PARTS II. AND III.

[^0]
## INTRODUCTION.

During the past few years large collections of the shells of Lifu and Uvea have been made by the Rev. James and Mrs. Hadfield, and have been consigned to several Manchester conchologists. By the kindness of Messrs. R. I). Darbishire, K. Cairns, and W. Moss, a very complete series of these shells has been presented to the Manchester Museum, which possesses in addition the types of the majority of the new species here described, though a few remain in Mr. Melvill's cabinet. They have been arranged for exhibition, and a list of them, with notes and descriptions of new species, was drawn up by Mr. J. Cosmo Melvill (a member of the Committee of the Manchester Museum), and Mr. R. Standen (of the Museum staff). As the collection is one of the largest and most important that has been received in this country from the Loyalty [slands, it has been thought desirable to afford the naturalists of Manchester and elsewhere an opportunity of obtaining separate copies of this catalogue, and it has therefore been reprinted from 'The Journal of Conchology' and issued as one of the Museum Handbooks.

Since ['art 1. of this catalogue was published, further consignments of shells have been received, which have increased the number of species recorder from 630 to $\$ 60$. Under these circumstanees it seened desirable to issue a continuation of the catalogue in the same form as before.

William E. Hoyle,
Keeper of the Museum,
The Owens College,
MANCHESTER.

NOTES ON A COLLECTION OF SHELLS FROM LIFU AND UVEA, LOYALTY ISLANDS, FORMED BY<br>THE REV. JAMES AND MRS. HADFIEII, WITH L.IST OF SPECIES.

Part II.<br>By JAMES COSMO MELVILL, M.A., F.L.S., AND ROBERT STANDEN.

(Read before the Conchological Society, October 14th, 1896).
Murex (Ocinebra) brachys sp. nov. (Pl. IX., fig. 1).
M. testa minutu, ovata, solida, pallidé ochracea, anfractious sex, corrusatis, supernis spiraliter unangulutis, nodulosis, ultimo anfructue undecim varicosu-costatis, costis fimbriatis, apud busim paullum producto, apertura ovata, labro extus scruposo, intus quadri-denticulato, columella recta.
Long., 6, Lat., 3 mill.
A small, obscure species, six whorled, the upper whorls (excluding the apical) being strongly once angled with prominent nodules, the last whorl with eleven rib-like varices, which are somewhat fimbriate ; at the base the canal is a little produced, the aperture is oval, outer lip rough without, within four-denticled, columella straight. Only one specimen. ( $\beta_{\mu}{ }^{\prime} \chi^{\prime}{ }^{\prime}$, short).
Nassa (Niotha) rotunda sp. nov. (Pl. IX., fig. 2).
N. testa ovato-globulari, subcompressa, pallidé achraca, ad apicem attenuatu, anfractibus sex, duobus apicalious, levibus, ceteris longitudinuliter arte recti-costutis, costis nodulosis, spiraliter liratis, apud suturas atitta ochracea spiraliter decoratis, et impressis, ultimo anfractu ad basim compresso, apertura rotunda, labro incrassato, intus denticulato, canali brevissimo, calloso-incrassuto, ad basim extremam fuldoochraceo suffuso.
Long., 6, Lat. 3 mill.

A small, very compact globular species, attenuate, however, towards the apex, the remaining whorts, which are compressed at the sutures, being very closely papillose with regular longitudinal papillary ribs, spirally crossed with lire, the canal is very short, callous at the base and stained dorsally with darker ochrebrown, mouth round, outer lip denticled within with teeth that extend as strix some way into the aperture. Five specimens.
Nassa (Telasco) Shacklefordi sp. nov. (Pl. IX., fig. 3).
N. tester ovata, lavissima, candida, polita, anfractibus septem, paullum tumidulis, perlevibus, nitidis, ad suturas indistincté ochraceo-maculatis, ultimo dorsaliter ad busimn sub lente transversim striatule, ct notis clathratis immersis feré celatis, decorato, clathris sub levissima superficie infra suturas et iterum ad basim calcareis, interstitios gradatis, ochraceis, apertura ovata, labro cxtus paullum incrassato, intus decem denticulato, et contimuo-striato, dente vel plica suturali, margine columellari ad basim bidenticulato, peristomate vir callose, canali brevi.
Long., I 3, Lat. 5 mill., sp. maj.
A polished white shell, usually seven whorled, most of the many specimens are, however, somewhat worn or broken at the apex, the aperture is ovate, peristome hardly callous, outer lip thickened and much denticulate within, the denticles extending in the form of strix far into the mouth. There is a sutural tooth, and the columella is twice denticled towards the base, the canal being short. Occasionally pale ochraceous transverse spots exist round the sutures, and, dorsally, upon the last whorl a beautiful latticed pattern is with a lens observable in the smooth substance of the polished shell, this pattern being absent in the middle of the whorl.

We have great satisfaction in uniting with this species the name of the Rev. Lewis Shackleford, who has rendered us great assistance in many ways.
N. (Telasco) ecstilba sp. nov. (PI. IX., fig. 4).
N. testa ovato-fusiformi, concinna, candida, nitida, feré luavi, anfractibus septem, duolus apicalibus, cateris subturritis,

$$
\text { J.C., viii., Oct., } 1896 .
$$

paullum zentricosis, longitudinaliter paucicostatis, costis lavibus, interstitios sub late spiraliter indistincte striatis, interdum lazissimis, in hac spcimine inter medium suturasque anfractumn soma indistincta spirali succingente, in illa absente, in ommilus infrá suturam anfractus ultimi ochracenmaculato, taniaque ochracea apud medium accincta, simul ac ad basim extremam, afertura rotunda, labro incrassato, dorsaliter ochraceo-bimaculato, intus denticulato, columellani margine callosa, abbreviata, canali brevi.
Long., ıо, Lat., 5 mill.
Several specimens of a neat, white, shining Nassa, not unlike the $N$. Cuzieri Payr. from the Mediterranean, and possibly identical with $N$. casta Gould, an authentic specimen of which we cannot find represented in our museums. The whorls are seven, few ribbed, longitudinally and indistinctly spirally striate, but the shell gives the impression of much brightness, whiteness, and smoothness. The outer lip is denticulate within, thickened without, and with two brown blotches dorsally. The columellar margin is callous, white, shining. In some specimens a thin brown line is seen above the sutures, in others it is absent, but all have a brown ochre blotch just below the suture of the last whorl, about the centre of the back of the shell. ( $\epsilon \kappa \sigma \tau i \lambda \beta o s$ shining).

Columbella (Seminella) Pacei sp. nov. (Pl. IX, fig. 5).
C. testa parva, compacta, albida, anfractibus sex, arcté longitudinaliter costulatis, costis spiraliter clathrato-liratis, antepenultimo anfractu suprá, juxta suturas, simul ac penultimo spiraliter et regulariter squarrosé-maculatis, maculis laté flavo-ochraceis, ultimo anfractu apud medium simili modo flavochraceo maculato, in pluribus speciminibus dorsaliter. fulvo-suffuso, usque ad basim, apertura augusta, lubro incrassato, intus levi, columella plantate.
Long. 4, Lat. I•75 mill.
Minute, yet particularly beautiful. Whorls six, compact, clathrate, with close longitudinal riblets and revolving lire. Just underneath the sutures the ante-penultimate and penultimate
whorls are sparsely spotted with fulvous; in the last whorl the spots again occur towards the middle, but are contiguous to, and below joined with, one large dorsal effusion of the same colour. The mouth is narrow, lip thickened, simple. Several specimens. To Mr. S. Pace our thanks are due, he having given advice concerning the Columbellidæ of this collection, and as a very slight return we would venture to associate his name with not the least elegant of that genus to which he is devoting so much laborious study.

Columbella (Mitrella) sigaloessa sp). nov. (PI. IX, fig. 6).
C. testa ovata, perlavi, nitida, laté pallidé ochracea, anfractibus sex, ad suturas paullum impressis, lavissimis, transrevsim infra, juxta suturas, albizonatis, zona fulao-brunnea sequente, et altera simili supra suturas, ultimo anfractu ad peripheriam laté rufo-sonata, et, infra, duabus similibus zonis accinctis, apertura angulatim ovata, labro extus paullum incrassato, intus multidenticulato, columella punicco-tincta.
Long., 9, Lat., 5.50 mill.
A smooth polished shell, prettily transversely banded with white and rufous, the body colour being very pale ochreous. Whorls six, slightly impressed at the sutures, and entirely smooth. Mouth effuse ovate, outer lip much denticulate within, columella stained with rose. Two specimens, one not so strongly banded.

Near C. semi-convexa Lamk. from Australia and C. srausapata Gould, this latter being a Central American shell. ( $\sigma$ ィ年adóєєs, smooth, shining).

Scalaria eranna sp. nov. (Pl. IX., fig. 7).
S. testa perforata, fusiformi, sub-turrita, sordidé albida, anfractibus septem, apicalibus duobus vitreis, creteris compressulis, arcté lamellatis, lamellis bi- vel tri-crenatulis, undulatis, interstitius levilus, apertura oiato-rotunda, peristomate incrassato, extus undulato-rugoso, basim ad columellarem paullum extenso.
Lons., $45^{\circ}$, Lat., $1 \cdot 50 \mathrm{mill}$.

A highly interesting little shell. It is narrowly umbilicate, fusiform, roundly turreted, dirty white, seven whorled, two being apical and glassy, the rest somewhat compressed, closely variced, the lamellæ twice or thrice crenulate or undulose, the spaces between are smooth, the aperture roundly oval, the lip is thickened, without wavy-wrinkled, and towards the columellar base it is slightly produced. Seeming from the figure to be near $S$. solutur Ad. One specimen, but quite full-grown. (ëpurvos, lovely.)
S. exomila sp. nov. (Pl. IX., fig. 8).
S. testa imperforata, parva, grudato-fusiformi, turrita, albida, zersus aficem attenuatu, anfractibus sex, undique arcté lamellatis, lamellis crassis, albis, intorstitiis sub lente transversim striatulis, apertura rotunda, peristomate lavi, crassiusculo, continuo.
Long., 4, Lat., I•50 mill.
A minute, but full-grown species, with distinctive characters, the whorls are turreted, attenuate towards the apex, contracted at the sutures. The lamellar are thick, dirty white, slightly angled below the sutures, and very finely striate at the interstices. Mouth round, peristome thickened, smooth and continuous. (ėछ́fu入os, a stranger).

Drillia ione sp. nov. (Pl. IX., fig. 9).
D. testa incrassata, fusiformi, pallidé violacea, apud basim paullum expansa, anfractibus septem vel octo, ventricosulis, apud suturas impressis, longitudinaliter crassicostatis, costis pancis, spiraliter undique tenuissimé liratis, interdum dorsaliter brumneo suffusis, interstitiois sub lente mire decussatulis, apertura lata, ovali, labro exteriore incrassato, transversim striatulo simul ac in anfractibus, canali brevi, lato, margine columellari simplice.
Long., 5, Lat., 3 mill.
A chaste pale violet species, with occasional brown dorsal shading, small, of thickened fusiform build, longitudinally thickly costate, the costre few in number. Sometimes, indeed, the ground colour is pale-brown or ochre, while other specimens
are pure white. Whorls seven or eight, slightly ventricose, uniformly spirally lirate, the interstices when viewed with a lens being beautifully decussate. Mouth wide, outer lip thickened, transwersely striate, as are the whorls, columellar margin simple, canal short, wide. About ten or twelve specimens. (Ione from iov a violet).

Drillia themeropis sp. nov. (PI. IX., fig. Io).
D. testa fusiformi, solida, percrassa, anfractibus seplemt (quorum apicalibus duobus), eventricosis, ad suturas crenulatoimpressis, longitudinaliter crassi-costatis, ultimo anfractu costis ad medium et infra evanidis, undique transversim tenuissimé-striolatis, interstituis levibus, in $\quad$ no specimine colore livido-cinereo, in altero late ochraceo, ultimo anfractu spiraliter albo-cinereo cingulo vittato, interdum pemultimo simili modo decorato, et apnd basim hic illic albisparso, apertura ovata, labro exteriore multum incrassato, simu perobscuro, columella simplice.
Long., 5, Lat., 2 mill.
In marking, this small species is a little like the well-known D. vidua Reeve, in comparison to which it stands a veritable pigmy. Two forms have been seen by us, differing in colour as follows:--In what would be considered the type, an ashy brown is the prevailing hue, filletted round the whorls transversely with bluish white; in the other, a handsomer variety, a warm ochre with flecking and median brown linear banding round the three last whorls, which are seven in number altogether. Form oblong, very solid, obtusely ribbed with fine spiral striolations, outer lip extremely thickened, inner simple. ( $\theta \epsilon \mu \epsilon \epsilon^{\prime}(\omega \pi \iota s$, grave, sedate, from the sombre appearance).
D. xanthoporphyria sp. nov. (Pl. IX., fig. it).
D. testa fusiformi, solidiuscula, parmm mitente, anfractibus octo, quorum dnobus apicalibus, brumneis, lavibus, cateris pallidé violaceis, apud medium flavida sona accinctis, ventricosis, apud suturas cremilatis, longitudinaliter crassicostatis, costis obtusis, et spiraliter arté filostiatis, apertura ovata, peristomate percrasso brumneo-strigato, sinu obscurissimo. Lons., 6, Lat., 5 mill.

One of the gems of the collection. Solid, in form fusiform, eight-whorled, two whorls being plain brown, small, apical, while the remainder are usually obtusely ribued longitudinally, crossed with fine spiral lines, the colour is pale violet or purple, with a broad fulvous-yellow zone encircling each whorl, the lip is extremely incrassate, striped with brownish yellow, and the sinus is hardly perceptible.

Two specimens, precisely like each other. (The name is derived from the Greek signifying yellow-purple, in allusion to the bright coloration).

Mangilia agna sp. nov. (Pl. IX., fig. 12).
M. testa anguste oblonga, attemuata, fusiformi, albo-lactea, interdum dorsaliter ochraceo-effusa, subpellucida, eleganti, anfractibus septem vel octo, ventricosulis, conspicué paucicostatis, costis rectis, longitudinaliter decurrentibus, transversim delicatissimé tenuistriatis, striis costas ommino accingentibus, apertura obliqué oblonga, simu inconspicuo, labro extus effuso, incrassato, intus cum columella applanato.
Long., $5^{\circ} 5^{\circ}$, Lat., 2 mill.
A pure milky white much attenuate species, sometimes with a pale ochraceous dorsal clouding, longitudinally few ribbed, the ribs decurrent and descending in the same plane from whorl to whorl, transversely very finely striolate, the strix surrounding the whole shell, including the ribs. The mouth is obliquely oblong, outer lip effuse, and, as well as the columella, quite simple within. ("̈ $\gamma^{\prime} 0 s$, castus).
M. bascauda sp. nov. (Pl. IX., fig. I3).
11. testa ovata, solidiuscula, pallidé ochracea, anfractibus sex, apicali simplice, levi, cateris longitudinaliter obliqué crassicostatis, et spiraliter acutiliratis, interstitios minutissimé decussatis, apertura peroblonga, simu suturali, insonspicuo, labro extus multum incrassato, fimbriatulo, intus septem vel octo denticulato, columella recta, simplice.
Long., 5.50, Lat., 2.50 mill.
A pale ochraceous oval Mamilia, more like one of the section Cythara than Clathurella, ovate, with somewhat rounded
whorls, the apical simple, smooth, the rest obliquely thickly costate, with transverse acute lire, the interstices extremely minutely decussate, the mouth is oblong, the sinus small, only half-hollowed out of the outer lip, and not extending across, the lip is much thickened, fimbriolate, within seven or eight denticled, columella straight, simple. A good many specimens. (Bascauda etymologically is interesting, as being an old British word, signifying a wicker basket; and subsequently Latinized of. Juvenal xii.46, Martial xiv.9.9, and in more recent times again anglicized).
M. calathiscus sp. nov. (Pl. IX., fig. 14).
M. testa fusiformi, apud apicem attemata, temui, deliata, gradato-turrita, anfractibus octo, quorum tribus a picalibus, simplicibus, lavibus, minimis, aeteris crassicostulatus, transversim elegantissimé clathratis, gemmulatis, albido-crystatlinis, hic illic sparsim ochraceo-tinctis, apud basinn gemmulotuberculatis, canali recurvo, apertura simuosa, simu excavato, amplo, labro extus cremulato, intus octo denticulato, columellat paulhum obscuré denticulata.
Long., 6, Lat., 2 mill.
An exceedingly graceful, delicate, crystalline shell, with thickened longitudinal ribs, and acute spiral liræ, the whorls being eight in number, of which three are small, and apical. The sutures are much impressed, whorls slightly tumid, canal recurved, aperture sinuate, sinus broad and excavate, outer lip crenulated without, eight denticled within, columella feebly and obscurely denticulate likewise. A very few specimens. (Calathiscus, a wicker basket).
M. eumerista sp. nov. (Pl. IX., fig. 15).
M. tester örato-oblonge, levissima, albida, mitida, anfractibus sex, zentricosis, longitudinaliter rotundi-costotis, costis laaissimis, ultimo anfractu infra, juxta suturas, inter custas ochraceo-punctato, lineis spiralibus semi-pellucidis ornato, apertura angusta, oblonga, labro extus incrassato, intus multidenticulato, columella etiam multi-denticulata.
Lons., 6, Lat., 2.50 mill.

