is rarely required, and should not be done unless you are sure it is necessary for your ISP connection.

➢ **Primary DNS** - Enter the DNS IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Secondary DNS** - Enter another DNS IPv6 address in dotted-decimal notation provided by your ISP.

➢ **Connection Mode** - The way to connect the ISP.

- **Alway On** - Connect automatically.

- **Connect Manual** - Connect by the user manually.

Click the **Connect** button to connect immediately.
Click the **Disconnect** button to disconnect immediately.

➢ **Address Autoconfiguration Type** - **RADVD** (Router Advertisement Daemon) and **DHCPv6** (Dynamic Host Configuration Protocol for IPv6) **Server**.

➢ **Site Prefix Configuration Type** - The type of IPv6 address prefix.

- **Delegated** - Get the IPv6 address prefix from the ISP automatically, and the device will delegate it to the LAN.

- **Static** - Configure the **Site Prefix** and **Site Prefix Length** manually. Please contact your ISP to get more information before you configure them.

➢ **LAN IPv6 Address** - Display the LAN IPv6 address created by the device.

Click the **Save** button to save your settings.

5) **Tunnel 6to4**

➢ **Address/Subnet Mask/Default Gateway** - The IPv4 address/ subnet mask/ default gateway assigned, in dotted-decimal notation.

➢ **Tunnel Address** - The 6to4 tunnel address created by the device to access to the IPv6 network.

> **MTU Size** - The normal MTU (Maximum Transmission Unit) value for most Ethernet networks is 1480 Bytes. For some ISPs, you may need to modify the MTU. But this is rarely required, and should not be done unless you are sure it is necessary for your ISP connection.

If your ISP gives you one or two DNS IPv6 addresses, select **Use the following IPv6 DNS Servers** and enter the **Primary IPv6 DNS** and **Secondary IPv6 DNS** into the correct fields. Otherwise, the DNS servers will be assigned from ISP dynamically.

> **Primary IPv6 DNS** - Enter the DNS IPv6 address in dotted-decimal notation provided by your ISP.

> **Secondary IPv6 DNS** - Enter another DNS IPv6 address in dotted-decimal notation provided by your ISP.

> **Address Autoconfiguration Type** - **RADVD** (Router Advertisement Daemon) and **DHCPv6** (Dynamic Host Configuration Protocol for IPv6) **Server**.

> **Site Prefix Configuration Type** - The type of IPv6 address prefix.

  - **Delegated** - Get the IPv6 address prefix from the ISP automatically, and the device will delegate it to the LAN.

  - **Static** - Configure the **Site Prefix** and **Site Prefix Length** manually. Please contact your ISP to get more information before you configure them.

> **LAN IPv6 Address** - Display the LAN IPv6 address created by the device.

Click the **Save** button to save your settings.

4.18 System Tools

Choose menu "**System Tools**", and you can see the submenus under the main menu: **Time Settings**, **Diagnostic**, **Firmware Upgrade**, **Factory Defaults**, **Backup & Restore**, **Reboot**, **Password**, **System Log** and **Statistics**. Click any of them, and you will be able to configure the corresponding function. The detailed explanations for each submenu are provided below.

4.18.1 Time Settings

Choose menu "**System Tools→Time Settings**", and then you can configure the time on the following screen.

➢ **Time Zone -** Select your local time zone from this pull down list.

➢ **Date -** Enter your local date in MM/DD/YY into the right blanks.

➢ **Time -** Enter your local time in HH/MM/SS into the right blanks.

➢ **NTP Server 1 / NTP Server 2 -** Enter the address or domain of the **NTP Server 1** or **NTP Server 2**, and then the Router will get the time from the NTP Server preferentially. In addition, the Router built-in some common NTP Servers, so it can get time automatically once it connects the Internet.

➢ **Enable Daylight Saving -** Check the box to enable the Daylight Saving function.

➢ **Start -** The time to start the Daylight Saving. Select the month in the first field, the week in the second field, the day in the third field and the time in the last field.

➢ **End -** The time to end the Daylight Saving. Select the month in the first field, the week in the second field, the day in the third field and the time in the last field.

➢ **Daylight Saving Status -** Displays the status whether the Daylight Saving is in use.

To set time manually:

1. Select your local time zone.
2. Enter the **Date** in Month/Day/Year format.
3. Enter the **Time** in Hour/Minute/Second format.
4. Click **Save**.

