## AUTHORSHIP

This publication was prepared by the staff and collaborators of the Hymenoptera Unit whose individual responsibilities were as follows: Karl V. Krombein, introductory section, Aculeata, and general supervision of the entire publication; B. D. Burks, Symphyta and Chalcidoidea; C. F. W. Muesebeck, Braconidae and Proctotrupoidea; Marion R. Smith, Formicidae; Luella M. Walkley, Stephanidae, Ichneumonidae, and Trigonalidae; and L. H. Weld, Cynipoidea.

## ACKNOWLEDGMENT

We are greatly indebted to a number of our colleagues, both in North America and abroad, for furnishing information which has been included in this supplement. The following specialists have cooperated by sending data on the groups specified after their names:

- R. B. Benson (taxonomy of Symphyta)
- J. C. Bequaert (taxonomy of Vespidae)
- G. E. Bohart (taxonomy and biology of Aculeata)

# Hymenoptera of America North of Mexico—Synoptic Catalog

(Agriculture Monograph No. 2)

## FIRST SUPPLEMENT

### INTRODUCTION

The "Hymenoptera of America North of Mexico—Synoptic Catalog" was published on July 11, 1951, as Agriculture Monograph No. 2. It contained references to the literature published through 1949, and to a few papers that appeared during 1950. This catalog immediately proved to be an indispensable aid to taxonomists working on Hymenoptera and to field entomologists concerned with insects in this important order. It was at once apparent that the volume of research being done in the Hymenoptera would require the issuance of periodic supplements, if this catalog was to maintain its maximum usefulness. This is the first of such supplements, and covers all the literature published from 1950-1951 through 1956.

### SCOPE

Information of the following nature has been included in the Supplement: Corrections of errors in the Catalog; omissions from the Catalog; significant extensions in geographic range; new host, prey, or flower-visiting records; citations to new papers dealing with biology or taxonomy; citations to categories described since completion of the manuscript for the Catalog; generic or sub-generic transfers; citations to synonymy published since completion of the manuscript for the Catalog, and some previously unpublished synonymy; and changes in rank of the included forms.

A list of the new names proposed in this Supplement will be found on page 270.

### FORMAT

Insofar as possible we have followed the sequence used in the Catalog. That is, the categories above specific rank are arranged in systematic order, while those of specific or infraspecific rank are arranged alphabetically under the generic or sub-generic heading. Recent information has indicated that a few major groups were incorrectly placed in the Catalog, or were given an inappropriate status. These changes are noted in the proper place in the text, with appropriate cross reference where this is necessary.

The treatment at the specific or infraspecific level, for all forms catalogued here for the first time, consists of a heading giving the specific name preceded by an asterisk, describer's name, distribution, and host, prey, or flower-visiting records. Below this are bibliographic citations to the original description and to any

synonyms, and to any additional papers on biology or taxonomy, as in the following example:

\**titusensis* Mitchell. Fla. (Titusville, Tampa).

*Colletes titusensis* Mitchell, 1951. Elisha Mitchell Sci. Soc. Jour. 67: 237, figs. 16, 17. ♂.

Taxonomy: Stephen, 1954. Kans. Univ. Sci. Bul. 36: 497, fig. 84. ♀.

Corrections of errors in the Catalog, extensions of geographic range, or new host, prey, or flower-visiting records are given by citing the specific or infraspecific name and author followed by the pertinent information, as in the following example:

*caerulescens subcorticalis* (Walsh). Prey: *Phidippus audax* (Hentz). Remove *nigrella* (Banks) and *nanella* (Banks) from syn.

The citation of new papers dealing with taxonomy or biology is accomplished by listing the specific or infraspecific name and author, and a separate reference beneath this heading to the paper and its field, as in the following example:

*fuscatus aurifer* Saussure.

Biology: Snelling, 1954. Kans. Ent. Soc. Jour. 27: 154.

The transfer of a form from one genus or subgenus to another is recorded by double entries. The entry under the genus from which it is being transferred consists of a specific heading in bold-face italics followed by a statement giving the genus to which it is being transferred. The entry under the genus to which it is being transferred consists of the specific heading in bold face followed by a statement of the genus from which it is being transferred and a citation of the authority for the transfer. The two entries covering the transfer of *hendersoni* Cockerell from one subgenus of *Osmia* to another are as follows:

*hendersoni* Cockerell. Transf. to *Osmia* subg. *Melanosmia*, p. 1165.

*hendersoni* Cockerell. Transf. from *Osmia* subg. *Acanthosmioides*, p. 1165. (teste White, 1952. Kans. Univ. Sci. Bul. 35: 221).