A pure white ovate species, very smooth white and shining, whorls six, ventricose, roundly longitudinally costate, on the last whorl there are just below the sutures brown spots between the costre in one transverse line, and also sub-pellucid linear marking ; the outer lip and columella are both much denticled. Sinus not very deep or conspicuous. Three specimens. ( $\epsilon$ ü well, $\mu^{\prime \prime} p u \tau \tau \sigma$ separated).
M. himerodes sp. nov. (Pl. 1N., fig. 16).
M. testa pergracili, subcrystallina, tenui, fusiformi, anfractibus septem, quorum duobus apicalibus, vitreis, lavissimis, ceteris gradato-turitis, infra suturas abruplé angulatis, longitudinaliter costulatis, costis regularibus, obliquis, undique spiraliter delicaté liratis, lin is acutis, interstitios sub lente longitudinalitor striatulis, ad angulum anfractuum pallidé ocluaceo-tinctis, et apud medium anfractus ultimi ochraceo iingulo, dorsaliter evanido, sed conspicuo ad labritn exterius decoratis, apertura oblonga, angusta, labro extus incrassato, columella simplice, recta.

Long., 6.50, Lat., 2.50 mill.
This species is on the border-land between the subgenera Glyphostoma and Cythara. A pure white, extremely delicate little species, subvitreous, fusiform, with seven whorls, two of which are glassy and apical, the remainder being all very delicately ribbed, with spiral lire, the interstices longitudinally striolate. At the sutures and the angle of the whorls there is a pale ochre band, again appearing, but almost obsoletely, in the middle of the last whorl. It is very conspicuous, however, just at the back of the outer lip. The mouth is narrow, outer lip thickened, columella simple. Many specimens. (i $\mu \in \rho \in \dot{́} \delta \boldsymbol{\eta} \boldsymbol{\jmath}$, pleasing, desirable).
M. himerta sp. nov. (Pl. IN., fig. 17).
11. brcoiter pyramidato fusiformi, parva, delicata, anfractibus sex, quornon duobus apicalibus, albo-vitreis, acteris pallidissimé flavo-ocliraccis, infra, juxta suturas, conspicué angulatis,
apud suturas quasi-cremulatis, costis longitudinaliter crassis, pancis, accinctis, transversim conspicné panciliratis, interstitios lavibus, ad suturas regulariter brumneo-sparsis, simul ac apud medium anfractus ultimi punctis regularibus, et dorsaliter ad medium labri exterioris brunneo-maculatis, apertura angusta, oblonga, simu lato, labro extus incrassato, columella simplice.
Long., 4, Lat., 2 mill.
This little shell has much in common with $M$. himerodes, describerl in this paper, but is smaller and of a pale yellow-ochre colour throughout. The whorls are angularly turreted, they are six in number, including the two vitreous apical whorls. At the sutures there is a quasi-crenulation, owing to the commencement of the prominent longitudinal ribs, there crossed by acute lire, the interstices being smooth. Faint brown transverse spots adorn the sutures and the middle of the last whorl ; the back of the outer lip is likewise ornamented with one ochre median blotch and faint signs exist in some specimens of another, or, indeed, two more alternating with white, looth above and below the median bloteh just mentioned. We have a near ally of this species from Bombay, still undescribed. (iцєpтós, pleasing).
M. orophoma sp. nov. (Pl. IN., fig. I8).
M. testa turita, angusta, parà, milida, pallidé-brunnea, anfractibus sex (apicalibus?) cateris infra suturas angulatis, apud suturas impressis, rectis, longitudinaliter recticostatis, costis pancis, spiraliter liratis, liris in penultimo anfractu sex, in ultimo novem, interstitios lavibus, apud basim tuberculato, canali paullum recurvo minime producto, apertura angusta, simu amplo labrum excavante,-labro extus incrassato, fimbriatulo, intus obscuré denticulato, columella plus minaste simplice.
Long., 3, Lat. I•25 mill.
A minute turreted pale brown species, with six whorls, angled just below the sutures, then straight, the straight longitudinal ribs, few in number, are crossed by liræ, conspicuous
and large for the size of the shell, six at the penultimate, nine on the last whorl, and less in proportion (e.g. four in the antepenultimate) on the other whorls. Mouth narrow. Sinus large and hollowing across the outer lip; which is somewhat thickened and obscurely toothed within. Very rare. (iрóфopu, a thatched roof).
M. stibarochila sp. nov. (Pl. IX., fig. 19).
M. testa angrusta, fusiformi, irassiuscula, anfractious sex, quorum duobus apicalibus, pallidé brunneis, subvitreis, ceteris brumneo-ochraceis, ventricosulis, longitudinaliter crassicostatis, costis albidis, transversim tenniliratis, interdum, sicut ad peripheriam anfractus ultimi, liris crassioribus, apertura oblonga, sinu amplo, labrum semi-effodiente, labro extus percrasso, ochraceo, superné albo-vittato, columella plana ochraceo-brunnea.
Long., 5, Lat., 2 mill.
A small stoutly-built solid species, six whorled, of a lively ochraceous brown, fading into white across the ribs. Some of these are much thickened and crossed by lire, of which a few are stronger than the others. The mouth is narrowly oblong, sinus wide and half extending across the very thick outer lip which is particoloured, white above, ochre below, the columellar margin clear ochraceous brown, simple.

The only specimen was in the first consignment (1891) of

M. thalycra sp. nov. (Pl. IX., fig. 20).
M. testa paroa, nitida, fusiformi, ad apicon attemuata, anfractious septem, turitis, i'entricosulis, albidis, ad suturas infra et supra, spiralit,r ochraceo-vittatis, et ad medüun anfractus ultimi simili modo ochraceo-cinctis, longitudinaliter. obtusicostatis, costis incrassatis, paucis, transversim spiraliter sub lente tenuistriatis, apertura oblonga, labro exteriove recto, interdum obscuré denticulato, columella ochraceo-tinctu, simplice.
Long., 6, Lat., I•75 mill.

A small brightly banded shell, the colour being white, banded with ochre, whorls seven, gradate, longitudinally stoutly ribbed, the mouth oblong, outer lip slightly thickened, columella ochre-tinged plain. Many specimens, mostly somewhat worn. (Aáduкрos glowing, from the bright colour).
M. thiasotes sp. nov. (Pl. IX., fig. 21 ).
M. testa fusiformi, solida, incrassatu, albu, lleté ochraceo-tinctu, anfractibus sex, apicali nigrescente, cuteris apud suturas fulvoochraceis, et, supra, juxta suturas, magnoperi nodulosis, nodulis perconspicuis, paucis, nitidis, transzersim striatis, ultimo in anfractu apud medium simili modo nodulifero, in specie majore nodulis tumescentibus, permagnis his subtus nodulis, ochreo-zonato, duobus nodulosorum minorum ordinibus transversim sequentibus, am linea nigerrima dorsaliter a margine columellari usque ad basim labri exterioris, labro paullum incrassato, margine columellari simplice, canali brevi.
Long., 7•50, Lat., $2 \cdot 50$ mill., sp. min.

$$
\text { " } 8 \quad, \quad 4^{\circ 25} \quad \text {, sp. maj. }
$$

A very beautiful species, and we know of no pleurotomoid shell which presents the same characteristics. 'The whorls are six, the apex pitchy black, the remainder being white with bright ochreous tinting. In the younger specimens transverse shining white rows of large gemme cross the whorls just above the sutures, and in the middle of the last whorl, below, there are ochre bands, in the last whorl this is followed by two smaller rows of gemmæ, and then by a pitch black line reaching from the upper portion of the columellar margin, across the back of the shell, to the base of the outer lip. The more mature skell is conspicuous for the very swollen row of white peripheral nodules, banded below with fulvous colour. The canal is short, columellar margin simple. ( $\theta$ uagétís a reveller).
M. (Cythara) euselma sp. nov. (Pl. IN., fig. 22).
M. testu fusiformi, attemutula, (in uno specimine latiore), delicatulu, pallidissimé ochraceo, anfractibus sex, spadatulis,
apud suturas impressis, unangulatis, longitudinaliter costulatis, spiraliter liratis, junctura costarum minute gemmulatis, ultimo anfractu transuersim quadri- qeel quinque- brunneolineato, penultimo unilineato, apertura oblonga, sinu recto, lubrum effodiente, labro extus incrassato, intus minutissime denticulato, margine columellari recto, simplice.
Long., $4 \times 50$ mill. Lat., 175 mill.
A rery delieate species, with beautiful gemmuled ribs, and faint spiral linear brown banding. Of attenuate fusiform shape, pale ochreous, impressed at the sutures, whorls six, gradate, mouth oblong, sinus straight, deep. Otter lip incrassate, minutely denticled within, columellar margin straight, plain. A few specimens. ( $\epsilon \ddot{i \sigma \epsilon \lambda \mu o s \text {, with good benches of }}$ oars, from the beautifully gemmuled riblets).
M. (Cythara) psalterium sp. nov. (PI. IX., fig. 23 ).
M. testu attenuato-fusiformi, perlazi, gracili, anfractious septem (?), omnibus longitudinaliter obliqui-costutis, costis lavibus, transzersim ochraceo-zonatis apud medium, ultime anfructu in medio simul ac ad busim simili modo sonato, intusque zonas bi vel tri vittuto, apertura ohlonga, angusta, labro extus paullum incrussato, intus hevi, columella simplice, obscuré denticulata.

Loul., $9^{*}$ Io, Lat. 3 mill.
A landsome smoothly ribbed shell, attenuately fusiform, whorls probably seven, but only five appear on our broken specimens, an ochraceous band appears in the middle of every whorl, the last whorl two-banded, moith oblong, narrow, outer lip thickened, inner smooth.

Slightly allied to M. vexillum Reeve, but not decussate. M. gracilis Reeve, from the Philippines, is of the same shape, and likewise banded in the same manner, but the revolving strix are perfectly absent in NF. psalterium. Very rare. (Psalterium, a harpsichord).
M. (Cythara) signum sp. nov. Pl. IX., fig. 24).
M. testa brevi, pyramidata, turritu, perlavi, anfractious sex vel septem, longitudinaliter obliquicostutis, costis liezibus, apud basim propé evanidis, undique transversim odiraceomultiliratis et zonatis, juxta basim evanidis, apertura sblonga, labro extus paullum incrissato, intus denticuluto, columella multidenticulata.
Long., 6-7, Lat., 2.50 mill.
A prettily-banded, smoothly-ribbed, stout little species, of which we have five specimens. Whorls six to seven, turreted, perfectly smooth. Mouth oblong, outer lip and columella denticulate within. (Sigzum, a standard).
M. (Glyphostoma) chrysolitha sp. nov. (Pl. IX., fig. 25).
M. testa breviter fusiformi, albida, delicutula, anfractibus septem (fortasse, apicalibus absentibus), quorum duobus unicoloribus albis, ommibus longitudinaliter costulatis, et spiraliter clathratis, junctura flavo-gemmulatis, gemmis tuberinlosis, nitidis, bino ordine in antepenultimo, trino in prenultimo, in anfractu ultime trino ad peripheriam ordine albido sequente, posthac duobus flavis ordinibus, apud basim parvis tuberculis, apertura oblonga, simu suturali lato, parum labrum effodiente, labro multum extus incrassato, intus sex denticulato, columellari margine plano.
Long:, 5, Lat., 2 mill.
A very pretty species, with much similarity of marking and texture to Clatlurella granicostatu Reeve, but the mouth is that of a Glyphostoma or Mangilia. It is shortly fusiform, white, delicate, whorls probably seven, of which the two highest after the apical are plain and uncoloured, the remainder showing regular spiral rows of yellow gemme at the junction of the longitudinal costæ with the transverse lire. There are two rows of these in the antepenultimate, three in the penultimate, and in the last, three above the periphery, where follows one row of spiral colourless gemmæ, then two rows of yellow, the base of the canal being tubercled and colourless. The mouth is oblong,
the sinus wide but not deeply cut, the outer lip much thickened, within six-denticled, columellar margin simple. Very rare. (The derivation of the specific name is the Latin chrysolithus from the golden-yellow gemmæ).
M. (Glyphostoma) dialitha sp. nov. (Pl. IX., fig. 26).
M. testar turritu, elongata, ad apicem attemuata, nitida, albescente, ad basim, atque ad suturas, ochraceo tincta, anfractibus octo, duobus aficalihus lazibus, ceteris tumidulis, ad suturas impressis, supernis binis spiraliter gemmularum ordinibus, panultimo et ultimo anfractu trinis succinctis, semmmlis magnis, conspicuis, ultimo apud basim productam tuberculatis, apertura oblonga, labro extus corrugato, intus obscuré denticulato, margine colnmellari trinis denticulis munito, simu lato, sed non profundo.
Lons., 5, Lat. I•50 mill.
A pretty, small, elongate species, shining white, turreted, eight whorled, with impressed sutures, which are stained with pale ochreous colour, as is a transverse band at the base, the whorls are furnished, the upper with two, the lower with three spiral rows of large unduliferous gemmæ, white, shining, mouth oblong, outer lip wrinkled without, obscurely denticulate within, sinus wide, but not deep, and extending to the outer surface of the peristome. ( $\delta u u_{\iota} \theta_{o s}$, decked with gems).
M. (Glyphostoma) latirella sp. nov. (Pl. IX., fig. 27).
M. testa parva, fusiformi, turrita, anfractious sex vel septem, uno zel duobus apiculibus, bullatis, crystallinis, cueteris anguliferis, ventricosis, ad suturas impressis, longitudinaliter. paucicostatis, costis latis, angulatis, irregularibus, spiraliter crassiliratis, liris allis, interstitios ochraceo-coloratis, ultimo anfractu ad basim attenuato, paullum producto, simili modo decorato, ad medium interstitiali sulco fulviore-ocleraceo, apertura angusta, sinuosa, simu amplo, labrum effodiente, labro extus ad basim paullum incrassato, intus thidenticulato, denticulis fulitis, columella tridenticulata, cum dente suturali simili modo fuliescente.
Long., 4.50, Lit., I'50 mill.

A very delicate species. At first we imagined it to be the juvenile of Latirus turvitus Rve., but the mouth and processes are those of a true Glyphostoma. The apical whorls are glassy, shining, the rest impressed at the sutures, and very coarsely costate, also roughly lirate, the liræ being white, the interstices fulvous. The mouth is narrow, sinus ample and profound ; the denticles of the outer lip, of the columella, and the sutural tooth are all tinged fulvous red. A few specimens. From the description of Gl. Gaidei Hervier, J. de Conch., vol. 43, p. 239, it must resemble this shell. There, however, are eight whorls, but little decussation, and other points of distinction. (Latirella resembling Latirus turritus).
M. (Glyphostoma) notopyrrha sp. nov. (Pl. IX., fig. 28).
G. testa parva, turrita, fusiformi, candida, solida, anfractibus septem, zentricasis, apud suturas compressis, lonsitudinaliter crassicostatis, transversimque pauciliratis, livis regularibus, conspicuis, ultimo anfractu infrá suturas dorsaliter squarrosé brunneo-maculato, apertura angusta, labro exteriore multum incrassato, intus denticulis magnis instructo, columella denticuluta.
Long., 5, Lat., 2 mill.
Many specimens of a pure-white turreted little species, with a conspicuous dorsal squarrose brown spot just below the suture of the last whorl. The whorls are ventricose and ribbed longitudinally, crossed with a few conspicuous lire, the outer lip is much thickened with large denticles on the inner surface, and the columella is toothed. (rôtos the back, mippois rufous).
M. (Glyphostoma) rhodacme sp, nov. (Pl. IX., fig. 29).
M. testa fusiformi, delicatula, albida, anfractibus septem, ventricosis, apud suturas impressis, duobus apicalibus punicis, lavissimis, simplicibus, creter is longitudinalitcr costatis, costis perpancis, transversim spiraliter crassiliratis, apertura simuatu, simu amplo, lubrum effodiente, labre extus incrassato, intus guadri-denticulato, columeila obscuré septem-denticulata. Long., 7, Latt., 2'50 mill.