To set time automatically:

1.   Select your local time zone.

2.   Enter the address or domain of the **NTP Server I** or **NTP Server II**.

3.   Click the **Get GMT** button to get system time from Internet if you have connected to the Internet.

To set Daylight Saving:

1.   Check the box to enable Daylight Saving.

2.   Select the start time from the drop-down lists in the **Start** field.

3.   Select the end time from the drop-down lists in the **End** field.

4.   Click the **Save** button to save the settings.

 Note:

1.   This setting will be used for some time-based functions such as firewall. You must specify your time zone once you login to the router successfully, otherwise, these functions will not take effect.

2.   The time will be lost if the router is turned off.

3.   The Router will automatically obtain GMT from the Internet if it is configured accordingly.

4.   The Daylight Saving will take effect one minute after the configurations are completed.

4.18.2 Diagnostic

Choose menu "**System Tools** → **Diagnostic**", and then you can transact **Ping** or **Traceroute** function to check connectivity of your network in the following screen.

➢ **Diagnostic Tool** - Check the radio button to select one diagnostic too.

➢ **Ping** - This diagnostic tool troubleshoots connectivity, reachability, and name resolution to a given host or gateway.

➢ **Traceroute** - This diagnostic tool tests the performance of a connection.

☞ **Note:**

You can use ping/traceroute to test both numeric IP address or domain name. If pinging/tracerouting the IP address is successful, but pinging/tracerouting the domain name is not, you might have a name resolution problem. In this case, ensure that the domain name you are specifying can be resolved by using Domain Name System (DNS) queries.

➢ **IP Address/Domain Name** - Enter the IP Address or Domain Name of the PC whose connection you wish to diagnose.

➢ **Ping Count -** Specifies the number of Echo Request messages sent. The default is 4.

➢ **Ping Packet Size -** Specifies the number of data bytes to be sent. The default is 64.

➢ **Ping Timeout -** Time to wait for a response, in milliseconds. The default is 800.

➢ **Traceroute Max TTL -** Set the maximum number of hops (max TTL to be reached) in the path to search for the target (destination). The default is 20.

Click **Start** to check the connectivity of the Internet.

The **Diagnostic Results** page displays the result of diagnosis.

If the result is similar to the following screen, the connectivity of the Internet is fine.
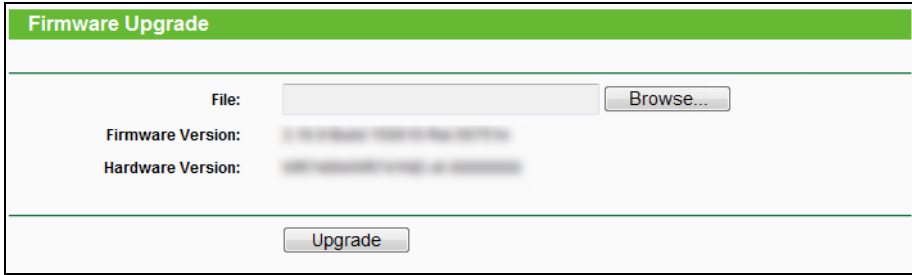

☞ **Note:**

1. Only one user can use the diagnostic tools at one time.
2. "Ping Count", "Ping Packet Size" and "Ping Timeout" are Ping Parameters, and "Traceroute Max TTL" is Traceroute Parameter.

4.18.3 Firmware Upgrade

Choose menu "**System Tools → Firmware Upgrade**", and then you can update the latest version of firmware for the Router on the following screen.

Firmware Upgrade

File:	[ ] Browse...
Firmware Version:	
Hardware Version:	

Upgrade

➢ **Firmware Version -** Displays the current firmware version.

➢ **Hardware Version -** Displays the current hardware version. The hardware version of the upgrade file must accord with the Router's current hardware version.

To upgrade the Router's firmware, follow these instructions below:

1. Download a most recent firmware upgrade file from our website (www.tp-link.com).
2. Enter or select the path name where you save the downloaded file on the computer into the **File** blank.
3. Click the **Upgrade** button.
4. The Router will reboot while the upgrading has been finished.

☞ **Note:**

1) New firmware versions are posted at http://www.tp-link.com and can be downloaded for free. There is no need to upgrade the firmware unless the new firmware has a new feature you want to use. However, when experiencing problems caused by the Router rather than the configuration, you can try to upgrade the firmware.

2) When you upgrade the Router's firmware, you may lose its current configurations, so before upgrading the firmware please write down some of your customized settings to avoid losing important settings.