The synonymy of species or infraspecific categories considered to be valid in the Catalog is also effected by double entries. One entry gives the formerly valid specific name in bold-face italics followed by a statement that it is a synonym of another species. The other entry gives the name of that other species in bold face, and beneath this, in synonymy position, a citation of the new synonym using the combination given in the Catalog, and a parenthetical statement as to the authority for the transfer. The synonymy of *Aporus (Aporus) hermes* Bradley under *niger* (Cresson) would be shown by the following two entries:

*hermes* Bradley. Syn. of *niger* (Cresson).

*niger* (Cresson).

*Aporus (Aporus) hermes* Bradley (syn. by Evans, 1956. Ent. News 67: 6).

Changes in rank are of two main types, the reduction of species to infraspecific rank and the raising of categories from infra-specific to specific rank. Both changes are achieved by double entries. One entry gives the former specific or infraspecific name in bold-face italics followed by a statement of its present status. The other entry consists of the present specific or subspecific designation in bold face and author, followed by the phrase,

“changed status;” beneath this in synonymy position is the combination used in the Catalog and a statement as to the action taken and authority. The reduction of *Colletes crawfordi* Swenk to subspecific rank is accomplished by the following two entries: *crawfordi* Swenk. A subsp. of *texanus* Cresson.

*texanus crawfordi* Swenk, changed status. North. Tex. On flowers of *Physalis*.  
*Colletes crawfordi* Swenk. Reduced to subsp. rank (*teste* Stephen, 1954.  
Kans. Univ. Sci. Bul. 36: 450).

There are also some cases of synonymy at the generic and subgeneric levels. Names not listed in the Catalog are preceded by an asterisk and cited in synonymy position under the appropriate generic or subgeneric heading together with their genotype designations. For names recognized as valid in the Catalog, the synonymy is effected by double entries, as discussed above, at the specific level.

Similarly, a change in rank at the generic or subgeneric level would be shown by double entries under the appropriate generic or subgeneric headings.

Some revisional papers have been published which assign the component forms to several subgenera, whereas the Catalog has no such division into subgenera. In order to minimize the number of changes required we are indicating this assignment merely by inclusion of the subgeneric name in parentheses in bold-face italics in the specific heading, as in the following example in the genus *Perdita*:

*lacteipennis canadensis* Crawford. Utah. (*Cockerellia*)

## ABBREVIATIONS AND SYMBOLS

The abbreviations and arrangement of titles of journals used in this work are essentially those recommended in United States Department of Agriculture Miscellaneous Publication 337, issued in 1939. The standard abbreviations are used for the various States and Provinces. Certain other abbreviations and symbols are explained as follows:

\*—used before a generic, specific, or infraspecific heading to indicate a category not included in the Catalog.

(!)—*lapsus* or misspelling of a scientific name.

“♂” = ♀ or “♀” = ♂—incorrect sex determination.

♂ (♀ misdet.) or ♀ (♂ misdet.)—only one of sexes described belongs to the species catalogued.

O—an insect gall, when used in same position in citation as sex signs.

changed status—used after a specific or infraspecific heading to indicate a rank different from that accorded that form in the Catalog; this is not necessarily the same as new status.

emend.—emendation.

n. comb.—new combination; used after a specific or infraspecific heading to indicate a new generic assignment.

n. name—new name; used after a specific or infraspecific heading to indicate a new substitute name for a homonym;

used after bibliographic citation to indicate a substitute name proposed earlier for a homonym.

n. status—new status; used where a form is here accorded a rank different from that which it previously had.

n. syn.—new synonymy; used after generic or specific bibliographic citations to indicate a new synonym, followed by a parenthetical statement giving the authority and basis for the action.

preocc.—preoccupied; used after a generic or specific citation to indicate a homonym.

Abbreviations for the faunal zones and their divisions are as follows:

Bor.—Boreal	L. Austr.—Lower Austral
Canad.—Canadian	Alleghan.—Alleghanian
Huds.—Hudsonian	Austrorip.—Austroriparian
Transit.—Transition	Carol.—Carolinian
Austr.—Austral	Sonor.—Sonoran
U. Austr.—Upper Austral

## INDEX

The following index contains both superspecific and trivial names. Supergeneric names are given in capital letters; valid names are shown in roman, synonyms in italic type.

Two entries are given to denote transfer of a form from one genus to another genus, the generic name from which transfer occurred appears in italics:

albiclava Grlt., <i>Eurydinoteloides</i> .....	79
albiclavus (Grlt.), <i>Zatropis</i> .....	78

The same procedure is used for the entry of transfers from "Unrecognized Forms", "Uncertain Disposition", "Nomina Dubia" or "Nomina Nuda" to a genus or subgenus.

To denote transfer of a form from one subgenus to another in the same genus one entry is given with two page numbers where necessary. The same procedure is used to denote transfer of a form from a genus or subgenus to "Unrecognized Forms", "Uncertain Disposition", "Nomina Dubia" or "Nomina Nuda".