A delicate white, thickly ribbed, and coarsely transversely lirate species, pure white, with pink tip. Sinus broad and scooped out of the incrassate outer lip, which is four-denticled within, the columella being weakly denticulate also. (forion', rose:

M. (Glyphostoma) thalera sp. nov. (II. X., fig. 30).
M. testa elousatu, fusiformi, albida, solidula, anfractibus quinque, obliqué angulutis, et longitudinaliter pauci-costatis, transtersim spissi-liratis, livis indistinctis, ultimo anfractu producto, inf ra suturas irreguluviter transversim rufo-punctuto ( penultimo interdum simili modo decorato), apertura ancustr, latro multum incrassato, rufo-tincto, intus multi-denticulato, columella multis denticulis munita, sinu obliquo, amplo, labrum effodiente.
Long., 7, Lat., 2 mill.
This would seem variable both in form and marking. One specimen shows a leaning to $M /$. pancimaculata Angas, another is almost marked as $M$. theskela M. \&S. 1t is, however, far removed from this latter species. Rude in contour, fire whorled, obliquely angled, coarsely ribbed longitudinally, and closely but indistinctly lirate transversely. In shape, elongate fusiform, mouth oblong. Sinus ample and deep, outer lip much incrassate, both it and the columella are many denticled, outer lip but not the columella tinged with fulvous. A few specimens of somewhat varying shape and size. ( $\theta$ ćdepos blooming, genial).
M. (Glyphostoma) theoteles sp. nor. (Pl. X., fig. 31).
G. testa oiato-pyramidata, mimuta, anfractibus quinque, supernis alhescentibus, subnitidis, tumidis, transversim papillosis, papillis srandibus, in penultimo anfractu bino ordine, papillarum, quorum inferiore masimo, ultimo precipue bino ordiule, ad suturas magno, conspicuo, interstitiis leté ochraceis, hos quatuor ordines acieinsentibus, cietera superficie alba unicolore, apertura angusta, ad sinumi angulata, sinu profundo, labrum exterius effodiente, labro extus multum incrassato, intus quadri-denticulato, oolumella simili modo quadridenticuluto.
Long., 3'50, Lat., 1 '75 mill.

Very small, and with some slight resemblance to $M$. thepalea. The nodulous papillæ are, however, much larger in proportion to the size of the shell, and, in consequence, fewer. The upper whorls are closely tubercled, shining white. The four rows-two on the penultimate, two on the last whorl -are approximate, and the space contained by them is banded with ochre, the white shining nodules standing out more prominently. The mouth is narrow, oblong, sinus deep, outer lip much thickened, four toothed within as is the columellar margin. Rare ; we have seen very few examples. ( $\theta \epsilon 0 \tau_{\epsilon} \lambda_{\eta} \boldsymbol{s}$ divinely perfect).
M. (Glyphostoma) thepalea sp. nov. (Pl. X., fig. 32).
M. testa parva, pyramidato-fusiformi, albescente, delicatnla, anfractibus septem, quorum apicalibus vitreis, ceteris (quinque) ventricosulis, longitndinaliter noduloso-costutis, costis in mediunn transversims unisulcatis, interstitios longitudinaliter temuissimé striolatis, infraque suturas simul ac apud mediume anfractus ultimi pallidé oclracco-cinctis, in uno specimine costis hic illic ad medium usque ad suturas utrinque ochraceopunctutis, in altero tribus supernis (apicalibus exceptis) unicoloribus, nodulis papillaribus semper allis, haud ochraceotinctis. Apertura oblonga, sinu suturali, obliqno, labro exteriore incrassato, intus conspicué septemdenticulato, columella denticulis minoribus sex veel septem munita.
Long., 5'50, Lat., 2 mill.
A very delicate, beautiful little shell. It is pyramidally spindle-shaped, white, with seven whorls, two being glassy and apical, the rest ventricose, impressed at the sutures, the longitudinal ribs are nodulous, shining, and very regular, one spiral sulcation crosses each rib in the middle, the interstices between are beautifully longitudinally striolate. At the sutures, and in the middle of the last whorl (in some specimens also on the upper whorls), there is a very pale ochraceous banding, the nodules of the ribs still retaining their white lustre. In other specimens the first three or four whorls remain quite colourless. The mouth is oblong, sinus sutural, obliquely extending over the
outer lip, which is much incrassate within with seven prominent denticles, these being provided with three also of lesser size. The species comes near Glyphestoma disconicum Hervier (J. de Conch., vol. 43, p. 48, published June, i896), as regards the transverse sulcus, but in many respects-eg. the mouth denticles -it differs widely, so far as can be told by description alone, without a figure. Several specimens. ( $\theta \eta \pi \quad \dot{\lambda} \lambda \epsilon \boldsymbol{s}$, wonderful, astonishing).
M. (Glyphostoma) thereganum sp. nov. (Pl. X., fig. 33). $G$. testa oblongo-fusiformi, ommino pallidí ochracea, gradatuloturritu, apud suturas multum impressa, anfractibus septem, quorum duobus apicalibus puniceis, lavibus, cateris juxta suturas angulatis, longitudinaliter costulatis, costis incrassatis, transversim liratis, liris snperioribus pancis, has inter. duabus minoribus intercingendis, ultimo anfractu apud basim tuberculifero, canali recurvo, sinu labrum exterius effodiente, profundo, apertura oblongo-sinnosa, labro extus percrasso, bino nodularum ordine longitudinaliter decorato, intus septem zel octo-denticulato, margine columellari simplice.
Long., 9, Lat., 2'75 mill.
A conspicuous well-marked shell, though wholly plain ochraceous, unredcemed by any particular marking. It is fusiform, turreted, much impressed at the sutures, seven whorled, the two apical being stained with pink, the lower whorls are angled at the sutures above, regularly longitudinally ribbed, the ribs rather thick, and transversely spirally lirate, one large lira in the proportion of $2: \mathbf{1}$, the two smaller intervening; the last whorl is tubercled at the base. Mouth sinuous oblong. Sinus deep, outer lip very thick with double fimbriate row of nodules without, and within seven or eight denticulate, the columellar margin being simple. Very rare, two specimens only. ( $\theta$ єpijquror, the wicker-basket of a cart, from the latticed appearance).
M. (Glyphostoma) thesaurista sp. nov. (Pl. X., fig. 34). M. testa parza, fusiformi, attenuata, albida, solidiuscula, anfractibus decem (?) ad suturas impressis, ocloraceo-cinctis,

Iongitudinaliter parvicostatis, costis inconspicuis liviformibus, liris spiralibus distantibus clathratis, ultimo anfractu apud medium cingulo ochracen spiraliter decorato, apertura onatosimuosa, simu cochleari, effuso, amplo, labro extus perincrassato, expanso, intus quinque denticulato, columella minuté denticulata.
Long., 6.50, Lat., 2.25 mill.
A handsome fusiform sliell, whorls probably ten, the apical being absent in our specimens, whorls slightly angled and ventricose, ribs and transverse lire of about equal size, the former being small and feeble; at the sutures and round the middle of the last whorl are ochre bands. Outer lip much thickened and expanded, sinus spoon-shaped, wide and broad, outer lip finely denticled within, columella also denticulate. ( $\theta_{i j}$ ruipos, treasure).
M. (Glyphostoma) thyridota sp. nov. (Pl. X., fig. 35).
G. testa brevi, pyramidata, unicolore, albida, anfractibus sex, turritis, ventricosis, apud suturas angulutis, longitudinaliter conspicué crassicostutis, transuersim paucilivatis, apud medium anfractuum uno ordine profundo fovearum instructis, in ultimo lino simili ordine, apertura angusta, obbiqua, labro extus multum incrassato, intus quadri-denticulato, columella minutissime denticulata, simu profundé in lubro exteriore effuso. Long., $4^{\circ} 5^{\circ}$, Lat. 2 mill.
A pure white, curtly pyramidal species, the surface not shining. Whorls six, turreted, angled at the suture, ventricose, longitudinally thickly ribbed, transversely ornamented with few lirations. In the middle of the upper whorl and doubly-ranked in the last whorl, are transverse regular deep pittings, squarrose, profound, between the ribs, which suggest the trivial name. The mouth is narrowly oblique, outer lip thickened, furnished with four strong denticles, the columellar teeth are more obscure and feeble. Only one specimen, and that slightly worn ; but the characters are so remarkable as to excuse description from such scanty material. ( $\theta$ vpî̀ostos, furnished with windows or doors.)

Clathurella caletria sp. nov. (Pl. X.., fig. $3^{6}$ ).
C. testa gracili, fusiformi, delicata, aloa, ad suturas pallidissimí ochracea, anfractibus septem, quorum duobus apicalibus, mamillatis, lavissimis, ceeteris grudatulo-turritis, arcté longitudinaliter gracili-costulatis, costis delicatis, elevatis, rectis, spiralitervegulariter clathrato-liratis, junctura costarum lirarumuue nitidé gemmulatis, ultimo anfractu sona indistincta pallidissimí ochracea apud medium, apertura oblongosinuosa, labro extus cremulato, intus simplice, simu lato, labrum exfodiente, latere dorsali suturali callo crassiusculo, nitido, laté odraceo, margine columellari zersus basime minuti-denticulato, canali paullum producto.
Lons., +'50 mill. Lat., I'50 mill.
A very beautiful and delicate species, whorls seven, turreted, two being apical, finely and regularly clathrate; the mouth is sinuously-oblong, outer lip simple within, columellar margin minutely toothed towards the base, canal a little produced, a very pale ochraceous band round the middle of the last whorl, as at the sutures. The sinus is deeply cut behind, at the sutural margin of the outer lip is a bright ochraceous thickened callus. Only one specimen. (кúdos beautiful, そ̈тpuos woven).
C. cnephæa sp. nov. (Pl. X., fig. 37).
C. testa breaitor fusiformi, corrugatu, solidiuscula, omnino nigro brunnea, anfractibus sex vel septem, paullum ventricosulis, longitudinaliter crassicostatis, et spiraliter costulatis, costis crassiusculis, paucis, apertura oblonga, labro exteriore intus quadri-denticulato, margine columellari recto, simplice, simu superficiali.
Long., 4•75, Lat. 1 •50 mill.
A completely unicolorous species, being either pale or dark blackish-brown, the latter predominating in the specimens before us in proportion of $5: 2$. A typical Clathurella, with squarely crossed costre, both longitudinal and transverse of equal thickness, not many in number, say thirteen on last whorl, crossed by eleven, of which two spiral lire below the suture are
approximate. The outer lip is denticulate within, sinus not extending beyond the middle of the outer lip. A considerable number of specimens. (кıєфuîos, dusky brown, from the colour).
Clathurella episema sp. nov. (Pl. X.., fig. $3^{8}$ ).
C. testa fusiformi, concinua, pallidé ochrucea, anfractious quinque (exclusis apialitus), distanter costulatis, spiraliter crassiliratis, liris et costis albo-ochreis, interstitios plus mimusve ochracco-fulvis, ultimo anfractu apud basim albescente, liris tuberculatis, apertura oblonga, labro extus incrassato, intus sex denticulato, margine columellari recto, simplice, simu amplo, profundo.
Long., 4.50, Lat., I•25 mill.
A neat little species, with the usual fusiform shape, and five whorls, exclusive of the apical, not present in our specimens. The whorls are clathrate, with longitudinal ribs and spiral lire, these being pale ochreous-white, the interstices darker ochreous. The last whorl is slightly prolonged and sculptured in the same way as the upper whorls ; one or two of the longitudinal ribs seem thicker than the others, giving a very slightly varicose appearance. The columellar margin is straight, simple, six denticled, outer lip incrassate, six denticled within, sinus deep and large. ( $\epsilon \pi i ́ \sigma \eta \mu^{\circ} \circ$ remarkable).
C. lita sp. nov. (Pl. X., fig. 39).
C. testa fusiformi, paroa, ochracio-brumnea, deliatula, anfractibus sex, quorum duobus apicalibus, tumidis, nitidis, cateris ventricosis, obtusé crassicostatis, lonsitudinaliter, et spiraliter pluriliratis, interstitiis planatis, apertura laté ovata, intus brunnea, labro exteriore paullum incrassato, albescente, sinu parvo, rotundato, margine columellari simplice. Long., 4, Lat., I•50 mill.
A small plain shell of simple character, not very dissimilar to some of our European species. The whorls are six; the lower ones ventricose, the two apical swollen, smooth and shining. Obtuse and thick ribs, longitudinally, ornament the shell, and these are spirally crossed by many conspicuous lire. The aperture is widely ovate, outer lip slightly thickened, whitish;
the mouth is brown within, columellar margin plain. Likewise the sinus on the outer lip is inconspicuous, small and rounded. Three specimens. (גíтos, plain, simple.)
C. longa sp. nov. (Pl. X., fig. 40).
C. testa attenuatu, prolongata, solidula, brunnea, anfractibus novem vel decem, ventricosulis, ad suturas impressis, longitudinaliter crassicostatis, costis paucis, spiraliter bi-vel trifilostriatis, ultimo anfractu medio usque ad basim filo-striato, striis duodecim vel tredecinn acingentious, apertura triangulari, simu extenso, canali brevi, labro exteriore crassiusculo.
Long., 5 mill., Lat., ェ'50 mill.
A small brown attenuate shell, being long in proportion to its width, of the same facies as the Australian C. Letourneuxiana Crosse, but smaller, more approaching in this respect $C$. incrusta of 'Tenison Woods, from Tasmania, the whorls are (probably) nine or ten, but all our many specimens are worn at the apex. The whorls are ventricose, longitudinally few and thick ribbed, impressed at the sutures, crossed spirally with few (three or four) spiral lines, which, at the junction with the longitudinal ribs are pale and shining. The last whorl has altogether twelve or thirteen such spiral revolving lines. The canal is short, aperture triangular, this appearance caused by the wideness of the sinus. The outer lip is incrassate, as in most of this section. The specimen in most perfect condition, which is therefore taken as the type, is not so attenuately long as some others.
C. Rogersi sp. nov. (Pl. X., fig. 41).
C. testa oblongo-fusiformi, colore valde variabili, mui pulcheŕ pallide rosea, muc ochracea unicolore, munc spiraliter brunnea multivittata, anfractibus sex, apicali mbro-coccineo vel fulvoochracco, vitreo, cateris angulato-costatis, undique spiraliter liratis, liris majoribus ad angulos costarmm, suturis impressis, apertura oblonga, labro simplice, simu perinconspiato, sepies absente.
Long., 4•50 mill. Lat., I'50 mill.

The prevailing form of this pretty little shell is the rosepink, though there are many of the striped, and of the plain ochreous form in our collection ; we do not think it the young of any species, although the characters about the outer lip are not very defined. We have seen many specimens, all alike in sculpture, but are not quite certain yet of its genus. From the figure, it may be one of Duclos' lost species, e.g., C. cledomida, placed as Columbella, but its affinities are distinctly Pleurotomoid. We have much pleasure in recogni?ing the many kind services extended to us by Mr. Thomas Rogers, of Manchester, in the naming of this species.

Clathurella spyridula sp. nov. (Pl. X., fig. 42).
C. testa mimutu, delicatula, attemuata, angusta, albidu, nitidu, anfractibus sex, quorum duobus apicalibus simplicibus, ceteris clathratis et cancellatis, livis autis, costis incrassatis, liris, junctura costanum, gemmulatis, apertura simuosa, sinu effuso, lato, labro extus irasse, intus minuté acto denticulato, columella rectu, simplice.
Long, 4, Lat., I mill.
Very minute, narrow, white, latticed, and cancellate, the junctions of these cancellated lire being gemmuled; the whorls are six, two being apical ; mouth sinuous, canal very short, outer lip minutely denticulate, columella straight, and of simple character ; we cannot find that its exact counterpart has been described. (spyridula dimin. from $\sigma \pi i$ ipus a basket).