3) Do not turn off the Router or press the Reset button while the firmware is being upgraded. Loss of power during the upgrade could damage the Router.

4) The firmware version must correspond to the hardware.

5) The upgrade process takes a few moments and the Router restarts automatically when the upgrade is complete.

4.18.4 Factory Defaults

Choose menu "**System Tools → Factory Defaults**", and then and you can restore the configurations of the Router to factory defaults on the following screen
Click the **Restore** button to reset all configuration settings to their default values.

- The default **User Name**: admin

- The default **Password**: admin

- The default **IP Address**: 192.168.0.1

- The default **Subnet Mask**: 255.255.255.0

☞ **Note:**

All changed settings will be lost when defaults are restored.

4.18.5 Backup & Restore

Choose menu "**System Tools → Backup & Restore**", and then you can save the current configuration of the Router as a backup file and restore the configuration via a backup file as shown below.
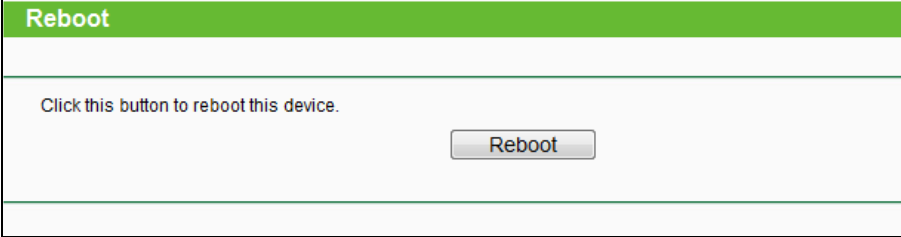

➢ Click the **Backup** button to save all configuration settings as a backup file in your local computer.

➢ To upgrade the Router's configuration, follow these instructions.

- Click the **Browse** button to find the configuration file which you want to restore.

- Click the **Restore** button to update the configuration with the file whose path is the one you have input or selected in the blank.

☞ **Note:**

The current configuration will be covered with the uploading configuration file. Wrong process will lead the device unmanaged. The restoring process lasts for 20 seconds and the Router will restart automatically then. Keep the power of the Router on during the process, in case of any damage.

4.18.6 Reboot

Choose menu "**System Tools → Reboot**", and then you can click the **Reboot** button to reboot the Router via the next screen.
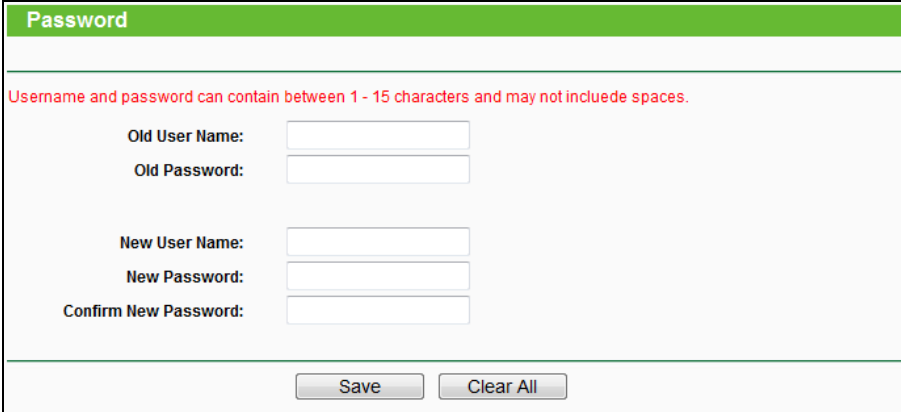

Some settings of the Router will take effect only after rebooting, which include

- Change the LAN IP Address (system will reboot automatically).

- Change the DHCP Settings.

- Change the Wireless configurations.

- Change the Web Management Port.

- Upgrade the firmware of the Router (system will reboot automatically).

- Restore the Router's settings to factory defaults (system will reboot automatically).

- Update the configuration with the file (system will reboot automatically.

4.18.7 Password

Choose menu "**System Tools** → **Password**", and then you can change the factory default user name and password of the Router in the next screen as shown below.

It is strongly recommended that you should change the factory default user name and password of the Router, because all users who try to access the Router's Web-based utility or Quick Setup will be prompted for the Router's default user name and password.

☞ Note:

The new user name and password must not exceed 15 characters in length and must not include any spaces. Enter the new Password twice to confirm it.