Daphnella terina sp. nov. (Pl. X., fig. 43).
D. testa fusiformi, delicata, albida, anfractibus sex; supra turritis, undique tenuistriatis, sub lente, omnibus preter ultimum anfractum et apicalem indistincte longitudinaliter costuliferis, ultimo infra suturas irunneo-maculato, branneisque flammis dorsaliter ad basim decorato, apertura angusté obliqua, labro simplice, simu pareo.
Long. 5, Lat. 2.50 mill.
Has some affinity with the large $D$. lymneiformis and also D. metcalfana Reeve, but is a smaller, shorter, and more deli-
cate species, and the upper whorls are white, turreted, and indistinctly ribbed. Two specimens. (т́́petoos tender).
D. thespesia sp. nov: (Pl. N., fig. 44).
D. testa delicatula, turrita, fusiformi, albida, anfractibus septem vel octo, squarrosé ventricosis, tribus apicalibus brunneis, subvitreis, cateris albidis, arcté decussatis, costis longitudinalibus obliquis, liris transzersis minuté semmulatis, suprá lineola una oikracea cingrulatis, et, in duobus speciminibus, ud suturas, ultimo anfractu evariipicto, in uno specimine infré, juxta sutures squarrosé ochraceo-punctato, et tribus ordinibus bilineatis cincto, in alio unilineatis,in alio lineis obsoletis, omnibus speciminibus dorsaliter ochraceomaculatis, apertura oblonga, simu lato sed non profundo, peristomate incrassato, suturaliter expanso, intus arcté denticulato.
Long., 6, Lat., 2.50 mill.
A beautiful species, by the description and figure allied to $D$. carioset Sow. from the same region. There are, however, no signs of varices. The shell is pure delicate white, with seven or eight whorls, of which three are apical and vitreous brown, the remainder finely decussate; where the spiral lines cross the oblique riblets a gemmuliferous appearance is presented. The whorls are squarely ventricose, impressed at the sutures. The coloration consists in orange-brown lines, different in number in every specimen. Some specimens are almost plain, others have a row of square brown spots just below the suture on the last whorl. The mouth is oblong, outer lip incrassate, suturally expanded, finely denticulate within, and the sinus is broad, but not deep. 'This species seems to approach the border land between Daphnella and Clathurella. Seven or eight specimens. ( $\theta \epsilon \sigma \pi \epsilon \epsilon \sigma t o s$, divine, is aptly applied to this exquisite form).

Mitra (Costellaria) Dorotheæ sp. nov. (Pl. X., fig. 45).
M. testa fusiformi, pallidissimé ochracea, spira acuminata, anfractibus oeto, apicali simplice, lacil, ceeteris aentricosulis, longitudinaliter crebricostatis, spiraliter arctí liratis, liris
costas contingentibus, ultimo anfractu superné juxta suturas rotuondo-angulato, anticé attenuato, costis rectis, apertura angusta, labro simplice, intus striato, columella quadriplicata, plica superiore magna.
Long., 19, Lat., 6 mill.
A critical species, which we have known for a long time, but never been able to diagnose with certainty. Its nearest affinities lie with M. angulosa Küster, a much more attenuate species, larger in all its parts ; M. Antonelli Dohrn, differing in colour and the clear shining ribs, not covered by the spiral liration ; M. fusiformis Kien. more closely ribbed and sharply angled, with different coloration ; M. salmonea Dohrn, perhaps the nearest approach, but differing in colour and texture ; and M. compta Reeve, but this last is not so easily comparable. It is a pretty shell, as are all the Costellaria, palest ochre in hue, turreted, whorls eight, ventricose, angled below the suture and with straight longitudinal ribs crossed with frequent lire. Mouth thick within, lip simple. A very few specimens. There is an individual in J.C.M.'s collection from Mauritius.

Bittium æolomitres sp. nov. ([1. X., fig. 46).
B. testa minutissima, cylindracea, pupreformi, compacta, anfractibus octo, duobus apicalibus, cateris bino gemmarum ordine spiraliter accinctis, in penultimo et antepemultimo anfractu gemmulis permagnis, mitidissimis, ultimo anfractu tribus similibus ardinibus decorato, apertura trigona, peristomate temui, camali brevi.
Long., 2•25, Lat., I•25 mill.
A very small specics. Pupiform, with eight whorls, adorned with two rows of papilliform gemme, those in the two whorls before the last being the largest, the last whorl having three rows of gemmules. The coloration is vivid. Apical whorls fulvous brown, the two next ochrcous, then a darker brown hue, the penultimate being slightly lighter, the last whorl pale ochrcous above, towards the base darker brown. (ú odopitpis, with glancing or glittering girdles.)
B. albocinctum sp. nov. (Pl. X., fig. 47).
B. testa minuta, cylindrica, ad apicem attenuata, apice obtuso, anfractibus octo, tribus gemmularum ordinibus seriatim dispositis, uno ordine infra, juxta suturas, albido, duobus pallidé ocloraceis, ultimo anfractu albido, bicingulato, apertura ovata, labro simplice, canali breìi.
Long., 4, Lat., r'75 mill.
A very pretty species, of which we have seen two or three specimens. Much resembling in sculpture $B$. uveanum, but differing in the mouth being larger, the shell less tun-shaped, and in the coloration. These two Bittia belong to the same section of the genus as $B$. puizis Issel (described by the author a sa Cerithiopsis), and B. tenthrenoïs Melv., described in Proc. Mal. Soc., 1896 , vol. 2 , No. 3, p. ıo9, from Bombay.
B. marileutes sp. nov. (Pl. X., fig. 48).
B. testa minuta, cylindracea, nigro-brumea, condensata, apud apicem obtusata, anfractibus octo, duobus apicalibus, cateris transversim papilliferis triseriatis, papillis gemmulatis nitidis, regularibus, apertura rotunda, labro simplice.
Long., 2•50, Lat., I mill.
One of the smallest if not the most minute of the genus. An almost pitchy-black little species, with eight close-grained whorls; the whorls are adorned with three transverse rows of papilliform gemmæ, black, shining. Mouth simple, very small.
 colour).
B. uveanum sp. nov. (Pl. X., fig. 49).
B. testa minutissima, dolioliformi, nitida, violacea, in specimine juniori apicalibus quinque albidis, quam maximé attenuatis, anfractibus novem, apud suturas impressis, tribus spiralium gemmularum ordimibus regulariter accinctis, gemmulis nitidis, nodulosis, interstitios planatis, ad basime infrá, simul ac ad apicem suprá, multum attenuatis, apertura parva, ovata, labro simplice, canali brevissimo.
Long., 3•25, Lat., I•25 mill.

Four or five specimens of a very small Bittium, pale violet in colour, one of them being a young shell, brownish in coloration, and exhibiting five perfect apical whorls, bright white in hue and extremely small and attenuated. The shell is tunshaped, much attenuate at both ends, the mouth is very small, and the whorls are ornamented with three regular rows of nodular gemmæ, the interstices being plain.

Cerithiopsis aurantiaca sp. nov. ( $\mathrm{I}^{\prime} 1 . \mathrm{X} .$, fig. 50).
C. testa longra, attenuata, subpellucida, leté aurantiaca, anfractibus duodecin (apicalibus?), apud suturas impressis et crenellatis, spiraliter tricarinatis, ultimo quadvicarinato, carinis pulchré crenellatis, longitudinaliter elevato-liratis, liris rectis, interstitios quadratis, alveolatis, nitidis, apertura orato-quadrata, labro simplice, basi nitida, planata.
Long., 4 mill. (approx.), Lat., I•25 mill.
A very delicate, semi-transparent orange-coloured minute form, long, attenuate, with angled whorls, crenulate, and impressed at the sutures. In number the whorls are twelve (approximately speaking, for our specimens are not perfect at the apex). 'Three carinæ adorn the upper whorls, four the lowest one; quadrately interlaced with longitudinal lire placed equi-distantly. Mouth ovato-quadrate, lip simple, base flattened, shining. Three specimens only.
C. catenaria sp). nov. (Pl. X., fig. 51).
C. testa paraa, fusiformi, uniformi, ochraceo-brunnea, anfractibus duodecim, quorum duobus apicalibus, vitrcis, ceteris ventricosulis, apud suturas impressis, tribus regularibus gemmularum catenis spiraliter decoratis, et longitudinaliter parviïratis, interstitios alzeolatis, simul ac ad suturas, apertura subquadrata, labro simplice, canali brewi.
Long., 6.15, Lat., 175 mill.
An elegant little species, fusiform, ochraceous - brown, with twelve whorls, two being apical, and glossy pale-brown, the rest ventricose, impressed at the sutures, longitudinally lirate, lire small and transversely crossed by three chains of
gemmæ, the interstices are somewhat alveolate in appearance, the aperture square, lip simple, canal short. A few specimens, not differing from each other. (catena, a chain).
C. eutrapela sp. nov. (Pl. X., fig. 52).
C. testa perlonga, cyiindriar, gradatim attemuata, albocinerea, delicatula, anfractibus quatuordecim, apicalibus tribus, simplicibus, haud nitcntibus, cameo-cinercis, cateris elegantissimis, ad suturas quasi-canaliculatis, pallide ochraceotimutis, tricarinatis, carinis subvitreis papilloso-gemmatis, undique lonsitudinaliter liratis, ultimo anfractu quadricarinato, ad basim planato, faullum excavato, apertura quadrato-orata, labro simplice.
Long., 7•50, Lat., I•50 mill.
A very elegantly chased, glassy species, cylindrical, fourteen whorled, the apical whorls being dark, cinereous, but smooth, the sculpture is such as is usual in this genus, thrice keeled whorts, the keels gemmulate at their junction with the longitudinal connecting lire, last whorl four keeled, mouth quadrato-ovate, base somewhat excavate, smooth, shining. Three or four specimens. (द́итритєдos elegantly formed).
C. Fosteræ sp. nov. (Pl. X., fig. 53).
C. testa gracillima, multum attenuata, delicatula, perpuldira, anfractibus quatuortecim, quornm tribus apicalibus, levibus, ochracco-brummeis, cateris angulato-zicntricosis, apud suturas canaliculatis, et achraceo-zonatis, in medium anfractuum allescentibus, suprá phus minusze ziolaceo-tinctis, duobus costis spiraliter conspicué accinctis, regularibus, gemmulatis, interstitios interdum, pracipue ad suturas, alacolatis, apertura subrotunda, peristomate tenui, marsinem apud columellarem triangulation capanso, canali breai.
Long., 6, Lat., r mill.
A most exquisite shell, extremely graceful and attenuate, with fourteen whorls, of which three are apical, pale-brown and smooth, the rest ventricose, slopingly angled, canaliculate at the sutures, and also banded at the junction of the whorls with ochraceous-brown, while the median portion is white, the
first seven or eight whorls being tinged with violet ; each whorl is spirally crossed by two prominent revolving ribs, these ribs gemmulate at the junction with the longitudinal strix, the interstices between being sometimes honeycombed in appearance especially at the sutures. The mouth is roundish, lip simple, and triangularly expanded towards the columellar margin, canal short. Eight or more specimens ; and named, in honour of Mrs. Emma Hadfield, née Foster, as a small token of appreciation and esteem.

Cerithiopsis hedista sp. nov. (Pl. X., fig. 54).
C. testa angusta, cylindrica, attenuata, gracili, anfractious duodecim, quormm apicalibus quatuor, pervitreis, levissimis, cateris spiraliter regularibus trious gemmularum ordinibus decoratis, semmulis papillatis, nitidis, his ordinibus varié coloratis, in ano specimine primo et medio albato, tertio oihraceo, in altero primo ochraceo, secundo et tertio albatis, ultimo anfractu ad basim bicarinato, apertura quadrato-ovata, labro brunneo-ochraceo, canali brevissimo.
Long., 5, Lat., I•50 mill.
A prettily variously-banded delicate cylindrical shell, the whorls ornamented with three rows of transverse gemmules, shining, papillary, these rows being coloured white and pale ochraccous-brown, sometimes two white rows together, followed by a brown row, and occasionally the obverse. The last whorl is furnished with two keels towards the base : the lıp is och-raceous-brown, and the canal very short. (iŋburos, most delightful).
C. adelpha sp. nov. (Pl. X., fig. 55).
C. testar attemuato-fusiformi, brumneo-nisra, regulari, subulata, anfractibus undecim, quorum duobus aficalibus, mimutissimé punctatis, pallide brunnen-ochraceis, cateris transversim papilloso-gemmulatis, gemmulis rotundis, nitidis, similious, tribus ordinibus succinctis, ultimo anfractu non producto, ad peripheriam acutangulato, basi plamulata, apertura quadrato-ovata, labro squarrosulo, tenui, simplice. Long., 4, Lat., I mill.

A dark-brown very attenuate Cerithiopsis, much resembling certain forms of European species, e.g. C. diadema Watson, but this latter is a larger shell. The arrangement of pattern is the same, viz., three rows of papilliform gemmules, round, brown, shining. Several specimens. ( $<\delta \in \lambda \phi o s$ akin).

Turbonilla belonis sp. nov. (Pl. X., fig. 56).
M. testa perlonga, attenuata, crystallina, albida, anfractibus duodecim, ventricosis, gradatulis, paullum suprá subdistortis, undique longitudinaliter recticostulatis, interstitios indistincté striatis, ultimo anfractu ad peripheriam fortiter spiraliter unicostato, hac costa basim circumcingente, apertura rotunda, labro circiter incrassato, intus ad labrum exterius quadridenticulato, columella suprá simplici.

Long., 8.50, Lat., 2 mill.
A highly interesting shell, which it was at first difficult to assign to any special genus. It is very long, attenuate, twelve whorled, crystalline, the whorls all ventricosely gradate and impressed at the sutures, longitudinally costate, the ribs being straight, at the periphery of the last whorl these ribs end in a strong transverse rib-process, which encircles the base. The mouth is round, lip thickened, and in the inner margin of the outer lip are four denticles which extend slightly within the orifice. The columellar margin is, so far as can be seen, simple. Undoubtedly a Turbonilla ; T. decussata Pease has the denticled mouth, but there is no transverse ridge at the base of the last whorl in that species. ( $\beta \in$ dovis, a small needle).

Pyrgulina gliriella sp. nov. (Pl. X., fig. 57).
P. testa ovata, obtusa, livido-punicea, glandiformi, anfractibus sex, apicali punicco, retorto, subvitreo, cateris longitudinaliter densicostatis, interstitios levibus, apertura ovata, peristomate continuo, margine columellari fortiter uniplicato.
Long., 2.25 mill. sp. min., 3.50 mill. sp. max., Lat., I mill. sp. min., 150 mill. sp. max.

Extremely minute. Shell oval, obtuse, livid pink grey, in facies much like Zafra pupoidea Ad. in miniature. The last whorl, at the apex of the smallest specimen, is twisted over the next, as is the habit of most of the Odostomice. The other whorls are longitudinally densely ribbed, the interstices between being smooth. The mouth is ovate, peristome continuous, columellar margin with a strong single plait or fold. A few specimens. (dim. of glis, a dormouse).

## Syrnola jaculum sp. nov. (Pl. XI., fig. 58).

S. testa acuta, attemuatu, temui, vitrea, anfractibus undecim, ommibus applanatis, in uno specimine quinque anfractibus superioribus pallidé apud medium brunneo-liratis, in cueteris ommino micoloribus, apertura attenuata obliqua, laboo temui, columella uniplicata.
Long., S, Lat. 2 mill.
Seven specimens of a pure white shining crystalline Syrnola, eleven whorled, whorls straight, very slightly channelled at the sutures, in one specimen only the five higher whorls, next to the apical, are delicately spirally twice zoned with narrow ochraceous brown lines, these becoming obsolete in the lower whorls. The other specimens have no trace of such banding. The whorls are perfectly smooth; mouth oblique; lip simple; columella once plaited. (Jaculum, a dart, from the pointed contour).
S. violacea sp. nov. (Pl. NI., fig. 59).
S. testa attemata, lavi, mitida, duobus anfractious apiatibus diaphanis, cafteris ziolaceis, unicoloribus, lavissimis, infrá suturas internam ob plicam transzersim quasi milimeolatis, ultimo anfractu ad hasim pallescente, apertura obliqua, labro simplice, columella umiplicata.
Long., ir, Lat., 2.50 mill.
A smooth violaceous shell, ten whorled, quite plain excepting for the line of the revolving plica showing through each whorl transversely just below the sutures; mouth somewhat oblique, outer lip plain, columellar one-plaited. Three specimens, but only one in first-class condition.

Alaba zadela sp. nov. (Pl. XI., fig. 71).
A. testa perlonga, attemuata albo-cinerca, mitente, gracili, anfractibus circa decem, hic illic taricosis, varicibus tumidulis, feré lavibus, undique spiraliter arcté liratis, liris minuté brunneo-punctatis, ultimo anfractu paullum prolongato, apertura ovata, labro tenui.
Long., 5, Lat., I•50 mill.
A small elongate shining ashy-white shell, whorls probably ten, but our specimen is broken at the apex, swollen varices are scattered over the whorls, and spiral lire uniformly cover them, with here and there bare patches where the varices come. These liræ are minutely brown dotted. Mouth ovate, lip simple. (cíd $\begin{gathered}\text { dos manifest). }\end{gathered}$

Litiopa limnophysa sp. nov. (Pl. NI., fig. 72).
L. testa ovato-oblonga, rapidé attemuata versus apicem, temuissima, rufocinerea, anfractious septem, quorum tribus minimis nigrescentibus, apicalibus, cateris tenuibus, sublavibus, ultimo expanso, sub lente transversin striatulo, infra suturas et apud medium anfractus spiraliter flemmis maculisve rufis depicto, apertura oblonga, labro tenuissimo, columella zerisus basim subtruncata.

Long., 5, Lat., I •50 mill.
Like a Limnea in miniature. Seven whorled, ovate oblong, the last three whorls apical, decussate beneath a lens, and blackish, the rest ashy red, painted on the last whorl, which is very finely transversely striate, with rufous flames and spots. Mouth oblong, lip very thin, columella truncate towards the base. Two specimens only; would appear near L. nitidula Pfr.

Alvania pisinna sp. nov. (Pl. XI., fig. 6o).
A. testa minutissima, oblonga, allida, concinna, anfractious sex, yuoum ducbus apicalions subvitreis, lavibus, cateris ventricosis, ad suturas multum impressis, arcté costulis longitudinalibus lirisque spiralibus decussutis, tibus lirarum ordinibus supernis, ultimo anfractu ordinibus quatuor, ad
basim spiraliter unicarinato, apertura rotunda, peristomate incrassato, continuo.
Long., I, Lat., ' 50 mill.
Very minute, pure white, whorls six, of which two are apical, much ventricose and impressed at the sutures. The whorls are ornamented with clathrate riblets and lire, threeranked spirally in the upper whorls, four in the lowest, with a sharply-turned keel round the base. Aperture round, outer lip continuous, thickened. (pisimnus, a small child).

Rissoina baculum-pastoris sp. nov. (Pl. XI., fig. 61).
R. testa prelonga, attenuata, interdum flewa, nitida, candida, anfractibus decem, apiarli papillari, cateris lavibus, ad medium spiraliter acutangulis, ad suturas impressis, ultimo anfractu biangulato, apertura ovata, peristomate incrassato, feré continuo.
Long., 6, Lat., I'50 mill.
Allied, doubtless, to $R$. spirata Sowb., so protean in its forms, but it seems distinct from every variety. It may also be allied to $R$. miranda A. Ad. or R. insolida Desh., by some considered only a variety, but there is no sign of the crenulations, so very conspicuous an ornament on the whorls of these two last species. One of our specimens is bent, giving the aspect of a shepherd's staff, hence the trivial name. The shell is white, shining, ten whorled, the whorls smooth, impressed at the sutures, and uniformly spirally once ribbed, the last whorl twice; mouth ovate, peristome almost continuous, thickened. Some slight resemblance in sculpture to species of Scalenostoma may be observable.
R. catholica sp. nov. (Pl. XI., fig. 62).
R. testa oblongo-fusiformi, parva, nizea, nitida, afice obtusato, anfractibus sex, apicali simplice, creteris ventricosulis, longitudinaliter arcté obliquicostatis, interstitios hic levibus, illic sub lente tenuissimé striatulis, apertura ovata, paullulum effusa, labro incrassato.
Long., 3, Lat., I•25 mill.

A small white species of simple character. Longitudinally obliquely ribbed, the costæ being many, and with their interstices mostly smooth, but oceasionally very finely striate when seen microscopically; mouth oval, lip rather thickened.
R. enteles sp. nov. (1’l. NI., fig. 63).
R. testa pyramidato-fusiformi, pellucido, albida, nitida, anfiactibus septem, minimé tumidulis, spiraliter temil-sulcatis, sulcis superficialibus, ultino anfractu infra medium nitidissime, planato, aliter tenuisulcato, apertura lunata, effusa, labro crassiusculo, planato, simplice.
Long. 6, Lat. 2.50 mill.
A white pellucid shell, with a milky tinge; the whorls, seven in number, are finely sulcate, sulcations extremely superficial. There is a space round the body of the last whorl where these sulci are absent, but they are resumed round the base. The mouth is wide, lip somewhat incrassate. ( ${ }^{\prime} \tau \tau \in \lambda$ ýs perfect, complete).
R. nesiotes sp. nov. (Pl. NI., fig. 64).
R. testa elongata, turrita, albida, anfractibus novem, quorum duobus apicalibus, vitreis, laribus, cateris rentricosulis, pallide achraceo-tueniatis, longitudinaliter obliqui-costatis, costis mumerosis, lavibus, nitidis, interstitios sub lente spintliter temuissimé striatis, in ultimo anfractue costis ad basim tuberculatis, tuberculorum quinque ordinibus, apertura ovata, labro multuen incrassato, intus simplice.
Long., 6, Lat., I•50 mill.
A smooth shell, elongate, obtusely turreted, whorls ventricose, nine in number, two being apical and glassy ; all the whorls are simply obliquely costate longitudinally, the interstices being extremely finely striate. A pale spiral ochreous band surrounds the lower half of the whorls. At the base of the last whorl, the costr become tuberculated; there are five spiral rows of these. Mouth ovate, much thickened. Several specimens. N.B.-A form of this species also occurs in
which the ribs are all more or less tubercled; we fancy this may be the more juvenile state of the species. ( $1 \eta \sigma \sigma \iota(\hat{T} \tau \eta$ s an islander).

Rissoina (Phosinella) quasillus sp. nov. (Pl. XI., fig. 65).
R. testa fusiformi, candida, versus apicem attenutator, anfractibus decem, quorum apicalibus duobus vitreis, levissimis, cateris arctí costulatis, costis rectis, spiraliter lirarum ordinibus accinctis, livis clevatis, ad junituram costularum gemmulatis, nitidis, apertura rotundo-lunari, labro extus paullulum incrassato, intus simplice.
Long., 450, Lit., 2 mill.
A very neat rough little white shell, clathrate, gemmuled at the junction of the ribs with the spiral liræ, ten whorled, aperture roundly-lunar, outer lip slightly thickened, simple within. Allied to $R$. Deshayesi Schwartz, from the Philippines. Several specimens. (Quasillus, a small work-basket, dim. of qualus).
R. sincera sp. nov. (Pl. NI., fig. 66).
R. testa pyramidato-fusiformi, iandidu, sub-turnitu, anfractibus octo (?) apud suturas impressis, tumidulis, superficialiter. longitudinaliter costulatis, costis remotis, simul ai liris spiralibus intersectis, quadrato-clathratulis, interstitios planis, apertura effusa, labro crassiusculo, intus simplice.
Long., 6.50, Lat., 2.50 mill.
A shell of bold contour. White, probably eight whorled (but only five remain on our specimens), whorls slightly ventricose, longitudinally superficially costulate, spirally lirated ; three rows on the two whorls before the last, on the last whorl there are five rows ; the quadrate interstices are plain, non striate, lip effuse, incrassate. Two specimens.
R. zonula sp. nov. (Pl. XI., fig. 67).
R. testa perparva, fusiformi, compacta, soìdiuscula, anfractibus sex, quorum duobus apicalibus, albovitreis, lavibus, cueteris concinné lonssitudinaliter obliquicostatis, costis arctis, temuibns, mitidis, interstitios planatis, apud suturas utrinque spiraliter fulrozonatis, simul ac à medio anfractus ultimi usque ad
basim extremam: apestura ovata, peristomate incrassato, margine columellari paullum expanso.
Long., 2, Lat. I mill.
A very small edition of such a species as $R$. fasciata A. Ad. Though only two millimetres in length, it is a finished shell, and the lip remarkably incrassate for its size. The whorls are six, two being apical and glassy white, the rest are obliquely costate, shining, with rufous zones on either side of and joining the sutures, and the basal half of the last whorl is of the same colour. A few specimens. (zomula, dim. of zona, a band).

Barleeia chrysomela sp. nov. (Pl. XI., fig. 68).
B. testa fyramidato-conica, semigradatula, lareissima, mitida, aurantio-fulza, tenui, anfractibus septem, paullulum tumescentibus, apud suturas spiraliter fulvo-brumneo vittatis, apertura parva, ovata, peristomate feré continuo, fuivo-brunneo zel nigresiente.
Long., 3, Lat., 1.50 mill.
Many specimens of a small Hydrocend-like species, which has many characters in common with the genus Barlecia Clark, where we place it provisionally. A conical shell, shining, golden orange-brown, with spiral darker sutural band, the peristome being of the same colour and nearly continuous. The mouth is somewhat contracted. (chry'somela, golden apple, from the colour).

Rissoia joviana sp. nov. (Pl. NI., fig. 69).
R. testa oblonga, solidiuscula, oclivacea z'el ochraceo-cinerea, anfractious decem (tribus apiallibus), ventricosis, ad suturas impresso-cremulatis, longitudinaliter rotundi-coslulatis, costis interdum obscuris et irregularibus, spiraliter arté liratis, apertura roturnda, labro extus simplice, columella alba.
Long., +, Lat., I•50 mill.
An oblong ochraceous shell, rather stout, with ten whorls, three of them being apical and very small, the rest roundly ribbed, and transversely closely lirate, whorls ventricose and crenulately impressed at the sutures. Nouth round, lip simple,
columella white. We have this species also from Thursday Island. What appears to be another form of the same shell is also in the collection, with darker ochraceous spiral lines across the two last whorls, the longitudinal costre obscure, and here and there wanting, apical whorls dark-brown.

Rissoia pyrrhacme sp. nov: (Pl. XI., fig. 70).
R. testa oblonga, delicatula, nivea, anfractibus novem (interaum octo), quorum apicalious tribus, fulvo-ochraccis, cueteris albis, ventricosis, ad suturas crenulato-impressis, longitudinaliter costulatis, spiraliter arcté sulculosis, apertura rotundo-ovata, labro simplice, paullulum effuso.
Long., 6, Lat., 2 mill.
A pure white ochre-tipped shell, whorls eight or nine, much swollen, longitudinally ribbed, spirally closely sulcate, aperture round, lip simple, a little effuse. We are not yet quite sure of the proper location of this and the preceding species, and only place them provisionally in Rissoia. If, indeed, they be Rissoik, they will, perhaps, be better included in a new section of the genus. Sereral specimens. ( $\pi$ íppos ochre red, üк $\mu \eta$ point).

Mathilda eurytima sp. nor. (Pl. XI., fig. 73).
M. testa delicirta, pyramidato-fusiformi, alba, anfractibus decem, ventricosis, ad suturas impressis, spiraliter acute tricarinatis, carinis angulatis, interstitiis longitudinaliter clathratulis, clathris arctis, sub lente concinnis, ultimo anfractu quadriarinato, basi tornata, apertura ozato-rotunda, labro simplice, canali producto.
Long, 6, Lat., 2 mill.
A most delicately lovely, though minute shell. A second specimen having occurred, the first, named provisionally M. sinensis by us in our last paper, has been carefully re-examined and found to be distinct from that species. The spiral keels are only three on the upper whorls, as against four in M. sinensis, the shell is not of thickened texture, and the
colour is a purer white. The size is about the same. (єiри́тィ䒑os, honoured, excellent).

Euchelus favosus sp. nov. (Pl. NI., fig. 74).
E. test, conica, perforata, scruposa, candida, apice depresso, planato, anfractibus quatuor, apud suturas profundé canaliculatis, penultimo et antepenultimo transversim bicarinatis, ultimo anfractu sex-carinato (inclusa spirali carina circa umbilioum), carinis longitudinalibus liris inter se junctis, interstitios alveolatis, vel favosis, carinis elegantissimé acuté crenulatis, umbilico angusto, apertura rotunda, labro extus scruposo, intus planato, margine sicut columellari.
Long., 3, Lat. 2 mill.
Yery small, but most beautiful in sculpture. Pure white, four whorled, including the depressed apex; sutures deeply canaliculate, the second and third whorls twice, the last six times keeled, including the spiral keel round the umbilicus, these kcels are longitudinally joined by stout liræ, the interstices being honeycombed; the carinæ are most elegantly sharply crenulate all round ; the mouth is round, outer lip rough with the edges of the keels, within smooth. Four specimens. (favosus, honeycombed).

Leucorhynchia tricarinata sp. nov: (Pl. XI., fig. 75).
L. testa perdepressa, albida, nitida, obtecté umbilicata, apice planato, anfractibus tibus cira suturas spiraliter crenelliferis, lavissimis, apud peripherian ultimi anfractus tricarinatis, media carina fortissima, interstitios arinarum suliatis, ultimo apud basim circa callositatem peristomalem crenellifero, apertura circulari, peristomate columellarem apud marginem calloso, linguifero, prominente, regionem umbilicarem supra impendente, callositate ipsa sicut in typica L. caledonica.
Alt., 1, Diam. 3 mill.
A third species of Leucorlynhchia Crosse, which genus we think sufficiently distinct from Teinostoma Ad., although M. Paul Fischer and Mr. Pilsbry hold a contrary opinion. From the type L. Caledonica Crosse, it differs in the tricarinate peri-
phery, the middle keel being strong, squarely built, and bold and projecting further from the whorl than the two other keels. Shell much depressed, apex papillary, sunk in the spire : spiral crenellæ run round the sutures and round the peristomial callosity, this being tongue shaped and well nigh concealing the umbilicus. One specimen only, discovered in the mouth of a larger shell by the Rev. Lewis Shackleford.

Alcyna lifuensis sp. nov. (Pl. XI., fig. 76).
A. testa imperforata, minuta, solidiuscula, parum nitida, anfractibus quinque, quorum apicalibus late puniceis, tribus ultimis albis, transversim interrupto-lineatis, lineis mbris, ultimo anfractu infra, juxta suturas, squarrosé regulariter alhispatiato, et apud peripheriam concinné rubra linea spatio simili alternato, apertura rotunda, liabro exteriore subexpanso, columella ad basim fortiter unidenticulata, denticulo acuto.
Long., I•75, Lat., I mill.
Smaller than $A$. rubra Pease, and differing from all the forms we have seen of it, and likewise of the Japanese $A$. ocellatu A. Ad. in the whorls being plainly five in number, and in the different pattern of the interrupted red lines, the shape being more effuse than $A$. ocellata, and the shell smaller than in A. mubra. There seem affinities with $A$. lineata Pease from the Hawaiian Islands, of which we have only seen a description, but here the whorls are fewer, the lip is not thickened out, the apex is pink, not white. Though small, it is a very brightly coloured little shell, being five whorled, the whorls slightly swollen, white, with transverse interrupted red lines encircling it spirally, round the periphery these lines are regularly interrupted, leaving equal white spaces, below the suture on the last whorl are square white spaces left bare, the mouth is round, lip slightly effuse, plain ; the columella having a very strong tooth near the base.

Minolia agapeta sp. nov. (Pl. XI., fig. 77).
M. testa minuta, effuso-conica, albida, solidiuscula, anfractibus quinque, turritis, infra suturas angzulatis, spiraliter
distincté et acuté liratis, interstitios longitudinaliter tenuissimé striatis, ultimo quoque anfractu apud peripheriam ang ulato, ciraí angulum suturalem flemmis puniceis depicto, ad anguli peripheralis costam puniceo-punctato minoribus etiam punicei colon is punctis hic illic obscuré decorato, umbilico frofundo sed angusto, superficie basali simili modo ac superna spiraliter lirata, apertura rotunda, peristomate crussiusculo, palllum reflewo, feré continuo, intus punicootincto.
Alt. 4, Diam. 4.50 mill.
A smaller species than the other Loyalty Island species of this genus. The shell is five-whorled, including the apical, white, angled below the sutures and in the last whorl, again at the periphery ; also painted round the sutures below with crimson coloured equi-distant flames. At the periphery, the spiral rib is encircled with minute pink dots; the whole shell is beautifully acutely spirally striate, the interstices, with the aid of a lens, appear finely striate longitudinally. The mouth is round, peristome thickened, a little reflexed; umbilicus deep, but narrow. A few specimens. ( $\gamma^{\prime} \dot{\pi} \pi \eta \tau o s$ beloved, choice).