Click the **Save** button when finished.

Click the **Clear All** button to clear all.

4.18.8 System Log

Choose menu "**System Tools** → **System Log**", and then you can view the logs of the Router.

➢ **Auto Mail Feature -** Indicates whether auto mail feature is enabled or not.

➢ **Mail Settings -** Set the receiving and sending mailbox address, server address, validation information as well as the timetable for Auto Mail Feature, as shown below.

- **From -** Your mail box address. The Router would connect it to send logs.

- **To -** Recipient's address. The destination mailbox where the logs would be received.

- **SMTP Server -** Your smtp server. It corresponds with the mailbox filled in the **From** field. You can log on the relevant website for help if you are not clear with the address.

- **Authentication -** Most SMTP Server requires Authentication. It is required by most mailboxes that need User Name and Password to log in.

Note:

Only when you select **Authentication**, do you have to enter the User Name and Password in the following fields.

- **User Name -** Your mail account name filled in the From field. The part behind @ is included.

- **Password -** Your mail account password.

- **Confirm The Password -** Enter the password again to confirm.

- **Enable Auto Mail Feature -** Select it to mail logs automatically. You could mail the current logs either at a specified time everyday or by intervals, but only one could be the current effective rule. Enter the desired time or intervals in the corresponding field as shown above.

Click **Save** to keep your settings.

Click **Back** to return to the previous page.

➢ **Log Type -** By selecting the log type, only logs of this type will be shown.
➢ **Log Level -** By selecting the log level, only logs of this level will be shown.
➢ **Refresh -** Refresh the page to show the latest log list.
➢ **Save Log -** Click to save all the logs in a txt file.
➢ **Mail Log -** Click to send an email of current logs manually according to the address and validation information set in Mail Settings.
➢ **Clear Log -** All the logs will be deleted from the Router permanently, not just from the page.

Click the **Next** button to go to the next page, or click the **Previous** button to return to the previous page.

4.18.9 Statistics

Choose menu "**System Tools → Statistics**", and then you can view the statistics of the Router, including total traffic and current traffic of the last Packets Statistic Interval.

➢ **Current Statistics Status -** Enable or Disable. The default value is disabled. To enable it, click the **Enable** button. If it is disabled, the function of DoS protection in Security settings will be disabled.

➢ **Packets Statistics Interval** （**5-60**） **-** The default value is 10. Select a value between 5 and 60 seconds in the drop-down list. The Packets Statistic interval indicates the time section of the packets statistic.

➢ **Sorted Rules -** Choose how the displayed statistics are sorted.

Select the **Auto-refresh** checkbox to refresh automatically.

Click the **Refresh** button to refresh immediately.

Click **Reset All** to reset the values of all the entries to zero.

Click **Delete All** to delete all entries in the table.

Statistics Table:

IP/MAC Address		The IP and MAC address are displayed with related statistics.
Total	**Packets**	The total number of packets received and transmitted by the Router.
	Bytes	The total number of bytes received and transmitted by the Router.
Current	**Packets**	The total number of packets received and transmitted in the last Packets Statistic interval seconds.
	Bytes	The total number of bytes received and transmitted in the last Packets Statistic interval seconds.
	ICMP Tx	The number of the ICMP packets transmitted to WAN per second at the specified Packets Statistics interval. It is shown like "current transmitting rate / Max transmitting rate".
	UDP Tx	The number of UDP packets transmitted to the WAN per second at the specified Packets Statistics interval. It is shown like "current transmitting rate / Max transmitting rate".
	TCP SYN Tx	The number of TCP SYN packets transmitted to the WAN per second at the specified Packets Statistics interval. It is shown like "current transmitting rate / Max transmitting rate".
Modify	**Reset**	Reset the value of he entry to zero.
	Delete	Delete the existing entry in the table.

There would be 5 entries on each page. Click **Previous** to return to the previous page and **Next** to the next page.

Click the **Logout** tab at the bottom of the main menu, and then the web-page will be logged out and return to the login window.

Appendix A: FAQ

1. **How do I configure the Router to access Internet by ADSL users?**

    1) First, configure the ADSL Modem configured in RFC1483 bridge model.

    2) Connect the Ethernet cable from your ADSL Modem to the WAN port on the Router. The telephone cord plugs into the Line port of the ADSL Modem.