Solariella (Conotrochus) tragema sp.nov. (PI. NI., fig. 78).
S. testa conica, albo-calcaria, profunde umbilicata, delicata, anfractibus sex, gradatulo-lurvitis, unangulatis, undique transversim spiraliter costulatis, costis tormatis, interstitios alveolato-decussatis, inter suturas et angulum anfractuum regulariter flammis puniceis sparsinn decoratis, ultimo anfractu apud peripheriam simili modo unangzulato, et infra, quadricostato, apud basim umbilico profundo sed angusto, undique spiraliter costulato, ut suprá, interstitiis simili modo decussatis, apertura rotundato, peristomate tenui, simplice. Long., 2'50, Lat. I'75 mill.
Eight specimens of a small conical chalky-white Solariella, colourless excepting for scattered transverse pink flames round the upper parts of the lower whorls just below the sutures. The shell is profoundly but narrowly umbilicate, whorls six, two being apical, slantingly angled in a gradate manner. The sur-
face is closely acutely ribbed, the transverse decussations some. what noticeable in the interstices, and these in some specimens give a crenulate appearance to the ribs themselves. The base is spirally costulate, as are the upper whorls ; the mouth round, outer lip simple. No doulst this species is nearly allied to Minolia Holdszeorthiama (r. Nevill from C'eylon, and M. singaporensis Pilsbry, of which we have only seen figures; but it differs from both these species by several salient characters. We are of opinion this group comes nearer Solariella than Minolia ; perhaps it would be well to separate them generically as Conotroclus Pilsbry. ( $\quad$ púzmua a delicacy).
Cadulus viperidens sp. nov. (Pl. XI., fig. 79).
C. testa mediocri, subinflexa, perlavi, apud apicem siant ad aperturam basalem paullum attenuata, delicata, pellucidu, lactea, apertura rotunda, margine tenui, apertura posteriore perparva, margine labialiter acuté bifisso, tenui.
Long., 6.50 mill.
Diam., oris, I mill., sp. maj.
," apicalis, 0.50 ",
Several specimens of a somewhat incurved, perfectly smooth, translucent, milky-tinged Cadulus, precisely corresponding with unnamed specimens in the British Museum from the shores of North Australia. In form it slightly recalls C. colubridens Wats. from New Zealand ('Challenger' Expedition), but is more uniform in width and less ventricose towards the base. It is likewise smaller than either that species, the common tropical C. gadus Montagu, or C. Jeffreysii Monterosato. The mouth is simple, round, the posterior or apical orifice, also round in diameter, has its edges labially bisected by a sharply-cut channel. The specific name chosen, "viperfanged," is self-evident from the form.

Tornatina Hadfieldi sp. nov. (Pl. NI., fig. So).
T. testa oblonga, leveissima, recta, temui, albo-lactea, anfractibus quatuor, ad suturas canaliculatis, ultimo anfractu oblongro, magno, sub lente spiraliter striolato, suprá medium
semipellucidis fenestralibus vittatis catenis spiraliter succincto, apertura oblonga, apud basim latiore; labro extus recto, simplice, margine columellari uniplicato.
Long., 4, Lat., 1•50 mill.
A curious species, which, of plain appearance, is relieved by a spiral band on the last whorl, just above the middle, of semi-pellucid window-like filleted catenations ; this is not, so far as we can make out, owing to any less deposit of shelly matter, but the whole substance, while as thick, is rendered semitransparent by some process that needs further study. We do not know of this character in any other species. Many specimens. To this, one of the most interesting of this consignment, we append the name of the discoverers, the Rev. James and Mrs. Hadfield.

NOTES ON A COLJECTION OF SHELLS FROM LIFU ANן UVE.S, LOYALTY ISLANDS, FORMED BY<br>THE RET. JAMES INI MRS. HADFIELD. WITII LIST OF SPECIES.

Pak't II. (contimued).

By Jas. Cosmo melvill, m.A., F.L.S., \& ROBERT Standen (Assistant-Keeper, Manchester Museum).
(Read before the Conchological Society, February roth, 8897 ).
Drillia cygnea sp. nov. (Pl. XI., fig. 82.)
D. testa fusiformi, crassa, lazi, nitida, candidissima, anfractibus sex vel septem, apicalibus . . .? cateris perlavibus (subl lente superficialiter striatulis), ventricosulis, longitudinaliter costatis, costis rectis, uniformibus, ad utrumque anfractum octo; apertura ovata, labro extus perincrassato, pracipué suprá, canali breai, sinu obscuro in speciminibus nostris.
Long. 15, Lat. 7 mill.
A pure white, shining, massive little species, with uniform straight longitudinal ribs, the surface being nearly smooth and shining. Ribs of the last three whorls continuous, and about eight in number. Four specimens.
(cygneus, swan-like).
Odostomia versicolor sp. nor. (Pl. XI., fig. 83.)
O. testa subturrita, attenuato-fusiformi, gracillima, delicata, anfractibus novem, quorum duolus apicalibus, pervitreis, cateris ventricosulis, precipué supernis, spiraliter delicatissimé striatulis, et supernis decussatis, ad medium et infrá anfractus ante-penultimi et trium superiorum hic aurantiotinctis, hic pallidé puniceis, illic unicoloribus; ultimo anfractu recto, prolongrato; apertura oblonga, labro paullum effuso, tenui, columella uniplicata.
Long. 5, Lat. 1.50 mill.

The shell is very graceful and delicate, attenuate, aciculate, nine whorled, two whorls being apical, the fourth, fifth, and sixth tinged in the lower half with either chestnut, yellow, pale-pink, or left wholly white and unicolorous; the antepenultimate whorl is often similarly tinged, but the last two whorls are white: the last is prolonged and straight. Mouth ovate, oblong; outer lip slightly effuse, thin ; columella one-plaited. A few specimens.

Allied to $O$. striata Pease, but the whorls are transversely striate and delicately decussate. It is not a typical Odostomia, but our knowledge of that genus and its allies is at present so unsatisfactory, that we do not know precisely where to locate it.

Elusa gradatula sp. nov. (Pl. XI., fig. St.)
E. testa attenuata, groduta, fusiformi, per-gracili, niven, levi, anfractibus decem, turritis, lavibus, longitudinaliter minuté et arcté costulatis, costis nitidis, interstitiis per-laeribus; apertura ovata, laliro temui, columella uniplicata.
Long. 4•50, Lat. I•50 mill.
This shell has some affinity with Prygrolina prrogomella Melv., described recently from Bombay. The whorls are ten, attenuate, gradate, very slender, white, smooth, uniformly very finely longitudinally costulate. Columella once-plaited.

Olivella Williamsi sp. nov.
O. testa fusiformi, polita, anfractibus sex, apud suturas profundé canaliculatis, et excavatis, per-lavibus, anfractu ultimo oblongo, cundido, flammis vel lineis fulgetrinis castune is concinné decorato, apertura angusta, oblonga, labro incrassato, columella 7-8 plicata.
Long. 15, Lat. 7 mill.
A well-marked, exceedingly pretty Olivella, which is not to be found either in the British Museum, Mr. Williams' collection, or any of the collections, public or private, we have been able to examine. Nor is any mention made of it in Mr. F. P. Marrat's Monograph of the genus in Sowerby's "Thesaurus Conchyliorum."

Mr. Williams writes us, that though in good condition, the markings in a quite fresh specimen would probably be much clearer and more characteristic. The shell is fusiform, polished, the whorls six, deeply canaliculate and excavate at the sutures; the last whorl and the penultimate are ornamented with clearly-drawn longitudinal zigzag chestnut lines; the mouth is narrow, oblong, outer lip thickened, columella $7-8$ plaited.

$\times 2$.
We have very much pleasure in connecting with this little Olizella the name of our friend, Mr. J. Michael Williams, of Liverpool, whose collection of Olives embracing as it does, so many types and unique or rare species and varieties, is probably the best extant at the present time, and to whom we have submitted thie whole of the genus in our Loyalty Islands' collections.

NOTES ON A COLLECTION OF SHELLS FROM LIFU ANI UVEA, LOYALTY ISLANDS, FORMED BY<br>THE REV. JAMES AND MRS. HADFIELD, WITH LIST OF SPECIES.<br>Part III.<br>by J.AS. COSMO MELJILL, M.A., F.L.S., d ROBERT STANDEN (Assistant-Keeper, Manchester Museum). Read before the Conchological Society, June 16th, 1897).

Tue present instalment of our work on the Lifu Mollusca contains a second list of the species observed up to the present time. For convenience we have arranged the families in the same order as in our previous catalogue (antea pp. 84-132), and we have included in the enumeration the new species described by us (antea pp. 273-315, 379-381). These are referred to by the letters "M. d. S.," with an indication of the pages where the original diagnosis will be found.

> Class GiStropoda.
> Order pulaonata.
> Family aURICUlid.E.

Melampus crassidens Gassies.- A conspicuous Melampus; as the specific name implies, the columellar teeth, and more especially the basal one, are thick and prominent.
Auricula Hanleyana Gassies.-An endemic species.

> Order OPISthobranchiata.
> Family BULLid.E.

Tornatina Hadfieldi M. \& S., p. $3^{14,}$, 896.
Bulla punctata A. Ads.-We can find no appreciable difference between our specimens and those coming from the shores of Panama.

FAMMS SCAPHAVDRIDAE.
Smaragdinella glauca (euoy:-One perfect small example, transparent, and pale green. Also from New Ireland.
Family APLUSTKIDAE.

Aplustrum thalassiarchi Mart.-Small, but characteristic. Only two occurred. Mauritius.
FAMILY OXYNOE1D.

Oxynoe Vigourouxi Crosse.-Four examples, quite perfect.

> Order prosobranchilata.
> family Contd e.

Conus (Hermes) mitratus Bruguière.-One beautiful and finely-marked specimen. Occurs also in the Philippines.
Drillia cygnea M. \& S., p. 379, 1897.
D. ione M. \& S., p. 277, 1896.
D. Mariesi Souverbie.-One specimen of a neat dark-brown shell, elegantly noduled with white spiral beading, which agrees with specimens of M. Souverbie's species in our National Collection. From Uvea.
D. Rougeyroni Souverbie = D. barkliensis H. Adams. Our three specimens are a little worn, but we think we are right in the identification. A dark-umber shell, spirally tornate, and noduled.
D. themeropis M. \& S., p. 278, 1896.
D. vidualoides Garrett.-A small and very pretty form, perlaps too nearly allied to $D$. vidua Kve. or $D$. unizonalis Lam, with which latter it is united by some authors.
D. xanthoporphyria M. \& S., p. 278 , 1896.
D. (Clavus) formosa Reeve=D. lactea Hinds.- Of the same character is $D$. vidua Rve. Recorded also from various distant Polynesian stations.
D. (Clavus) gibberulus Hervier, J. de Conch., vol. xliii., p. 143, for 1895 (i896).-Many speeimens of an elegant smooth straw-coloured shell, with irregular prominent longitudinal ribs.
D. (Clavus) protentus Hervier.-Too near, in our opinion, to $D$. vidua Reeve.

Borsonia bifasciata Pease.-Exactly agreeing with Sandwich Island types in the British Museum, but surely a Clathurella.
B. Iutea Pease.-A pale straw-coloured shell, equally well placed as Glyphostoma.
B. nigrocincta Montrouzier.- Quite typical, and in good condition. The genus Borsonia Bellardi, founded in 1839 on a fossil possessing a columellar plait, has been extended to embrace a few recent N . Caledonian species, but in our humble judgment they intergrade with Glyphostoma and other Mangiliie, and we only keep them separate now for the sake of comparison with Tryon's Manual.
Mangilia agna M. \& S., p. 279, 1896.
M. bascauda M. \& S., p. 279, ı896.
M. calathiscus M. \& S., p. 28o, 1896.
M. eumerista M. \& S., p. 280, 1896.
M. himerodes M. \& S., p. 28i, 1896.
M. himerta M. \& S., p. 28ı, 1896.
M. orophoma M. \& S., p. 282, 1896.
M. stibarochila M. \& S., p. 283, 1896.
M. thalycra M. \& S., p. 283, 1896.
M. thiasotes M. \& S., p. 284, 1896 .
M. (Clavatula) rubida Hinds.-Many specimens. It seems variable, hoth as to size and form. Some are more oblong than is normal, the ribbing then being not so pronounced. All, howerer, agree in colour and marking. M. rubida is of wide distribution, being recorded from Mauritius, New Guinea, New Ireland, Fiji Islands, and Cook's Island (Tryon).
M. (Clavatula) zonata Reere. $-\Lambda$ prettily-banded species; also recorded from the Philippines.
M. (Cythara) conohelicoides Recre - Large and wellmarked. Plentiful.
M. (Cythara) euselma M. \& S., P. 2St, 1896.
M. (Cythara) gibbosa Reeve.-Only one example. Allied to $C$. interrupta Reeve in the character of its sculpture and marking, but of a different form. Recorded from the Philippines.
M. (Cythara) gracilis Reeve. - Very beautiful, and strikingly marked with orange-brown square spots spirally arranged across the smooth ribs. The form also is attenuate-fusiform, and very graceful. Also a native of the Fiji and Philippine Islands.
M. (Cythara) interrupta Reeve.-Conspicuous for its fusiform shape, somewhat attenuate at both ends, with transverse interrupted stretched brown lines between the ribs. Allied to M. bella Reeve, and M. theskela M. \& S. Mitro cimelium Rve., also found at Lifu, has the same interrupted linear marking. Of very wide distribution, from Mauritius, throughout Polynesia, to the Sandwich Isles. Also recorded from the Philippines.
M. (Cythara) matakuana Smith. - Conspicuous for robustness of form, and dorsally blotched with burnt-sienna marking.
M. (Cythara) paucimaculata Angas. $-A$ handsome orangemouthed species, which seems variable. The types in the British Museum came from S. Australia.
M. (Cythara) psalterium M. \& S., p. 285, 1896.
M. (Cythara) signum M. \& S., p. 286, I8y6.
M. (Cythara) Souverbiei Tryon.-A beautiful but very variable species, of which we received a dozen specimens. In some, the dorsal brown blotch is almost absent ; others are spotted with brown ; others, again, unicolorous white.
M. (Glyphostoma) Aubryana Hervier. - A wonderful shell. Principally conspicuous for its colouring rather than its form, which is that of a typical incrassate Glyphestoma; the ground colour is white ; round the upper part of the penultimate whorl runs a bright pink median band,
the lower half of the whorl being white, the antepenultimate suffused pink of a lighter bue, apex pink, the intermediate whorls white or straw colour, the last whorl having just below the suture a narrow straw-coloured band, then a broad white space, and towards the base, again, unicolorous straw colour. 'Two specimens. We refer to M. Hervier's description for fuller details, J. de Conch., vol. xliii., p. 146 , for 1895 (published 1896 ).
M. (Glyphostoma) chrysolitha M. \& S., p. 2S6, iS96.
M. (Glyphostoma) crassilabrum Reeve. - A handsone species, occurring rarely in our consignments. It shows some little variation both in form and sculpture. Recorded from the Philippines.
[M. (Glyphostoma) cremonilla M. © S., J. of Conch., vol. viii., p. 96, iS95.-This name has precedence over $M$. ( $G$. $)$ lamproideum Hervier (J. de Conch., vol. xliii., p. I44, for IS95, published iS96.) Wre have also two or three very elegant pink varieties of this species. These are smatler than the type.]
M. (Glyphostoma) Crosseana Hervier. -- An interesting straw-coloured shell, banded with transverse brown lire. Four specimens.
M. (Glyphostoma) dialitha MI. \& S., J. of Conch., vol. viii., p. 287, 1896.
M. (Glyphostoma) globulosa Hervier.-One specimen of a pale straw-coloured shell, which we assume by the description (J. de Conch., vol. xliii., for 1 S95, p. 147) to be this new species, though even more globular than is represented in the plate. It seems very distmet.
M. (Glyphostoma) Goubini Hervier. -Three specimens. A very elegant little form, light violet with a white transverse band around the last whorl. A very small species, well described by M. Hervier (J. de Conch., vol. xhii., for 1895, 1. 149).
M. (Glyphostoma) infracincta Sowerby.-An exceedingly beautiful little shell, variable in size, pale flesh-colour pink, with brown transverse banding.
M. (Glyphostoma) Jousseaumei Hervier (?)- -One or two somewhat doubtful. A pretty orange-pink species.
M. (Glyphostoma) latirella M. \& S., p. 287, 1896.
M. (Glyphostoma) melanoxyta Hervier. - Many specimens of an elegant small fusiform shell, evidently, from the detailed description of the author, the above species (described in J. de Conch., vol. xliii., p. I50).
M. (Glyphostoma) notopyrrha M. \& S., p. 288, 1896.
M. (Glyphostoma) ocellata Jousseaume (Bull. Soc. Zool. France, i..., p. 184, 1884).-The most beautiful of all the little Pleurutomida, in our opinion. Two specimens only. This species is the type of the genus Lienardia Jouss., which, in our opinion, is a synonym of Glyphostoma; white, coarsely ribbed, the interstices being roundly and regularly blotched with pale-straw colour, margined with circular brown lines. A single spiral brown line also crosses the last whorl at the periphery. Mouth oblong, sinus deep, outer lip much incrassate and coarsely toothed. It was with some little difficulty we succeeded in maming our specimens, no example being found in the British Museum, and we believe, till now, only one typical specimen, well figured but not coloured in the publication above referred to, has been discovered, and this was from Mauritius. It is, indeed, one of the special gems of the collection.
M. (Glyphostoma) rhodacme M. \& S., p. 288, 1896.
M. (Glyphostoma) strombilla Hervier. - Two specimens of a small and very angulate form, pale-straw colour, and unspotted.
M. (Glyphostoma) thalera M. \& S., p. 289, 1896.
M. (Glyphostoma) theoteles M. \&.S., p. 289, 1896.
M. (Glyphostoma) thepalea M. \& S., p. 290, 1896.
M. (Glyphostoma) thereganum M. \& S., p. 291, 1896.
M. (Glyphostoma) thesaurista M. \& S., p. 291, 1896.
M. (Glyphostoma) thyridota M. \& S., p. 292, 1896.

Clathurella Blanfordi G. \& H. Nevill.-We cannot separate a little violaceous species from one recorded from Ceylon by Nevill.
C. caletria M. \&́S., J. of Conch., vol. viii, p. 293, 1896.
C. cavernosa Reeve.-One specimen. A prettily-coloured but very small shell, pale violet ciouded over with ochreous. Recorded from the Philippines and Fiji Isles.
C. clandestina Deshayes.-A pale purple species, curiously like Thala mirifica Reeve, to outward seeming.
C. cnephæa M. \& S., J. of Conch., vol. viii., p. 293, 1896.
C. commoda Smith.-An exceedingly delicate species, transparent and finely latticed, with here and there orangebrown staining. Described originally from South Africa.
C. episema M. \& S., J. of Conch., vol. viii., p. 294, 1896.
C. felina Hinds.-Small, but typical.
C. lita M. \& S., J. of Conch., vol. viii., p. 294, 1896.
C. Ionga M. \& S., p. 295, 1896. -This name must yield to M. (Glyphostoma) trigonostomum Herv., published September, 1896, and consequently having precedence of two months. Judging from the plate, our specimens are not so perfect, especially in the mouth and thickened outer lip, as those in M. Hervier's possession.
C. Malleti Recluz-Small, but brilliant carnation in colour, with a tinge of violet. Recorded from the Navigator and other Polynesian Islands. Extremely abundant, over two hundred specimens occurring; probably a Glyphostoma.
C. polynesiensis Reeve.-Almost typical. We have lately seen this widely-distributed Clathurella from Karachi and the Nubian coast, dredged by Captain Shopland and Mr. F. W. Townsend. Also there are specimens from the Persian Gulf and Fiji in the National Collection. It is
very near, if not identical with, Glyphostoma parthenicum, described by M. Hervier (1896).
Clathurella Reeveana Deshayes.-Very delicate, attenuate, white, microscopically decussate, with clear receding orangebrown lines, two on each whorl, base dorsally blotched with the same colour. Found also in Mauritius and Isle of Bourbon ; also recorded from Polynesia. Connecting Daplinella with Clathurella, it might be included in either section.
C. rissoides Reeve.-A large smooth shell, beautifully spirally filleted with chalky-white beading; outer lip and columella quite smooth. Evidently a very rare form. It has been reported from Ticao Island.
C. rubicunda Gould.-Also recorded from Loochoo. Very beautiful, though small ; pink, many and close-ribbed, with indistinct white band round the middle of the last whorl. On the border-land between Clathurella and Glyphostoma.
C. Rogersi M. \& S., J. of Conch., vol. viii., p. 295, 1896.
C. rufozonata Angas.-Peculiar for the spiral red linear banding round the upper whorls, and again twice or thrice similarly banded on the last whorl, the general colour being pale stramineous.
C. spyridula M. \& S., J. of Conch., vol. viii., p. 296, 1896.
C. tincta Reeve.--Only one example, nearly allied to C. albifurniculatu Reeve, with which Tryon, but we think erroneously, unites it. It is also near our $P$. Hadfieldi, which we at the time of description called a Drillia, but which falls more naturally into the section Cluthurella of Mangilia. We obtained several of this latter in the second consignment.
Daphnella boholensis Reeve.-A Plilippine species extending to the Loyalty group. Very variable in colour, and even form, as some examples are almost turreted in the whorls. All agree in the minute decussation and pale straw colour, the apical whorls often dark brown.

Daphnella delicata Reere.-An exceedingly graceful species, attenuate, finely chased, and spotted with chestnut. Two specimens only.
D. pluricarinata Reeve. - An expuisite little shell, the apical whorls (3) dark-brown, and shewing plainly in contact with the straw colour of the remaining whorls. The decussation on the apical whorls is remarkable. Also a Philippine Island shell.
D. terina M. \& S., p. 296, ז896.
D. thespesia M. \& S., p. 297, 1896.
D. varicosa Souverbie-One specimen only, which seems to meet M. Souverbie's description. We have not seen a type.
[D. dulcinea M1. d. S., 1895.-Of this species we obtained three or four fresh specimens in the present consignment; we now withdraw it from Daphnella, where we provisionally placed it (J. of Conch., vol. viii., P. 95), and consider it a Mangilia, allied to M. agna].

> FAMMY CANCELLAKIID.E.

Cancellaria (Trigonostoma) contabulata Sowerby.-A fair number, identical with Ceylonese examples.

```
Fammy OIITlD.FE
```

Oliva (Strephona) polita Marratt.-Two examples, almost exactly agreeing with typical West Indian O.polita. Mr. J. M. Williams, to whom we referred these shells, says he can find hardly any difference.
O. textilina Lam. var. albina.- One very fine and beautiful example, of an ivory polished whiteness.
O. (Strephona) todosina Iuclos.-Identical with Fijian specimens, but all somewhat worn. With a lens, however, traces of the marking are very perceptible.
Olivella nympha Adams \& Angas.-Also found in Australia, and we believe Bombay specimens recently to hand are a mere variety of Adams and Angas' species.

Olivella Williamsi M. \& S., p. $380,1897$.
FAnliy MARGINELLID.E:
Marginella (Glabella) suavis Souverbie.-Extremely pretty, pure white and shining, with a chestnut yellow spiral band across the centre of the last whorl.

## Famlly MITRID.E.

Mitra digitalis Reeve.-One small, but beautifully marked example.
M. (Costellaria) Dorotheæ M. \& S., p. 297, i896.
M. (Cancilla) carnicolor Recve.-Our somewhat worn examples scem to harmonize with Recve's description. The coloration is exquisite in one example, being white, suffused with the most delicate pink, and the spiral carinæ are pale horn colour, spotted. Also from Chinese seas.
M. (Cancilla) incarnata Reeve.-Also a Philippine species.
M. (Chrysame) Antonii Küster.-Orange examples. Mostly a little worn. Rare ; we only obtained four specimens. Mauritius is its head quarters.
M. (Chrysame) caledonica Petit. - A stout handsome brown species.
M. (Chrysame) pellis-serpentis Reeve-One fresh, fine and typical example.
M. (Chrysame) Rüppelli Reeve.--Small, but we think correctly named. It is allied to M. Hanleyi Reeve, from the Red Sea.
M. (Chrysame) tabanula Lamarck.-Typical individuals of a red-brown, and beautifully spirally ribbed. Also from Mauritius.
M. (Chrysame) telescopium Reeve.- One characteristically marked individual.
M. (Chrysame) tornatelloides Reeve.-Also from Philippines.
M. (Strigatella) auriculoides Reeve.-A few typical examples.
M. (Pusia) aureolata Swainson.- Bright orange, with white banding. Perhaps a var. of N. affinis Reeve. Also found at Mauritius.
M. (Pusia) cimelium Reeve.-Many fine specimens of a shell hitlierto represented by three small individuals in our National collection. The interrupted spiral chestnut scratched lines between the ribs are characteristic.
M. (Pusia) rubra Reeve. - Small, but of brilliant pink, with white spiral banding. The examples in our National collection came from Lord Hood Island.
M. (Pusia) turturina Somverbie.- A well marked species, of which we have received but few examples. It appears to be endemic.
M. (Costellaria) cineracea Reeve.-Worn examples, agreeing with specimens in I. C. M.'s collection.
M. (Dibaphus) edentulus Phil. - One fine example. Also found in Mauritius.
M. (Thala) mirifica Reeve.-Two specimens, one much larger than the other. Also recorded from the Philippines. Pale violet; in sculpture much resemhling Clathurella clandestina, only larger, and, of course, possessing the columellar plaits of the Mitride. Thald, perhaps, is best separated as a genus, on conchological grounds; it might well be considered an intermediate between the Mitre and Pleurotoma, especially as there are traces of sutural sinus.

## Family BUCCINIDAE.

Engina nodicostata Pease. One pretty, but rather waterworn example. Recorded also from Hawaii.

## Family N.ASSID. E.

Nassa (Niotha) granulosa Marratt. - Perhaps may be a pale variety of $N$. splendidula Dunker. The author gave no locality with his description.
N. (Niotha) rotunda M. \& S., p. 273, 1896.

Nassa (Niotha) splendidula Dunker.-A highly coloured shell, fulvous-ehestnut. Also recorded by its author from the Philippine group.
N. (Telasco) ecstilba M. \& S., p. 274, 1896.
N. (Telasco) Shacklefordi M. d S., p. 274, i896.
N. (Hebra) echinata A. Adams. - Typical, but rather worn. Another Philippine species.

```
FAMILS COILUMRELLID.EE.
```

Columbella (Mitrella) moleculina Duclos. - A very beautifully marked Mitrella, being quite smooth, ochraceous, with round white spaces, and darker filleted spiral interrupted bands between.
C. (Mitrella) sigaloessa M. \& S., p. 276, 1796.

Columbella (Conidea) Peasi Martens $=$ C. varia Pease non Low.-Mr. Stephen Pace kindly named our examples of this variable species. The headquarters are the Sandwich Isles.
C. (Seminella) Stepheni n.n.-Mr. Edgar A. Smith having (Ann. N.H., xvi., p. 5, 1896) described a Columbella from Coromandel under the name C. Pacei, we suggest the above specific name in place of the one previously given (antea p. 275), which will equally commemorate Mr. Stephen Pace.

Family MURICID. Fi.
Murex (Ocinebra) brachys M. \& S., p. 273, 1896.
Famlly TRITONID.F.
Triton (Epidromus) bracteatus Hinds.-One example only.
Famay CyPR.FID.E゙
Ovula (Cyphoma) gibbosa Linné.-Only one specimen.
Cypræa contaminata Gray:-'Two worn shells we refer to this rare little species.
C. hirundo Linné.-Several specimens, quite typical.
C. (Luponia) Thomasi Crosse.-One very pretty specimen which perhaps is too nearly allied to Cernica Sowb. or
C. spurcal L., but the dorsal confluent markings seem characteristic, and the lateral spotting at once separates it from, at all events, typical examples of C. cernica.
Trivia exigua Gray $=$ T. tremeza Duclos.-Many beautiful and fresh examples of this exquisite species, the most recherchée perhaps of the smaller Trivice. It is recorded from the Sandwich Islands, as well as the New Caledonian group.
T. globosa Gray.-Two characteristic specimens. Of wide distribution; we see no difference between the shells from the Eastern, as opposed to those from the Western Hemisphere. It extends from the West Indies, Sandwich Islands, to Australia; it may almost be deemed cosmopolitan within the tropics. It is not, however, very commonly found in collections.
T. grando Gask.-Also recorded from Manila. Apparently typical. Several specimens.
T. pellucidula Gask.-Four examples of what is apparentiy this species.
T. vitrea Gask.-Several specimens: also recorded from the Philippines.

```
FamHLY CERITHIIDAE.
```

Triforis carteretensis Hinds.-A plain species with grooved plain spiral keels. The British Museum specimens, with which ours have been compared, are from New Ireland.
T. cinguliferus Pease.-Several specimens. Also from the Sandwich Islands.
T. hilaris Hinds.-A variegated species with close receding keels. Several specimens. Also from the Sandwich Islands and the Philippines.
T. obtusalis Jousseaume.-An obese black noduled shell.
T. ruber Hinds.-Pale violet, not red, as the name would suggest. Exceedingly abundant. It also occurs at New Ireland, Tahiti, and Isle of Bourbon.

Triforis tristoma Blainsille. One beautiful specimen, in fresh condition, and characteristic. Also from Australia.
T. (Ino) collaris Hinds. - Very pretty and striking, with spiral rows of gemmules on a darker body-ground. Many examples. Also from the IIawaiian Islands.
T. (Ino) corrugatus Hinds. - I well-known conspicuous species.
[We have also in the collection many unidentified species of Triforis].
Cerithium abbreviatum Brazier.-Many, of ordinary character.
C. (Vertagus) attenuatum Phil.-Perhaps more commonly known under the name of $C$. longicaudatum. It is a handsome form with a conspicuously retrorse canal.

Biltium æolomitres M. \& S., p. 298, iS96.
B. albocinctum M. \& S., p. 299, iS96

Family PLANAXID.E.
Plesiotrochus Souverbianus Fischer.-We (erroneously) included in our first list this species under the name of Cerithium dubium Sowb., to which it bears some superficial resemblance. It is a highly interesting species, allied to the Australian Riselle, trochoid in shape, and beautifully crenulated, also mottled with brown bands and lines. A great many specimens.

Family VERMETID.E.
Vermetus of. glomeratus Chem.-About half-a-dozen small contorted groups of what may be this Philippine form
judging from their similarity to plate and description． We have not been able to compare it with any specimens．
Vermetus（Siphonium）maximus sowb．－We have what is evidently the many－coiled horny operculum of this Fer－ metus，known as a native of the New Caledomian group， but no shells．

## ドAMH TUKにKTELIII．F゙，

Mathilda eurytima M．d．S．，p．3ro，i896． FAMIIY SOLARIID．E．
Solarium（Philippia）cingulum Sow．－A few examples． Found also in Philippine，Sandwich，and Fiji Islands．
S．（Philippia）hybridum Linné－Several，of ordinary char－ acter．

## FAMILY LITIOPID．E．

Litiopa limnophysa M．\＆S．，p．305， 1896.
Alaba zadela M．\＆S．，p．305， 1896.

> FAMIIY RISSOIIDA:

Rissoia joviana M．\＆S．，p．309，i896．
R．pyrrhacme M．\＆S．，p．310，i806．
R．（Alvania）pisinna M．\＆S．，p．305， 1896.
Rissoina baculum－pastoris M．\＆S．，p．306，isg6．
R．catholica M．\＆S．，p．306， 1896 ．
R．crassa Angas．－Many of a prettily costate，white shel！； recorded both from Red Sea and Australia．
R．enteles M．\＆S．，p．307，ı 896.
R．elegantula E．A．Smith．－A white shell with close－grained longitudinal rils，very delicate and elegantly formed．Also from S．Australia．
R．nesiotes M．\＆S．，p．307，iSg6．
R．scalaroides C．B．Adams．－A very delicate species，identi－ fied by Tryon as synonymous with $R$ ．bryerea Mitg．；a native of Cuba and Jamaica．
R．sincera M．\＆S．，1．308， 1896.
R．turricula Pease．－Similar to $R$ ．crassa in many respects． Our specimens agree with var．cernica from Mauritius in
the British Museum. 'The typical form is from Sandwich Islands and Fiji.
Rissoina variegata Angas. - Mbundant, and brilliantly banded in some cases with ochre or fulvous, while other examples are white and plain. We lately received from Mr. Arnold Umfreville Henn this shell from Sydney, N.S.IT.
R. zonula M. \& S., p. 308, 1896.
R. (Phosinella) Deshayesi Schwartz.-Common. Iround also in the Philippines.
R. (Phosinella) quasillus M. \& S., p. 308, 1896.
R. (Pyramidelloides) insolita Deshayes.-A curious form with the receding ribs beaded and prominent. The name insolitu evidently suggests its unaccustomed appearance. 'The range is wide, embracing the Red Sea, Japan, Mauritius, and Indian Ocean
Barleeia chrysomela M. \& S., p. 309, 1896.
Family NARICID.E:
Vanikoro Gueriniana Recluz.-One cxample of a beauti-fully-ribbed and sub-crystalline species in very perfect condition. Also from the Philippine Islands.
V. Souleyetiana Recluz.-Few specimens. A smooth, white, plain Vanikoro. We may here call attention to the fact that Vanikoro Quoy has precedence over Nariad Recluz and Leucotis Swains. This species is also known from Ceylon and the laumotus Islands.