    3) Login to the Router, click the "Network" menu on the left of your browser, and click "WAN" submenu. On the WAN page, select "PPPoE/Russia PPPoE" for WAN Connection Type. Type user name in the "User Name" field and password in the "Password" field, type password in the "Confirm Password" field again, finish by clicking "Connect".

    4) If your ADSL lease is in "pay-according-time" mode, select "Connect on Demand" or "Connect Manually" for Internet connection mode. Type an appropriate number for "Max Idle Time" to avoid wasting paid time. Otherwise, you can select "Auto-connecting" for Internet connection mode.

☞ **Note:**
i.   Sometimes the connection cannot be disconnected although you specify a time to Max Idle Time, since some applications is visiting the Internet continually in the background.
ii. If you are a Cable user, please configure the Router following the above steps.

2. **How do I configure the Router to access Internet by Ethernet users?**

1) Login to the Router, click the "Network" menu on the left of your browser, and click "WAN" submenu. On the WAN page, select "Dynamic IP" for "WAN Connection Type", finish by clicking "Save".

2) Some ISPs require that you register the MAC Address of your adapter, which is connected to your cable/DSL Modem during installation. If your ISP requires MAC register, login to the Router and click the "Network" menu link on the left of your browser, and then click "MAC Clone" submenu link. On the "MAC Clone" page, if your PC's MAC address is proper MAC address, click the "Clone MAC Address" button and your PC's MAC address will fill in the "WAN MAC Address" field. Or else, type the MAC Address into the "WAN MAC Address" field. The format for the MAC Address is XX-XX-XX-XX-XX-XX. Then click the "Save" button. It will take effect after rebooting.

3. I want to use Netmeeting, what do I need to do?

1) If you start Netmeeting as a host, you don't need to do anything with the Router.

2) If you start as a response, you need to configure Virtual Server or DMZ Host and make sure the H323 ALG is enabled.

3) How to configure Virtual Server: Log in to the Router, click the "**Forwarding**" menu on the left of your browser, and click "**Virtual Servers**" submenu. On the "**Virtual Servers**" page, click **Add New…**. Then on the "**Add or Modify a Virtual Server Entry**" page, enter "1720" for the "Service Port" blank, and your IP address for the "IP Address" blank, taking 192.168.0.169 for an example, remember to **Enable** and **Save**.

☞ **Note:**

Your opposite side should call your WAN IP, which is displayed on the "Status" page.

4) How to enable DMZ Host: Log in to the Router, click the "**Forwarding**" menu on the left of your browser, and click "**DMZ**" submenu. On the "DMZ" page, click **Enable** radio button and type your IP address into the "DMZ Host IP Address" field, using 192.168.0.169 as an example, remember to click the **Save** button.

5) How to enable H323 ALG: Log in to the Router, click the "**Security**" menu on the left of your browser, and click "**Basic Security**" submenu. On the "**Basic Security**" page, check the **Enable** radio button next to **H323 ALG**. Remember to click the **Save** button.

4. **I want to build a WEB Server on the LAN, what should I do?**

1) Because the WEB Server port 80 will interfere with the WEB management port 80 on the Router, you must change the WEB management port number to avoid interference.

2) To change the WEB management port number: Log in to the Router, click the "**Security**" menu on the left of your browser, and click "**Remote Management**" submenu. On the "**Remote Management**" page, type a port number except 80, such as 88, into the "Web Management Port" field. Click **Save** and reboot the Router.

☞ **Note:**

If the above configuration takes effect, you can visit and configure the Router by typing http://192.168.0.1:88 (the Router's LAN IP address: Web Management Port) in the address field of the Web browser. If the LAN IP of the modem connected with your router is 192.168.1.x, the default LAN IP of the Router will automatically switch from 192.168.0.1 to 192.168.1.1 to avoid IP conflict; in this case, please try http://192.168.1.1:88.

3) Log in to the Router, click the "**Forwarding**" menu on the left of your browser, and click the "**Virtual Servers**" submenu. On the "**Virtual Servers**" page, click **Add New…**, then on the "**Add or Modify a Virtual Server**" page, enter "80" into the blank next to the

"**Service Port**", and your IP address next to the "**IP Address**", assuming 192.168.0.169 for an example, remember to **Enable** and **Save**.

Virtual Servers

ID	Service Port	Internal Port	IP Address	Protocol	Status	Modify
1	80	80	192.168.0.169	ALL	Enabled	Modify Delete

Add New...   Enable All   Disable All   Delete All

Previous   Next

Add or Modify a Virtual Server Entry

Service Port: 80 (XX-XX or XX)
Internal Port: 80 (XX, Only valid for single Service Port or leave a blank)
IP Address: 192.168.0.169
Protocol: ALL
Status: Enabled

Common Service Port: --Select One--

Save   Back

5. **The wireless stations cannot connect to the Router.**

1) Make sure the "**Wireless Router Radio**" is enabled.

2) Make sure that the wireless stations' SSID accord with the Router's SSID.

3) Make sure the wireless stations have right KEY for encryption when the Router is encrypted.

4) If the wireless connection is ready, but you can't access the Router, check the IP Address of your wireless stations.

Appendix B: Configuring the PCs

In this section, we'll introduce how to install and configure the TCP/IP correctly in Windows 7. First make sure your Ethernet Adapter is working, refer to the adapter's manual if needed.

1. **Install TCP/IP component**

   1) On the Windows taskbar, click the **Start** button, and then click **Control Panel**.

   2) Click the **Network and Internet**, and click the **Network and Sharing Center**, then click **Change adapter settings**.

   3) Right click the icon that showed below, select **Properties** on the prompt page.
   4) In the prompt page that showed below, double click on the **Internet Protocol Version 4 (TCP/IPv4)**.
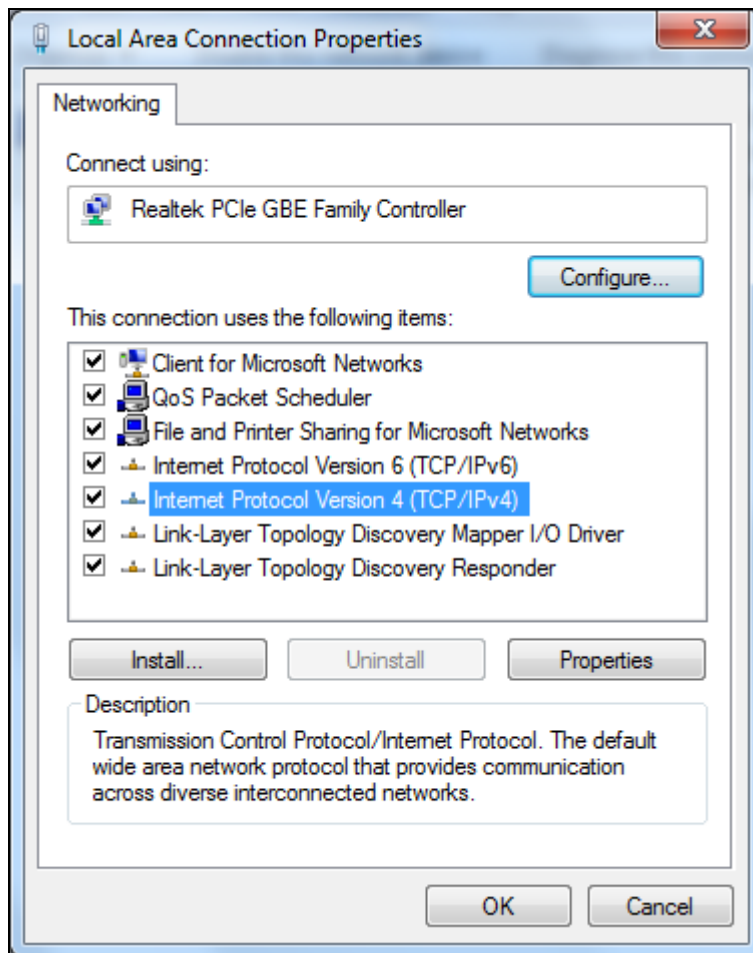

5) The following **TCP/IP Properties** window will display and the **IP Address** tab is open on this window by default.

Now you have two ways to configure the **TCP/IP** protocol below:

➢ **Setting IP address automatically**

Select **Obtain an IP address automatically**, Choose **Obtain DNS server automatically**, as shown in the figure below:
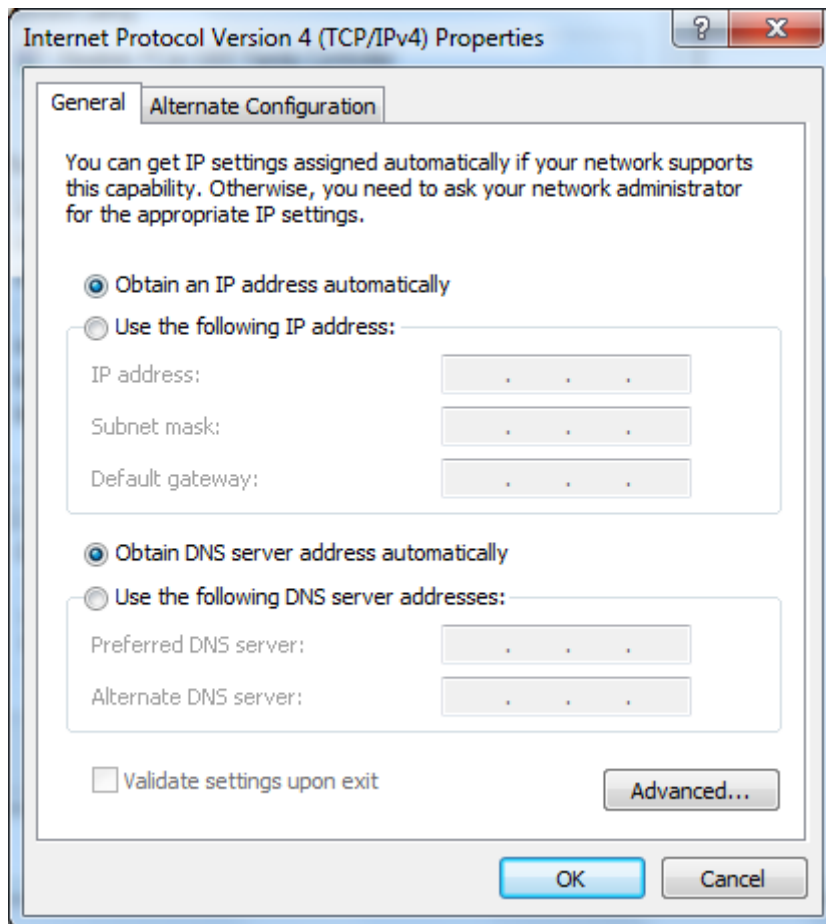

➢ **Setting IP address manually**

1   Select **Use the following IP address** radio button. And the following items available

2   If the router's LAN IP address is 192.168.0.1, specify the IP address as 192.168.0.x (x is from 2 to 254), and **Subnet mask** is 255.255.255.0.

3   Type the router's LAN IP address (the default IP is 192.168.0.1) into the **Default gateway** field.

4   Select **Use the following DNS server addresses** radio button. In the **Preferred DNS Server** field you can type the DNS server IP address, which has been provided by your ISP

Internet Protocol Version 4 (TCP/IPv4) Properties

General

You can get IP settings assigned automatically if your network supports this capability. Otherwise, you need to ask your network administrator for the appropriate IP settings.

○ Obtain an IP address automatically

◉ Use the following IP address:

IP address: 192 . 168 . 0 . 241

Subnet mask: 255 . 255 . 255 . 0

Default gateway: 192 . 168 . 0 . 1

○ Obtain DNS server address automatically

◉ Use the following DNS server addresses:

Preferred DNS server: 202 . 96 . 134 . 133

Alternate DNS server: .   .

☐ Validate settings upon exit

Advanced...

OK   Cancel

Appendix C: Specifications

General	
Standards	IEEE 802.3, IEEE 802.3u, IEEE802.11n, IEEE802.11b, IEEE 802.11g
Protocols	TCP/IP, PPPoE, DHCP, ICMP, NAT, SNTP
Ports	One 10/100M Auto-Negotiation WAN RJ45 port, Four 10/100M Auto-Negotiation LAN RJ45 ports supporting Auto MDI/MDIX
Cabling Type	10BASE-T: UTP category 3, 4, 5 cable (maximum 100m) 　　　　　EIA/TIA-568 100Ω STP (maximum 100m)
	100BASE-TX: UTP category 5, 5e cable (maximum 100m) 　　　　　EIA/TIA-568 100Ω STP (maximum 100m)
LEDs	⏻ (Power), 📶 (WLAN), 🖥 (LAN 1-4), ⊘ (WAN), 🔒 (WPS)
Safety & Emissions	FCC, CE
Wireless	
Frequency Band*	2.4~2.4835GHz
Radio Data Rate	11n：up to 150Mbps（Automatic） 11g：54/48/36/24/18/12/9/6M（Automatic） 11b：11/5.5/2/1M（Automatic）
Frequency Expansion	DSSS(Direct Sequence Spread Spectrum)
Modulation	DBPSK, DQPSK, CCK, OFDM, 16-QAM, 64-QAM
Security	WEP/WPA/WPA2/WPA2-PSK/WPA-PSK
Sensitivity @PER	130M: -68dBm@10% PER 108M: -68dBm@10% PER; 54M: -68dBm@10% PER 11M: -85dBm@8% PER; 6M: -88dBm@10% PER 1M: -90dBm@8% PER
Antenna Gain	5dBi
Environmental and Physical	
Temperature.	Operating : 0℃~40℃ (32℉~104℉)
	Storage: -40℃~70℃(-40℉~158℉)
Humidity	Operating: 10% - 90% RH, Non-condensing
	Storage: 5% - 95% RH, Non-condensing

* Only 2.412GHz~2.462GHz is allowed to be used in USA, which means only channel 1~11 is available for American users to choose.

Appendix D: Glossary

- **802.11n -** 802.11n builds upon previous 802.11 standards by adding MIMO (multiple-input multiple-output). MIMO uses multiple transmitter and receiver antennas to allow for increased data throughput via spatial multiplexing and increased range by exploiting the spatial diversity, perhaps through coding schemes like Alamouti coding. The Enhanced Wireless Consortium (EWC) [3] was formed to help accelerate the IEEE 802.11n development process and promote a technology specification for interoperability of next-generation wireless local area networking (WLAN) products.

- **802.11b -** The 802.11b standard specifies a wireless networking at 11 Mbps using direct-sequence spread-spectrum (DSSS) technology and operating in the unlicensed radio spectrum at 2.4GHz, and WEP encryption for security. 802.11b networks are also referred to as Wi-Fi networks.

- **802.11g -** specification for wireless networking at 54 Mbps using direct-sequence spread-spectrum (DSSS) technology, using OFDM modulation and operating in the unlicensed radio spectrum at 2.4GHz, and backward compatibility with IEEE 802.11b devices, and WEP encryption for security.

- **DDNS** (**D**ynamic **D**omain **N**ame **S**ystem) **-** The capability of assigning a fixed host and domain name to a dynamic Internet IP Address.

- **DHCP** (**D**ynamic **H**ost **C**onfiguration **P**rotocol) **-** A protocol that automatically configure the TCP/IP parameters for the all the PC(s) that are connected to a DHCP server.

- **DMZ** (**Dem**ilitarized **Z**one) **-** A Demilitarized Zone allows one local host to be exposed to the Internet for a special-purpose service such as Internet gaming or videoconferencing.

- **DNS** (**D**omain **N**ame **S**ystem) **-** An Internet Service that translates the names of websites into IP addresses.

- **Domain Name -** A descriptive name for an address or group of addresses on the Internet.

- **DSL** (**D**igital **S**ubscriber **L**ine) **-** A technology that allows data to be sent or received over existing traditional phone lines.

- **ISP** (**I**nternet **S**ervice **P**rovider) **-** A company that provides access to the Internet.

- **MTU** (**Maximum Transmission Unit**) **-** The size in bytes of the largest packet that can be transmitted.

- **NAT** (**N**etwork **A**ddress **T**ranslation) **-** NAT technology translates IP addresses of a local area network to a different IP address for the Internet.

- **PPPoE** (**P**oint to **P**oint **P**rotocol **o**ver **E**thernet) **-** PPPoE is a protocol for connecting remote hosts to the Internet over an always-on connection by simulating a dial-up connection.

- **SSID -** A **S**ervice **S**et **Id**entification is a thirty-two character (maximum) alphanumeric key identifying a wireless local area network. For the wireless devices in a network to communicate with each other, all devices must be configured with the same SSID. This is typically the configuration parameter for a wireless PC card. It corresponds to the ESSID in the wireless Access Point and to the wireless network name.

- **WEP** (**W**ired **E**quivalent **P**rivacy) **-** A data privacy mechanism based on a 64-bit or 128-bit or 152-bit shared key algorithm, as described in the IEEE 802.11 standard.

- **Wi-Fi -** A trade name for the 802.11b wireless networking standard, given by the Wireless Ethernet Compatibility Alliance (WECA, see http://www.wi-fi.net), an industry standards group promoting interoperability among 802.11b devices.

- **WLAN** (**W**ireless **L**ocal **A**rea **N**etwork) **-** A group of computers and associated devices communicate with each other wirelessly, which network serving users are limited in a local area.