## Famil.y LAMEL.LARIID. Z:

Caledoniella Montrouzieri Souverbic.-- One specimen only of this very rare and obscure molluse ; allied to Lamellaria and Coriocella. It is small, and Vitrina-shaped, very depressed, translucent, white, and delicate.

## Family SCALARIIDAE.

Scalaria angustata Dunker. - A small form of this widelydistributed species. A great many examples.
S. eranna M. \& S., p. 276, iS96.

Scalaria exomila M. \& S., p. 277, 1896.
S. (Cirsostrema) bicarinata Sow.-Two specimens. 'The form is abnormal and peculiar.

```
Family EULIMID.E.
```

Stylifer dubius Baird.-Found in a Holothurian stomach by Mr. Hadfield. Two specimens, quite perfect.
Eulima caledonica Morelet.-Many spccimens.
E. dentiens Dunker. - Also recorded for the Viti or Fiji Islands. This species seems to us identical with Rissoina curta Sow., sometimes known as Eulima curta.
E. solida Sow.-Many, but all slightly worn. Alsu recorded from the Sandwich Isles.
E. (Subularia) aciculata I'ease.-lour living shells, taken from stomachs of Holothurians, have been submitted to Mr. E. A. Smith, who considers them to be this species. It is recorded from the Sandwich Islands.

Leiostraca Metcalfei A. Adams.- Beautifully marked with angular and branching interrupted chestnut lines. Quite typical, but not very large. Also recorded from Hawaii. About ten specimens.

```
Famhy PrGamidellid.E.
```

Obeliscus terebelloides Adams. - Two examples of this prettily chestult-banded shell, only one of which is fairly perfect.
Syrnola cinctella A. Adams.-Several of this form, some plain, others chestnut-banded round the sutures, but none quite perfect.
S. jaculum M. \& S., p. 304, 1896.
S. violacea M. \& S., p. 304, 1896.

Elusa gradatula M. \& S., p. 380, 1897.
Styloptygma typicum Tryon.- One specimen, not quite perfect at the base, which with some degree of confidence we place under the above name. It is a shell described as S. stylina Adams, from the Philippines.

Odostomia bulimoides Souverbie. - Agreeing with the description and figure in everything excepting size, our two examples being only 3 mm . in length.
O. versicolor M. \& S., p. 379, 1897.

Pyrgulina gliriella M. \& S., p. 303, 1896 .
Turbonilla belonis M. \& S., p. 303, 1896.
Family NERITID.E.
Nerita pica (iould.-A small grey and white mottled shell. Native of Polynesia, and extending as far north as Japan ( $N$. japonica I) unker).
Neritina Souverbiana Montrouzier.-Six specimens. A pretty pale fulvous species nearly allied to N. Rangiana Recluz and N. siridissima 'T. C.
N. (Vitta) viridissima Tapp. C:- Five specimens, all beautifully fresh, and with characteristic black pencilled markings. The N. viridis l., with which this has been confounded, is ummarked, and a native of the Antilles. Tryon associates it with $N$. R'angiana Recluz.

> FAMHI TURBINID.E.

Turbo (Senectus) nivosus Reeve.-A small example.
T. (Senectus) setosus (imelin.-Worn, but evidently this spuecies.
Alcyna lifuensis M. di S., p. 312, 1896.
FAM1LY TKOCHID. F.
Gibbula fasciata Born=Monilea carneola I amk.-Also a native of the W'est Indies, where one of the authors has collected it. It is strange to find it in Lifu, but we can see no appreciable difference in the appearance of individuals from these shores.
Oxystele suavis Phil-Endemic in the New Caledonian group of islands. One example only.
Pyramidea histrio Reeve.-Six prettily coloured examples, all small.

Pyramidea nodulifera I.am.-Juvenile examples only. Also from Philippines.
Minolia agapeta M. © S., p. 312 , IS96.
M. pudibunda Fischer.-A pretty pink species, exhibiting some variation, and near our M. glaphyrella, from which it differs, however, in colour and sculpture. Many specimens.
M. rhodomphaia Souverbie.-Very beautiful, with bright crimson suffusion round the umbilicus. Three specimens.
Solariella (Conotrochus) tragema M. \&. S., p. $3^{13}$, 1896.
Euchelus favosus M. is S., p. $3^{11}$, 1896.

## Famli DELPHINULID.E.

Liotia crenata Kiener.-A full grown shell, white, and of chaste appearance and sculpture.

FAMHM CFCLOSTREILATID.E:
Cyclostrema cingulifera A. Adams.-One specimen, agreeing with Japanese types.
Leucorhynchia tricarinata M. \& S., P. 31I, 1896.

## Family STOMATHIDAE.

Gena strigosa Adams.-Two, strikingly zebra-marked, and quite perfect. An Australian species.
Stomatia rubra Lam.- One, in good condition. Also from Corea and the Philippines.

```
Famlly FISSURELIID.F.
```

Fissurella (Lucapina) singaporensis Reeve.-Apparently this species. Only two, and both perfect, and beautifully clathrate, white, mottled with brown.
Emarginula pulchra A. Adams.--Two specimens in good condition.

FAMILY ACMEMD.E.
Williamia radiata Pease.-Proc. Zool. Soc., i 860, p. 437. There are specimens in the British Museum from the Sandwich Isles, Cape Verde, and St. Helena. Mr. Edgar Smith informs us he can detect no difference hetween any of these specimens, and conjectures it is a l'ulmonate.

Pilsbry (Man. Conch., vol. xii., p. 154), places it under the "unidentified and unfigured species" of Limpets, as a synonym of TTilliamia Gussoni Costa, and makes no comment except that it is one of the Siphonariide. The fact of this most interesting shell occurring in the Loyalty Isles marks a wide extension of its hitherto known range.

> Class SCaphopola.
> Family DENTALIIDAE:

Cadulus viperidens M. \& S., p. 314, 18g6.
Class PELECYPODA.
Family SPONDELID. E .
Spondylus rubicundus Reeve.-One dead valve, though very large, and identifiable. A Philippine species also. Family ARCID.E:
Anomalocardia scapha Chem.-One perfect living specimen, full grown. Found also in Philippine Islands.

Family LIMID.E.
Lima tenera Chem.-Several imperfect valves. Famley GaLEOMAIID.E.
Scintilla semiclausa Sow.-Characteristic, though not quite perfect. One specimen. Colour pellucid ochreous. Recorded from Borneo.

## AIIDENDUN.

Mangilia theskela M. \&S., p. 97, 1895.-Now that more specimens have come to hand in better condition for examination, we slould consider this interesting shell near 1. interrupta Reeve and M. bella Reeve, and therefore coming under the typical section of the genus. We have thought it best, under these circumstances, to give a new figure (Pl. N1., fig. $S_{1}$ ), which is all the more necessary, as, owing to a clerical error, the numbers attached to this species and M. dulinea were, unfortunately, transposed.

## GENERAL OBSERVATIONS.

In giving a history of the Hadfield Collections of the Mollusea of the Loyalty Islands, it is necessary just briefly to recapitulate what has been already said in the prefatial remarks to our first paper on the subject (antea pp. $8_{4-132}$ ).

It was in $\mathbf{1}$ S91-92, the Rev. James and Mrs. Hadfield brought over a considerable assortment, mainly consisting of the larger and more showy species of marine mollusca. By cleaning out the mouths of some of the specimens, however, we discovered certain minute, but very beautiful, shells, some of them hitherto unknown ; and this induced us to ask that further consignments of shell-sand might be forwarded.

Very faithfully did our kind friends attend to our request. The next parcels arrived in 1893 , to Messrs. II. Moss and R. Cairns, of Ashton-under-Lyne, whose coadjutorship and help have been invaluable to us throughout, and who placed every facility in our way for thoroughly examining this large mass of material.

Whilst the first collection therefore contained mainly the more conspicuous forms, the next composed an assemblage of intermediate size, rery rich indeed, as our lists show, in forms of certain attractive genera, e.g., Mitra, Conus, Cyprea, Columbella, etc. ; but there were still comparatively few of the yet smaller grade we were so anxious to see, and which we were sure, if they could be procured, promised great results so far as novelty was concerned.

We felt, however, that the time had come for a catalogue of these two consignments, and this was published in the present volume, pp. 84-132, in the summer of 1895 (July-Oct.).

In this article, to which we would refer those who may be interested in the subject, we drew attention to the favoured geographical position of the Loyalty Islands, which are situated
due east of the large island of New Caledonia, and not very far within the tropics, namely long. $168^{\circ} \mathrm{E}$. lat. $22^{\circ} \mathrm{S}$.

They occupy a very central position in the great IndoPacific province, if we may still be allowed to consider Australia a portion of that region. They belong to France, and to French conchologists, notably MM. Crosse, Fischer, Souverbie, (iassies, Lambert, Montrouzier, and now Hervier, we are indebted for our knowledge of their mollusca, M. Crosse, for instance, has only lately (Journ. de Conch., vol. xliii.) concluded his exhaustive list of the terrestrial mollusca of the New Caledonian region ; but, so far as we could gather, no catalogue existed of the marine mollusea of the Loyalty Islands, which include the three islands of Lifu, Maré, and Uvea. This led to our publishing a list, as complete as we could make it, consisting only of those species found in the Hadfield collections, which number nearly 630 species. We now regret having mentioned the terrestrial mollusca, which were insignifieant in number, and of no novelty; but it was far otherwise as regarded the marine portion, more particularly the Gastropoda.

In this enumeration twenty-one new species were described, in one or two cases from single or hut two or three specimens. It is very gratifying, therefore, to be able to say, now that the third eonsignment has been thoroughly examined and overhauled, that some of the species are represented in considerable numbers, eas., Minoliar shaphrella, many ; Mitra nitidissimar, many, including a crimson-red varicty, the normal form being pitchy shining black; Mansriliat theskela, a great number: M/wex (Ocinebret) henedictus, twenty specimens ; but on the other hand it is curious that Dirla Hardyi, of which there are many in the former collections, is entirely absent from this assortment.

This third consignment was forwarded to Mr. R. I). Darbishire, carly in isyf, and consisted of a large packingcase, filled with partly-sifted shell-sand. When treated to further sorting through a sieve, the richness of the material
became evident. Shells new to us appeared every moment, all minute, but all exquisite either in colour, design, or detail of form.

They could not all, of course, be called specimens in the highest state of perfection, as in hardly any cases is the operculum present, or traces of the animal, proving they had been collected as recently thrown up drift, but in the majority of instances, so far as the actual shells are concerned, they are in as good as a living condition.

We forthwith determined to lose no time, but devoted the best part of fire or six months to the elucidation of these little forms. It was no slight labour to sort the material, but this was effected more rapidly than we had considered possible ; and that done, and the published literature on the subject well examined, one or other of us took all the species about which there was the least doubt for close comparison with the vast collections of the British Museum, South Kensington, and it is, we must admit, no mean task to take stock of what our national stores possess in such genera as Kissod, Odostomia, or the Pleurotomide.

Very detailed investigation into the Philippine species was carried out for comparison ; especial attention was also given to Mauritian species, for although separated hy nearly three thousand miles in distance, there seems much of cognate character in the molluscan fauna of both these localities. Two instances will suffice. The original bye of Mitra fukeosuliatat Melvill, was collected in Mauritius ; it has leen found common in Lifu. And, sceondly, we believe that Dr. Jousscaume's original and hitherto uniqute type of Lienardia ocellatar was Mauritian ; we have found two (one of which we have sent to the British Museum) of this most expuisite of all shells, in our Lifu material.

We had already drawn up descriptions of some forty species, when Father J. Hervier's first communication, enumerating several I'leurotomide, from Lifu and New Caledonia,
mainly collected by Father Goubin; S.M., was published. We found that in those accurate and lengthy diagnoses, several we had signalized as new were abready described, e.g., Clazus silblernlus, Glyphostoma Aubrevanum, G. Crosseamm, G. strombillum, and $G$. meldnoxytum, and we are glad that we were thus spared the reduplicating of names, by the appearance of M. Hervier's article just before the publication of our own.

Since then,* this author has issued descriptions of new Clathurelle and Daphnelle, some of which may possibly be identical with ours, but as none of them are figured, it is difficult to form an opinion.

We think it of such importance for future malacologists, who in days to come may be studying or monographing the Pleurotomide, to have a clear understanding as to actual dates of publication of species, described about the same time, as influencing the law of priority, that no apology is needed on our part for calling attention to the fact that must already have been noticed with regret by many, that the Journal de Conchyliologie is now antedated by exactly one year.

The actual date of publication of M. Hervier's first communication, with descriptions of species of Drillia, Clavus, Surcula, and Giliphostoma, was June, 1896 (J. de C., vol. xliii., no. 3, Pp. Iflif52) dated (erroneously) as " 1 Juillet, 1895 ." The date of 1895 has been subsequently given (op. cit., vol. xliv. no. I, plp. $5^{1-96}$ ) by M. Hervier in his résume of these same species, whereas none were deseribed, as already said, till the following year, the first portion (rol. Aliii. 110. 3) in June, the second (op, cit., no. 4) in September, iSyG. His next instalment dealing with certain new Clathurelle and Daphnellie, appeared in J. de C., vol. aliv., no. 2, pl. 1 $3^{8-151}$, and was published April 1897, five months after the appearance of our descriptions of eighty new species from Lifu, including nine of these two genera, on Nowember tath, asy, (I. of Conch., vol. viii., pp. 273315 ).

[^1]We are ignorant of the causes which have led to the Journal de Conchyliologie so falling into arrears of date, but it is all the more important to call attention to this fact moze, as when the volume is bound up, no sign would appear from internal evidence in the serial itself, that it fers antedated.

For ourselves, our first communication on Lifu shells was published October ${ }^{15}$, 1895 : our second, November 12 th, 1896: and our third, with description of Drillia cygnet, April 1, 1897.

The extraordinary wealth of these islands is evidently very far from being exhausted, as is evidenced by our having described 106 , and M. Hervier 43 new species in so short a period, and there is scope, we feel sure, for many an investigator in the future, as some of these endemic little shells are decidedly local. We should like, for example, to see collections from the island of Maré. We may add, that of the genus Triforis we have many species, but have not rentured to identify them, without submitting them to M. Jousseaume, who has monographed the genus.

The total number catalogued by us in our two lists amounts to the respectable total of 860 ; mainly, as we have said, in marine Gastropoda, for the I'eleopodare not at all well represented nor are they in such good condition.

In conclusion, we must acknowledge that Mr. Tryon's "Manual of the Mollusca" has been of much service to us, especially in the reproduction of figures, otherwise difficult of access. The arrangement we have adopted, and in the main adhered to, is that of the late Dr. Paul Fischer in his admirable "Manuel de Conchyliologie," 1887.

Our best thanks are due to Mr. R. D. Darbishire, primarily and especially, for allowing us such free access to the collection; to the Rev. Lewis Shackleford and Mr. J. Ray Mardy for aiding us materially in the sorting and investigation; and to Mr. Edgar I. Smith for the painstaking kindness invariably
extended by him to all who ask for help in their researches at our Natural History Museum, S. Kensington.

We may add, that so far as was possible, our National Collection has been supplice with examples of the new species, many of which are also contained in Mr. Darbishire's and our own private collections. The original types are all in the Manchester Museum, Owens College.

## MUSEUM RECULATIONS.

I.-The Muscum is open to the public every week day from 11 a.m. to 4 p.m., during the months of Novemher to February; II to 5 during March to October ; and on Sundays from 2-30 to 4 or $4-30$. Admission free and without ticket.
2.-The Museum and Museum Library are further open to persons desirous to make use of them for the purposes of study. The Keeper will issue tickets of admission on suitable recommendation.
3.-Students of the College are admitted to the Museum on any day in the week between the hours of 10 a.m. and 5 p.m. Those whose studies necessitate access to the specimens and the loan, for use in the Museum buildings only, of the books in the Museum Library, may procure Students' tickets from the Keeper, on the recommendation of the Professors or Lecturers in the several departments, such tickets to be valid only for the session in which they were issued.
4.-'The Museum is closed on Good Friday and Christmas Day:
