WEISH LANGUAGE is written phonctically, aud therefore practically every one who can speak it can also read it. The oldest piece ot comected Welsh writing is the "Black Book of Carmarthen, "amanuscript dating from the end of tho seth century, but the oldest Welsh literature dates from a much earlier period. The mos? important of these very ancient works is the "Gododin," which was probably contposed about the 6th century, though the manuscript of it only dates from the 13 th century. The great literary revival of the "Mabinogion" and the "Arthurian Legends "cane in the same century with Geoflrey of \$lonmouth (about 1545 A.D.), and the Isth century introduced an age of amatory lyrics-known as the Golden A.ge of Welsh Literature-the greatest poet being Datydd ap Gwilyn.
WENER, LAKE, the famous Swedish "inland-sea," has an area of 2400 square miles, being nearly 100 miles in length aud 50 miles wide in the broadest part. That is to say, it is ten times as large as Lake Constance, and about eighty times as large as Loch Lomond. It is, however, too shallow for any navigation in a great inany places, and its lowest depth is only 300 feet.
WENHAM LAKE. (See ICE above.)
Wenloch Abrey, in Shropshire, is a ruined Cluniac convent, originally founded as a mumery at the end of the seventh century by St. Milbarga, a granddaughter of the fine old pagan warrior, Penda of Mercia. It was refounded after the Norman Conquest by an Earl of Shrewsbury.
WERE-WOLF was a man transformed into a wolf according to ancient superstition. It was thought that such a being was a man by day and a wolf by night.
WERNER, FRIEDRICH, the German poet, was born in 1768, and died in 1823. He was the fuunder of the branch of the Romantic School c: Poets that dealt with the extravagant mysteries of 'fate-tragedies." His own fate was tragic enough, as he married three times, and was three times divorced, ans then entered the Romish Church as a priest.
Wescey, John, the founder of Wesleyan Methodism, was born in 1703. He became a Fellow of Lincoln College and Lecturer and Moderator in Classics in 1726. Among his followers were Hervey. Whitefield, and Law. In 1735 he went to America, and, returning in 1737. was converted, after which he visited Herrnhut, the Moravian settlement. In 1739 lie began open-air preaching, and henceforth devoted his life to that work. He died in 1791. His collected werks were published.
WEST, BENJAMIN, the well-known painter, was born in I738. At the age of eighteen he established himself as a portrait painter at Philadelphia. In 1760 he visited Italy, and in 1763 England, where he remained. He painted "Hector and Andromache." "The Retum of the Prodigal Son," "Agrippina," etc., and a series of historical works for Windsor. In 1792 he became President of the Royal Academy, after which he painted "Christ Healing the Sick," "The Crucifixion," "Ascension," "Death on the Pale Horse," "Death of General Wolfe at Quebec," and "The Battle of La Hogue," the two last being his best historical pieces. He died in 1820.
WESTCOTT, PROFESSOR, was bom in 1825, and edu-cated-like Hatch, Lightfoot, and Benson-by Prince Lee at King Edward's School, Birningham. After a very distinguished academic career, he graduated Senior Classic in 1848, and was elected Fellow of Trinity College, Cambridge, in 1849 . He was an assistant master at Harrow from 1852 to 1869 , when he was made a canon of Peterborough. He became Professor of Divinity at Cambridge in i87o, Canon of Westrninster in 1883. and in r8go succeeded his old friend Lightfoot as Bishop of Durhain. He was one of the committee for the revision of the New Testament, and his views had more weight than they
deservod, as luis knowledgo of manuscripts was inferior to that of either Scrivener or Burgon. His edition of the New Testanent in Greek was published jointly by him and Dr. Hort in 1881. He is a voluminous writer.
WESTERN AUSTRALIA owes its phenomenal advance in quite recent times to the very rich deposits of gold found in and round Coolgardie. Like the rest of Australia, it is a land of oddities. For instance, anongst its characteristic vegetation, flowers lave uo scent, ferns grow as tall as telegraph posts, trees throw no shadow, and cherries have their plps ou. sicle. Among its characteristic animals, the platypus lays eggs and the kangaroo walks on two legs. Amoug its characteristic birds, the emuruns instead of flying, eagles are white and swans are black, and small birds do not sing. The country contains, maturally, no milk-giving aninal and no flour-giving grasses, which helps to account for the very backward 'civilization' of the natives-the savagest in the world.
WEST INDIES were discovered by Columbus in 1492. and called 'Indies' because lie thought he had got to India. Negro slaves were introduced in I525 to take the place of the Carib natives, who had been decimated by the villainous cruelty of the Spanish planters. The intrusion of other European nations, especially the English, French, and Dutch, began in the 17 th century, the English superiority being decided by the famous battle off Dominica in 1782. when Admiral Rodney almost annihilated the French fleet.
WESTMACOTT, SIR RICHARD, the sculptor, was born in 1775, and became a pupil of Canova's in Rome in 1793, where he carried off a gold medal given by the Pope. In 1816 he was elected an R.A., and in 1827 he succeeded Flaxman as Professor of Sculpture in the Academy. He died in 1856. He is best known by his public statues, including those of Pitt, Fox, Perceval, and Addison in Westminster Abbey.
WESTMINSTER consists, geographically, of an island in the Thames, 4 which is called 'Thorney' in some old records, and it stands on the old Roman road of Watling Street.
WESTMINSTER ABBEY was built on the site of a church erected in 1065 in the Norman style by Edward the Confessor. Part of the latter structure remains in the pyx-house and south side of the cloisters, but the main building as it now stands was begun in I220 by Henry III., and practically completed by Edward I. Additions were made down to the time of Henry VII., who built the chapel called after him, and Sir C. Wren designed the upper parts and two western towers. The Abbey was the burialplace of numerous English kings, from Edward the Confessor to George II., and the north transept contains monuments to warriors and statesmen, while the Poet's Corner (the burial-place of most famous English writers, from Clinncer downwards) is in the soutls transept.
WESTMINSTER ASSEMBLY was the celebrated convocation appointed by the Long Purliament to settle the doctrine, liturgy, and government of the Church of England. One of the first things which it did was to express approval of 'the Solemn League and Covenant '-a piece of impertinence entirely outside of its powers. The members were fairly unanimous on points of doctrine, but split into a dozen bitterly hostile camps over the question of Church government.
WESTMINSTER CLOCK is regulated by electric machisery from Greenwich, and seldom varies more than one second in about 10,000 minutes. It has a special contrivance for making the first blow of the hour strike exactly at the right time.
West Point Military Acanemy stands on the site of an old fortress on the right bank of the Huclson river, which was taken by the British in 1777, bu abandoned after Burgoyne's surrencler. The Academy was established in 1802, and the education is gratuitous. The average number of cadets is abou 275 , who are allowed 540 dollars a year apiece by the Government. The discipline is exceedingly strict, and the standard of education is very high, the entrance examination belng especially difficult.

WEYMAN, STANLEY, the novelist, was born in 1855, and took his degroo at Oxford in 1877. His first work was "The Honse of the Wolf," which appeared in 1889. "The New Rector" appeared in 1890 , followed by "The Story of Francis Cludde"; and then in 1893 appenred "A Gentleman of France." In 1894 he wrote "The Man in Black," "Under the Red Robe," and "My Lady Rotha": in 1895 "Memoirs of a Minister of lirance": and in 1896 "The Red Cockade." He is one of the very best of modern writers of romance.
Whale Fishing, as it is called, is one of the oldest marine 'fisheries,' laving been followed by the Norsemen, and it was a common occupation of the Basque fishermen from the 10 th to the 16 th century. Then whales became scarce in Central European latitudes, and the inore northerly fishery fell into the hands of the Dutch and the English. At the end of the 17 th century the Dutch had more than 250 vessels and 14,000 men employed in the industry, and Holland was the chief oil market in the world. But the competition of the British was so severe, that by the end of the I8th century the Dutch industry was more or less defunct. Even at the height of their prosperity, however, the English had never much more than 150 vessels in the trade. At present there is practically no whale fishing industry left, though Dundee and Peterhead have between them 20 to 30 vessels employed.

The crew of a whaler are usually shipped on a profitsharing system, which is very precarious, as slips sometimes come home 'clean,' i.e. without a single fish.

The oil is really the only thing of much economic value, and gas and various inineral and vegetable oils have supplanted it ; but sperm oil does still find a ready market. - The whalebone, spernaceti, and ambergris are quite subsidiary products, and are no longer necessary to civilization.

Whalebone is the baleen plate of the Arctic and similar species of whale, but it is not really 'bone' at all, being more akin to hair than to bone. Its valuable qualitles are fiexibility, lightness, strength, toughness, cleavability, and indifference to heat. It used to be employed in the umbrella trade, but was replaced by steel wire about the niddle of this century. An average whale yields about half a ton of whalebone, valued at from $£ 2500$ to $£ 3000$ per ton. Wharton, Philip, Duke of, was borm in 1698, and was educated by his father to be a great orator, a Whig in politics, and a Presbyterian by religion. He made a 'Fleet 'marriage, but soon left his wife, and went to Geneva with a French Huguenot tutor. When he returned he took his seat in the Irish House of Peers, and supported the English Government with so much zeal and abllity that he was raised to the English peerage. He opposed the Government on the South Sea Bill, fell deeply in debt, went to Rome, there jolned the Pretender, assumed from him the title of Duke of Northumberland, and fought for the Spaniards against the Euglish in the siege of Gibraltar. He died in ${ }^{1731}$.
WHATELY, RICHARD, Archbishop of Dublin, was born in 1787 . He graduated at Oriel College, Oxford, and in 1810 won the English Essay Prizer In 1819 he published his famous "Historic Doubts relative to Napoleon Bonaparte," and in 1822 he was appointed Bampton Lecturer at Oxford. In 1825 he became Principal of St. Alban's Hall, Oxford, and published "Essays on Some of the Peculiarities of the Christian Religion," and a second series, "On Some Difficulties in the Writings of St. Paul and Other Parts of the New Testament," was published in 1828 , followed by "The Errors of Romanism Traced to their Origin in Human Nature" in 1830. His books, "The Elements of Logic" and "Elements of Rhetoric "" were most successful. He died in 1863. Wheat is simply a cultivated grass, and, from the nature of the plant, it is top-heavy by the time that it is rlpe. In the first place, then, its roots need to be in a fairly stiff soil, and it can be easily injured by a wet wind. As a grass, however, it needs a considerable amount of moisture and abundance of sunlight ; and the necessary tillage can be conducted
properly only In the absence of mountains or of rocky soil. Conscquently, it grows best on a warm, dry plaln whleh has a soil stiff enough to support the plaint and to retain moisture. All extremes of climate are therefore unsuitable; and within suitable latitudes the best place is a plain far enough from the sea to be dry, but with enough vegetable matter in the soil to retain moisture; and amongst such plains the preference must be given to the one which lias the richest soil and the easiest access,

A glance at a physical map will direct attention at once to the great European plain, the prairies of North America, the pampas of South America, and the plains whicli stretcli north and south of the lunge watershed of Central Asia. And the question of water for irrigation or transport draws special attention to the Volga, the Danube, the St Lawrence, the Mississippi, the Plate, the Judus, and the Obi.

The least populated of these regions ought to lave the largest surplus for export, and the diferent latitudes with their different times of harvest ought to lessen competition. The Argentine larvest is in January, the Canadian in September, the Austrian in July, and the Siberian in October.

No doubt, wheat grows well elsewhere, especially with the scientific tillage which it receives in Britain and Denmark; but these great river-plains offer the largest supplies for export at the least cost. Denmark produces 42 bushels to the acre, while Russia and India only produce 9 apiece; but it cannot compete with either of the latter as an exporter.
As a matter of fact, the three great exporting regions are North America, South Russia, and Western India. The Hungarian plain is comparatively small, and Siberia and the Argentine have scarcely come into the field yet as serious competitors. WhEATEN' STANDARD OF COMFORT. The standard of national comfort is gauged by the material of which the mass of the people make their bread. Nearly all Central Europe uses rye, South Europe uses maize, India uses rice or millet, Ireland substitutes potatoes, Egypt substitutes beans, and Uganda substitutes the banana. A 'rice' civilization is the lowest, and a 'wheat' one is thie highest.
Wheatfield, Largest, 'on Earth' is not in U.S.A., but in the Argentine, where Guazone's field near; Buents Ayres is about 67,000 acres (roo square miles). The Elk Valley field, U.S.A., is 10,000 acres; and the Bell field, Canada, is 4000 acres.
Wheatstone, Sir Charles, the scientific investigator and discoverer, was borm in 1802. In 1823 he attracted the attention of scientific men by his paper, "New Experiments on Sound," published in Thomson's "Annals of Philosophy." In 1834 he became Professor of Experimental Plilosophy in King's College, London; and in 1836 he exhibited experiments there, showing the velocity of electricity, which resulted in his taking out the first patent for the electric telegraph in $\mathbf{5 8 3 7}$, in conjunction with W. $\mathbf{F}_{\text {; }}$ Cooke. He wrote for the "Philosophical Magazine," etc.
WHEEL.BREAKING was formerly a common method of inficting the death-punishment in France and Germany, the criminal being stretched on a wheel with his arms and legs along the spokes. The executioner smashed each limb by successive blows with an iron bar until death relieved the sictim of the awful torture. The last executions of the hind were inficted in Germany during the present century for treason and parricide. In France the victim was often allowed to be strangled after the first or second blow. The most famous instance of wheel-breaking on record is probably the murder of Patkul, the envoy of Peter the Great, by Charles XII, of Sweden; and the officer in command at the time was cashiered by the Swedish ruffian because he had allowed the victim's head to be cut off before life was quite extinct.
WHETSTONES have to be of coarse grain for scythes and other large blades, but of fine grain for razors. chiscls, pen-knives, etc. Any hardish slate of smooth uniform texture will make a fine whetstone or 'hone," several good kinds being found in Wales.
Whewell. William, the English philosopher, was bom in 1794. He graduated at Trinity College,

Cambrldge, as second W ramgler, and second Smith's prizeman; and in cluc course became lellow and Tutor of hls College. In 1828 ho becamo I'rofessor of Mineralogy; in 2833 took the Chalr of Moral Philosophy, and In 1855 became Vico-Chancellor of the University, having been Master of Trinity from 18.4R. Le wrote the "Bridgewater Treat lse," "I hilosophy of the Inductive Sciences," "On Liberal Education in General," "Lectures on the listory of Moral Philosopliy In England." etc.
'Witt was the nane which, from the time of Charles II. to the 18th century inclusive, was applied to the party which atlvocated denocracy. The word is of Scottish origit, and was first applied to the Covenan. ters of the south-west of Scotland.
WIIPPING Is much the best cure for blackguards of the wife-beating or child-beating type, and it is the only thing which this worst type of bully really dreats. In thesc efferminate days outcries agoinst it are often heard, and much monsense is talked about the dignity of the human body; but that is all the more reason for sturdy patriots and rational thinkers supporting vigorously a plentiful supply of the 'Cat for all crimes of violence. The worst part of the United Kingdom for such crimes is the country round Swansea, Cardiff, Merthyr-Tydvil, Aberdare, and Newport.
WHIRLPOOLS are really circular currentso water produced by winds or other currents. They are very seldom found on a large scale, but they can be studied in miniature as eddies in a shallow stream. The two celebrated whirlpools of the work are the Maelstrom and Scylla-and-Charybdis. The latter is merely a choppy sea caused by the wind acting obliquely on a current which 'secms' rapid in the alnost tideless Mediterranean, and the Roman terror of it proves what bad sailors the old Romans were. Tbe Maelstrom is much more dangerous, mainly because the meeting of the cold Arctic air and water with the warm surface water of the Gulf Stream and with the persistent warm S.W. winds causes dense fogs and severe storms. There is no 'vertical 'action in either case 1 Any stories of ships being 'sucked down 'are pure fabrications.
WhIRLWINDS are very short and very local except in the case of a simoom, which is really a succession of whirlwinds, and-unlike a storm-the eddies may turn any way. They generally rise in tropical deserts, where the sand becomes unequally heated, causing ascending currents of hot air and descending currents of cooler air in close proximity to each other; and the whole disturbance may be carried some distance from its source by the ordinary wind that is prevailing at the time. Extensive fires-c.g. of bush or praireare also fertile causes of whirlwinds. When they occur at sea they carry up the spray of broken waves and thus form a water-spout.
WHISKY is a corruption of the Gaelic "usquebaugh," which means 'the water of life." It is made by the distillation of the fermented extract of any starchylelding substance, but barley is much the bestmalted. Large quantities of maize and rice are also used, however, and on the Continent even potatoes and beetroot are used. Pure malt whisky is made alınost exclusively in Scotland, Irish whisky containing a lot of maize, oats, etc.; and In England a good deal is made from raw cereals with some nalt and sugar. This makes excellent methylated spirits and-British brandy!

Nearly $4,000,000$ gallons are exported a year, mainly to Australia, and it can be exported free of duty. Proof-spirit is allowed a drawback of ad. per gailonproof spirit being practically equal portions by weight of water and of absolute alcohol.

Distilling was practised in England, by monks, as early as the eleventh century for medical purposes, and it commenced as a trade in the Tudor period. Scotch distilleries began to be taxed in ' 1579 , and private distilleries began to be interfered with. The excise tax on spirits began during the great rebellion, and has varied from id, to $£ 1$ per gallon. The latter price was resorted to in 1736 with the object of suppressing drunkenness. There was a hot feud in the eighteenth century between the Highland and the

Lowland distillers In Scotland, the former getting an immenso advantage in a suall licence rate, and tho latter being much the more skilful. Smuggling was very common. Glenlivet being, a veritable nest of sungglers, and illicit distilling is still quite common in Ireland. Abont thirty million gallons of proofsplrit are consumed annually in the United Kingdons, and practically all of it contains a suall proportion of impurity or by-products known as fusel oil. It is quite erroncous to think that this clisappears with age, but in luss quantities than 3 per cent. per fallon of proof-spinit it is liarmless. In the pot stills so common $\ln$ Ireland it rises to ${ }^{2} 2 \mathrm{I}$.

Whisky in its natural state is quite colourless, and colour is produced by storage in wine casks, caramel syrup, etc.
Whist is said to be a game of English origin, and the earliest extant reference to it is in the poens of Taylor, the water poet, in 162 r . Colton, in his "Compleat Gamester," says that it derived its name from the fact that it was played in silence. It was formerly played $g$-up, but was changed to ro-up in the begin. ning of the eighteenth century. Short whist was introduced about 1785 .
The first writer of any importance on the game was Edmund Hoyle, in 1742 .
Whistler, James, the painter and etcher, was born in U.S.A. in I834, and studied under Gleyre in Paris before settling in London. In 2884 he became a member of the Society of British Artists, and was made an officer of the Legion of Honour in Franco in 1892. He began to exhibit in the Royal Academy when he was only twenty-five years old, with "Two Etchings from Nature." Amongst his first oil paintings are, "The Artist's Mother." " Portrait of Thomas Carlyle," and ""Portrait of Miss Alexander "i and amongst his finest etchings are " The French Set," "The Thames Set." and two "Venice Sets." He was attacked most intemperately by Ruskin in "Fors Clavigera" for July, ${ }^{1877}$, and raised a libel action against him, the verdict of which was 'one farthing danages without costs.' Whistler, however, had his revenge in the pamphlet, "Whistler $v$. Ruskin: Art and Art Critics," which was reprinted along with his "Ten o'Clock Lecture" in "The Gentle Art of Making Enemies."
Whiston, William, the divine and mathematician, was born in 1667 , and becane a Fellow of Clare College, Cambridge, in 1693. His "Theory of the Earth "brought him so much reputation that he was appointed successor to Newton as Lucasian Professor at Cambridge, but he was expelled for Arianism (q.v.). Amongst the loud-mouthed hypocrites who raged against him. Dr. Sacheverell was prominent. His famous heretical essay on the Apostolic Constitutions will be found in his " Primitive Christianity Revived." His translation of "Josephus" is published-revised by Sbilleto-in Bohn's Library.
Whitby AbBey was founded by St. Hilda in 657 A.D. for both sexes, and is hallowed by memories of Caed* mon and St. Joln of Beverlcy. The old Abbey was burned by the Danes in the time of Alfred the Great, and refounded-for monks only-after the Norman Conquest. Sir Walter Scott's reference to nuns there, in "Marmion," is a poetic licence.
WHITE, REV. GILBERT, the naturalist, was born in ${ }^{1720}$, and became a Fellow of Oricl College, Oxford, in 1744. He declined Church preferment, but in his latter years was curate in his native village. His "Natural History of Selborne," published in $17^{89}$, is an English classic. He was also the author of letters on the antiquities of Selborne.
WhITE, HENRY KIRKE, the poet, was born in 1785 , the son of a Nottingham butcher, and was apprenticed to an attorney. He worked at hls duties and at literature with such zeal that hls weak constitution gave way, and he died'of consumption- at the age of 21. Southey edited his literary remains.

WHITE, JOSEPH BLANCO, made hls name famous by a slngle sonnet, on "Night and Death," cledicated to Coleridge; but he inight with equal justice be remembered for his nutobiograpliy, which is a profonnd revelation of a deeply religious soul in search of that
certainty which, in tho very nature of things, religlon can never guaranteo.
WHITE HORSES are found $\ln$ several counties, e.g. A berdecushire, Yorkshire, etc.; but by far the most numerous and most fanous are those cut on the chalk clowns of Wiltshire and Berkshire. The great 'White Horse' is at Uffington in Berkshire, and measures 355 feet from nose to tail, and reo feet from ear to lieel, Liko its fellow near Westbury, it is said to commemorate one of Alfred the Great's victories over the Danes; and it is certainly of very ancient date, as it was mentioned about the time of Henry II. as having been in existence about the time of the Norman Conquest. It las been 'scoured,' and probably enlarged, from time to time. Nearly all the other 'White Horses' are of modern date.
White Lavy, of German legends, whose name is generally Bertha, is a survival of the old goddess of nature in Teutonic inythology. She appears under various names, amongst them being berhta, 'the bright. Her snow-white garb is appropriate to her festival, which was held on 'Twelfth Night.' Sir Walter Scott has used the legends-weakly-in "The Monastery."
WHITE LEAD is the basis of nearly all oil colours, to which it is added to give them body. Commercial white lead is generally mixed with barium sulphate, but the manufacturers object to the mixture being called ' adulterated,' on the ground that it is sold as such. It is an extremely unhealthy paint to work with.
Whitefield, George, founder of the Calvinistic Methodists, was born in 1714. He met the Wesleys at Pembroke College, Oxford, and joined their society. He was ordained deacon in 1736, and became a popular preacher, going in 1738 to America. Returning to England in 1739, he went to London and preached to crowded congregations both indoors and out. He went backwards and forwards again between England and America, and then remaned four years in the latter country, after which he was in Ireland. He died in 1770 , having gone on his seventh visit to America.
WHITEWASH is simply slaked quicklime reduced to the consistency of milk by means of water, and when intended for sanitary purposes it is used in that form. But when intended merely for colouring, size is added.
Whitgift, ARCHBISHOP, was bom nbout 1530. He was elected a Fellow of Peterhouse, Cainbridge, and protected by the Master during the Marian persecution. In 1563 he was made Professor of Divinity, and then Master of Trinity College, Dean of Lincoln. Bishop of Worcester, and eventually Archbishop of Canterbury in 1583 . He attended Queen Elizabetl on her death-bed, and crowned James 1. He was a notorious pluralist.
Whiting is chalk ground into a powder and washed. It is often mixed with white lead as an adulterant.
WHITMAN, WALT, the American poet, was born in 1819. During the Civil War he tended the sick in the hospitals of Virginia and Washington, and at the end of the war his constitution was broken. He subsequently entered government service till 1874. His best-known poems are, " Leaves of Grass," "Drum Taps," and "Democratic Vistas." "Specimen Days and Collect" and "November Boughs" contain his prose writings.
WHIT'NEY, ELI, the American inventor, made his fame and his fortune by the manufacture of firearms, being the first to apply the principle of the division of labour ; but by far his most useful invention was that of the cotton gin.
WHITSUNDAY in Scotland is one of the usual terms for the letting of houses, and has no connection with any 'Sunday.' It used to be a movable date, but was fixed in 1690 to mean May 15 th.
WHITTIER, JOHN, the American poet, was born in 1807. He worked on his father's farm and learnt the shoemaking trade at first, but in 1831 he published his "'Legends of New England," in prose and verse, and in $1835-36$ became a member of the Legislature of Massachusetts. Some of his volumes of poetry are, "Moll Pltcher, "Lays of My Home," "The Voices of Freedom," "The Chapel of the IIermits,"
"Home Ballads and Poenns," "National Lyrics," "The King's Missive," etc.
WHITTINGTON, DICK, was born about 1358 , and set out at the age of ${ }_{3}$ to make his fortune in London. He apprenticed himself to a prosperous mercer, whose daughter he afterwards married, and was eventually three times Mayor of London-in 1397 . 1406, and 1418 . He was kniglited by HenryV. Rev. S. Lysons in his "Model Merchant of the Middle Ages" defends the story of the 'cat' suld to the Moorish king, and denies the explanation that "cat' ineans a 3 -masted vessel of about 500 tons that traded in coal; but similar 'cat' stories are faniliar in the folklore of almost all the nations of Europe. Bow Bells could certainly have been heard on Highgate Hill, where Whittington's runaway steps are said to have been arrested by their peal.
WHITWORTH, SIR JOSEPH, the English engineer, was born in 1803. He started business In London in 1833 as a manufacturer of engineers' tools, and subsequently turned his attention to a uniform system of screw threads. In 1854-55 he began his experiments with fire-arms, which led to the production of the Whitworth rifle, and his manufacture of rifled ordnance. He also originated the fluidpressed steel used in making cannons and shipplates. He published his book, "Guns and Steel," in 1873, and died in 1887. He founded some scholar. ships.
WHYIE-MELVILLE, the sportsman novelist, was born in 1821, and educated at Eton. In 1839 he entered the Coldstream Guards, and retired in 1849 with the rank of major, but joined the Turkish contingent during the Crimean War. He began his literary career in 1850, and most of his novels were devoted to fox-hunting, steeple-chasing, etc. His most popular books are the "Gladiators,", "Queen's Maries," "Sarchedon," and "Satanella." He was killed in the hunting-field in 1878.
WICKETS WITH SUCCESSIVE BALLS. In a match near Perth on June 28th, 1893, the Murthly bowler took 8 wickets in ro balls for no runs-the last ball of one over, all 5 balls of the next, and the 3 rd and 4 th balls of the following over; seven were clean bowled and the eighth was caught. For Knowle Park v. Dartmouth Park 2nd XI., W. Park took 7 wickets in 7 balls on June 14, 1890 .
WICKLIFFE, JOHN, was bom about $13200^{\circ}$ He was educated at Oxford, elected Master of Balliol College, and in 136 became Rector of Fylingham, in Lincolnshire. Heafterwards becameDoctor of Theology and teacher of Divinity in the University. In 1374 he was one ot the commissioners sent to confer with the nuncio of Gregory XI., at Bruges, respecting the statutes of provisors and praemunire. He preached and spoke against the Pope, and was summoned to appear before a convocation at St. Paul's, and later the Pope rose against him, but the queen-mother defended him. In 1381 his heresies were condemned by Oxford theologians, his works were burnt, and some of his followers imprisoned, He died at Lutterworth in 1384 . 1 He translated the Bible from the Vulgate. The influence of his doctrines may be traced in the history of the Reformation. He ranks as the father of English prose.
WIELAND, CHRISTOPHER, was bom in 1733, and conceived a violent admiration for Klopstock. He began his literary career with poetry of a religious, inystical, and sentimental type, but eventually became the most popular author of his day. His most popular work was his heroic poem "Oberon," and his most useful was his translation into German of Shakespeare's plays-the first of the kind. He was a friend of Goethe and Schiller.
wieliczka Salt Mines are near Cracow, and are the most wonderful in the world. The bed is 300 miles long, 4000 feet deep, and has been worked for 600 years. Whole villages exist under-ground cut out of the salt.
WIG is simply a contracted form of 'periwigg, whicls is connected with the Latln word pilus, 'hair.' Wigs were evidently used from the earliest times, both to conceal baldness and for dignity or ormament. for they are found on Egyptian numunies, and indicated
in Assyrian sculptures; but the modlern wig started in France, and liad its day in the 17 th century and the early part of the 18th. It had its death-blow also in France-at the time of the Revolution, though professional wigs have lingered on. The judge's wig is the full-dress wiy of gueen Anne's reign, while the barrister's is the undress wig of the same perlod. Such wigs are made of carcfully prepared white horse-halr: wigs for baldness are made, of course, of human hair; and theatrical wigs are generally made of jute.
WILBERFORCF, SABUEL, the English prelate (son of Willian Wiberforce, the philanthropist), was born in 2805 , and graduated at Oriel College, Oxford. IIe became Canon of Windsor in 1840, Bampton Lecturer in 18\&I, and Dean of Westminster and Bishop of Oxford in 1845 . He led the High Church Party, and wrote "Eucharistica," "Note-book of a Country Clergynaan," "History of the Protestant Episcopal Cluurch in Ainerica," a volume of "University Sermons," etc. He died ill 1873.
Wilberforce, William, the philnnthropist, was born in 1759. He entered Parlianent in 1780, is member for his native town, Hull. 1111786 he met Clarkson, who gained his sympathies on behalf of the agitation against slave-trade, and in 179 r he brought in a bill to prevent further unportation of African negroes into the British colonies. The bill was not passed till 8807 . He then devoted his energies to the abolition of the trade, and three days before his deatb the House of Commons passed a bill, abolishing it altogether. He died in 1833.
WILKES, JOHN, was born in 1727 . He entered Parliament in 1757 , and attained notoriety by publishing a paper called the "North Briton," in one number of which he commented severely on the King's speech to Parliament in 1763 . He and others were committed to the Tower, but were released, as the prosecution was declared illegal ; and in 1764 a special law was passed by which he was expelled from Parliament. As he remained in France instead of coming to receive sentence, be was outlawed. Ife made several attempts aftewards to get back into Parliment, but he failed, and was imprisoned, and tbat gave rise to agitations in favour of 'Wilkes and liberty." He was released from prison in 1770, and eventually become Lord-Mayor of London. He published many speeches and pampllets; and he died in 1797.
WILD-FOWIL PROTECTION ACT was passed in 1880 , and forbids the shooting of the protected birds between February 15 st and August 15t.
WILD HUNTSMAN is found in the folklore of almost all Teutonic nations. He and his hunt come along generally between Christmas and Epiphany, bistrain being filled with the ghosts of drunkards, suicides, malefactors, etc. When he comes to a cross-road, he falls, and gets up on the other side of his borse. The 'noise' of the hunt is probably due to the ligbt of geese or redwings. The original huntsman was Woden.
WILFRID. SAINT, the famous Bishop of York, was born about 635 A.D., and was brought up in the old monastery of Lindisfarne. As a young man he visited Rome, and thus became a strong supporter of the Roman Party in England. At the Synod of Whitby he won over the King to the Roman side by the argument that, as the keys of Heaven had been given to St. Peter, lie would probably lock out any one who had opposed him on earth.
WILKIE, SIR DAVID, the famous painter of the British School, was born near Cupar in 1785 . He received his carly art training at the Trustees'A cademy, Edinburgh, and entered the schools of the Royal Academy, London, in 1805. His first picture, "The Village Politicians," exhibited there in 1806, won him his reputation, and in 2811 he became an academician. He travelled on the Continent in 8825 , and while in Spain was much influenced in his art by Velasquez and Murillo. In 8830 , having returned to England, he became painter in ordinary to the king. Some of his pictures are, "Blind Fiddller," "Rent Day"" "Cut Flnger," "Penny Wedding," "Cottar's Saturday Night," "Blind Man's Buff," "Chelsea Pensioners," "John Knox I'reaching before the Lords of the Con-
gregration," etc, ilis latest pictures were all historical. He died in 18.42.
WILKINS, BISHOP, was born in 1614, and was instru. mental in bringing about the formation of the Royal Society. He becane warden of Wodhan Collcge, Oxford, and married a sister of Oliver Cromwell, and was subsequently made Master of Trinity Collese, Cambridge.
WILkINSON, SIR JOIIN, the Egyptologist, was born in 1797, and educated at Harrow and Exeter College, Oxford. In 2821 he set out for Alexandria to devote himself to exploration. With Cairo as his headguarters he explored almost every part of Egypt and Lower Nubia, twice iscencled the Nile up to the second cataract, spent a whole year at Theles, and visited the deserts on both sides of the river. Ile published a number of books on the subject.
With refers to the active side of the mind, and in voluntary actions there is practically an 'end' in view, towards which the volition must be turned. If this end is attained, the result gives satisfaction. The disputed points in connection with voluntary action are generally summarized under the head of the 'Free Will Controversy,' though that is more an ethical and theological than a psychological question. The controversy began with Aristotle, but Christianity introduced into it a new conception of the relations between God and man. The ablest treatise against the ordinary idea of the freedom of will was probably that by Jonathan Edwards, though Hobbes, Hume, Priestley, the Nills, and Bain have all contributed materially to the subject. The cleverest view of the whole question was probably to be found in J. S. Mill's "Examination of Sir W. Hamilton's Philosophy." The arguments for necessity, or fatalism, or determinism are-(x) The universality of the connection between cause and effect, and (2) the constant presence of motive in volition. The arguments for free will are-( x ) The consciousness of freedom, and (2) the moral argument about responsibility. For a quite "nodern statement of the whole subject, see Sully's "Human Mind."
WILL O' THE WISP, or JACK O' LANTERN. Why Will or Jack? Only because these were the commonest names in England and France (Bill and Jacques), and came to be used as general "labels* for anything and everything-Jackanapes and Jack-a-lantern, or Union Jack and roasting Jack.
And what, after all, is Will-o'the-Wisp? Only PH3-phosphuretted hydrogen gas.
In grave-yards, where the gas escapes from the soil without having to pass through a layer of water, it cones in a long continuous stream; and this, when spontaneously ignited by coming in contact with the dry air above, makes the tall blue ghost.
In marshes, where the gas has to force its way throughalayer of water, it gets scattered, and reaches the surface in innumerable successive bubbles. Each of these, as it comes in contact with the upper air, ignites; but they may come up in a variety of places. Thus they are never 'caught,' and lure the traveller on and on, as of diabolic deliberate purpose, into the midelle of the swamp.

The 'faithful withess ' will give most circumstantial details as to the movement of the 'spirit,' its flowing garments, and the waving its bloodless fingers. Here is the close observation of the genuine scientific mind, only befuddled by a superstitious imagination.

The malicious sinall boy or practical joker can have a Will-0'the-Wisp, with fowing, robes and waving hands, on his own back-green-if he will bury some calcium phosphide in the soil, and throw a bucket of water over the spot. Presently, up will come the gases; at the first touch of the upper air they will ignite: and the white rings of phosphoric smoke will wavo theatrically in the air.

If there is not enough water, you will only have a ghost, not a Will-o'the.Wisp. for the wreaths are due to the smoke breaking througls the circular opening made by the bubble of fas in escaping from the water. All smoke, even that of a cigarette, in escaping through a circular hole, makes similar rings; and, as with the cigitrettesmoker. 'Will' has no wreathing garments or waving laands when the air
round him is agitated. Ho is then only a malignant spark-no longer a 'ghost, but a 'light in a cottage window.
WIILIAM 1., THE CONQUEROR, was born in 1027, and after ruling in Normandy took the English crown in 1066. He introduced the feudal system into England, with one or two improvements in the administratlon of it; c.g. all serfs and vassals owed allegiance to himb is well as to their feudal superior. He also instituted the Doonsday Book, which stil! exists. His relgn was full of revolts and bloodshed, but lie ruled well, if sternly. He clied in 1087.
Willianilil., Stadtholder of Holland and King of England, was bom in 1650. His parents were Winliamil., Prince of Orange, and Henrietta Stuart, daughter of Charles 1. of England. At first John de Witt had all the power, but when France and England declared war against the Netherlands in 1672 , there was a popular revolt, in which De Witt was silled, and Villiam was declared Captain-General, Grand-Adniral, and Stadtholder of the United Provinces. In the campaign that followed he forced the French to retire by opening the dykes round Amsterdam. In 1688 he was invited to England, James II. fled, the throne was declared vacant, and in 1689 he and Mary were proclaimed king and queen. Scotland acknowledged them, but Louis XIV. sent James to Ireland, and the battle of the Boyne and of Aughrim were fought, James being defeated. Louis XIV. had also to acknowledge William in 1697 . The war of the Spanish Succession was beginning when william died in 1702.
William 1., first German Emperor and seventh King of Prussia, was born in 1797 . In the campaign of $1813^{\circ}$ 14 he took part, under Blificher, and was Commander of the Forces in Baden in 1849. In I861 he became King of Prussia, and during his reign Prussia defeated Denmark, quarrelled with Austria, and in 1870 went with the rest of Germany to war with France, in which war the Prussian generals were directly under his supervision. He was proclaimed German Emperor in 187x, at the siege of Versailles.
William THE Lion was the Scottish king with whom Henry 11. made the famous Treaty of Folaise -afterwards revolved by Richard 1. in consideration of the payment of 10,000 marks for his Crusade expedition.
William the Sailor was William IV. of Englancl. He entered the Navy as a midshipntan in 1779, and was the first English prince who ever visited the New World. His professional cateer ended in $178_{9}$, but he was formally promoted through the various ranks up to that of Admiral of the Fleet. He came to the throne in 1830, and did all that he could to hinder the passing of the first Reform Bill. He was succeeded by his niece, Queen Victoria, in 1837.
William The Silent was the Prince of Orange who freed the Netherlands from the Spanish yoke in the sixteenth century.
WILLIAMS, JOHN, the martyr-missionary, was born in 1796, and joined the London Missionary Society before he was twenty years of age. He was sent first to Erinco and then to Raiatea, and his zeal and wonderful power of organization produced a narvellous result. In 1823 he Christianized the group of the Hervey Islands, and then extended his labours to Samoa. Eventually, he was killed and eaten by the cannibals of the New Hebrides in 1839.
Willinms, SIr MONIER, the great Sanskrit scloclar. was born at Bombay in 1859, and educated at Oxford University, where he became Professor of Sanskrit in 1858. He was knighted in 1886 on the accasion of the opening of the Indian Institute, which was established very largely owing to his energy. His books are very numerous.
Williams, Roger, the founder of the State of Rhode Island, and one of the early apostles of Toleration, was born in 1600, and attracted the attention of Sir Edward Coke by his shorthand notes of sermons aud of speeches in the Star-Chamber. He emigrnted to America in 163I, and founded the first Baptist Church there in his new city of Providence. He was spoken of by Milton, who knew him personally, as a noble confessor of religious liberty.' He died in 1683.
Willow WOpD is used for cricket-bats because it is
remarkably tougl and durable and at the same time soft ind light. In olden days it was used for shicelds, and is still used for niaking steamboat paddles.
Wilson. Alexander, the Anerican ornithologist, was in Scotsinall by blood and birth, and the droll verses "Watty and Meg"-by which he is best known-are written in Scottish dialect. He was prosecuted for a lampoon oll a Paisley 'body, and emigrated in 1794. Under the influence of Willian Bertrain he developed his study of nature and specially his drawings of birds. Eventually he determined to unake a collection of all the birds that were to be found in North America, and set out on his first excursion in 1804 . The result appeared in the first volume of an " Anerican Ornithology" in 1808. The seventh volume was published just before his death in $18 \mathrm{ra}_{3}$, but an eighth and a ninth were published afterwards, edited by his assistant Ord, and the work was continued by Cliarles Lucien Bonaparte in 1828.
WILSON, SIR DANIEL, the archaeologist, was bom in 1816, and educated at the High School and University of Edinburgh. In 1853 he was made Professor of Mistory and English Literature in the University of Toronto, of which in 1881 he became President. He was made a knight in 1888, and died in 1892.
WILSON, SIK ERASMUS, besides being a specialist on skin diseases, was also a well-known Egyptologist and an enthusiastic philanthropist. He made his reputation as an operator at the College of Surgeons in London, where he founded a Chair of Dermatology; but he is best known to most people for having brought to England 'Cleopatra's Needle'-at a cost of $£$ ro,000. He was made a knight in r881, the year in which he was elected President of the College of Surgeons.
WILSON, GEORGE, the great chemist, was a younger brother of Sir Daniel (see above). He lectured on chemistry in the Edinburgh College of Surgeons and elsewhere, and in 1855 was appointed Professor of Technology in the University of Edinburgh. He died quite a young man in 1859.
WitSON, JOHN, better known in literature as Cliristopher North, was born in 1785, educated at Glasgow University, and gained the Newdigate prize at Oxford for an English poem. He was a good athlete too. He settled down at Elleray, near Windermere, made friends with Wordsworth, Southe 3 , and Coleridge, and in 1812 published his poem. "The Isle of Palms," and in 1806 another called "The City of the Plague." He was one of the original contributors to "Blackwood's Magazine," and in 1820 took the Chair of Moral Philosophy in Edinburgh University. He wrote the "Noctes Ambrosianae,' "Recreations of Christopher North" (both from magazine articles), and "The Lights and Slandows of Scottish Life," "The Trials of Margaret Lindsay"," "The Foresters," and " An Essay on the Genius and Charncter of Bums." He died in 1854.
WILSON'S "TALES OF THE BORDERS" were originated by John Mackay Wilson, the editor of the "Berwick Advertiser." They were issued from Berwick in weekly numbers, beginning on 8 th November, 1834, and in six months had reached a circulation of 30,000 . Wilson himself died in October, 1835. inainly of drink: but the series was carried on by Sutherland, the Edinburgh bookseller. Amongst the writers were Leighton (who edited for Sutherland), Sir Theodore Martin, Hugh Miller, and Professor Gillespie.
WINCHESTER was the cradle of English prose as Whitby was of English poetry.
WINCHESTER COLLEGE, the oldest of the English ' Public Schools,' was founded in 1387 by William of Wykeham as a nursery for New College, Oxford.
WINCKELMAN, JOHANN, the first appreciative critic of Greek art, was born in 1717; and after studying theology, medicine, and mathematics at various German Universities, he became librarian to Count von Bunau near Dresden. Subsequently he became a Romanist on the promise of a librarianship in Rome, and eventually becane librarian to Cardinal Albani. His great "History of Ancient Art " was published at Diesden in 1764, and may be said to
have ghted all subsegnent progress in aesthetics. He was murdered in 1768 by a fellow-triveller to whom he land shown some valuable old gold coins.
WINDERMEKE, thourh called 'the Queen of English Lakes.' is very smail, beimg only one quarter of the size of Loch Lomond. It is nearly eleven miles long, and its cxtrente breadtly is about one mile. Its soft, rich beauty, howeyer, has made it very popular: ancl, of course, it has inmemorial associations with Wordsworth ind Christopler North and their varions friculs.
Windiam, WILLiAs, the brilliant talker of last century, first attracted attention by his tellinhr speeches ayminst Lord North's administration, ancl eventually, in 1794, became Secretary for War uncler Pitt. His great powers were neutralized by intellectual cowardice, the result of a morbid self-consciousness. He was very fond of a paradox, and was nicknamed 'the weather-cock.' He latl also a passion for prize-fighting, and spoke veluemently asainst the abolition of bear-baiting. He died in 18 ro.
WINDMILLS are sid to have been introduced into Europe by the Crusaders, who had seen them in use among the Sarncens; and though not so valuable as some other inventions borrowed in the same waye.g. gunpowder, printing, and the compass-are of very great use in new countrics where fuel is scarce and work may be intermittent. A good windmill, under ordinary circumstances, averages about one hour's work in every three hours. They are used very largely in Holland for draining purposes, and Lord Kelyin strongly recommends their being used as an auxiliary to steam.
Window means litemlly 'Wind-eye, but modern sanitary science insists on winclows being only intended to light, and not to ventilate. Very many economical, but ignorant, housewives pull down their blinds so as to save their carpets-not under. standing that the sanitary value of the sunlight far more than compensates for the damage done to the carpet. In the East windows lave always looked, not into the streets, but into in interior court, romd which the houses are built. Amongst the Romans mica was used instead of plass, hom coming into vogue instead of the mica in the and century after Christ. The first distinct mention of glass is made by Gregory of Tours in the 4th century, and St. Wilfrid (q.v.) filled the vindows of York Minster with glass about 670 A.D. Glass began to be used in the windows of private houses in England at the end of the izth century.
The window is one of the importint characteristics of Gothic architecture, as the pillir was of Classical architecture. In Early Gothic the windows were small and narrow, with round tops. In Early English they were lengthened and made pointed at the top. In the Decorated Period they were filled up with multions in the lower half and tracery in the upper half, and In the late Tudor Period they were finttened and made rectangular. Between the Decornted and the Tudor Period came the Perpendicular, the architects of which sometimes had the impertinence to alter beantiful windows of the older style into the lanky models of their own style.
Vinds. All rerular winds on the face of the earth start at the Tropics, and blow either towards the equator or towards the nearer pole. Anything which clanges the density of the atmosphere, and thus makes the pressure in one place greater than in another, causes the movement of the atmospherewhich we call wind-from the area of higher pressure to that of lower pressure. The clief causes are heat and vapour, which are in excess at the equator or in defect round the two poles. Trade-winds, therefore, start where the pressure is greatest, i.c. the Tropics, and try to blow to the equator, where the heat is greatest; but the earth is spinnlng so much faster Ats they approach the equator that they get left behind, i.e. deffected to the left-the west. The anti-trade winds, blowing from the Tropics towards the poles, get ahead of the earth, and are thus deflected to the right-the east. This accounts for the constant S.W. 'antitrade' winds which blow upon the west coast of Britain on 360 ont of the 365
days in the year. The corresponding N, W. 'antltmale' winds irre, of course, sonth of the equator, and are "the Brave West Winds" so often referred to in sen stories. They are more regular than the S.W. ones, because there is so molh more water and so much less land south of the equator.
VINDSOR Castres was the site of a hunting-box of the Saxon kings, and Harold buitt the first castle there. Anong the interesting events that are connected with it may be mentioned-the marriage of Henry 'the Good Scholar.' to his Saxon love, the birth of Edward 111., the institution of the Knights of the Girter, the marringe of the Black Prince to the ' fair maid of Kicnt ' (who had had two husbands previously), the birth of Henry VI., and the deaths of George IV., Willian IV., and the Prince Consdrt (all in the same room).
VINE, or the fermented juice of the vine, consists mainly of water-a fact which might be noted by ardent water-drinkers; and the clanacter of it depends far more on the soil and climate than on the vine itself, for the same species of vine will produce an entirely different wine in different places.

Dry' wines are wines which have been allowed to go on fermenting until every portion of the natural sugar has been converted into alcohol. In 'swect" wines the fermentation is stopped before all the sugar has been converted, 'Still' wines are those which have been bottled while not fermenting, and effer* vescent wines are those which have been bottled while fermenting. Extraneous sugar is often added to the "grape-juice to produce 'a rich, fruity wine ; ancl, if a cheap and fermentable kind of sugar is used, the 'doctoring' cannot afterwards be detected, even by chemical analysis.

When wines are matured naturally-i.c. without any 'doctoring' to hasten the process-the age at which they attain their perfection varies very greatly. For instance, Rhine wines, which contain very little alcohol, and all those wines which contain either much sugar or little tannic acid will not keep.

Wine improves by being kept in casks, because the watery element is lessened by evaporation and the other elements are relatively strengthened. Bottling does not, as most people think, increase the percentage of alcohol in a wine, but it does affect the colour. For instance, red wines which contain little tannic acld becone darker, while red wines which are rich in tannic acid, e.f. port, deposit a sediment, and therefore become lighter.
Winifred, Saint, was the noble British maid whose head was cut of by the scoundrel Prince Caradog because she repelled his unwelcome advances. The head rolled down the hill in Flintshire where the two were standing, and when it stopped the spring of Holywell suddenly gushed out. The hend was kindly picked up by St. Beuno, and replaced on the maiden's neck, where it had the sense to remain, and St. Winifred surviverl the miracle for 15 years. No wonder that the Romish pilgrims thonght so highly of the place!
Winthrop, John, the founder of the famous Winthrop family, was born in the year of the Arniad.a, and was bred to the Law, becoming a Justice of the Peace at the early age of 18. In i629, owing to his reputation for legal ability and moral worth, he was elected by the Missachusetts Bay Company to govern their colony, and he landed at Salem with the charter, mid-summer 1630 . He had more influence than any other man it the fommation and developuent of the political institutions of the New England States.
WIRE is a very ancient invention, a piece exhibited in the Kensington Museum being said to have been made by the Ninevites about eight humdred years before Christ, and certainly Homer mentions is similar product-made of beaten metal cut Intostrips and hammered together. The art of wire-drawing, however, does not seem to have been practised any: where till the fonrtcenth century, and was not introduced into England till the seventeenth. Tho property which entables metals to be thus "drawn" Is ductility, and the ductility of different metals varies enormously, which helps to account for the
fact that iron has now been almost entirely superseded by steel in the wire inclustry.
WIRE ROPES were invented in Gernany about x8ar, and were first used on a large scale for the suspension bridge at Geneva in 1822. Besides their permanent use un suspension bridges, they are very largely used for temporary purposes in bridge-building, no less than 'sixty miles' of wire rope having been used temporarily in the erection of the Forth Bridge.
WISEMAN, Nicholas, CARDINAL, was born in x802, was educated at Waterford nud the Roman Catholic College, Ushaw, near Durhan, and then joined the new English College at Rome in 1818, of which he became Rector. He was also Professor of Oriental Languages, He returned to England in $\mathbf{1 8 3 5}$, and in 1850 became Romanist A rchbishop of Westminster. He wrote "Lectures on the Connection between Science and Revealed Religion," "Letters on Catholic Unity," "Papal Supremacy," etc., and was joint-editor of the "Dublin Review."
WISHART, GEORGE, one of the first martyrs to the Protestant religion in Scotland, was born early in the sixteenth century. He travelled in France and Germany, where he accepted the reformed doctrines, returned to Scotland, and preached. He was prosecuted for heresy and fled to England in 1538, but having gone back to Scotland in 1543 to preach, Cardinal Beaton had him burnt in 1546 .
1 WITCHCRAFT is one of the most foolish, and has been one of the most injurious, of superstitions. It flourished amazingly from the fourteenth to the seventeenth centuries, but then began to decay owing to the spread of scientific knowledge.
All the sorcery of the heathen world was admitted into Christianity, and used in the popular ideas about the devil; and as the knowledge of natural causes was very slight and very inaccurate, gaps were filled up by guesses-and post hoc came to be translated as if it had been propter hoc. And, as it was very difficult to realize what was not concrete and obvious, all unknown causes were massed together under the one word ' witchcraft,' and were made concrete in some poor and unoffending ' witch.'
The Christian conception of witchcraft in early times was, therefore, a combination of scientific iguorance and heathen magic, with inisinterpretation of incidents and phrases from the Bible-'the witch of Endor,' the 'Prince of the power of the air,' the 'possessed pigs,' etc. It was raised into a fine art of destruction by the fiends of the Inquisition; and as the monkish system implied the inherent vileness of women, the victims were generally witches, though real discoverers in the sphere of plysical sciencelike Roger Bacon-laid themselves open to attack. The Archbishop of Treves avenged the bad weather of the spring of 1586 upon 118 witches and 2 wizards. And the Inquisitors boasted at the end of their $\mathbf{1}$ oth year of existence that they had burned at least 30,000 witches.
The last formal trial for witchcraft in England seems to have been that of Jane Wenham, who was convicted at Hereford in 1772 , but she was not put to death. The superstition still lingers on, however, in a few country places; and in the country at large its place is adequately filled up by Theosophy (q.v.).
Witenagemot, or 'the meeting of wise men,' was the great national council in Saxon times. It was composed of the chief clergy and chief nobility, who were in no real sense 'representative.' It elected the king out of the members of the Royal Family, and helped him to govern both at home and in his foreign relations. Each kingdom under the Heptarchy had its own Witenagemot; but, on the union of the whole of England under Egbert in 827, the separate ones were merged in the central one.
WITHER, GEORGE, the fiery ${ }^{\circ}$ puritan, wrote his pastoral "Shepherd's Hunting" in prison, where he had been sent as a punishment for his satire, "A buses Stript and Whipt." He was then taken prisoner by the king's troops during the Civil War, and is said to have owed his life to Sir John Denham, who begged that he might be spared, because, as long as wither lived, he himself could not be called the worst poet
in Enyland. This passed into popular belief, and it was not till Charlis Lamb wrote his famous essiy on himn that thre world began to wake up to the fact that Wither's "Juvenilia" contained sonie very beautiful poetry-marred, however, by frequent bathos.
Wittenberg, 'the cradle of the Reformation,' fitly contains the graves of Luther and Mtclancthon, It was to the old wooden door of the Schlosskirche that Luther nailed his theses, but it was lurned by the Austrians during the Seven Years' War.
WITWATERSRANDT GOLDFIELDS were discovered in $\times 886$, and in the subsequent ten years Jolamnesburg has become a city of 70,000 people. Their prosperity, however, will probably be materially affected by the recent discovery of the Klondike Goldfields in the extreme north-west of Canada.
WOBURN ABBEY, the seat of the Dukes of Berlford, stands on the site of the old Cistercian A bbey, which was founded there in 1145 A.D.
WODROW, ROBERT, the historian of the Church of Scotland, was born at Glasgow in 1679, where he studied theology under his father, who was professor of that subject in the University. His "History of the Sufferings of the Church of Scotland from the Restoration to the Revolution." was published in 1721, WOFFINGTON, PEG, the famous actress, was born in 1720-the daughter of a Dublin bricklayer. She appeared on the Dublin stage in 1737, and played all kinds of parts. In 1740 she appeared at Covent Garden as Sylvia in the "Recruiting Officer," and scored an immense success. Her only drawback was a rather harsh voice, but her beauty, grace, and vivacity far more than compensated for that. She was immoral, but most intensely kind-hearted and charitable, of which the Teddington Almshouses are a standing memorial.

Her sister married Horace Walpole's nephew, and she herself would probably have married Garrick if he had asked her. In 1757 she broke down while she was playing 'Rosalind in "As you Like it," and at once left the stage. She died at Teddington, where she had spent so much in charity and good works, on March 28th, 1760.
WOLCOT, DR. JOHN, the audacious writer of squibs under the pseudonym of 'Peter Pindar,' was born in 173 . He was absolutely fearless in his attacks on all sorts of people and things, from George 11 I. himself, and the Royal Academy exhibitions downwards. And his work was so popular that in 1795 his London booksellers gave him an annuity of $£_{250}$ for his copyrights, which he continued to enjoy for 24 years. The ministry are said to have endeavoured more than once to bribe hinn to silence, but in vain.
WOLF is a species or dog, and is a native of the frozen north-to suit which its milk is remarkably rich in fat. The story of the wolf suckling Romulus and Remus is simply a relic of an age when the milk of the dog or wolf was as regularly used by man as the milk of the sheep was a few years ago in Wales and Scotland. The damage done by wolves in Russia includes about 200 human lives, a loss of from $£ 700,000$ to $£ 1,500,000$ worth of farm stock, and an incalculable loss of $u$ seful wild animals. Ten roubles is paid for every wolf killed in Russia, and a hundred francs in France-that is, for a full-grown animal, only forty francs being paid for a cub. There is no mention of wolves in England after the reign of Henry VII., but they probably lingered on in Sutherlandshire till 1743 .
WOLF, FRIEDRICH, the greatest classical scliolar and critic of his age, was born in 1759 . As a boy he had mastered Latin, Greek. French, Italian, Spanish, Hebrew, and English. He established his fame by his edition of Plato's "Symposium" in 1779, and in 1783 he became Professor of Philology and Education in the University of Halle. His famous "Prolegomena ad Homerum " appeared in 1795, in which he unfolded his theory that "Homer " was a collection of many ballads by various minstrels, strung into unity by years of unconscious editing, and begun by Homer. He was a wonderful scholar, but greatly lacking in tact.
WOLFE, JAMES, the famous English general, wins boru in 1727 . He entered the Aruy, and, proceeding
with hls regiment to the Low Countries, took part in the battles of Dettingen, Foutenoy, Falkirk, Culloclen. and Laffeldt. Afer distinguished service in Anerica, against the French, he went in 1759 to assault Quebec, scaled the Heights of Abrahani, and was nnortally wounded in the batele which lie won the next clay. His opponent, Montcalm, was also mortally wounded. Wollaston, William HYDe, the great chemist, was born in 1766, and became a Fellow of Caius College, Canbridge. Being defeated in his application for the post of physlcian to St. George's Hospital, he gave up medicine and began to devote himself entirely to scientific research, with the most bencficial results to his own fame and pocket and to the world. He died in 1828. His greatest discoveries were in chenistry and optics.
WOLSELEY: GARNET, LORD, the British general, was boru in 1833 , took part in the second Burmese War of $185=-53$, when he was wounded, and served with distinction in the Crimea, being also wounded at the siegre of Sebastopol. He wats engaged in the siege and capture of Lucknow, in the Mutiny of 1857.58 , and was employed in the Chinese War in 1860. In 1867 , he received command of the Red River Expedition, and in 1870 of an expedition to punish the King of Aslantee. In 1882 he stormed the lines of Tel-el-Kebir, and captured Arabi Pasha, in Egypt; and in $188 ;$ he was despatched with the Relief Expedition to General Gordon at Khartoum. He is the author of "The Soldier's Pocket-Book." "Field-Book for the Auxiliary Forces," and "Narrative of the War in China.'
WOLSEY, THOMAS, CARDINAL, was born in I4Tr, and educated at Magdalen College. Oxford, He eventually became a private chaplain to the Archbishop of Canterbury, one of the governors of Calais, chaplain to Henry VII. then Dean of Lincoln, Canon of Windsor, Dean of York, Bishop of Lincoln, and Archbishop of York; and his nomination as Cardinal in $55 \times 5$, and Pope's. Legate in 1558, completed his ecclesiastical dignities. He was twice a candidate for the Papacy, and actually became Lord Chancellor of the Kingdom. He projected Christ Church College, Oxford, founded lectures, and built Hampton Court Palace. He was wise in his counsel to Henry, enabling him to hold the balance of power between Francis I. and the Emperor Charles V.; and at the same time he succeeded in making his own power very great. His success terminated in I520, at the Field of the Cloth of Gold; and his failure in obtaining a divorce between Henry and Catherine of Aragon hastened his downfall. He was arrested, and died in 1530 at Leicester Abbey. Shakespeare's account of his death is famous.
WOOD. ANTHONY, the antiquary, was born at Oxford in 1632 . He was led to the labour of his life by Dugdale's "Antiquities of Warwickshire." His various works on Oxford are monuments of erudition and research.
WOOD, MRS. HENRY, the novelist, was born in 1814. and published her first novel: "Danesbury House," in 1860, "East Lynne" following in 186x. Her work is rather vulgar and essentially common-place melodrama, except in "Johnny Ludlow": but she was very popular. and "East Lynne" has had a very large sale. She died in 1887 .
WOOD. SIR EVELYN, was bom in 1838 , and began life in the Navy. He served in the Crimean War, and was badly wounded in the assault on the Redan. In 8855 he joined the Army as cornet of the 13 th Light Dragoons, and wun the $V$, $C$. in 1859 while commanding a regiment of Beatson's Irregular Horse in India. He was called to the Bar in 1874 !
WoODBINE is really honeysuckle, but the name is given to other climbing and creeping plants.
WOOD-ENGRAVINGS are easy to print along with 'text, because they are in relief like type, and all the Chinese books have been printed for ages from them. The application of the same principle to woot-stamps was certainly known to the Egyptians and Romans, and was used by then for stamping bricks, etc. ; but modern wood-engraving began in the rith centuryprobably for printing playing cards-and was made a real art by Thomas Bewick at the beginning of this
century. The wood used is box, which has the closest grain, and only the Turkish box is usually large enough.
WOOD'S IlALFPENCE was a copper coinage for Ireland patented by William Wood for the Englisls Governinent in 1722. The excellent Wood was to share his profits-or the clifference betwien the real and the nominal value of the coins-with the king's inistress, the Duchess of Kendal. But Swift's " Drapier's Letters" roused sucli public indigitation against the job that it was abandoned-and Wood was conspensated with a pension.
WOOLLEN MANUFACTURE. The use of wool as an article of clothing dates from the earliest times, and, doubtless, it wis woven before flax or cotton. Anong ancient Jews it was the staple inaterial of clothing, and in Greece and Rome it was made into fabric of special excellence. The Romans seem to have introduced it into England, though for some time it was only inacle into coarse material, finer ones being imported from Brabant and elsewhere. In the beginning of the 18 th century Yorkshire began to assume an important position in woollen manufactures. Now Great Brítain, France, Germany, and Russia all raise it, but for local use, and they linport additional supplies. Saxon and Silesian wools and the long-staple wool of Lincolnshire and Leicestershire are all in great demand. The three chief 'wool-exporting regions' of the world are Australasia, the Plate basin, and South Africa. Amongst the Australasian Colonies New South Wales, New Zealand, and Victoria monopolize the export trade, and the best Australasian wool coines from Victoria under the title of "Port Philip." On the Great 'Karoo' in South Africa, Angora goats and even Merino sheep thrive wonderfully, and wool and mohair are therefore shipped froin Port Elizabetl. In Yorkshire Hull, Goole, and Grimsby export the manufactured goods, and Leeds and Bradford are the centres of the undustry. The 'Plate' trade is essentially wool, animals, and grain; but most of the wool goes to Havre, Dunkirk, and Antwerp.
WOOLSACK, on which the Lord Chancellor sits in the House of Lords, is a large square bag of wool covered with red cloth. It was first used in the time of Edward III. to remind the peers of the great innportance of the wool trade to England, and the consequent necessity of keeping friendly with Flanders.
WOOLWICH Military ACADEMY was founded in 174x for cadets to the Engineers and the Artillery:
WOMEN'S SUFFRAGE is in itself a 'Iogical and just arrangement in any country where men have suffrage, but has been thwarted persistently in Britain by Mr. and Mrs. Gladstone. It was actually conferred in New Zealand in 8893 , and in South Australia in 8894. Under the Local Government Act of 1894 women, whether married or single, are eligible-under the same conditions as men-for election as parish councillors, guardians, rural or urban district councillors, or as members of London vestries and district boards, but are still disqualified for borough or county councils.
WORDSWORTH, WILLIAM, the famous poet, was born in 1770, and in 1787 he went to St. John's College, Cambridge, crossing to France in 179x. In 1793. on his return to England, he published his "Evening Walk " and "Descriptive Sketches." In I795 he received a Iegacy from his friend Raisley Calvert, and he then settled at Racedown, in Dorset, and wrote "The Borderers." In 1797 he was visited by Coleridge, who persuaded him to go and live near him in Somerset, when they wrote and published, together, " L' Lyrical Ballads." In 1799 lie settled at Grasmere: in 1802 he married his cousin, Mary Hutchison; in 1813 he removed to Rydal Mount, went several journeys to Scotland later, and then to the Continent. and In 1843 became Poet-Laureate at Southey's death. His great poem, which was to be the 'Gothic cathedral of his labour, 'received only a fragmentary accomplishment in "The Prelude" "Tlise Excirsion," and " The Recluse," but lals "Ode to Immortality" and "Laodamia." with other short poems, justified his conception of himself as in 'dedicated spirit.' Itu
dled in 1850 . Professor Kıight has published a com. plete edition of his poems, ind Dr. Grosart his prose writings, and his sister Dorothy's "Diary of a Tour In tle Highlands" gives an interesting account of them both.
WORKMEN'S Insurance and Commlercial SUPREMACY, Are the Germans beatimg us in many of the world's markets not merely' by reason of their superior teclinical education, but because they take better care of their workmen \& This is the question with which Mr. C. B. Roylance Kent opens his paper in "Gentleman's" for July, 1897, on ' Working Mcn's Insurance in Germany." Improved vitality and greater productivity may be expected to result from this insurance system. Here are sone of the figures for the labouring population of eleven inillions:-

Sick Insurance, 1893- The sick clubs number 25,226; the insured number $7,106,804$; the cases of sickness number $2,794,027$; the income reaches 132,137.396 marks; the expenditure reaches 126,018,810 marks.
Accident Insurance, 1894.-The number of corporate trade unions number 497 ; the insured number 18,660,000; the cases of compensation number 266,400; the income reaches $78,000,000$ marks; the expenditure reaches $64,200,000$ marks.
old Age and Invalid Insurance, 1894. - The insurance institutions number 40; the insured number 11,510,000; the pensioners number 295,200; the income reaches 109,580,000 marks; the expenditure reaches $25,560,000$ marks; the Inperial subsidy reaches $13.920,000$ marks.
Employers alone compensate for accidents. Employers and employed share sick payments. The State joins employers and employed in paying old age and invalid pensions. The rates are relieved, the number of accidents nominally increases, but the severe and fatal accidents are diminishing, and Socialism is not curtailed, but spreading,
WORMS, DIET OF, at which Luther defended himself before Charles V. and the princes of the empire, was held in 1521.
Worth, CHarles Frederick, the great ladies' tailor, was born in Lincolnshire, but went to Paris in 1846, and started his business in the Rue de la Paix, It employs nearly a thousand workwomen, more than half of them on the premises-the only sanitary and economia system-for outside work lends itself to sweating and to the spread of disease.
WOtten, Sir Henry, the Elizabethan traveller, scholar, poet, and diplomatist, was born in 1568, and educated at Winchester and Queen's College, Oxtord. After spending a number of years on the contineut, employed for most of the time in diplomatic business. he settled down in England, and was made Provost of Eton. He died in 1639 . He was the author of the 'tip. to young diplomatists, "Always speak the truth, for it will never be believed, and you have saved your conscience.'
Wrangler, the name given in the University of Cambridge to those candidates who get first-class honours in mathematics, had originally its literal meaning, as the candidates had to 'wrangle' or publicly discuss the questions asked them. The best candidate for the year is the 'senior wrangler'; and the worst that gets honours at all is the ' wooden spoon,' and with the eleven immediately above him forms the band of the 'apostles.'
WRECKING, or showing false lights along a dangerous coast with the deliberate intention of wrecking ships, used to be a very common custom in the United Kingdom, especially in the Cornish peninsula, and as the object was plunder, little or no effort was made to save life. In fact, in some cases the unfortunate survivors were thrown back into the sea in order that there might be no tales told.
Wreckis account for an amual average loss of about 260,000 tons of British shipping, and 130,000 tons of U.S.A. shipping, compared with about 45,000 ol German and 30,000 of French and of Italian. Formerly sunken wrecks which could be reached were simply blown up, now wreck-raising has been carried to the perfection of a science. A dozen or so wire cables, each capable of bearing is tension of 150 tons,
are passed under the wreck and fastened at 'dead low water ' to n number of large lighters, and, as the tide rises, the lighters ralse the wreck. Between r880 and regz the Thames Conservancy Board raised about 400 vessels in this way, but none of th:cm weighed under water hinore than 1800 tons.

Annollgst the famous wrecks of the ieth century were those of Sir Cloudsley Shovel's 'fleet off the Scilly Isles in 1707, when 2000 lives were lost, ind of the "Royal George" in Portsmouth Dock when 900 lives were lost.

During the present century there have been one or two horrible cases of fire at sea, the worst being that of the "Queen Charlotte" in 18c0, when 700 lives were lost; but of course the wrecks have been far more numerous. In 1805 about 300 lives were lost in the "Abergavenny " off Portand Bill, and 300 inore in the "Amora" on the Goodwin Sands. In 185o-II alsout r800 lives were lost in the North Sea by the wrecking of the three frigates, "St. George," "Minotaur," and "Defence." In 1849 about 400 lives were lost in the "Royal Adelaide" off Nargate; in 1852 about 450 were lost in the "Birkenhead "off the Cape of Good Hope; in 1859 about the same number were lost in the "Royal Charter" off Anglesey; in 1860 about 360 were lost in the " Lima," and in 1865 about 220 were lost in the "London," both off the Frencli coast.

Between 1870 and 1880 there was a terrible list472 lives in "H.M.S. Captain" off Caje Finisterre in 1870; 300 in the "Northficet" off Dungeness in 1873, and 560 in the "Atlantic" off Nova Scotia during the same year; 45 in the "Strathmore" in the Indian Ocean, 33 I in the "Schiller" off the Scilly Islands, and 70 in the "Deutschland" off the Thames wall three in 1875 . In 1878 about 300 were lost in "H.M.S. Eury dice " off Ventnor, 650 in the "Princess Alice" in the Thames, and 300 in the "Grosser Kurfurst " man-of-war. In 188i about 700 were lost in the "Victoria" on the Canadian Thames, Ontario. In 1883 more than 120 were lost when the "Daphne" capsized during her launching on the Clyde. In I 884 nearly 100 were lost in the "City of Columbia" of Massachusetts. . In 1891, off Gibraltar, 574 were lost in the "Utopia," In r8g2, off the Pescadores lslands, 125 were lost in the " Bokhara," and II3 were lost in the "IRoumania " off the Portuguese const. But the most appalling calamity was the loss of "H.M.S. Victoria" in the Mediterranean in 1893-on a beautiful, calm day in full siglt of land-when 360 lives were sacrificed, including that of Admiral Sir George Tryon, who was responsible for the disaster.
WREN, SIR CHRISTOPHER, the English architect, was born in 163I, educated at Wadham College, Oxford, and became Fellow of All Souls in 1653. He became Professor of Astronomy at Gresham College in 1657 , and in 1660 Savilian Professor of Astronomy at Oxford, He rebuilt St. Paul's Cathedral after the fire of 1666 . It was begun in 1675 , and his son laid the last stone in 1705. He also designed the modern part of Hampton Court Palace, the library of Trinity College, Cambridge, the hospitals of Chelsea and Greenwich, the churches of St. Mary-le-Bow, St. Michael, Cornlill, St Bride, Fleet Street, etc., and the campanile of Christ Church, Oxford.
WREN, HUNTING OF THE, is a very old custom, especially popular in the south of Ireland on St, Stephen's or Cliristmas Day, though it was rery common elsewhere and on other days, When driven out of bushes or hedge-row protection, the wren is quite easy to run down owing to its short flight ; and in mid-winter a number of wrens will often take refuge together in the hole of a wall, especially of a byre, where the warmth from the cattle is a great protection. Once driven out into the cold air, with no leafage to shelter them from pursuit, they soon succumb.
WRESTLING was one of the favourite forms of athletic exercise in Greece (see SURFACE above), and was one of the items of the Olympian Games (q.r.). Plutarch says that it was the hardest of all to win, because the laws were very intricate, and grace of novement was an essential. The old classical wrestlers would probably liave shone in the contests
which still survive at the Grasmere and other sports in Cumberland and Westmoreland, but they would certainly have despised the stupid and brutal caricature of a grand old sport which is adopted in U.S.A., France, Lancashire, and elsewhere, generally under the pretentious and' misleading title of 'the GraecuRoman Stylc,' more accurately termed 'groundworrying.' Tripping-which is the wery essence of wrestling, and which is carried to a fine pitch of perfection by the Cumberland and Westmoreland wrestlers, and by the Cornish and Devonshire menis forbidden entircly. One of the best all-round wrestlers of modern times is Steadman of Brough, Westinorelind, who fur some tine held tbe chainpionship belt. The great international match between Karl Abs and Tom Cannon took place at Berlin in x89x, when the Gernaan won.
Writivg is usually divided into 'ideographie writing,' anel 'plonetic writing,' the former being an attempt to convey ideas by copying objects direct froml nature, the latter being signs representing sounds, otherwise picture-writing and sylabic or alphabetie writing (according to whether the signs represent a whole syllable or only a single sound). The Chinese signs are read in colunns from top to bottom, the Mexican from botton to top. Ilebrew writing from right to left. Latin, Greek, Sanskrit, and all European languages from left to rigbt. In the Clinese system there is no alphabet, the characters being ideographic. Writing was introduced to the western nations by the Phoenicians, who based their system on the Egyptian one. The 'cuneiform 'writing was invented by the inhabitants of Claaldea, and adapted to several languages; and the Chinese system is of independent origin. The Egyptians had the hieroglyphic, hicratic (which tbe Phoenicians copied), and the encborial or demotic kind of writing. Writing was introduced into Greece between the roth and 7 th century B.C., and it spread as Christianity spread westward. The Saxon style prevailed in England in the early Middle Ages, then a combination of Roman. Lombardic, and Saxon-tben the Norman style, and Englisb court hand. Systems of sbortband are generally phonetic.
WYATT, SIR THOMAS, courtier and poet, was bom in ro3, and at the age of twelve went to St. John's College, Cambridge. Besides being a poet of no mean merit, he had the distinction of being one of the very few statesmen in Henry VIII.'s reign who combined real diplomatic ability with moral integrity. His son was a supporter of Lady Jane Grey.
WYCHERLEY, William, the dramatist, was bom about 1640, and was converted to Romanism by the beautiful Duchess de Montausier during an early visit to France, but on his return to England he became a Fellow-Commoner of Queen's College, Oxford, and retumed to the Protestant fold. He wrote "Love in a Wood" when he was nineteen, and "The Gentleman Dancing-Master" two years later, but both must have been written up to date after. wards, as they contain allusions to events sub. sequent to the yeurs 1659 and I66I. He became a great favourite with the infamous Duchess of Cleve. land and her friend the king; but neither his natural ability nor his favour in high places could keep hint out of debt, for which he spent many years in prison. Elis strongest-but also his coarsest-play was "The Country Wife, "and amongst the rest, "The Way of the World" and "The Plain Dealer" are conspicuously excellent. For the latter James II. paicl all the author's debts at the time, thus freeing him from the Fleet prison. and gave limm a pension of Ezo0 a year. Wycherley, wais much the cleverest playwright of the Restoration.
WYKEHAM, WILLIAM OF, the great ecclesiastic, was born in the reign of Edwarrl H1., and was employerl in the construction of the Ronnd Tower of Windsor Castle. He gave such satisfaction in this that he was made Surveyor of Royal Castles, and afterwarls; Keeper of the Privy Seal and Sccretary to the King, and 111367 he was made Bishop of Wincliester and Cliancellor of England. He began New College, Oxford, in 1380 and Winchester Scliool-as a feeder to the College-seven years later; and the rest of
his life and his large fortune we:e devoted to the rebuilding and decoratlon of Winchester Cathedral, in which he was buried. He was a great arclitect and it good man, but not a deep theologinn-liis creed leing practically summed up 1 h his fayeurite notto "Manners (i.c. morality) maketh man." He is best known as "the Father of the English public-schuol system,' in which he aimed first at conduct and then at scholarship; and he was the carliest and best of the 'Perpendicular ' style of architects in Lingland. (See Raligious Architecture above.)
WYndiam, Charles, the actor, was born in 1841, ande educated for the medical profession. Iİo made his first appearance on the stage with J. W. Booth in U.S. A., and afterwards fought in the Civil War. His first appearance In London was in 8868, and he took over the management of the Criterion Theatre in 2876. His most popular presentation is of "David Garrick."

Xavier, St. Francis, the 'apostle of the Indies,' was born in r506. He came under the influence of Ignatius Loyola, and was one of the first members of Loyola's Society of Jesus. In 1542 he was appointed papal nuncio in the Indies, where he worked as a missionary. He proselytized at Ceylon, Malacca, and the Moluccas, and visited Japan. He died in 1552 as he was starting for Clina; and he was canonized in 1621 .
Xenophon, the Greek historian and essayist, was born about 430 B.C., and he became an early disciple of Socrates. In 4or B.C. he joined (in no mulitary capacity) the Greek mercenaries under Cyrus the younger, and after the latter's death, the chicf Greek officers having been assassinated, Xenophon led the famous retreat of the io,000 through mountainous regions for five months till they reached Trebizond. This expedition forms the subject of his best-known work, the "Anabasis." He also fought in the war between Sparta and Persia, and, having sided against his countrymen at Coroncia, was banished to Scyllus, where he probably wrote most of his works. Besides the "Anabasis," he wrote " Cyropaedia " a political romance), the "Hellenica." and "Memorabilia."
XERXES, the great|Persian monarch of the fifth century b.C., was the son of Darius. In his famous invasion of Greece he crossed the Hellespont on a bridge of boats a mile long; and when the bridge was destroyed by a storm, he ordered 300 lashes to be given to the sea as a punishment ! His huge army of $2 \frac{1}{2}$ million men took a week to cross the bridge, and marched on unopposed as far as Thermopylae, where Leonidas and his 300 heroes $k$ ept it in check long enough to enable the Athenians to safely embark in their flet and make all preparations for tbe battle of 'immortal Salamis' (B.C. 480). His 1200 men-of war could not manoeuvre in the narrow straits, and the Athenians inflicted an overwhelming defeat on them. which saved Europe from Asiatic conquest. The remnant of the great host was annihilated in the following year at Plataea, and Xerxes himself was murdered in 465 B.C.
Ximenes, Francisco, the Spanish cardinal, was born in 1437. In 1492 he became Confessor to Queen Isabella of Castile, and in 1495 A rchbishop of Toledo, when he distlnguished himself as a reformer of ecclesiastical and monastic abuse. In 1516, at King Ferdinand's death, he became regent, during the absence of the former's grandson, Charles; but in 1517 Charles returned and dismissed Ximenes, out of jealousy. Ximenes founded the University of Alcala de Itenares, and spent much money on the fanous Complutensian Polyglot.

## Y

Yacirt. Tite word was first used in Elizabeth's time, and James 1. had one built for his son Henry; but the first yachting club was not established until 1720 in the United Kingdom. It was the Cork Harbour Water Club (now Royal Cork Yacht Club). In 18ra the Royal Yacht Squadron was established at Cowes, amd the Royal Thantes Yacht Club in 1823 . The Royal Northern Yacht Club was founded In the

Clyde in 1824, and the Royal Lastern Yincht Club in 1836. In the international contests between Ancrica ind Britain the former comutry lias been must successful.
Yale College is one of the oldest and inrgest of American universities. It was established in Connecticut in 17or, but was removed to New Haven in 1716 and clristened Yale College after Elihu Yale, a benefactor of the institution. It has four faculties, philosophy and arts (including a scientific and engineering school), theology, hiw, and medticine. Bishop Berkeley preseuted rooo books to the library in 1730; and Gcorge Peabody endowed its museum of natural history with 150,000 dollars.
YANKEE (a corrupt pronunciation of the French Anglais formerly current among American Indians) was the name applied by the British to all insurgents during the American Revolution; and during the Civil War was applied by the Confederates to the Federal soldiers. It is now sometimes misapplied by the British to natives of the United States, instead of to those of the New Eugland States.
Yams are the 'potatoes of the 'Tropics,' though the root looks much more like a carrot or a pirsnip than a potato. All the species are very full of starch, and most of then have a pleasant taste when boiled, though some are very unpleasant and even poisonous. In the U.S.A. the name 'Yam' is often given to the sweet potato, which is really a convolvulus.
YARROW, the much-sung stream, rises at the meetingpoint of the three counties of Peebles, Dumfries, and Selkirk, and joins the Ettrick, which is aimost equally famous in ballad poetry. It flows through St. Mary's Loch, and just above the loch stands ' Tibbie Shiel's hostelry.' The poets who have sung the beauties of the swirling stream, include Hogg, Scott, and Wordsworth.
YATES, EDMUND, the journalist, was born in 183I, and for 25 years was in the Post Office service, being employed for 10 years in the ' missing-letter depart. ment. He founded, with Grenville Murray, "The World" weekly newspaper in 1874, and became sole proprietor of it in 1875. He published his entertaining " Recollections" in 1884, during which year he was imprisoned for two months for a libel on Lord Lonsdale, and he has written a number of novels.
YAWNING is merely a modification of ordinary breathing, and, in moderation, is by no means an unhealthy exercise for the lungs. It is, however, sometimes a sign of indigestion, and it is very infectious.
YFAR. The tropical or civil year is 365 days, 5 hours, 48 minutes, and 49.7 seconds, and should not be called the solar year, though it is measured from the sun's appearance over one tropic to its return to the same tropic. The sidereal year, which is the period required for the sun to move from any given star round to the same star, is 365 days, 6 hours, 9 minutes, 9.6 seconds. (See Calendar above.)
YEAST is a vegetable growth to which fermentation is due.
Yellowstone National Park, is in the State of Wyoming, and is between 5000 and. 6000 square miles in area. It is famous for its geysers and its scenery, Including the Grand Canon and the Devil's Den. A number of wild animals, e.g. elk and buffalo, are preserved in it from extinction, and its forests are carefully preserved for the sake of the rainfall on the Great Divide.
YEOMAN, or 'villager,' was originally applied to any ordinary servant, but after the fifteenth century came to be applied to small freeholders of one grade below the rank of Franklin or 'Gentleman.' 'Their best representatives now are the small 'statesmen' of Westmoreland-a class of sturdy, narrow-ininded, astute farmers, who are fast dying out.
YEOMANRY CAVALRY was instituted during the wars of the French Revolutlon, when it included infantry, but all the infantry were disbanded after the peace of 1814-to reappear in after years as volunteers. Unlike the volunteers, the yeomanry can be called out at any time to aid the civil magistrates; and when serving, they are treated as regulars.
YEOAEN OT THE GUARD were originally a royal body.guard of old soldiers, chosen for their fine
appenrance, They were constitused a corps by Ilenry VIl., and their corps still wears the Tudor uniform. The officers ire a captain, a lieutenant, an ensign, a clerk of the cheque, four exons or 'police; and a number of quaintly naned non-comnissioned officers (messengers, bed-goers, bed-hangers, cic.) They have nothing to do with the Becfeater ' Guards of the Tower, though the latter are allowed to wear the Ycoman of the Guard uoiform without its shoulder-belt.
YEW-TREES live to an age of 400 or 500 years, but the 'thousands of years' clainied for the 'Darley Dale' and the 'Fortingal' yews is absurd. Yew wood was the favourite material for the grand old English bow, which won Crecy, Poictiers, and Agincourt, mainly because it could easily be kept dry in a case like an umbrella-case, while the French 'fiddle' or 'cross' bow could not. The idea that the red berrics of the yew are poisonous is incorrect; but the error is a useful one, as the 'seeds' are very poisonous.
YGGDRASIL is a Scandinavian corruption of the Christian Cross.
YOKOHAMA, previous to the opening of Japan in 1854, was a tiny fishing-village, and has now a population as large as that of Oldham, or Sunderland, or Cardiff.
YONGE, CHARLOTTE, the English authoress, was born in 1823. Her writings are well known, especially "The Heir of Redclyffe," "The Little Duke," "The "Daisy Chain," etc. Her other works are one on Chris. tian names, "Life of Bishop Pattison," "Cameos from English History," etc.
YORK, H.R.H., GEORGE, DUKE OF, was born at Marlborough House on June 3rd, 1865 , and entered the Royal Navy as a cadet in 1877, 'spending two years on board the "Britamnia" training-ship. In 1879 lie started in the "Bacchante" on a tour round the world, which lasted for three years. In r 883 lie was made midshipman to the "Canada" on the North-American station, and in 1885 was promoted to be lieutenant. In $18 g 0$ he was promoted to the command of the gun-boat "Thrush" on the West Indian station, and in that capacity presided at the opening of the Industrial Exhibition of that year in Jamaica. In 189ı he was made commander, and in 1892-by the lamented death of his elder brother, the late Duke of Clarence (aiways an unlucky title !) became heir to the throne. In 1893 on July 6 th, he was married to Princess Victoria Mary ('May') of Teck, by whom he has two sons; and the elder of them is conciliating petty national jealousies by a caravan ot names that includes the names of all the patron saints of the various nationalities of the United Kingdom-George, Andrew, Patrick, and David.
YORK, HOUSE OF, was united to the House of Lancaster when Henry VII, married the eldest daughter of Edward IV. The emblem of the Yorkists was a white rose.
YORK MINSTER is specially interesting because the Rolls in connection with its building have been so carefully preserved that we know the exact dates of the various parts. The first church on the site was built by Edwin ot Northumbria when he embraced Christianity, and was burned in 74 I A.D. It was rebuilt, but all except the central wall of the present crypt was again destroyed by fire during the Norman Conquest. The Early English transepts were built (by Archbishop Grey) about the time of 'Magna Charta,' and the nave about the time of Bannockburn. The Minster has been especially, unfortunate in the matter of fire, the worst fires having occurred in 1829 (an incendiary one) and in 1840. The Minster is 524 feet long, the nave is r40 feet broad, and the central tower is 216 feet high. Its greatest beauty, is its wonderful stained-glass of the 'Decorated' period.
YOSEMITE FALLS is only one out of a wonderful series of cataracts in the famous X'osemitë or "Grizzly"bear' Valley. The whole valley is 6 niles long and from $\frac{1}{2}$ mile to $x_{3}^{3}$ miles wide, and the granite crags rise iffmost perpendicular on eacli side from 3000 to 6000 feet. The Yosemite Falls consist of one direct plunge of 1500 feet, a broken cascade of $6=6$ feet, and
then another direct plunge of 400 feet. The 'Virgin's Tcars' I'all is roco feet, the "Bridal Veil' is 200 , and the 'Nevada' is 600 . All these are wonderfully grand aud beautiful, but need to be seen during or just after the rainy season to be really appreciated. In August and September they look cunparatively insignificant.
YOUNG, Brighast, Iresident of tho Mormon Church, was born in 801 in the United States. Ile became a Mormon in 183 , and preached the doctrine nctively, He was elected President when the Mormons settled in Utah, and his rule was successful. Ile died in 1877. (See MORMONS.)

IOUNG, EDWAKD, the author of ' Night Thoughts.' was born in 168r, and was educated at Winchester and Oxford, where he did not shine, though he was then, as always, in shameless toady. His first poem was the "Epistle," in 17 I2 the "Love of Fame" appeared about 17:5. and the "Night Thoughts" about 1742 -after the death of his wife, Lady Eliza. beth Lee. In 173i he made a partially successful claim to the estates of his friend the Duke of Wharton, and he had a pension from Sir Robert Walpole. Anong his other friends was the notorious Bubb Dodington, at whose house he saw a good deal of Voltaire.
YoU*G. JAMES, the chemist, was born at Glasgow in I8ri, and he studied it Anderson's College, Glasgow; and University College, London. While at chemical works in St. Helens and Manchester, he discovered a method of distilling oil from shale, by which he founded the mineral oil industry of Scotland, and led to the development of the petroleum industry in America and elsewhere. He cudowed a Chair of Technical Chemistry in Anderson's College, and died in 1883
YOUNG ENGLAND PARTY, THE, was formed about 1844 by Disraeli, after he had begun to oppose Sir Robert Peel's policy. Other members of it were Lord John Manners (now Duke of Rutland), Mr. George Smythe (afterwards Viscount Strangford), and Mr. Bailie-Cochrane (afterwards Lord Laming. ton). Its programme was the reconciliation of the aristocracy and the Church on one hand, and the people on the bther. Its principles were expounded in Disraelis " Coningsby " and "Sybil."
Young Men's Christian associations seem to have existed as early as the 17th century, for in 1632 some London apprentices had meetings at five o'clock on Sunday mornings for prayer and praise, and in 1678 a band of young men belonging to the Church of England was formed for common worship and for evangelistic work, and before the end of the century there were fully thirty similar societies.

The London Y.M.C.A. was founded in 1844, mainly by Mr. George Williams, and in 1845 the ' Exeter Hall Lectures were instituted. And the work spread so fast that in 1855 a general conference of European and American associations was held in Paris. Eventually, in 188 r . ' Exeter Hall was bought for $£ 25,000$, and became the headquarters of the movement.

In r8ge there were 846 centres in the United King. flom, with an aggregate membership of nearly 84,000; and at the same time there were 3361 centres in Europe. 1440 in America, 124 in Asia, 29 in Oceania, and 28 in $\Lambda$ frica, with an aggregate membership of nearly 350,000 Amongst the most famous members is Mr. D. L. Moody.
YOUNG WOAtEN'S CIIRISTIAN ASSOCIATION is a kindred society to the above, but quite n modern institution. having been founded as in entirely new movement in 1857. It has a membership now of over 100,000.
YUKON RIVER, along which the new klondike goldfields have been discovered, is formed by the junction of the Pelly and the Lewis rivers; and the gold deposits are about 100 miles inside the Canadian boundary.

In this modern El Dorado one shovelful of 'dirti' has brought as much as is shillings worth of gold with it, and though such extraordinary returns are few, the ricliness of the field is quite beyond doubt. The gold is found not only in the bed of the riyer, but in great veins of quartz, from so to 30 feet wide,
which seem to be seattered all over the Klondike district.

The difficulty of reaclaing the gold-field is, however, very great, and the necessities of life are frightfully expensivo. The two routes usually adopted are by the river itself, and by the Chilkoot Pass. Occan steamers ply to the mouth of the river, where a sternwheel steaner is waiting twice ln the season to carry passengers up to the gold centres-which are about three weeks' journey up the river, The Chilkoot Pass is reached from Juneau City, which is on the I-ynn Canal, and is being neglected now in favour of its neiglubour the White, which is easier, though a little Ionger. Whichever pass is chosen, the destina. tion desired is a tributary of the Yukon, on which there is boat or canoe traffic for 700 miles down to the gold-fietd.

The mistaken iden that Klondike was in 'Alaska, U.S.A. has been successfully contradicted; but the equally incorrect idea that Klondike is in British Columbin is still very prevalent. It is really in the Yukon district of the North-West Territory.
The region was explored ten years ago by Dr. Dawson of the Dominion Geological Survey, and was found to be giving from 3 to 100 dollars a day to the few scattered miners, the latter sum being got along the Stewart River and along the Forty-Mile Creek.

The discoverer of the Klondike (or Trondec) field was a miner called George Carmack, the original find being on Bonanza Creek, which gave 3 dollars to the pan. Since then much better returns have been got, one actually exceeding 14 dollars, and 5 to 7 dollars is quite common.
At present the whole of the outlying region is practically deserted for the Klondike centre, but there is very little doubt that the whole country is richly aurferous; and the enterprising few who are buying up claims dirt-cheap, especially along the Stewart and the Cassiar, will assuredly not come out of the business worst off.
IULE, SIR HENRY, the Oriental scholar, was born in 1820, and entered the Bengal Engineers in 1840. He was a member of the Ava Mission in I855, and was employed during the Mutiny in maintaining railway communications up the Ganges Valley. He was on the Indian Council from 1875 to 1889 , and was a President both of the Hakluyt Society and of the Royal Asiatic Society. He wrote and edited a num. ber of books, including an "Anglo-Indian Glossary,"

## 2

ZABISM was a name-said to be derived from one Zabi, a supposed contemporary of Abraham-given to a variety of religions in the early centuries after Christ. Its members were not Jews or Christians or Muhammedans, but held some of the Neo-Platonlst doctrines; and the name was adopted mainly in order to avoid persecution. Many Zabians were very famous in all branches of early knowlecige.
ZADKIEL was the name assumed by Richard James Morrison when he started his "Astrological Annual" in 1830 . He had been in the Royal Navy, and was a Hebrew and astronomical scholar. He died in 1874.
ZAHN, THEODOR, the great Biblical scholar, was born in 1838 , and has written some very famous books, mainly devoted to Biblical criticism. Amongst the most important are, "Forschungen zur Geschichte des Neutestamentlichen Kianons" and "Geschichte des Neutestamentlichen' Kanons."
Zama, Battle of, was the final blow to Carthago in the second Punic War. The Roman gencral Publius Cornelius Scipio, who had been so successful in Spain, invaded Africa, and thus obliged Hannibal to cvacuate Italy in order to hurry home for the defence of Carthage, with the result that Sciplo completely defented him at Zama in 202 B.C. Peace was mado forthwith, and Carthage gave up all her possessions outside Afric, and pledged herself not to engage in any war without the consent of the Roman Sennte. That is to sny, the Semitic race had failed to wrest the Mediterranean from the Aryan.
Zamelda, Giacomo, the Italian poet, was horn in 1820, and entered the priesthood; but his genius wis literary, and in 1866 he was clected to the Professor.

Ship of Italian Literature in the University of Padua, Ile was one of the very fewreal lyric pocts of modern Italy, and yet was thoronglaly in touch with the scientific spirit of the age, as may lee seen in his fanous pocm, "La Concliglia Iossite." Ite died in 1888.

Zangwill, ISRAEL, the novelist, wats born in 8864 , and at the age of nine went to the Jews' Free School at Spitalfields, where he had a brilliant career, both as pupii and as teacher. Eventually he devoted himself to literature, publishing "The Premier and the Painter" in 1888, and founding "A riel" in $\mathbf{8 8 9 0}$. Among his most popular novels are, "The Chilliren of the Glietto," which appeared in 189z, and "The Master," which was three years later. He has also made a considerable success of his "Without Prejudice" causeric in the "Pall Mall Magazine."
ZANZIBAR SLAVE TRADE, about which so much virtuous, but rather misguided, indignation has becn passed on that prince of colonizing villains, John Bull, is extinct; but. of course, slaves are still to be found both in Zanzibar and in the Island of Pemba. The revenues of both the islands are practically derived from a single crop-cloves; and this is a crop which is unusually risky to cultivate, and which is rather a luxury than a necessary. The labour on the plantations at present is done entirely by domestic slaves; and, as these die off, the Arab proprietors cannot procure fresh supplies from the mainland without the greatest difficulty and danger-owing to the British cruisers, and they have no ready money with which to hire labour elsewhere. The result is that labour is becoming very scarce, though the existing slaves are passed on, by inutual agreement between the proprietors, from plantation to plantation. As a matter of fact many plantations which might yield a most profitable crop are being allowed to run to seed, others are only half picked, and much valuable land has already gone actually out of cultivation.
ZEBRA is really a striped ass, though the Quagga species has some points of closer resemblance to a horse. The true zebra is a highland animal, and can climb like a goat. It has been tamed and driven in harness, e.g. by the Boers, but its temper is very uncertain ; and as its senses of sight, surell, and hearing are marvellously acute, it is an extremely difficult nimal to catcl, even on lowland plains. The stripes are black and a silvery white.
ZEBU is a kind of ox very sinilar to the ordinary ox, except for the hump between its shoulders, and is often called 'the Brahnin ox.' The size of the hump varies very much, being as much as 50 lbs . weight in well-fed animals that do no work, and the flesh of it is considered a great delicacy by Europeans in Inclia. The animals are used for draught and for burden, and can travel, on the average, about 25 miles n day. In the recent French canpaign in Madagascar it was found that neither horses nor mules could be used for the field-guns, because of a smanll insect-called ' carapetes'-which inserted itself between their skiu and their flesh, and then tortured them into a state of complcte exhaustion. In the emergency it was found advisable to import herds of the zebu, which were trained to the gun-work within four or five weeks, and which proved extremely satisfactory, as they are very quiet and teachable, and-like the Irish donkey-seem to have no nerves.
ZECHARIAH, the Jewish priest, was born in Babylonia during the Captivity and accompanied the first band of exiles who were allowed to return to Palestine. It was his prophetic zeal that stirred up the Jews to complete the restoration of the temple. The book of the Bible which benrs his name is only partly by him, all after chapter eight being by different and probably later hands. The ninth, tenth, and eleventh chapters are much older than the twelfth, thirteenth, and fourteenth, and nay even be older than the first eight chapters.
ZELLER, EDWARD, the theologian and philosopher, was born in $\mathbf{8 r} 4$, and eventually became Professor of Theology in the University of Berne in 1847 , but was transferred in 1862 to the Professorship of Philosophy in the University of Ileidelberg. He was the son-in-
law and philosophic disciple of Baur, and is best known in the United Kingdom for his great work ou Greek Plilosoply, which has been translated into English in various prirts. He also lield professorships at Narburg and Berlin.
ZENANA is that part of a house reserved exclusively for the women in a family of good caste in India.
ZEND-AVESTA is the collective name for the sacred writings of the I'arsees, ascribed to Zoroaster, and reverenced as a Bible, prayer book, and sole rulc of faith and practice. The oldest part of the book is written in the Zend language, consisting partly of gathas, or songs, whicla may contain Zoruaster's own words, and do contain his doctrines. An Englisl2 translation of the Zend-Avesta has been published.
ZENITH is the vertical point of the heavens at any place, or the point right above a spectator's head, and from which a line drawn perpendicular to the plane of the horizon would eventually pass through the earth's centre, supposing the earth to be a perfect sphere. Therefore, each point on the earth's surface has its corresponding zenith.
ZENO, founder of the Stoic sclool of philosophy, was born in Cyprus about the beginning of the 3rd century b.C. He settled and taught in Athens, in the Stor, a porch adorned with the picturcs of Polygnotus, whence lis followers were called Stoics or 'disciples of the Porch.' His writings are all lost ; but in his ethical system the nature of moral obligation was recognized as unconditional, virtue the ouly good, and vice, not pain, the only evil. Developed by Zeno's successors, Stoicism became the creed ot the noblest of the Romans, until Christianity was generally accepted.
ZENOB1A, Queen of Palmyra, was the wife of King Odenathus, and accompanied liun both in war and in the chase. Galienus, in return for his services, acknowledged Odenathus as Emperor ; so, when lier husband was murdered in 267 A.D., Zenobia conquered Egypt, and called herself Queen of the East. Her ambition roused the Emperor Aurelian against her, and after a stubborn resistance, she fell into his power (273 A.D.), and was made to grace his triumph. She passed the rest of her life as a Roman matron. She was courageous, beautiful, and a good linguist.
ZERO, in Physics, is ally convenicut point. with reference to which plienomena of the same kind (quantitatively estimable) are compared, e.g. the point of a graduated instrument at which its scale begins, or the neutral point between an ascending and descending scale, generally marked o. In thermometers the zero of the Centigrade and Réaunur scales is the freezing-point of water, and in Falirenheit's scale $32^{\circ}$ below the freezing-point of water.
ZEUS, in Mythology, the supreme divinity among the Greeks, and the ruler of the other gods, treated as the equivalent of the Roman Jupiter. He was the son of Cronos and Rhea, brother of Poseidon (Neptune) and Fera (Juno), who was also his wife. He expelled his father and the dynasty of the Titans, defeated the attacks of the giants and the conspiracies of other gods, and became chief power in heaven and earth.
ZEUXIS, the celebrated Greek painter, lived about $420-$ $400 \mathrm{~B}, \mathrm{C}$. in Eplesus. He belonged to the Asiatic school, of which the distinguisling points were accurate imitation and the representation of plyysical beauty. One of his most famous works was his picture of Helen of Troy.
Zieten, Hans Joachim von, the great Prussian general, was born in 5699 , and entered the scrrice at the age of fifteen. He retired from it for two years, in $\times 724$, and was dismissed from it for another two years--owing to a quarrel with his captain-in 1728 , hut from 1730 onwards his career was unchequered. When he became colonel of a hussar regiment in 174I, he began to introduce a number of great inprovements, which were adopted throughout the light cavalry. His first great exploit was a splendid 'raid 'into Bolheuia in 1744, ending with his victory at Moldau-Tein, and this was far surpassed by his conduct at Holienfriedeberg in the following year. This was the beginning of a series of brilliant actions, including the battles of Prague, Cullin, Leuthen,

Liegnitz, and Torgau. He was made General uf 6 Cavalry on the battlefield of Liegnitz. He seemed to havo a charmed life, and lived to the goud old age of 87 in Berlin, where old linther Zleten' was a great favuurite with every one, from the king onwards.
ZntBasye Rutns in Mashonaland are the chief of a series of similar ruins along the Sabl river. They are 3000 feet above the sea, and cunsist of a large build. ing in the form of an ellipse--280 feet long, with walls 35 feet high and r6 feet thick-with outworks cxtendhill, own into tho valley and up on to a nelghbouring constructed somewhat on the lines of a maze. Tho place seenis to have been a depôt for troops engnged in the protection of the gold miners, of whose work there are still innumerable traces. There have also been found on the spot objects of art and religion, both quite foreign to Africa, so that Mr. Theodore Bent, who explored the place thoroughly in r891, considers that the ruins belong to a very early A rabian settlement. An ingenious and plausible attempt has been made to identify the place with the Ophir of King Solomon's time.
Ztat3tERJAN. RITTER VON, the philosopher, was born in 1728 , and first attracted attention by his treatise, "On Irritability." He eventualfy became town doctor at Bruge, when he published his most popular work, "On Solitude." It was an immensely overrated book, but was so popular that it was translated into nearly every European language. He attended George I11, of England and Frederick the Great of Prussia. 1
ZINC was originally used for little else than making brass (an alloy of copper and zinc), and though the ore was used with copper by the Romans under the form of calamine, the metal was not differentiated till the time of Paracelsus. Early in the present century it was discovered that zinc could be made quite fit for manipulation by machinery, simply by being heated to a temperature of about $300^{\circ} \mathrm{F}$; and since then the metal has been used by itself, as well as in alloys, for all sorts of purposes-roofing, baths, statuettes of 'imitation bronze,' etc.; but its use in all these connections is mainly as a 'cover' for iron -i.e. galvanizing.
ZISKA, JOHN, leader of the Hussites, was born about I36o in Bohemia He joined the Knights of the Teutonic Order as a volunteer, and fought against the Poles, and with the Hungarians against the Turks. He is also said to have fought on the English side at Agincourt. He threw in his lot with the militant reformers who took up arms after the martyrdom of Huss and Jerome, and he became their leader, establishing himself at Mount Tabor, which he fortified, and where his followers grew up, thereby winning the name of Taborites. He hạd been blind in one eye from boyhood, and lost the other at the siege of Raby, but he directed operations, and his forces defeated a powerful imperalist army at Deutschbrod. He died from the plague in $5 \$ 24$
ZITHER is the corrupted form of the word 'cithara, and Is really the old cithara. It is still common in the Tyrol. The player's thumb is often 'armed' with a metal plectrum to bring out the melody. Its sound is very clear and yet sweet, and is heard to great advantage over water.
zoDIAC is an imaginary belt or zone in the heavens, extending ahout $9^{\circ}$ on each slde of the ecliptic, and it is divided into twelve equal parts, which are the 'signs.' The ancients marked it as distinct from the rest of the heavens, because the apparent places of the sun, moon, and known planets were within it. This is not true, however, of all the planets.
ZOLA, ExttLE, the French novelist, was born in 1840, and was the son of an Italian engineer. He first became known in 187x, when he started his famous series of novels, entitled "Les Rougon Macquart. Histoire Naturelle d'une Famille sous le Second Empire." English translations of several of these novels are forbidden to be sold, they are so coarsely realistic: but one, "L Assommoir" (portraying the evil results of drink), was dranatized by Charles Reade under the title of "Drink." Other novels of

Zola's are, "La Terre," "La Béte Humaine, otc., all written in the same style.
ZOLLVEREIN, the German customs union and precursor of the present Germas Kinpire, wis tounded in 1827. Its chief object was the establishnuent of a unifurm rate of custonis duties throughout the states joining the union, The territuries of the Zullverein coincide with those of the German Enipire now, and include Luxembourg also.

The German princes had been deposed by Napoleon, but were set up at the iPcace of Vienna, and promised to institute constitutional government. This promise was universally ignored or forgotten, but the national spirit tended towards union, and this tendency was very much strengthened by the progress of Prussia. Frona I8ı8 Prussia began to beconte a definite commercial centre for the various German states, and thus the centre of a commerclai union between these states. This union was called the Zollverein; the members of it undertook to levy no duties on any kind of merchandise passing from one to another, though they all levied duties on the common frontier; and by degrees most of the states joined lt.
ZONES OF THE EARTH are divisions corresponding to the distribution of the sun's heat over the surface of the earth; for the warmth of the sun's rays varies with their direction. A vertical ray is hotter than a sloping one-for two reasons: it is more concentrated, and it passes through less atmosphere. Thus, the only part of the earth that ever gets the rays of the sun quite vertical lies between the parallels of $231^{\circ} \mathrm{N}$. and $232^{9}$ S., and the space thus enclosed is the Torrid Zone. Again, owing to the inclination of the earth's axis, one or other of the earth's poles is in shadow the whole of the twenty-four hours of rotation up to $232^{\circ}$ from the pole. Between the Polar Zones and the Torrid Zone come the two Temperate Zones.
zoological Garden in Regent Park, London, was founded in 8828 , and is probably the finest of the kind in the world. It belongs to the Zoological Soclety of London, of which Sir Huinphrey Davy and Sir Stamford Raflles were promoters, and which was founded in 1826. The Jardin des Plantes in Paris is the oldest zoological garden. It was founded in 1794.

ZOOLOGY is the science of animal life, and is the sister science to botany, the science of vegetable life, the two together forming biology. It first took definite shape with Aristotle, who studied both the morphological and the physiological sides-i.e. both the forms and the habits of animals, of which he seems to have known some 500 species, With the Renaissance the study was taken up again, especially by Edward Wotten in England, and from the time of Buffon it has been a real science. The great names in its development are Linné, Cuvier, Huxley, Haller, Hunter, etc.
ZOROASTER, one of the great religious teachers of the Enst, founded what was for centuries the national religion of Persia, and which is still adhered to by the Parsees. He was probably a native of Iran, if he actually lived, which some people do not believe; but it is not known when he lived, though he probably did exist. His doctrines are found in the Parsee scriptures, called the Zend-Avesta (which see) and the 'Gathas' (songs) are said to contain his real utterances. The fundanental idea of his doctrine was the existence, from the first, of a spirit of good, Ahurô Mazdaô (Ormuzd) and is spirit of evil, Angrố Mainyush (Ahriman). These two are in perpetual conflict over the soul of man; but Ormuzd vilt ultimately triuntph. The religion of Zoronster, wien it becane that of Iran, was expounded by a priesthood, and a ritual and ceremonial was laid down by the priests. Marion Crawford's book "Zoroaster" gives a description of the service.
Zovaves were originally mercenaries belonging to a Kabyle tribe, When Algeria becane a French possession, the Zouaves in the pay of the Dey of Algiers were incorporated with the French army thers, preserving their Arith clress; but ultitnatcly the native element was eliminated, and they became merely lirench soldiers in the Arab costume, As
such they distinguished themselves in the Crimea and the l'ranco-ltalian War of 1859.
ZULUS are a branch of the Bantu family, of which they are the finest and the bravest, physically and nentally. They aro very free from all kinds of inmorality, and very seldom harbour revenge against one another. Their constitution is defuitely democratic, and their legal code-though unwritten-is very complete and miversally known. They were practically consolidated into a nation at the beginning of this century by Fheir great clief Tshaka, who conquered the whole of Atrica from the Zambesi to Cape Colony. Cetewayo succeeded to the chieftanship in 1874, and annihilated a column of the British army at 1sandula on January 22, 1879, but-after Rorke's Drift-was himself beaten at Ulundi. He died in 1884 , and Zululand was annexed by the Britisli in 1887.
ZUMPT, KARL, the philologist, was born in 1792, and died in 1849. He wrote and edited a number of books, mainly on classical subjects, the most important being his " Lateinische Grammatik."
ZUTPHEN, BATTLE OF, at which Sir Philip Sidney was killed, was fought on October 2, 1586.
ZWINGLk, ULRICH, the Swiss reformer, was born in the canton of St. Gall. He learned the evangelical doctrines, which he afterwards preached so successfully, from his teacher and friend, Thomas Wyttenbach, a reformer before the Reformation. His first overt revolt against the Romanist system was when he was a priest at Einsiedeln (1516), whither pilgrims resorted to a miracle-working image of the Virgin. He denounced the superstition of pilgrimages so effectively that his sermons were discussed in Rome, and, it is said, that he was offered promotion as a bribe for his silence. In 1518 he became preacher in Zürich Cathedral, and eventually made the place
thoroughly Protestant. In 1528 he had a resultess confercuce with Luther and Melanchthon on the doctrine of Transubstantiation, which he repudiated. In 153I the Forest Cantons (having adhered to the Rouish faith) made war upon lim, and he was mortally wounded in an engagement near Zurich. laving accompanced his troops as chaplain.
ZUYDER ZEE RECLAMATION SCHEME is a scheme for reclaiming from the sea an area of about 450,000 acres at present included in the Zuyder Zee. The estinated value of the area is between twenty-five and thirty million pounds sterling, and the estinated cost -including compensation to the fishermen and the necessary defences-is very nearly as large. It is calculated that the work will take about thirty years to complete; and the main item in it is a large dyke from the Helder to the nearest point on the Friesland coast. This dyke will measure about 30 miles in length, about 155 feet in breadth at the base, and nearly 20 feet high; and it will probably take nine or ten years to build.

The Zuyder Zee is so shallow that it is practically of no use for navigation, and there is a canal direct from Amsterdam to the Helder for vessels going to the Baltic. In fact, the Zuyder Zee is simply an encroachment of the sea, dating only from the 1ath century, when some very high tides seem to have broken through the little isthmus of sand which separated the fresh water of Lake, Flevo from the salt water of the North Sea. The Dollart Zee was formed in exactly the same way in 2277, and is also being reclaimed. Indeed, it is estimated that since the 13 th century considerably more than 2000 square miles of Holland have been submerged in various ways, but at least 1500 square miles have been reclaimed. The motto of one of the provinces is
"I strive, and keep my head above water."

Words of same Meaning and their Opposites

Let me press upon you the many advantages to be derived from the habit of distinguishing Synonyms. The great masters of style in every tongue, pause to discriminate between the words they are using. How much care and labour, how much subtlety of thought they have counted well bestowed on the operation; how much importance do they avowedly attach to it; not to say that their works, even where they do not intend it, will be a continual lesson in this respect. A great writer merely in the accuracy with which he employs words will always be exercising us in synonymous discrimination.-Archbishop Trench.

## FROPORTION OF ANGLO.SAXON WORDS

 USED BY OUR CHIEF ENGLISH AUTHORS.Shakspeare uses 85 p. c. of A.S., is of other words.

| Milton | " | 8 r | " | " | 19 | " |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Cowley | " | 89 | " | " | 11 | - |
| English Bible | " | 97 | " | " | 3 | - |
| Thomson | " | 85 | $\cdot$ | " | 15 | " |
| Aldison | , | 83 | " | " | 17 | $\cdots$ |
| Spenser | " | 8 r | " | $\pm$ | 19 | $\cdots$ |
| Locke | $\checkmark$ | 80 | " | , | 20 | $\cdots$ |
| Pope | " | $7^{6}$ | " | " | 24 | 0 |
| Young | " | 79 | " | " | 21 | " |
| Swift | " | 89 | " | " | 11 | " |
| Robertsen | " | 68 | $\cdots$ | " | 32 | " |
| Hume | " | 65 | $\cdots$ | " | 35 | $\bullet$ |
| Gibbon | $\cdots$ | 58 | * | $\square$ | 42 | - |
| Johnsor | - | 75 | * | $\bullet$ | 25 | $\sim$ |

It has been reckoned that the agricultural labourer uses about 1500 words, but this is probably an overestimate. Intelligent artisans have a vocabulary of 4000 words, while educated persons are familiar with, if they do not use, 8000 to 10,000 words.

## Rules for Spelling.

1. A word of one syllable, ending in one consonant preceded by one vowel, doubles its final consonant before a suffix beginning with a vowel: Blot, blotting, blotted; swim, swimmer, swimming; man, manned, manning.
Words ending in $x$, whicb is a double letter, are not included in this rule.
Exceptions.-Gas gases; cbar (to work), chared, charing.
2. A word of two syllables, with accent on the second syllable, when ending in one consonant pre. ceded by one vowel, doubles the final consonant before a suffix beginning with a vowel: Repel, repelled, repelling; begin, beginner, beginuing ; forbid, forbidden, forbidding.
This rule does not apply when, on the addition of any suffix, the accent of the dissyllable shifts to the first syllable: Couference, deference, deferential, iníerence, preference, reference, transference, etc. On the other hand, we spell conferred, conferring, deferred, deferring, etc., the accent being on the second syllable.
3. A word ending in a single consonas.t, but not accented on the last syllable, or ending in more than one consonant, or ending In a consonant preceded by more than one vowel, does not double the last letter before a suffix: Alter, altering, altered; blind, blinded, blinder: appeal, appealed, appealing.

Exceptions.-Acquit, acquitted, acquitting ; coquet, coquetted, coquetting ; quit, quittal, quittance, quitted, quitting; worship, worshipped, worshipping, worshipper.
4. A word ending in a single 1 doubles the 1 before a suffix beginning with a vowel: Wool, woollen, woollens ; travel, traveller, travelling; gambol, gambolled, gambolling.

Ėxceptions.-Parallel, paralleled: equal, equalise, equality; signal, signalise; peril, perilous; annal, annalist; feudal, feudalism; fossil, fossllised; herbal, herbalist; journal, journalist ; legal, legalise, legality; moral, morality; mortal, mortality ; regal, regality; scandal, scandalous; social, socialist : total, totality; civil, civilise, civility; symbol, symbolical, symbolise ; devil, devilish ; alcohol, alcoholism ; idol, idolatry.
5. A word ending in e drops that letter before a suffix beginning with a vowel: Please, pleasure, pleasant; serve, servant, service, serving ; fine, finish; love, loving.

Exceptions.-A word ending in ee or ge retains the e before able and ous: Notice, noticeable; peace, peaceable; change, changeable; outrage, outrageous; courage, courageous. On the other hand, we have practice, practicable.

Singe and swinge retain the final e before ingsingeing, swingeing-to clistinguish them from singing and swinging.

Words ending in ee, oe, ye also retain the final e before ing: Fee, feeing ; hoe, hoeing ; dye, dyeing.
ie changes into $y$ before ing: Die, dying; tie, tying: vie, vying. Yet we have lie, hieing,

## FORMATION OF PLURAL NOUNS.

Nouns or names generally form the plural by adding s , as boot, boots; hat, hats. But-
(x) Nouns or names ending in ch, sounded soft, $x, z$, s , sh, also in i and $o$, preceded by a consonant, take es after them to form the plural, as in cluurch, churches : box, boxes; topaz, topazes; glass, glasses ; brush, brushes; alkali, alkalies; calico, calicoes.
(2) Nouns or names ending in 0 or 00, preceded by a vowel, and the words canto, grotto, duodecimo, junto, memento, octavo, portico, quarto, solo, and tyro takes after them to form the plural, as cameo, cameos; cuckoo, cuckoos; folio, folios ; bamboo, bamboos.
(3) The following nouns change $f$ into $v$ before taking es to form the plural: calf, elf, lualf, leaf, loar, self, sheaf, shelf, thief, wolf $=$ calves, elves, halves, and so forth. But knifc, life, wife change finto $v$ and take 9 only to form the plural, as in knives, lives, wives.
(4) Nouns ending in $y$, preceded by a consonant, change the $y$ into $i$ before taking es, as in arny, armies; spy, spies. luut $y_{1}$ preceded by a vowel, takes s only, and retains the $y$, as in boy, boys; toy, toys; chimney, chimneys; except soliloquy, soliloquies; collotyuy, colloquies.
(5) Some compound nouns form the plural by adding s to the first part of the word: Sing., aide-de.camp, Plurul, aides-de-camp; commander-in-chief, com-manders-in-clief; court-martial, coúrts-martial ; dauglı-ter-in-law, daughters-in-law ; sergeant-1najor, sergeantsmajor.
(6) Some nouns form their plural by adding the Saxon termination en, or by changing the vowels: Sing., child; Plu., children; ox, oxen; foot, feet; mouse, mice ; tooth, teeth ; goose, geese; man, men ; woman, women.
** All compounds of man take men in the plural, except Mussulman, Mussulmans; Turkoman, Turkomans ; Brahman, Brahmans ; German, Germans; Norman, Normans.
(7) Several nouns have two plurals: Sing., brother, Plu., brothers, bretlıren ; cloth, clotlis (difterent klnds), clothes (articles of wearing apparel); die, dies (stamp for making impressions) ; dice (sniall cubes used in gaming); penny, pennies (single coins); pence (amount or quantity).
(8) The following nouns form their plurals according to the rules of the language to which they belong: (a) um or on is changed into a in the plural : sing., addendum, Plu., addenda; animalculum, animaicula; arcanum, arcana; automaton, automata; criterion, criteria; datum, data; desideratum, desiderata ; dictum, dicta ; effluvium, effluvia; encomium, encomia; ephemeron, ephemera; erratuin, errata ; ganglion, ganglia; medium, media; memorandum, memoranda [in business circles memorandums]; momentum, momenta; phenomenon, phenomena; speculum, specula; stadium, stadia; stratum, strata.
(b) Is changes into es in the plural, and $x$ into ces: Sing., amanuensis; Plu., amanuenses ; analysis, analyses; antithesis, antitheses; appendix, appendices; axis, axes; basis, bases; crisis, crises; ellipsis, ellipses ; emphasis, emphases; hypothesis, hypotheses; metamorphosis, metamorphoses; oasis, oases; parenthesis, parentheses; radix, radices; synopsis, synopses; thesis, theses.
The following change ex into ices in the plural: Sing., apex, Plu., apices; index, indices; vertex, vertices; vortex, vortices.
In the following the plurals are formed by des and ges: aphis, aphides; apsis, apsides; clirysalis, chrysalides; ephemeris, ephemerides; iris, iricles, or irises; phalanx, phalanges, or phalanxes; sphinx, sphinges, or sphinxes.
Latin words ending in us are changed Into $i$ in the plural: calculus, calculi ; focus, foci ; fungus, fungi; Ignis fatıus, ignes-fatui ; magus, magi ; nucleus, nuclei ; radius, radii ; stimulus, stimuli ; terminus, termini ; tumulus, tumuli.
And latin words ending in a are changed into $x$ in the plural: aurora, auroræ; formula, formulæ; larva, larve; lamina, laminæ; macula, maculæ; minutia, minutiæ; nebula, nebulæ; pupa, pupæ.

## Some Common Eprors to be avoided in Writing.

Acknowledgment, not acknowledgement.
Afraid, not affraid. Agreeable, not agreable.
Allege, not alledge. Always, not allways.
Ambidextrous, not ambidexterous.
An is incorrectly used before words beginning with $h$, when it is distinctly aspirated, as in hall, harangue, hero, hercic, history, historical, historian, house, hypothesis, heraldic, etc. It is correctly used before words in which the initial $h$ is silent, as in heir, herb, honest, honour, hostler, hour. It is not correct before words beginning with eu, as in European, and $u$, as in union-a house, a history, a useful thing; an heir, an honest man.

Ante = before, is to bo distinguished from anti =a
against. Thus: antediluvian, antecedent ; antichrist antipodes, antidote.

Apostasy, not apostacy. Arctle, not artic.
Auxiliary, only one 1 .
Aye, meaning always, for ever.
Battalion, two t's and one $L$.
Ay, meaning yes.
Balance, only one $L$ Bellef, not beleif.
Best and Better slionld be thus used: "This is the best of the three " ${ }^{\text {" " This is the better of the two." }}$

Blamable, not blameable; but blemeful, blame. worthy.

Blissful, only one 1.
Breech, of a gun ; Breach, in a wall.
Brief, not breif.
Celling, not cicling.
Britamua, only one $t$.
Chief, not cheif.
Chargeable, not chargable.
Controvert, not contravert. Door-jamb, not Jam
Dose, a prescribed quantity of medicine.
Doze, a light slumber. E'er, contraction of ever.
Envelop, to wrap round : envelope, cover of letter.
Ere, meaning before. Faithful, one 1.
Farewell, two l's; but only one in welfare.
Farther, not further (though often used).
Field, not feild.
Fiend, not feind.
Fulfi, but=fulfiling. Handfuls, not handsful.
Illegible, not illedgable.
Inclosure, preferable to encle su'e.
Inquire, not enquire. Inseparable, not inseperable.
Irrelevant, often mispronounced irrevelant.
Longwlse, not longways. Lest, in case, not least.
Misspell, not mispell. Mistakable, not mistakeable. Mouldy, not moldy. Negotiate, pref. to negociate.
Neither and nor; is and are; was and were: "Neither man or woman are capable of perfectlon in this world" should be "Neither man nor woman is capable" and so forth. "Neither John nor James were at the concert" should be "Neitber John nor James was at the concert." Slr Walter Scott, in his hurriedly-written Waverley Novels, often errs in this respect. For example, in the secand chapter of "The Abbot," near the end, Henry Warden is represented as saying: "Neither husband nor wife, neither son nor daughter, neither friend nor relation, are lawfully to be made the objects of our Idolatry." The words hero printed in italic should be, of course, is and object

Niece, not neice.
Nightfall, two l's.
Nowise, not noways.
Only, this word is scldom in its proper place, both in writing and speaking. Thus: "He ouly walked a mile" should be "He walked only a mile": "only walked" might mean that he aid not run or ride. "Mr. Blank only spoke a few words" sbould be "spoke only."

Or, a very common error is the expression "seldom or ever," which should be "seldom if ever."

Pailfuls, not pailsful.
Parallel is often misspelled paralell.
Practice and practise are often misused : practice is a substantive, as "a bad practice," and practise, a verb, as "to practise benevolence."
Precedent, an authorised example; and president, the head of a state, society, etc., are frequently con. founded.

Privilege, not priviledge.
Prophecy, a prediction, a foretelling of an event; and prophesy, to predict, or foretell an event.

Quarrel, not quarell, or quarrell.
Raze, to level a wall or building with the ground, has the opposite meaning of raise, to elevate, or lift up.

Recall, not recal.
Reins, for guiding horses, must not be written rains:
Relevant is often mispronounced revelant.
Repel, not repell.
Retrieve, not retreive. Roonkul, onel.
Rotary, not rotatory. Seize, not sieze.
Separate, not seperate.
Serjeant, not sergeant, a legal dignitary, a non-commissioned officer in the army.

[^0]Subtraction, not substraction. Tallness, not tahess, That kind. "He is one of those kind of men" should be "that kind."
Try to. "Try and come to-morrow" should bo "try to come."
Enrol, not enroll.
Vermilion, not vermillion.
Welcome, not wellcome.
Useful, not usefull.
Waygon, not wagon.
Whatf, plural, wharfs, not wharves
Whether or no, should be whether or not.
Whom. "Who is that for?" "Who did you give 1: to ?" should be "Whom," etc.
Whooping-cough, uot hooping cough.
Wield, not weild.
With. "He is a wealthy man in comparison to me" should be "in comparison with me."
Woeful, not woful.
Yield, not yeild.
Yours truly, not your's truly.
Shall and Will.
These words are often wrongly employed, both in couversation and writing, especially by natives of Scotland, and the following rhyme may be useful:

In the first person, simply shall foretells ;
In will, a threat or else a promise dwells; Shall in the second and third does threat; Will inerely then foretells the future's fate.

## Words having the same Sound, but different Spelling and Meaning.

* To many persons wbo may not be acquainted with the signification of every word in this list, it would prove a useful as well as interesting exercise to go over it with the help of a good Dictionary.

$\dagger$ The Duke of Saxe-Coburg relinquished $£ x 5,000$ on Ils accession to the German principality.

## Table of Precedency.

THE SOVEREIGN. The Prince of Wales. The Queen's Younger Sons. Grandsons of the Sovereign. The Archbishop of Canterbury. The Lord High Chancellor. The Archbishop of York. The Lord President of the Council.

The Lord Privy Seal.
Tbe Lord Great Chamberlain. The Earl Marshal.
The Lord Steward of Her Majesty's Househoid. The Lord Chamberlain.
The last four rank above all Peers of their own degree. Dukes according to their Patents of Creation:-1, Of
England; 2, of Scotland ; 3, of Great Britain; 4, of Ireland; 5, those created since the Union.

Marquises, according to their Patents, in the same order as Dukes.
Dukes Eldest Sons.
Earls, according to their Patents, in the same order as Dukes.
Marquises' Eldest Sons.
Dukes' Younger Sons.
Viscounts, according to their Patents, in the same order as Dukes.
Marquises' Younger Sons.
Bishops of London, Durham, and Winchester.
All other English Bishops according to their seniority of Consecration.
Bishops of the Irish Church, created before r269, according to seniority.
Secretaries of State, if of the degree of a Baron. Barons, according to their Patents, in the same order as Dukes.
Speaker of the House of Commons. Treasurer of Her Majesty's Household. Comptroller of Her Majesty's Household. Master of the Horse.
Vice-Clamberlain of the Household.
Secretaries of State under the degree of Barons.
Viscounts' Eldest Sons.
Earls' Younger Sons.
Barons' Eldest Sons.
Knights of the Garter. Privy Councillors.
Chancellor of the Exchequer.
Chancellor of the Duchy of Lancaster. Lord Chief Justice. Qneen's Bench. Master of the Rolls.

The Lords Justices of Appeal.
Judges according to seniority. Viscounts' Younger Sons. Barons' Younger Sons.
Daronets of England, Scotland, Ireland, and United
Kingdom, according to date of Patents. Knights of the Thistle. Knights of St. Patrick.
Knights Grand Cross of the Bath.
Knights Grand Commanders of the Star vf Indla.

Knights Grand Commanders of the Indian Empire. Knights Bachelors.
Judges of County Courts.
Companions of the Bath.
Companions of the Star of India.
Companions of St. Michael and St. George.
Companions of the Indian Empire.
Companions of the Distlnguished Service Order.
Eldest Sons of the Youngest Sons of Peers. Baronets' Eldest Sons.
Eldest Sous of Knights:-1, Garter ; 2, Thistle ; 3, St
Patrick; 4. The Bath; 5, Star of India; 6, St.
Michael and St. George; 7, Knights Bachelors.
Younger Sons of the Younger Sons of Peers. Baronets' Younger Sons.
Younger Sons of Knights in the same order as Eldest Sons.
Gentlemen entitled to bear Arms.
Women take the same rank as their husbands or as their brothers; but the daughter of a Peer marrying a Commoner retains ber title as Lady or Honourahle. Daughters of Peers rank next immenhately after the wives of their clder brothers, and before their younger brothers' wives. Daughters of Peers marrying Peers of lower degree take tlie same order of precedency as that of their husbands; thus, the daughter of a Duke marrying a Baron degrades to the rank of Baroness only, while ber sisters married to Commoners retain their rank and take precedence of the Baroness. Merely official rank on the husband's part does not give any similar precedence to the wife.
There are three Orders confined to ladies:-The Order of Victoria and Albert, the Crown of India, and the Royal Red Cross. But members are entitied to nu special precedence.

LOCAL PRECEDENCY.-No written code of county or city order of precedence has been promulgated, but naturally in the county the Lord Lieutenant stands first, and secondly the Sheriff. In London and other Corporations, the Mayor-in Scotland, the Provost-stands first, and after him the Sheriff, Aldermen-in Scotland, Bailies-Chief Officers and Livery. At Oxford and Cambridge the High Sheriff takes precedence of the Vice-Chancellor.

## Relative Rank in Apmy and Navy.

Puisne judges and Barons of Exchequer.Begin and end as to Vice-Chancellor. Superscribe: The Honourable Mr. Justice

Note.-An Attorney is a person only qualified and admitted to suc out any writ or process, or to commence, carry on, or defend any action or other proceeding in the name of any other person in any court of $l s \%$ in England or Wales. A Solicitor is a person duly qualified and admitted to perform the same functions in a court of equity. Up to the time of admission the manner of becoming an attorney or a solicitor is the same. Most, if not all, persons who are admitted to practise in one court are admitted also in the other, and are therefore styled attorneys and solicitors, acting in the former capacity in courts of law, and in the other in courts of equity.

In Scotland there are no courts of equity, and a solicitor is also styled a law agent and a writer. There are also Writers (or Clerks) to H.M. Signet, and Solicitors before the Supreme Court in Edinburgh. There is no difference in the functions of Advocate and Barrister.

## MAYORS AND PROVOSTS.

## TELEGRAMS.

INLAND.-Telegrams may be sent to all parts of the United Kingdom at the rate of 6 d . for the first twelve swords, and one halfpenny for every additional word: stamps in payment to be affixed to the form by the sender. The address of the receiver is charged for, but not that of the sender when written on the back of the telegram form. Five figures are counted as one word, so is a letter preceding or following a group of figures. The charge includes delivery within the town postal limits, or within one mile of the head office-beyond that the charge 156 d . per mile for the first three miles; if three or more miles at the rate of 15 . per mile from the office door. Telegram forms are of two kinds: one Issued gratis; the other (A1), embossed with a stamp, may be purchased singly, or interleaved with carbonic paper, in books of 20, price 105. 2d. each.
FOREIGN TELEGRAMS are subject to a codo of 25 sules, too lengthy to be here reproduced. The charges per word are: 2d. to Belgium, Exance, Germany, and Holland; $2 \frac{1}{d}$ d. to Luxembourg ; 3 d . to Algeria, Italy. Swiizerland, Austria, and Tunis; $3 \frac{1}{2 d}$ to Denmark and Norway ; 4d. to Roumania, Servia, Bosnia, Spain. and Sweden ; $4 \frac{1}{2}$ \%. to Bulgaria, Gibraltar, and Portugal ; $5 \frac{h}{2}$. to Russia; 6d. to Malta and Morocco ; $6 \frac{1}{2} \mathrm{~d}$. to Cyprus and Turkey; 7 d . to Greece: Is. to Canada; 15. to Is. 8 d . to United States ; 3s. 8d. and upwards to India; 4s. 7d, and upwards to Australia: 5s. to New Zealand ; 55. to 125. 2d. to South America; our own Colonies and Possessions being generally charged at abont the highest rates.

SUNDAYTELEGRAMS.-In most Engllsh provincial towns the Telegraph Offices are open from 7 or 8 to 10 a.m., and again from 5 to $6 \mathrm{p} . \mathrm{m}$.; in Scotland, from 8 or 9 to $10 \mathrm{a} . \mathrm{m}$. , and in a few places for an hour in the afternoon; In Ireland, from 9 to $1 \mathrm{a} . \mathrm{m}$., and from 5 to 6 p.m. In London the following offices are always open: Central Telegraph Station, Great Northern Station, King's Cross: Great Eistern Stations, Llverpool Street, and Stratford; London Bridge (S.E.R.),

Paddington, St. Pancras, and Victoria (L.C. and D.R.) Stations; West Strand and Whllesden Junction; the offices at Birningham, Bradford, Irighton (except between midniglit Saturday and 7 a.nı. Sunday), Bristol, Cardift Docks, Derby, Devonport, Fixeter, Falmouth, Holyhead, Hull, Hurst Castle, Leeds, Liverpool, Manchester, Newcastle-on-Tyne, Norwlch. Nottinghain, Penzance, Plymouth. Shefficld, and Southampton; as also are those at Aberdeen, Dundee, Edinburgh, Glasgow, and Inverness, in Scotland; and Belfast, Cork, Dublin, Loudonderry, and Queenstown, in Ireland.

## The First Day of the Year.

Many persons consulting Parish Registers and other ancient records are sometimes perplexed by the dates, especially by the seeming discrepancies in the time when the year commenced. It began:--

At Christmas from the 7 th to the r4th centuries.
On March 25, by the Church, in the 12th century, and the same date was adopted by laymen in the 14th century.
In $175^{2}$ the New Style was introduced, Sept. 3 becoming Sept. 14, and the year dating from Jan. I. Previous to this two dates were used in documents, one for the civil year, which commenced Mar. 25 , the other for the historical year, which began Jan. x ; and thus we find the same event chronicled under the dates, for example, Feb. 26. 1683.4. The Old Style is still used in the Russian and Greek calendar. Jan. I being Jan. 13 of the calendar used elsewhere in Europe.

JEWISH CALENDAR.
The Jewish Year is reckoned by lunar months. The year $5654=$ Sept. II, 8893 ; the year $5655=0 \mathrm{ct}$. I. L894. Feast of Passover, A pril 21-28, 1894 . The Jewisll Day begins at Sunset.

## MOHAMMADAN CALENDAR.

Moslems reckon the years from A.D. 622 (July 16). which is called the Year of the Hejira, or Flight, of Mohammed from Mecca to Medina (A.H. =Anno Hejira=Year of the Fight). It is a common practice for readers in this country to add 622 to a given Moslem year (A.H.), in order to ascertain the corresponding year of the Christian era; but this is entirely wrong, as the Moslem year is reckoned by lunar months. For example, A.H. 10 was not A.D. 632 , but began on April 9, 631 ; A.H. 169 was not A.D. 79 ( $169+622=791$ ), but began on July 14, 795 A.1). Thus calculating by lunar months in the course of years the great Moslem fasts and festivals occur at different seasons: the Ramadan fast, for instance, sometimes occurs in sweltering midsummer, at other times in midwinter. The Moslem year 13 Ix began isth July, 1893 ; A.H. $1312=3$ 3rd July, 1894 ; and the following is a table of the relative years A.H. and A.D. to the end of the present century :-

## Watch and Time on Board of Ships.

WATCH. - For purposes of discipline, and to divide the work fairly, the crew is mustered in two divisions: the Starboard (riglit side, looking forward), and tho Port (left). The day commences at noon, and is thus divided:-

These make seven Watches. whicl enable the crew to keep them alternately, as the Watch which is on tho forenoon one day has the afternoon next day, and tho men who havo only four hours' rest one night have
chght hours the next．This is the reason for having Doy Watches，which are made by dividing the hours between 4 p．m．and 8 p．m．into two watches．
TIME is kept by means of＂Bells．＂although there Is but one bell on the slip，and to strike the clapper pro－ perly against the bell requires some skill．First，two strokes of the clapper at the interval of a second，then an Interval of two seconds；then two more strokes with a second＇s interval apart，then a rest of two seconds，thus ：－
BELL，ONE SECOND ；B．，TWO SECS．；B．，S．；B．，SS．； B．，S．；B．，SS．；B．
I Bell is struck at 12．30，and again at 4．30，6．30， 8.30 p．m．： $12.30,4.30$ ，and $8.30 \mathrm{a} . \mathrm{m}$ ．
2 Bells at I（struck at an interval of a second between eacli－B．s．，B．），the same agaln at 5,7 ，and 9 p．m．；1， 5 ，and $9 \mathrm{a} . \mathrm{m}$ ．
3 Bells at 1． 30 （B．s．，B．ss．，B．），5．30，7．30，and 9.30 p．m．：I．30，5．30，and 9．30 a．m．
4 Bells at 2 （B．s．，B．ss．，B．s．，and B．） 6 and to p．m．； 2，6，and to a．m．

5 Bells at $2.3^{\circ}$（B．s．，B．ss．，B．s．，B．ss．，B．）and $10.3^{\circ}$ p．m．；2．30， 6.30 ，and $10.30 \mathrm{a} . \mathrm{m}$ ．
6 Bells at 3 （B．s．，B．ss．，B．s．，B．ss．，B．s．，B．）and 11 p．m．： 3,7 ，and is a．m．
7 Bells at 3．30（B．s．，B．ss．，B．s．，B．ss．，B．s．，B．ss．，B．） at II． $30 \mathrm{p} . \mathrm{m}$. ； $3.3 \mathrm{BO}, 7.30$ and $11.30 \mathrm{a} . \mathrm{m}$ ．

8 Bells（B．s．，B．ss．，B．s．，B．ss．，B．s．，B．ss．，B．s．，B．） every 4 hours，at noon，at 4 p．m．， 8 p．m．，midnight， 4 a．m．，and 8 a．m，

## $\operatorname{Tim} \theta$.

The year is also divided into 12 calendar months，viz．：

A lunar month has 28 days．
The number of days in each month may be readily remembered by means of the following old lines：－

Thirty days hath Scptember， April，June，and November； February has twenty－eight alone ； All the rest have thirty－one， Except in leap year，when design Gives February＇s days as twenty－nine．
As the true solar ycar is nearly 6 hours more than 365 days，every fourth year，termed leap year，is reckoned as consisting of 366 days，in order to make allowance for the excess，the additional day being given to February，

## LEAP YEAR．

To ascertain if any year is leap year，divide it by 4，and if there be no remainder，it is a leap year；if there be a remainder，the number over indicates how many years it is after last leap year．

The even centuries are not reckoned as leap years， unless they can divide by 400 without a remainder； thus， 1900 （which is the last year of the 19th century， not，as is commonly supposed，the first year of the zoth century，since the present century began on Jan． 1，1801，and ends on December 31，1900）will not be a teap year，but 2000 will be one．

## TIME IN DIFFERENT PARTS OF THE

 WORLD．When it is noon at Greenwich，the time is as follows at the chief cities on the globe：

|  | A．M． |  | P．M． |

## Easter Sunday

Comes next after the full moon that follows，or falls on， the 21st of March（the vernal equinox）．When that date is Sunday and full moon also，the next is Easter Sunday．Thus，in 1804 ，the full moon was on the very day of the equinox，Wednesday，March 2Ist，and the Sunday following，March 25th，was Easter Sunday．Table of Days，

## The Roman Calendar.

The word Calendar is derived from calend or kalond, wlileh in the Rontan chronology denoted the first day of every noith ; and this word is taken from tho Greek, signifying to call, or prochaim, because the chief priest, whoso duty it was to watch the appearance of the new moon, summoned the people to the Capitol, and with a loud volce proclaimed the number of kalends, or the day on which the nones would happen, or, according to another account, proclained the several feasts or holidays in the month.
The kalends were reckoned backwards; thus, the first day of May was called the kaleuds of May, the 3oth or last day of April, the day before the kaleudsfridie talendarum-or second of the kalends of May; the soth of April, the third of the kalends of May, and so on to the r3th of April, when the idos commenced, which were also reckoned backwards to the 5th of April, when the nones began, and were numbered backwards to the first, which then took the name of the kalends of April.
To find the day of the kalends corresponding to any day of the month, according to the modern computaHon of time, the following is the rule:-To the nunber of days yet remaining of the month add two, and this number will denote the day of the kalends of the succeeding month. Thus, suppose it is required to convert the and of April to the corresportding day in the old Roman calendar, eight days are wanting to complete the month, or to bring it to the ist of May, the day on which the kalends of May commence; two being added to eight, the remaining number (ten) marks the roth of the kalends of May, because the last day of April is called the second day of the kalends, the last but one is the third, and so on. The Romans had a saying to express a time that would never come, "At the Greek kalends," as the Greeks had no kalends in their computation of time.

First Monday in August. Christmas Day.
Candlemas, February 2. Whitsunday, May 15 . Lammas, August 1.
Martinmas, November 11.
Removal Terms in Scot. tish Burghs are May 28 and November 28.
saucls of cubic freet of gas consumed. Thus, the hauds on the dials iudicate the consmmption of forty-two thousiand seven hundred cubic feet of gas:

The hand on Dial A indicates 700 cubic fect.

42,700 cublc feet.
The register at all times shows the quantity that las passed through the neter since it was first set, by declacting from which the amount that has been paid for (withoit any regard to the time when) you find the difference remaining unpaid.

## Weights and Measures.

## AVOIRDUPOIS WEIGHT.

27 11.32 grains make 1 dram=27 $11-32$ grains. 16 dran1s
 28 pounds : . . . 1 quarter (qr.). 4 quarters . . . I hundredweight (cwt.) 20 cwt. (ira lbs.) - $\quad$ iton.

This weight is used In almost all commerclal transactious, and in all the common dealings of life. Bread must be sold by the pound avoirdupois; bakers are now prohibited from selling by the peck loaf with its sub-divisions. Bakers sending out bread for sale must send with it weights and scales. By a late Act of Parliament, the legal stone is, in all cases, to consist of 14 lbs . avoirdupois: 8 such stones make 1 cwt ., and 20 cwt. I ton. Flour is sold nominally by measure, but actually by weiglıt, at $3 \frac{1}{2} \mathrm{lbs}$. to a quartern, 7 lbs . to a gallon, 34 lbs . to a peck, and so on.

## Troy Weight.

4 grains
make I carat.
6 carats (or 24 grains).
20 penn ( $"$ pennyweight.
12 ounces,
". I ounce.
25 pounds : : make 1 quarter.
100 pouhds : . ." I hundredweight.
20 hundredweights, . II I ton of gold or silver.
By this weiglit the precious metals are weighed. It is also used in physical experiments, and in ascertain. ing the strength of spirituous liquors.

Gold plate, or any manufacture of gold, may be of any of the standards of 18, 15, 12, or 9 carats fine gold In every pound troy. Thus, when an article of gold plate or jewellery is 18 carats fine, 18 parts are of pure gold and 6 parts copper. All alloyed gold is considered as divided into 24 equal parts. The relative value of the carat of gold is 10 pennyweights.

## JEWEL WEIGHT.

40 poles make Ifurlong.
8 furlongs, or 1760 yards ," 1 mile.
3 niles $\quad$. $\quad, \quad{ }^{2}$ league.

The length of a mile is not the same in every country. The French kilometre is equal to about fiveeightlis of our English nile. A Spanish and Polish mile is about $3 \frac{1}{2}$ Enylish miles. A Swedish, Danish, and Itungarian mile is from 5 to 6 English. A Russian nille, or verst, is about three-quarters of an English mile. The French metre is equal to $x \circ 0$ yard.

## $\mathrm{r}-12 \mathrm{inch}$

make x line.
$1 \cdot 3$ inch
barleycorn.
3 inches

* I palm.
$4{ }^{\prime \prime}$ : : " x hand. 1
723.25 inches • - $\quad 1$ link.

9 inches . - . $\quad$ span.
${ }^{18}$ fëet : • - ." 1 cubir
${ }_{5}^{22}$ " (geometrical) : ". $x$ pace. 2
60 geographical miles : "I fathom. ${ }^{3}$
360 degrees make the circumference of the globe, or any circle.
${ }^{1}$ The hand is used for measuring the height of horses.
${ }^{2}$ The pace is a measure taken from the distance between the feet of a man while walking, usually reckoned at $2 \frac{1}{2}$ feet, but the geometrical pace is 5 feet.
${ }^{3}$ The fathom is used in sounding to ascertain depths, etc., and for measuring cordage.

## Geographical Measure.

60 seconds make $x$ minute. 30 degrees make 1 sign.
60 minutes ." rdegree. 12 signs makergreat circle

The knot, or nautcall mile, is the same as the geographical ciegree, and is $7954^{-8}$ feet longer than the statute inile. The statute knot is $6082^{\circ} 66$ feet, the Admiralty knot is 6080 feet.
The log line (used on board ships to ascertain distance sailed) is about 150 fathoms in length, or 900 feet long. It is usually divided into 8 equal spaces, called knots.

> Wine measure.

4 gills make $x$ pint. 42 gallons make $x$ tierce.
2 pints " I quart. 63 ." I hogsli'd.
4 quarts ", i gallon. 2 hogsh'ds." I pipe, or ro gallons, I anker of

$$
\begin{aligned}
& \text { anker of } \\
& \text { brandy. } 2 \text { pipes tun. }
\end{aligned}
$$

A puncheon is equal to 2 tierces; a runlet is 18 gal lons; and a tull of wine 20 cwt . avoirdupois.
ALE AND BEER MEASURE.

2 pints make I quart. 2 kilderkins make y barrel. 4 quarts " I gallon. st barrel ${ }^{2}$ I hald. 9 gations ", I firkin. ${ }_{2}$ irkins hogsheads ", I butt.
Practically, the only measures in use are"gallons and quarts, the others are merely nominal; for example, the hogsheall of 54 gallons, old measure, contains but 52 gallons, I quart, I pint, and $3^{3} 55$ gills imperial measure, and of wine six nominal quarts go to the gallon.

## Miscellaneous.

A dicker of hides, so skins; a last of hides, 20 dickers. Herrings are measured by the barrel of 266, or cran of $37 \frac{1}{2}$ gallons.
A pocket of hops, average weight about $x_{2} \mathrm{cwt}$. to 2 cwt ., a bag of hops nearly $3 \frac{1}{2} \mathrm{cwt}$.
A bushel of carn, 8 gallons; 8 bushels, a quarter.
A solid yard of well-wrought clay will make 160 bricks; $\mathbf{3 2}^{2}$ common bricks cover a square yard. A common brick must not be more than 9 inches long, $\frac{12}{2}$ inches wide, and $2 \frac{1}{2}$ inches thick.
A square foot is 144 square inches. A square yard contains 9 square feet. An acre contains 43,560 square feet, or 4840 squase yards. A section, or square mile, contains 640 acres.

A solid foot contains 1728 solid Inches; a solid foot of water weighs 62 h 1125 . A pint of water weighs I 1 lb . A gallon of water hilds 23 solid inches. A gallon of milk weighs 8 lb , and ro oz.

## METRIC WEIGHTS AND MEASURES. Lineal Measure. yds. ft. in.

Surpace, or Squarr Measure. acres. sq. yds.
roo centiares, or or ix9. $6033=1$ are.
100 ares,$\quad 2280^{\circ} 3326=1$ hectare.
A centiare measures r'xg6033 sq. yard.
Solid Measure. cub. ft.
ro centisteres, or $3^{\prime} 5317=1$ decistere.
yo decisteres , $35^{\circ} 3 r^{\prime}=1$ stere.
A centistere measures 6xo' 28 cubic inches.

> CAPACITY.

## gals. qts. pints.

A millilitre measures 'oor76 of a pint, or 'ocoor275 of a bushel.
ro milligrammes, or to centigrammes . to decigrammes ". sogrammes " ro decagrammes .. yohectogrammes .,

## WEIGHT.

## lb. oz. drams.

A milligramme measures ${ }^{\circ}$.0r543 $=1$ kilogramme.

## To Convert Metric to English Measures AND WEIGHTS.

To convert grammes to ounces avoirdupois, multiply by 20 and divide hy 567.

To convert kilogrammes to pounds, multiply by 1000 and divide by 454.

To convert litres to gallons, multiply by 22 and divide by 100.

To convert litres to pints, maltiply by 88 and divide by 50 .
To convert millimetres to Inches, multiply by xo and divide by 254 .

To convert metres to yards, multiply by 70 and divide by 64

The metre is the fundamental unit of measurement, and is considered to be the ten millionth part of the distance from the Pole to the Equator.

From the metre is derived the unit of measures of capacity, viz., the litre, which is the cube of the tenth part of the metre.

The thousandth part of the weight of a litre of distilled water is used as a unit of weight-the gramme.

One thousand square metres are used as the unit of superficial measures-the are.

The multiples of these, proceeding in decimal progression, are indicated by the Greek prefixes; the sub-divisions by the Latin prefixes, representing tens, hundreds, thousands, etc.

British Coinage.
The authorised Coinage of the United Kingdom conslsts of the following pieces, some of which are Issued only on special occasiuns :-

| Denomination. | Standard Weiglt. | $\begin{gathered} \text { Least } \\ \text { Current } \\ \text { Weight. } \end{gathered}$ | Kenedy. |

| Farthing, . | 4375000 |  | -87500 |

STANDARD GOLD contains eleven-twelfths of fine metal and one.twellth of alloy; fineness, $91^{6 \cdot 66 .}$ Twenty troy pounds of standard gold are coined into 934 sovereigns and one half-sovercign.

STANDARD SILVER consists of thirty-seven fortieths of fine metal and three-fortieths of alloy ; fireness, 925. One troy pound of standard silver is coined into 66 shillings. (There is legally another, called the "New Sterling, or Britannia, of the fineness of ir oz, rodwt., but at Goldsmiths' Hall, London, it has not been used for the last 100 years.)

BRONZE is a mixture of copper 95 parts, tin 4 parts, and zinc I part.

THE "RESEEDY" is the amount of variation in fineness and weiglit permitterl.

TOKENS.-No person is allowed to coin any token to pass for, or as representiug, bronze or other money, under a penalty of $£ 20$.

LIGHT GOLD. - Any person to whom it is tendered may break, cut, or deface any gold coin below the current weight.

Bank of England Notes are issued for sums of $£ 50,10, £ 20, £ 50, £ 100, £ 200, £ 300, £ 500$, and $£ 1000$.
Legal Tenijer of Money.-The tender of Bank of England Notes is legal in England and Wales for every purpose, and by any bank (except by the Bank of England). No one, however, can be compelled to give change. Gold of the full weight is a legal tender to any ainount. Silver ls not a legal tender for sums over two pounds, nor bronze for sums over one shilling, while farthings are not a legal tender for more than sixpence.

OLD ENGLISH MONEY.
Angel, ros.; Noble, 6 s. ; Moidore, 275.; Carolus, 23s.; Guinea, 215.

## SCOTS MONEY

Was abolished, as a circulating medium, by the Articles of Union; but the "valued rent" of lands, and, in many places, the feu-duties, ministers' stipends, and other parochial hurdens are still reckoned by the pound, or the merk, Scots, tlough paid in sterling money.

Pence Stg.

A juryman failing to answer to his natne, without sufficient cause, after being duly clted in Scottish courts of law, is strll fined in 100 merks Scots $=£ 58 \mathrm{~s}$. 4 d ,

## Slang Terms for Money.

In addition to the ordinary terms, there are others which, although puzzling to a foreiguer, are tolerably well understood in this country. In Scotlind, a inan who fies "kites" may not be wortls a :" bodle," and in England, not worth a "mag"-coins which have no existence. Such a man will toss you fur a " bob." He, of course, would be shunned by the lady who lost a "pony "on last year's "Oaks," and by her husband who lost a "monkey" on the "Derby" at Epson two days previously. A gentleman who is worth a "plum" ( $£$ roo,000) need never be short of "tin": while the wretch who hegs a few "coppers " in order to procuro a bed has generally no "blunt." The following terms are cominonly in use:-
$\Lambda$ joey $=4 \mathrm{~d}$.
A tanner $=6 \mathrm{~d}$.
A bob=rs.
Half a bull=25. 6d.
A bull=5s.
A pony: $=£ 25$.
A monkey $=£ 500$.

- tion bill.

A nuid $=f, \quad$ Browns=copper orbronzo
Blunt, brass, dibs, dust, rhiro, the ready, mopuses
Blunt, brass, dibs, dust, rhino, the ready, mopuses, oof=money generally.

Noth. - A rough and ready, but, for ordinary purposes, sufficiently accurate mode of computing the valise of a number of American dollars is to divide by 5, thus, 100 dollars are about equivalent to §20 sterling ; 25 of French, Belgian, Swiss, and Greek francs, of Italian liras, and of Spanish pesetas may be reckoned at nearly of the value of an English sovereign; the Austrian florin may be considered as about equal to two shillings; the German imperial mark, one shilling.

\section*{Indian Money, Woights, and Measures. MONEY. Stg. value at exch. <br> 

The principal welghts are the sear and the mound (or man), aud these vary considerably in diferent parts of India. In I Iombay the ordinary mand is 88 lbs. avoir., and contains 40 to 42 seers: in Madras the maund is usually equivalent to 25 lbs ; in IBengal, 22 llis .

> LJNEAL MEASURE.

These vary throughout India. In Northern India the beegah contains 3025 sq . yards, or fóths of an acre; m Bengal, sooo sq. yards, or little more than 3 frd of an acre. According to Sir John Malcolm, tho smallest beereal is $1 / 5 \mathrm{rd}$ and the largest \#srds of an acre.

## Population of the World.

The following important statistics as to the AREA and population of the great divisions of the EARTH'S SURFACE, according to the latest data, are from the Bevölkerung der Erde :-

|  | Sq. Miles. | Population. | Tors Sq. |
| :---: | :---: | :---: | :---: |
| Europe,a | 3,797.410 | 357.851,580 | 94 |
| Asia,b . | 17,039,066 | 825.954,000 | 48 |
| Africa, e | 11,518,004 | 168,499,017 | 14 |
| N. America, ${ }^{\text {d }}$ | 7,952,386 | 88,386,084 | 11 |
| S. America, | 6,844,602 | 33,342,700 | 5 |
| Australasia, e | 3.458,029 | 5,684,600 | 1. 6 |
| Polar Islands, . | 1,689,834 | 11,170 |  |
| TOTAL. | 52,299,431 | 1,479,729,151 | 28 |

a Including Iceland, the Azores, and Madeira, but not the islands in the Arctic Sea.
o Without the Arctic Islands.
$c$ Including Madagascar, and other islands round Africa, etc.
d With Central America and the West Indies.
e The Contigent, Tasmania, New Zealand, New Guinea and South Pacific Islands.
It was calculated by Dr. Oppel cluring 1893 that $1,700,000 \mathrm{sq}$. miles of the earth's surface are uninhabited or,ownerless, $5,000,000$ sq. miles nore without settled goverument, while the remaiuing $45,000,000 \mathrm{sq}$. miles are occupied by definite states, of which there are 75. Of these, however, 18 make up 87 per cent. of the total area.

## Romoval of Stains from Books.

Nearly all the aclds remove spots of ink from paper, but it is important to use such as attack its tissue the least. , Spirits of salto, diluted into five times or six times the quantity of water, may be applied with success upou the spot. and after a minute or two washing it of with clear water. A solution of oxalic acid, cieric acid, or tartaric acid is attended with the least risk, and may be applied upon the paper or plates without fear of damage. These acids, takling out writing ink and not touching the printing, can be used for restoring books where the margins lave been written upon, without attacking the text.

When the paper is disfigured with stains of iron, it may be perfectly restored by applying a solution of sulphetret of potash, and afterwards one of oxalic acid. The sulphuret extracts from the iron part of its oxygen, and renders it soluble in diluted acids.
The most simple, and at the same time very effectual, method of rasing spots of grease, wax, oil, or. any ${ }^{\text {cother fat }}$ substance is by washing the part with ether, and placing it between white Elotting-paper: then with a hot iron press above the part stained, and the defect will be speedily removed In many cases, where the stains are not bad, roctifed spirits of wine will be found to answer the purpose.
Another method of removing grease from paper is to strew over the spot, or spots, a little finely.powdered French chalk, cover this with a piece of clean blotting. paper, then hold a hot iron close to the paper without bringing it in contact.

## To Restore Calf Bindings.

Wash lighty with soft sponge dipped in a preparation consisting of $1 / 2$ oz. of the best glue dissolved in a pint of warm water, to which add a teaspoonful of glycerine and a little four paste. Rub well with chamois leather when dry.

## Hints as to Using Books.

Never handle books unless with clean hands.
Never hold a book near the fire.
Never drop a book upon the floor.
Never turn leaves with the thumb.
Never lean or rest upon an open book.
Never turn down the corners of leaves.
Always keep your place with a book-mark.
Never leave a book open face downwards.
Always turn leaves lrom the top with the middle or forefinger,

Never pull a book from a shelf by tho binding at the top, but by the back.
Never place another book, or anythling elsc, upon the leaves of an open book.
Never close a book with a pencil, a pad of paper, or anything else between the leaves.
Always open a large book from the middle, and never from the ends or cover.
When opening a book hold the leaves loosely, so as to let thein yield gently. By opening a book with the leaves grasped tightly to the covers with each hand. an undue stress is put on the binding, and the back of the book frequently broken.

Never cut the leaves of a book or magazine with a sharp knife, as the edge is sure to run into the print.

- Never write upon a paper laid upon the leaves of an open book, as the pencil or pen-polnt will either scratch or cut the book leaves.

Never lend the borrowed book, but return it as soon as you have done with it, so that the owner may not be deprived of its use.

## British Museum.

The total amount for the expenses of the British Museum for the year ending 3Ist March, 1895, is estimated as follows:-

| Salaries and Wages, | 655,132 |
| :---: | :---: |
| Police, . | 4,275 |
| Purchases and Acquisltions, | 21,000 |
| Bookbinding and Repairing, etc., | 9.447 |
| Printing Catalogues, etc., | 7.527 |
| Reproduction of Works of Art for Local Museums, | 600 |
| Warming, Ventilating, Fire-extinguishing, and Electric Lighting Apparatus, | 3,240 |
| Furniture and Fittings, - . | 10,160 |
| Incidental Expenses, | 2,468 |
|  | Ex13,839 |

- The following are a few details regarding the salaries and wages paid:-The Principal Librarian and Secretary receives $£ 1200 ; 8$ Keepers of Departments receive from $\mathcal{L}^{650}$ to $£_{750}$; Assistant Secretary, 6650 ; 6 Assistant Keepers of Departments receive from $£ 500$ to $£ 600$; Clerk in Charge of Accounts, $£ 650 ; 28$ First-class Assistants receive from $£^{250}$ to $£ 450 ; 40$ Second-class Assistants receive from $£ 120$ to $£ 240 ;$ Electrician, 6200 ; 56 First-class Attendants receive from 6 ros to $120 ; 74$ Second-class Attendants receive from $\mathcal{E} 60$ to $\not \subset 100 ;$ Messenger receives from 6120 to £iso; 3 Assistant Messengers receive from $\mathcal{L}$ roo to firo; 35 Labourers and Window Cleaners receive from 245 . to 305. per week; 22 Boy Attendants receive from 125. to 15s. per week; 7 Gatekeepers receive from 245. to 275 . per week. In addition to those there are quite a number of Housemaids, Female Attendants, Firemen, Stokers, Engine Drivers, Masons, and Commissionalres.

## Wedding Anniversaries.

First Anniversary,
Third Anmiversary, Fifth Anniversary, Tenth Anniversary,
rwelfth Anniversary,
Fifteenth Anniversary, Twentieth Anniversary, Twenty-fifth Anniversary, Thirtieth Anniversary, Fortieth Anniversary, Flaticth Anniversary, Sixtieth Anniversary,

Cotton Wedding.
Leather Wedding. Wooden Wedding. Tin Wedding. Silk and Finc Lineu Wedding. Crystal Wedding. China Wedding. Silver Wedding. Pearl Wedding. Ruby Wedding. Golden Wedding. Diamond Wedding.

## Poisons and their Antidotes.

1. AcIDS: CARBOLIC, SULPHURIC, NITRIC, MURIATIC, NITRO-MURIATIC, CREOSUTE, IODINE, Phosphorous.
Antidoto.-White of egg, well beaten up witls water.

A teaspoonful of mustard flour in a cup of hot water. Very thick line water-in the case of sulpliuric, oitric, murlatic, or nitro-muriatic acids.
2. ChROMIC ACID, CHBOMATES, all prepara. tions or compounds of CHROMIUSI, ANTIMONY, COPPER, MERCURY, OR ZINC.
Antidote.-Alundance of white of egg in water. A teaspoonful of mustard flour in water. Copious draughts of an infusion of salt herbs.
3. Ammonia, Soda, Potash, Alkalies, Sili. CATES. AND SULPHATES.
Antidote.-Strong vinegar and water. Large doses of oil. Large doses of milk.
4. PRUSSIC ACID AND ITS SALTS, ALL CYANIDES AND SULPHO-CYANIDES, OIL OP BITTER AL. MONDS, AND NITRO-BENZINE.
Antidote.-Continuous and heavy douches of ice-cold water over the head and spinal colurnn. Mustard plasters on the stomacl and soles of the feet. Prevent sleep.
5. ETHER, PETROLEUM, BENZINE, CONCENTRA. red or absolute alcohol, Fruit Essence.
Antidote.-Plenty of mustard-flour in large quantity of hot water. Cold water douches. Fresh air. Prevent sleep absolutely.
6. COMPOUNDS OF BARYTA aND LEAD.

Antidote.-A teaspoonful of inustard-flour in warm water. Strong solutioos of Epsom salts or Glauber's salts in cold water.
7. COMPOUNDS OF ARSENIC.

Antidofe.-A teaspoonful of mustard-flour in warm water. A teaspoontul of dialysed iron mixed with the same quantity of calcined magnesia every five minutes for one hour. Then plenty of oil, or milk, or some mucilaginous tea-say linseed.
8. OXALIC ACID AND ITS SALTS.

Antidote.-Very thick paste of line and water by large spoonfuls at the time. After several of these, large draughts of lime water. Finally, 4 ounces of castor oil.
9. Nitrate of Silver.

Antidotc.-Large doses of ordinary kitchen sait, dissolved in water, after which, one teaspoonful of mus-tard-hour in warm water.
10. NITROUS FUMES OR VAPOURS arising in vitriol or chemical work.
Antidote.-Frequent and small doses of stroog acetic acid-the stronger the better.

## Medical Suggestions in Emergencies.

AGUE.-As a preventive, give five grains of quinine every morning. As a cure, act on the bowels, give ten grains of quinine three times a day, and a vapour bath every evening.

APOPLEXY.-Act on the bowels, apply wet cloths to the head, undo the collar.
BITES of snakes, mad dogs, etc.-Apply a ligature (a cord) on the side nearest the heart; suck the wound, scratch the edges with a penknife, and apply caustic or carbolic acid to the wound.

BURNS.-Place the injured part in a natural position. and apply cloths soaked in oil.
COLIC AND DIARRHEA.-Give 20 drops of chloro. dyne in a little brandy and water.
DYSENTERY.-A small teaspoonful of ipecacuanha, and a powder every two hours.
DRUNKENNESS.-An emetic of a teaspoonful of mustard in water, and douche the head in cold water.

DELIRIUM TREMENS.-Act on the bowels, beeftea every half hour, 20 grains of chloral in water as a sleeplng draught.
EMETICS.-Substances which cause vomitiog. A tablespoonful of salt, or mustard and water; an ounce of ipecacuanha wine; 15 grains of sulphate of zinc in water.
Fainting from loss of blood, weakness, or shock.Keep the body in the lying position; undo the dress; give plenty of air ; sprinkle the face and chest with cold waterl; apply smelling salts to nostrils.
FITS.-Loosen the clothing about the neck ; fresh air, and prevent patieut from injuring himself.

FROSTBITE. -Avoid heat, and restore circulation in the part by rubhing the skin.
RILEUMATISM.-Avoid its canses: wet clothes, damp ground, liquor. ICelery is said to relieve, if not wholly cure, this painful complaint: cut the celery into pleces, and boil in water till soft, and let the suflerer pleces, the water. Put new milk, with a little flour and nutmeg. Into a saucepan with boiled celery, serve it warn with pieces of toast ; ent it with potatoes.]
SCALDS.-Smear with a solution of lime and oil, and envelop in cotton wool.
SPRAINS.-Elevate and rest limb; apply cold-water cloths.
SUNSTKOKE.-Loosen dress at neck; act on bowels; cold water to the head.

## Cautions In Visiting the Slck.

Do not visit the sick when you are fatigued, or when in a state of perspiration, or with the stomach empty. for in such conditions you are very liable to take the infection. When the disease is very infectious, take the side of the patient which is near to the window. Do not enter the room the first thing in the morning before it has been aired. and when you come away take some food, change your clothes and expose them to the air for some days. Tobaccosmoke is said to be a preventive of malaria: chloride of lime is certainly as good, if not much better.

## Marriago.

ENGLAND.-A mutual promise of marriage is binding in English law. Marriage there may be done either by the proclamation of banns or by the certificate of a registrar. In either casè, a residence of twenty-one days in the district must be proved before the certificate can be granted. If a party wish to be married without delay a license must be obtained, the fees for which are very much higher than those, paid for the banns or the ordinary certificate. A registrar cannot give a license for marriage in church, as, although his ordinary certiticate is usually accepted in place of banns, a minister may insist on banns or episcopal license when the marriage is in church. The law of England requires that the actual ceremony take place between the hours of $8 \mathrm{a} . \mathrm{m}$. and 3 p.m. before witnesses, and that it be duly registered. If It is not in the parish church, but in a dissenting chapel or other place of worship, a registrar must be in attendance,

IRELAND.-The law in regard to what constitutes marriage is practically the same as that of England, although the ceremonies may differ owing to what may be the various religious persuasions of the contracting parties.
SCOTLAND.-In Scotland the orthodox fashion is by the proclamation of banns in the parish church, which now only costs about 2s. 6d., or by having the names of the contracting parties exhibited on the "notice board " outside the registrar's office. The latter is frequently the most convenient, and saves time.

Irregular marriages, or civil marriages as they are called, are quite legal, and in large centres of population amount to almost 5 per cent. of the whole. The two contemplating marriage go to the registrar's, accompanied by two witnesses, who must be prepared to swear that they know the bride and bridegroom, and that one of them at least has resided for three weeks in Scotland. From this they go to the Sheriff's Chambers, where authority is given to have the marriage registered. This method only costs about 305. Such marriages are sometimes gone through agam according to the rites of the church.

The registrar must receive seven clear days' notico prior to the granting of his certificatc. Througlout the United Kingdom, a marriage must be reglstered within three days, a birth within twenty-one days, and a dcath within eight days. A child nust be vaccinated within six months after the date of its birth.

FORBIGN.-The marriage of British subjects recorded in the books of a British consul is legal. When one or both of the suhjects are of foreign nationality
and not marrled in the precincts of the consulate, then the law of the parties domicile and place of celebration asually govern the rights and form of the marringe.

UNIIED STATES.-Almost all that is required to constitute a legal marriage in the United States is that mutual consent be proved. In scarcely any of the States is any definite form of ceremony or preliminary imposed, thougli in Peunsylvania it requires that the marriage be gone through in the presence of at least twelve witnesses. A few of the other States provide that a license be taken out, and the marriage celebrated before a clergyman or magistrate.

## Equivalent Legal Titles in England and Scotland. Englishs. <br> SCOTTISH

Barister-at-Law or Bar-
rister.
Attorney.
Solicitor. $\}$
Proctor.
Notary.

White precipitate,
White vitriol,

Muriate of ammonia.
Hydrate of calcium.
Oxide of sodium.
Ammonia.
Hydrochloric or muria. tic acid.
Sulphate of lione. Acetate of lead. Basic acetate of copper. Sulphide of mercury.
Acetic acid (diluted).
Ammonia.

- Oxide of hydrogen.
- Ammoniated mercury.
- Sulphate of zinc.

## Percentage of Alcohol in Wines and Spirits.

## National Flopal Emblems.

The fleur-de-lis is the emblem of France.
England's national emblem is the rose.
The thistle is the appropriate emblen of Seotland.
Ireland boasts of the "shamrock so green" as the emblem of her nationality.
The leek has been worn in Wales from time immemorial.

The sacred lotus of the River Nile is the ancient emblem of Egypt.
Germany has as its national emblem the corn fower.
Italy's emblematic tlower is the lily.
The emblem of Canada is the sugar maplo.

## How to Mix Ink and Paint for Various Tints.

Mixing Black and Red gives Brown.
Mixing Brown and White gives Chestnut.
Mixing White, Yellow, and Venetian Red gives Buff.
Mixing Yellow and White gives Straw Colour.
Mixing Black, Blue, and White gives Pearl Grey.
Mixing Lamp Black and White gives Lead Colour.
Mixing Lamp Black and Indigo gives Silver Grey.
Mixing Green and White gives Pea Green.
Mixing Light Green and Black gives Dark Green.
Mixing Red, Blue, and Black gives Olive.
Mixing Yellow and Red gives Orange.
Mixing Carmine and White gives Pink.
Mixing Emerald Green and White gives Brilliaut Green.
Mixing Blue, White, and Lake gives Purple.
Mixing Venetian Red and Black gives Chocolate.
Mixing Lake, White, and Vermilion gives Flesh Colour.
Mixing Blue and Lead Colour gives Pearl.
Mixing White and Lake gives Ruse Colour.

## Memory Rlaymos. <br> BIRTHDAYS.

Monday for health.
Tuesday for wealth, Wednesday best of all; Thursday for crosses, Friday for iosses, Saturday no luck at all.
DAYS IN EACH MONTH.
Thirty days hath September, April, June, and November; All the rest have thirty-one, February alone hath twenty eight,
Except in leap year thenty-nine.
BEES.
A swarm of bees in May. Is worth a ioad of hay; A swarm of bees in June, Is worth a silver spoon; A swarm of bees in July. Is not worth a fly. RULES FOR RIDING.
Keep your head and your heart well up. Your hands and your heels keep down,
Press your knees close to your horse's side,
And your elbows close to your own.
Height and Welght in Females.
The following table gives a fair idea of what the relative proportions of height and weight should bo in the average developed female, although it inust be observed that the general tendency is to get stouter in mature and advancing years:-

> Welght

## How to tell a Person's Age.

Show this table to your friend, and ask him or her to say in which columm or columns their age is to lie found, then add together the figures at the top of these columns, and the secret is yours. Thus, suppose 2I to be the age; this number occurs in the first, third, and fifth columns; add the top figures of the three, and we have 21 , the number required.

## Designs and Trade Marks Registration.

A Trade Mark for the purpose of Registration must consist of, or contain at least one of, the following particulars:-

1. A name of an individual or firm printer, impressed, or woven in some particular or distinctive manner; or,
2. A written signature, or copy of a written signature, of the individual or firm applying for registration thereof as a Trade Mark; or,
3. A distinctive device, mark, brand, leading, label, or ticket ; or,
4. An invented word, or invented words ; or,
5. A word or words having no reference to the character or quality of the goods, and not being a geographical name.
The cost of registering a Design is from ros. to £a ros., according to the class, and the cost of registering a Trade Mark is about $£ 3$ 35. British Trade Marks can also be secured in most foreign countries, and Designs in some of thein, The cost varies according to tho professional agents employed.

## Price of Patents in Different Countries.

## BRITISH PATENTS.

The Patent Laws are rather numerous and complicated, but the following may be taken as pretty accurate. It is well, however, for any person intending to secure a Specification to consult an agent. The costs incidental to preparing and lodging an Application accompanied by a Provisional Specification, including stamp fecs, agency charges, etc., are on an average about $£ 445$, and of completing the Applica. tion by preparing and, within nine months, iving a "Complete Specification"" about $£ 88 \mathrm{Bs}$. Or, it a
"Coinpleto Speclfication" be filed in the first instance, the total expense for font years would le ouly about foo xos. When drawings are reyuired, there is an additional clarge of about from £I upwards, accord. Ing to the amount of work involved. The terin of a pateut is for fourtcen years, counting from the original date of application. The fees for the maintenance commence from the fifth year, when a renewal fee of $£ 5$ is payable; for the sixth year it is $£ 6$, for the seventh $£ 7$, and so on up to $£ 14$ for the fourteenth and last year.

## FOREIGN PATENTS.

Foreign Patents should in some cases be applied for before filing the Englisli "Complete Specification."

The following is a fairly approximate scale of charges, and includes agency fees, Government tax, stamp duties, a translation of the Specification, and all other charges for procuring the Patents (except drawings):-France-Patent granted for 15 years, including tax for one year,

- In Italy a tax of 8s. has also to be paid for each year the patent is applied for.

## Wills.

A will must be written in ink, and be signed by the Testator, in the presence of at least two withesses, and if written on more than one sheet, each sheet should be signed by testator and witnesses. Persons under 2 I years of age cannot legally make a Will.

FORM OF WILL.

do.

## Notes on Etiquette.

In making an introduction the gentleman should be introduced to the lady, not the lady to the gentleinan.

If both are of the same sex, prescut the inferior in social position to the superior.

Permission must always be obtained before a gentle. man is presented to a lady.

On gentlemen belng introduced to each other, they usually acknowledge by a bow, not by offering the sand.
Any one meeting at the house of a mutual friend and not introduced, should not claim acquaintance if they nieet elsewhere.

When out walking with a friend, if you meet or are joined by a third party, it is not necessary to iutroduce the one to the other.

Letters of Introduction sliould be sent by post, enclosing your own card, and not by personal delivery. This is, however, not always convenient.
If anxlous to honour the person introduced, Invite him to dinner and have some friends to meet him.
Morning calls are usually made between the hours of two and four.
When returning purely complimentary calls, you may leave your card without going in.
All visits of congratulation or condolence should be paid within a few days of the event that occasions them.
On making morning calls, a gentleman should not leave his hat in the hall, but take it into the room with lim, holding it in his hand during his brief stay. Leave your umbrella in the hall.
When a lady visitor leaves the drawing-room, it is polite to rise.

It is bad form to look at your watch during a visit.
In conversation avoid political and religious subjects, and never interrupt another person while speaking. Do not converse in a language that any in the com. pany does not understand. Avoid whispering, as it is bad taste.

When speaking with persons of rank, avoid the too frequent use of their titles; address a nobleman as you would any other gentleman. The Prince of Wales is only addressed as "Slr" in conversation; the Queen as " Madam."
It is customary to write letters of invitation and acceptance in the third person. Invitations are now usually issued in tbe name of the lady of the house. Letters to strangers should commence with "Sir" or "Madam," and at the close. on the left hand corner of the page, write the name of the individual addressed.

At evening parties, put on your gloves before entering the room, pay your respects to the lady of the house on entering, and do not remain to the close unless you are on very familiar terms of friendship with the hostess.
Except in a case of necessity, never stop a business man In the street; if you must speak with him, walk on in his direction, state your business briefy, apologising for the detention.

In walking with gentlemen your superior in age or statlon, give them the place of honour by taking your. self the outer side of the pavement. In walking with a lady, always take the outer side of the parement.
" It is in good manners, and not in good dress,
That the truest gentility lies."-Dr. Watts.

## Roman Numerals.

These have been used largely in printing the dates on the title pages of books, especially old books. the headings of chapters and clauses, and on the dials of clocks and watches, etc. Put bricfly, the following are the characters, with their relative values: $-I=1, V=5, X=10, L=50, C=100, D$ or $I J=500$, - M or CI = $=1000$. MDCCCXCVI=r806. When a character is folloved by another of less or equal value, the number expressed denotes the sum of their single values, but when preceded by one of less value it signifies the difference. For instance, III stands for 3, IV for 4, and VI for 6, XL for 40 , LXX for 70 and so on. Our forefathers displayed considerable ingenuity and eccentricity in the arrangement of these symbols, so much so that they often prove a $v e x a t i o u s$ puzzle to our modern bibliographers: but the above simple explanation is sufficient for all purposes in these practical times.

(Archipelago) between Greece and Asla Minor. ${ }^{(6000}$. AEGINA, isl. Greece, $16 \mathrm{~m} . \mathrm{S} . \mathrm{W}$. Altica, 50 m . by 30 m .; Aerde, isl. Danish, In Little Belt; 11,776.
AFGHANISTAN, mountainous country, Asia; $N$. of Beluchistan, between Persia and India; 500 m . N. to S.;600 m.fromı Herat frontier to K haibar l'ass; 260,000 sq. m. 1 Mohammedan; 4,000,000. [35,400. AFIUMKARahissar, c. Asia Minor; opium, inadder; AFRICA, continent, inainly in Torrid Zone; length from Cape of Good Hope to C. Blanco in Tunis, 4700 ; breadth from C. Verde to C. Gardafui, 4360 mm . area, us min. sq. m., of whicli the Sahara Desert ( 3000 m . by 1200 m .) occupies 2 mills.; S. of Sahara lies the Soudan, called also Nigritia or Negroland, stretching across the entire continent from Senegambla to Abysslnia; the contlnent has been wonder. fully opened up since 1849, when the missionaries Rebman and Krapf discovered Kilima-Njaro and Kenia, snow-clad mts. just so. of the equator; from 1849.1856 Barth explored the N. Soudan; 1849 Livingstone (since 1840 agent of London Missiouary Soclety) began his explorations and discovered Lake Ngami ; in 1856 descended the Zambesi to Quilimane and dlscovered Victoria Falls; In 1857-59 Burton and Speke discovered Tanganyika, and Speke discovered another northern lake which he revisited with Grant in 1860, explored it, and under the name of Victoria Nyanza connected it with the Nile: In 186s Livingstone explored Nyassa, and in 1864 Baker discovered Albert Nyanza, the second great feeder of the Nile; Rolphs, Du Chaillu, Von Decken ex. plored N.W. and E. Africa; in 1867 Livingstone discovered L. Moero, $\ln 1868$ L. Bangweolo, and in 1871, howing out of L. Moero, the R. Lualaba (Upper Congo) ; other recent African explorers are Cameron, Nachtigall, Stanley; Stanley discovered and named L. Albert Edward, south of Albert Nyanza, and showed it to be part of the Nile system. African

LANGUAGES are very numerous: 438 langunges and 152 dialects lave b en connted up in six great families; the Negro family, spread over the Soudan, is most numerously spoken; more wiclely spread is the great Bantu fanily, extending in varying but more or less closely related forms from the Cameroous to C. of Good Hope. Most of the European powers possess or claim large portions of the African continent; politically and commercially the British are domlnant is So. Africa; recent conventions have been made by Brit. with Germany and Portugal marking off their respective 'spheres of influence.' The population of $A$. has been variously estimated. British estimates have put it at $203,000,000$; accord. ing to the ' Bevolkerung der Erde, it is no more than 163,953.000.

## Pears'

## Dictionary of

## Cookery and Pastry

The Practice of Cookery and Pastry adapted to the Business of Everyday Life

## NOTE

The greatest care has been taken in preparing the recipes in this Cookery Book, so as to give, by easy and distinct directions, dishes at once economical and elegant.
The exact quantity of the different ingredients, the seasoning, and time required for cooking each dish have been carefully specified, to make the book thoroughly serviceable even to the inexperienced.

# PEARS' <br> COOKERY AND PASTRY. 

## SOUPS.

Clear Brown Soup. -To make two quarts of good soup allow three quarts of cold water, two pounds of hough of beef and the same weight from the neck, both freshly cut, one small turnip, one good-sized carrot, half a head of celery, one smatl parsnip, two onions, a quarter of an ounce of black and Jamalca pepper-coms, one teaspoonful of sugar, and about half an ounce of salt. Cut the meat from the bones in pieces weighing about four ounces, put the bones in the bottom of a soup pot, next the pieces of meat, two quarts of the water and the half of the salt, let it come slowly to the boil, add half of the reserved quart of cold water, and let it again boil slowly for half an hour, then add the remainder of the water along with the pepper-coms previously soaked in three gills of cold water in a bowl on the stove, which gradual heating draws out the colour and helps to brown the soup. Let all boil very slowly and steadily for three hours, taking care that the scum does not break and go through the soup, which it will do if allowed to boil quickly even for a few minutes, then add the vegetables, cleaned and cut in pieces, not too stmall, the onions, from which pare top and bottom, and cut in halves, leaving the skins on, the sugar, the remainder of the salt, and continue boiling one hour and a half longer, after which strain through a hair sieve, breaking the meat and vegetables as little as possible, and let it stand in a cool place from twelve to twenty-four hours. When wanted take off the fat carefully, put the soup on in a clean pan, keeping back the sediment; let it boil for ten minutes, and season with a little ketchup and salt if required. To make a second stock, put on the strainings again, keeping back the pieces of turnip, cover well with cold water, boil slowly for four hours, and strain. When onions are peeled for various dishes the skins should not be thrown away, but added to this soup with the regetables, as they not only clear the soup but greatly improve the colour.
Clear Vegetable Soup or Stock.-Put on half a pound of dried green peas in two quarts of cold water and boil very gently for three hours, then add one carrot split up and cut in two-inch lengths, one small turnip cut in four, two stalks of celery cut in short lengths, one Spanish onion with top and tail cut off, but the skin left on, and cut in two or four according to size, one teaspoonful of salt, the same of sugar, and continue boiling, still very slowly, for one hour and a half longer, then strain through a wire sieve and put aside for use. When wanted for Julienne or other soups with;a vegetable garnish prepare the vegetables and cook separately, according to directions given for said soups. with meat stock, only do not drain themexcept cabbages, savoys, lettuces, or Brussels sprouts. When the strips of carrot, turnip, etc., are sufficlently cooked in the water with the salt and sugar, add the
stock to them, retaining the water; boil together for a few minutes, removing the scum as it rises, then add the drained green vegetables, stir gently and serve. About double the quantity of vegetable garnish should be allowed for a vegetable stock to that which is usually added to a meat stock.
Strawberry Soup.-Put one pound of fresh strawberries in an enamelled pan with one quart of cold water and an ounce and a half of bread. Let all boil gently for half an hour, then pass through a wire sicye and return to the pan. Add five ounces of sugar, one glass of white wine, and one teaspoonful of corm flour dissolved in a little water. Stir the soup till it boils again, remove the scum, and finish by stirring in half a gill of cream. The soup must not boil after the crean is added.
Summer Hotch Potch (MarGRE)-Put on in an enamelled pan about five ounces of haricot beans with cold water enough to cover them well, a bit of carbonate of soda about the size of a pea, and half a teaspoonful of sugar, boil gently one hour and a half, adding occasionally more cold water; should it reduce too much, then add one ounce of lentils well washed by running cold water on them through a strainer, and continue boiling two hours longer. An hour and' a half before the beans and lentils are finished cooking, put on in a separate pan a dozen green onions cut small in one pint of boiling water with half a teaspoonful of sugar and the same of salt ; boil for half an hour, then add three young carrots cut small; boil half an hour longer, thell add a good-sized garden turnip cut into inch squares, also four early potatoes, which have been cut into quarters and boiled in a separate pan for ten minutes; continue boiling for twenty minutes, after which add the beans and lentils, along with the water in which they have been boiling, and boil all together for a few minutes. A few green peas and a lettuce will be an agreeable addition, the peas to be put in amongst the beans and lentils half an hour before the finish, the lettuce to be washed thoroughly, shred down, put on in boiling water with a little salt, sugar, and a small pinch of soda, boiled ten minutes, then strained, and stirred in gently at the finish. If more salt is necessary, let it be added with the turnip and potatoes.
Hotch Potch.-To make one quart take two pounds of neck or back ribs of mutton. Put the meat in a pan with a pint and a half of cold water, and let it come slowly to the boil. Skim very carefully, and allow it to simmer for two hours. Add one dozen green onions cut small, one teaspoonful of salt, and a pinch of sugar, and continue boiling it for another half hour. Add then half a pint of carrots cut into small dice and boil it for twenty minutes longer, then half a pint of turnips cut like the carrots, and a cauliflower broken Into small pieces, and boil it for forty minutes longer. Have ready boiling in another pan half a pint of water, into which put one pint of shelled green peas, half a teaspoonfili of salt, the same of sugar, and a pinch of
soda. Boil the peas for fifteen minutes and then add one lettuce shred down small, and boil them for ten or fifteen minutes longer. Stir all Into the soup, water included.
Pieces of meat are sometimes served in the tureen with the soup, and if this is wanted, cut off a few small pieces from the meat before cooking it, and stew in a separate pan with a very little water and salt. Stir this into the soup before serving.
Sidney Soup.-Put on in three quarts of cold water two pounds of the neck or hough of beef, with one large ox kidney, or two small ones, one carrot, one small turnip, both sliced, a few pieces of celery, three onions, each cut in two, leaving the skins on, and about a quarter of an ounce of salt. Put about a quarter of an ounce of black pepper-corns into a bowl, cover with cold water, let it stand on the stove until the colour is drawn, then add to the soup; let all boil gently for two hours, take out the kidney, and let it boil two hours longer, then strain through a wire sieve, and set aside till cold. Shortly before the soup is wanted, remove the fat carefully, and pour it into a soup-pan; brown three ounces of butter with three ounces of flour in a small stew-pan, stir a little of the boiling soup into it, then mix with the soup; add the kidney, previously trimmed and cut into small pieces, season with a little ketchup, and let it boil about fifteen minutes, removing the scum as it rises.

OX-tail Soup is made exactly as described in the foregoing recipe, substituting the tail for the kidneys. The tail must be notched at the joints before putting it on with the other ingredients.
Russian White Soup.-Melt in an enameiled pan two ounces of butter with two ounces of flour, then add two quarts of nicely-seasoned good white stock, and stir constantly until it has boiled about fifteen minutes, carefully removing the scum as it rises to the surface. Cut a veal kidney into small pieces about the size of a hazel nut; melt, without browning, one ounce of butter in a frying-pan, and toss the pieces of kidney in it for four minutes. Slice one ounce and a half of pickled gherkins, also eight or ten small tinned or cooked mushrooms, and put them on a plate. Beat up in the tureen the yolks of two eggs, add half a pint of boiling creaun, pouring it in gradually and stirring well; then put in the prepared kidney, gherkins, and mushrooms, after which pour in the boiling soup, stirring gently, and serve immediately.

Bonne Femme Soup.-Prepare two quarts of good white stock, melt in an enamelled pan two ounces of butter, then put in one small cucumber, peeled, and finely sliced, one large stock of lettuce, or two small ones, finely shred, cook for ten minutes, being careful to keep them from browning. Mix one tablespoonful of flour with a little of the stock, add to the vegetables, then all the stock, and simmer all together for fifteen ninutes. Beat up in the tureen the yolks of three eggs with half a pint of cream, pour in the boiling soup gradually, stirring carefully to prevent curdling the cggs.
Spring Soup,-Have a good stock prepared as for brown soup; take a bunch of asparagus, cut the green ends in small bits, a few green peas, with small sprigs of cauliflower, one dozen of small onions, one large carrot, and one turnip; cut them in strips, boil these vegetables separately; when tender, strain them through a sieve, and add them to the soup.

Clear Soup ala Royale.-Beat up in a basin with a spoon the yolks of four eggs, one gill of stock, a little grated nutmeg and salt, strain through a piece of muslin, pour into a buttered custard mould, and steam till quite firm. When cold, turn it out and cut into small dice. When wanted, put it into the tureen and pour two quarts boiling clear soup over it. This custard may be of various colours-red by adding purée of carrots, green by adding purée of spinach, before pouring it into the mould to steam.

Ciear Soup with Quenelles.-For two quarts remove the flesh from the breast of a tender fowl, take off the skin, scrape it down with a knive, extracting the sinews, then pound it in a mortar, and pass through a wire sieve. Mix this thoroughly with twothirds of its weight in butter, and one-third in bread panada, add one egg, the yolk of another, and season
with white pepper, salt, and nutmeg. Sprinkle some flour on a board, divide the mixture into three dozen pieces, roll these lightly with the hand, forming them like gooseberries, then poach them $\ln$ boiling water for ten minutes, put them into the tureen, and pour the boiling soup over them.

Clear Soup with Rice.-For two quarts, prepare two ounces of the best whole rice, as directed in recipe-(TO BOIL WHOLE RICE); put it into the tureen, and pour the boiling soup over it.

Clear Soup with Croutons.-For two quarts, stamp out from slices of stale bread, about a quarter of an inch thick, four dozen rounds the size of a shilling; brown them in the oven; put them in the tureen, and pour the boiling soup over them.

Clear Soup with Vermicelli,-For three quarts, soak in cold water four ounces of vermicelli for fifteen minutes, then let it boil five minutes and drain, put it in the tureen, pour the boiling soup on it, and serve with grated Parmesan cheese on a separate plate.

Brunoise Soup,-Cut into small dice, iturnip, red carrot, the white part of leeks, white celery, and onions, four ounces of each, cook separately in boiling water with a little salt and sugar in it, drain and put them in a soup tureen. Blanch for one minute in boiling water three ounces of Italian paste, then boil it five mlnutes in stock, drain, and add to the vegetables in the tureen, pour three quarts of boiling clear soup over them, and serve.

Julienne Soup.-Cut into small pipes one inch long four ounces of the red part of carrots, the same quantity of turnips, the white of one small head of celery, two ounces of onions, and four of the white part of leeks. Cook each of these regetables separately in boiling water with a little salt and sugar in it, drain and put them in the tureen. Cut into shreds one inch long some cabbage lettuce, boil gently for a few minutes with a very little carbonate of soda in the water, drain, add to the other vegetables, and pour over them three quarts of boiling clear soup.
Julienne Soup (MAIGRE),-Put in a pan a quart and a half of cold water with half a pound of dried green peas. Boil this slowly for three hours, then add one small carrot, two stalks of celery, one small Spanish onion, half of a small turnip, one teaspoonful of salt, and half a teaspoonful of sugar. Boil all slowly for one hour longer, then strain the stock through a hair sieve, and set it aside till next day. Cut into straws about an inch long a small carrot, a slice of turnip, and a stalk of celery, and boil them till tender in fast boiling water with a little salt and sugar in it. Cut half a dozen Brussels sprouts also in strips, and cook them separately in boiling water with a little salt and a pinch of soda in it. Strain these vegetables and pour over them the stock heated to boiling point. Care must be taken to keep back the sediment.
Jardiniere Soup.-Cut into slices a quarter of an inch thick an ordinary-sized carrot and turnip, from them stamp out as many rounds as they will give, with a vegetable-cutter a quarter of an inch in diameter, from the white part of a small head of celery cut an equal quantity with the same cutter; cut the white part of the leaves from a cabbage lettuce with a round cutter the size of a shilling, divide into flowerets one head of cauliflower or brocoli, peel twenty-four button onions, and shell one pint of green peas. Cook all the regetables separately in the usual way, drain, put them in the soup tureen, pour three quarts of boiling clear soup over them, and serve.
White Stock for Soups and Sauces.To three pounds of uncooked meat and bones, such as knuckle of veal, scraps and bones of the same, bones and giblets of poultry, allow three quarts of cold water, or, what is better, the water in which any fresh meat has been boiled, one small carrot, the same of parsnip, both cut in slices, a few short pieces of celery, two onions sliced, a few sprigs of parsley, two bay leaves, two blades of mace, and one teaspoonful of whole white pepper. If knuckle of veal is used, cut the meat in pieces from the bones, put the bones in the bottom of the stock pot, then the meat and other iugredients, add a little salt, put it on the stove or fire, and as it comes slowly to the boil skim it carefully. Let it boil slowly and steadily for about three hours,
then strain it through a lair sieve and let it stand in a cool place for twelve hours, the fat should then be taken clean off, the stock put on in a pan, allowed to come to the boil, carefully skimmed, then poured into a basin and put aside for use.
Rich White Soup. - To make two quarts. Put on in an enamelled pan two ounces of butter, let it ruelt, then stir in two ounces of flour, taking care not to let it brown; add two quarts and a halif of good white stock, stir, and let it boil for fifteen minutes, remoring the scum as it rises, and season with grated nutmeg and white pepper. Beat up in the tureen the yolks of three eggs, stir in half a pint of grood creant, mixing well, then pour in the boiling soup gradually to prevent curdling, and serve.
Plain White Soup.-Knnead two ounces of butter with two ounces of flour, put it ons to melt in a stew-pan, add one pint of sweet milk, stir and let it boil, then add two quarts of nicely-seasoned white stock, a little grated nutmeg, and salt if necessary. Let it boil akout fifteen minutes, add a good tablespoonful of chopped parsley, and serve.
Potato Soup.-Put on in about two guarts of cold water two pounds of neck of mutton, or hough of beef, and one onion minced, let it come to the boil, remove the scum, and let it boil gently for two hours; then add about a dozen ordinary-sized potatoes, which have been peeled, put on in cold water, allowed to come to the boil, and the water poured off; salt to taste, and boil gently one hour longer. Before serving skim off the fat, and, if liked, a little chopped parsley may be added.

If made with drippings, for the same quantity put on two ounces of drippings with the minced onion in a little of the two quarts of water, cold, tet it come to the boil and simmer gently for half an hour; then add the remainder of the rvater, boiling, along with the potatoes prepared as above, and boil for an hour longer. If made from roast beef bones, proceed in the same way as with the fresh meat.
Purée of Brussels Sproutsa-Put on one pound of Brussels sprouts in boiling water with a little soda, let them boil with the cover off the pan till tender, then drain them and pass through a wire sieve with a wooden spoon. Put this purée into a clean pan with three pints of boiling white stock, add a small teacupful of good cream, season with a little white pepper and salt; let it get quite hot, but do not allow it to boil. Serve with fried sippets. Observe, great care must be taken not to let this soup boil, as by doing so it will lose the colour, and be unfit to send to table.

Celery Soup.-Put on in an enamelled pan one quart of good white stock, with four ordinary-sized onions, peeled and cut into small dice, the white part of two heads of celery, washed and cut into pieces about an inch long. and a good tablespoonful of ham liquor; let it boil gently for about an hour, or till the celery is quite tender, then pass through a wire sieve, and return to the pan. Dissolve one tablespoonful of corn flour in a very little cold water or milk, stir into the soup, and let it boil for eight minutes, removing the scum as it rises; season with a little celery salt and white pepper, and just before serving add one gill of cream; let it get as hot as possible without boiling, and serve with crontons of bread on a separate dish.

Tomato Soup.-To make one quart. Cut down four ordinary-sized onions, put them on in an enamelled pan, with a little white stock, and let them simmer for half an bour, then add six or eight tomatoes, according to size, cut in halves crosswise, one quart well-soasoned white stock, and about one tablespoonful of ham liquor ; when it comes to the boil, add one tablespoonful of corn flour,"previously dissolved in a little cold water; let all boil together for about half an hour, stirring occasionally, and pass through a wire sieve. Return to the pan, let it boil for a few minutes, removing the scum as it rises, and serve with croftons of bread on a separate dish.
If liked, lialf a gill of cream may be added just before it is poured into the tureen. The liquor got from ham in process of steaming is what is meant, and is very much better for flavouring than water in which ham has been boiled.
Tomato Soup (MAIGRE), -Pass one tin of
tomatoes through a wire sieve and add to it half a pint of water. Melt one ounce of butter in a pan and stir into it one ounce of flour or cors flour, mixing thers together till quite smooth. Add gradually the tomato pulp and water, stirring continually till it contes to the Let it simmer for a few minntes, then take the pan from the fire and stir into the soup one gill of good milk, one teaspoonful of salt, one teaspoonful of suggr, and a little pepper. Put the pan un the fire again and let the soup get quite hot, but do not allow it to boil.
White macaroni Soup.-Put on four ounces of the best macaroni in one quart of boiling water, let it boil gently for three-quarters of an hour, then drain and cut in half-inch lengths. Put it on again in a quart of white stock, let it simmer gently for twenty ninutes, then draw to the side of the fire for five minutes. Ilave the yolks of two eggs beaten aud mixed with one gill of crearn; add to the soup, along with one ounce of grated Parmesan cheese, a little white pepper, and a small pinch of cayenne. Stir till thoroughly heated, but do not allow it to boil.
Chantilly Soup.-Put on in boiling water two pints of fresh green peas, a small carrot cut up, one onion sliced, a small bunch of parsley, a little mint, and half a teaspoonful of sugar. Let them boil with the cover off the pan till tender, then take out the carrot and onion; drain the peas, and pass through a wire sieve. Moisten one dessert-spoonful of corn flour with a little stock, and boil it in two pints and a half of seasoned white stock. Stir in the purée of green peas into the boiling stock, but on no account allow it to boil after the puree is added.
Bisque or Crab Soup.-Take a good weighty crab freshly boiled, remove the claws, break them, take out the flesh carefully, separate the flakes either with the fingers or two forks, and put aside on a plate. Put on in a stew-pan two ounces of butter with a carrot and turnip, each sliced, a small bunch of parsley, a dozen white pepper-coms, and two blades of mace. Let it simmer with the cover on for fifteen minutes, being careful not to let it brown, then add two ounces of flour, and gradually one quart of white stock. Let it boil slowly for an hour, then add the yellow pith from the body of the crab along with another quart of stock; let it boil again for fifteen minutes, and press through a wire sieve, taking out the vegetables before doing so. Put it on again, let it come to the boil, then draw it to the sicle of the fire; add the flesh of the crab, with one gill of cream, a few grains of cayenne, and salt if necessary, Let it get thoroughly heated, stirring it gently, but it must not boil after the flesh of the crab is added. Lobster soup may be made in the same way, and both should be served with bread cut in dice, browned slightly in the oven, and sent to table on a napkin.

White Haricot Bean Soup.-Put one quart of cold water on in a stew-pan with one pound of white haricot beans, one carrot cut in four, one small onion, a small bunch of parsley, a pinch of sugar, and the same of salt. Let this boil about forty-five minutes, or till the water reduces, then add more cold water, and repeat till the beans are soft, which takes about three hours. When quite ready, drain them through a colander; take out the carrot, onion, and parsley, press them through a wire sieve, adding a little stock occasionally to soften them. Put this purée on in a clean stew-pan, with one pint and a half of white stock, stir and let it simmer for ten minutes, season with pepper and salt, and before serving add a small teacupful of cream. This will give about two pints and a lalf of soup. and if too thick a little more stock nay be added, which, of course, will increase the quantity. Serve with toast cut in dice on a separate dish.

Cauliflower Soup.-Wash a small cauliflower well and remove the green leaves. Put it in a basin and cover it with boiling water, adding is small piece of washing soda if the water is hard. After it lias stood for five minutes, take it out and put it in a pait to boil, with a quart of milk and water, or skinn milk withont water, until quite tender. Pass all through a sieve and scason with one teaspoonful of salt and a little white pepper. Melt one ounce of butter in the sauce.pan and add to it a dessert-spoonful of corn flour, mixing till perfectly smooth. Add the soup gradually and stir till it boils. Let it boil for three mlntites, then draw it
aside and stir in two or three tablespoonfuls of cream. Do not allow it to boil again after adding the cream.
Purée of Fowl a la Reine.-Clean a good young fowl and put it on in three quarts of good white stock, keeping back the nesh from the hall of the breast for quenelles. Along with the fowl put a small bunch of parsley, a bay leaf, one onion, one small lump of sugar, a little white pepper and salt, and let all boil together till the fowl is tender, then strain the stock through a sieve, aud skim the fat off very carefully. Take all the meat from the fowl, free it from skin and fat, and pound it in a mortar, with four ounces of bread soaked in the stock, then pass it through a wire sieve, adding at intervals a little of the stock to make it go more easily, put it into a clean stew-pan, and let it get as loot as possible without allowing it to boil. Blancl and pound in a mortar twenty Jordan almonds, adding by degrees, while pounding, half a pint of good cream, and add to the soup. From the half breast of the fowl prepare some quenelles, put them into the tureen, pour the soup over them and serve. The quenelles are made as follows:-Pound the half breast of the fowl in a mortar, pass it through a wire sieve, mix with it onethird of its quantity in butter, and two-thirds in bread panada, the yolk of one egg, and season with white pepper, salt, and nutmeg. Form into small quenelles about the size of a nutmeg, and poach till firm in boiling white stock.
Purée of rabbit may be made in the same way, using one of the fillors from the back of the rabbit instead of the half breast of the fowl.
Palestine Soup (MAIGRE). 3 Pints -Peel and cut into small dice one good-sized Spanish onion, put it on in an enamelled pan with cold water, enough to cover it; after boiling slowly for an hour, add one dozen artichokes, peeled and cut into pieces, one carrot, one turnip, both cut in pieces, not too small, three bay leaves, three gills of cold water, and a little salt, boil gently till the artichokes are soft, then pass through a wire sieve after picking out the pieces of carrot and turnip, and return to the pan. Mix in a bowl till quite smooth one ounce of flour with a little milk, then stir in half a pint; add this to the soup, and boil for ten minutes, stirring occasionally. Before serving stir in one ounce of butter, after which do not boil; season with a little white pepper and serve with brown bread.
Palestine Soup, No. 2.-Put on two quarts of white stock with two ounces of rice flour, and stir occasionally till it boils, then add one dozen large peeled artichokes, let them boil till soft and pass through it wire sieve. Return this purée to the pan and let it boil till all the scum rises, which must be carefully removed; season with white pepper and salt, and just before serving add half a pint of boiling cream.
Gipsy Soup. -Take four or six leeks, according to size, and cut them in half-inch lengths. Put them in a pan with a quart of boiling water, a teaspoonful of salt, and half a teaspoonful of sugar. Boil this slowly for half an hour, then add the white part of a head of celery cut like the leeks, and boil it for another half hour. Cut one dozen ordinary-sized potatoes in pieces the size of a walnut, boil them for five minutes, then strain and add to the soup. Moisten a dessert-spoonful of pea flour with a little cold water, stir it in, and continue boiling for half an hour longer. Slice down a cabbage or savoy, put it into a pan of boiling water with a pinch of soda and a little salt and sugar, and boil it for ten minutes. Cut four ounces of mushrooms in small pieces and stew them in a little butter till tender. Add these to the soup before dishing it. Serve with brown bread.
Brussels sprouts may be substituted for the cabbage or savoy.
Vegetable Marrow Soup.-Peel and quarter the marrow, scoop out the seeds, then cut into slices, and put it on with a small Spanish onion peeled and sliced, one blade of mace, three bay leaves, three gills of water, and a little salt; let it boil gently till tender, and press through a wire sieve. Mix one ounce of four with a very little milk, then stir in half a pint; put it on in an enamelled pan with the marrow pulp, and let it boil for eight minutes, stirring constantly ; after which removo from the fire, and stir in one ounce of
butter; season with white pepper and salt, and serve with small squares of fried bread on a separate dish. The marrow should weigh about two pounds and a half.

Oyster Soup.-Tº make two quarts. Melt two ounces of butter with two ounces of flour in Ah enamelled pan, being careful to keep it from browning, then stir in one quart of good white stock, and one quart and a half of fisl stock with the oyster liquor in it ; stir, and let it boil fifteen minutes; seasou with one teaspoonful of anchovy sauce, grated nutmeg, and white pepper. Just before serving stir in half a pint of good cream, then add three dozen oysters, previously scalded and bearded, after which it must not be allowed to boil, fbut made as hot as possible. To scald the oysters: put them on in their own liquor, and shake the pan occasionally, until they just boil up, then take them off immediately; strain through a gravy strainer into a basin, adding the liquor to the fish stock, which is used for the soup as already stated, and remove the beards from the oysters

Oyster Soup, No. 2.-Knead one ounce of butter into one ounce of flour, put it on to melt in a stew-pans add one pint of sweet milk, stir and let it come to the boil, then add one pint of fish stock and the strained liquor of one tin of oysters. Season with a little white pepper, grated nutmeg, and salt if necessary. Let it simmer for about ten minutes, then add the tin of oysters, after which do not let it boil. If liked, a tablespoonful of chopped parsley may be added

## just before serving

Jenny Lind Soup.-Make a good stock from about two pounds of hough, a piece of veal or fowl, a parsnip, and a little mace. When the meat is quite boiled down, strain and let it stand till cold, then skim carefully and return to the pan; add two tablespoonfuls of finely-minced parsley, a little pepper and salt, and boil fifteen minutes. Have the yolks of four eggs well beat up, mixed with a teacupful of good cream, and put into the tureen, then pour in the boiling soup, stirring all the time

Lentil Soup.-Put on one pound of boiling beef in one quart and a half of cold water, add one onion cut in small dice, and half a pound of lentils, remove the scum when it boils, and let it boil gently for three hours, salting to taste about half time, and serve with small squares of toast in the tureen.

Ientil and Rice Soup (MaIGRE). 3 Pints. Put on in an enamelled pan three pints of cold water with three ounces of lentils, half of a Spanish onion, peeled and cut in small dice, a saltspoonful of curry powder, a teaspoonful of salt, and the same of sugar; let it boil gently for about two hours, then add two ounces and a half of whole rice, another teaspoonful of sugar, the same of salt, and let it boil gently one hour longer. Just before dishing, stir in one teaspoonful of vinegar, one tablespoonful of chopped parsley. and a good tablespoonful of cream, or half an ounce of butter, after which do not let it boil.

Mock Turtle Soup.-Put a well-fed calrs head on in a large pot with cold water, and one tablespoonful of washing soda, allow it to come to the boil, turning it occasionally, then take it out, and scrape the hair clean off with a sharp knife, after which wash it well and put it in cold water. When quite cold, take it out of the water, remove the flesh on both sides from the bone; divide the head, take out the tongue, and saw the bones into convenient pieces. Place the bones at the bottom of a soup-pot, then the sides of the head, the tongue, a knuckle of veal, andean old fowl from which the breast fillets have been removed, add about eight quarts of cold water, corer closely, and skim carefully when it comes to the boil. Allow it to boil steadily for about an hour, take out the sides of the head, and lay them aside; let it boil an hour longer before taking out the tongue, which skin and lay aside. Now add to the soup one carrot, a small head of celery, one small turnip, four onions, one bay leaf, one blade of mace, Jamaica and black pepper-corns, half an ounce of each, and a little salt. Before adding the pepper-coms let them be put into a bowl, well covered with cold water, and allowed to stand on the stove till thoroughly heated and the colour drawn, which helps to darken the soup. Let it boil slowly and steadily for another two hours, and straill, after which put it in
a cool place for at least twelve hours; then, after removing the fat carefully, put it uns in a clean pan, with the whites and shells of two eggs, slightly beaten with a gill of cold water; add is little powdered sweet basil, marjoram, and savoury, stir with a switch until it boils, cease stirring, and let it boil for five minutes : then remove a little back from the fire, let it stand with a lid on it for ten minutes, and pour throngh a jelly bag. Cut the head and tongue into small pieces about an inch square ; have small quenelles made from the breast of the fowl, poach theni in bolling water for five minutes, and add along with the small squares of meat to the soup just before serving.
Albert Soup.-Take the two points of the hind houghs of an ox, together weighing from twelve to fourteen pounds, wash them well, put them in a large stew-pan, cover with water and a little salt, skim clean when it comes to the boid, then add one ounce of whole white pepper, one handful of parsley, and let it boil slowly for four hours, then take out the meat, cut off the gristly parts, lay them aside, and return the bones witl the meat left on them to the stew-pan containing the stock. Have a good young fowl prepared, add it to the soup, let it boil for one hour, then take it out and remove the fleshy parts from the breast, return the remainder to the stock, boll two hours longer, and strain through a hair sieve. If the process of boiling reduce the stock too much, a little boiling water may be added. When the soup is to be used, skim off the fat, return it to the stew-pan, keeping back the sediment, and add to it the gristles, cut into small pieces about an inch square. Pound with the breast of the fowl a little lean ham, some bread crumbs, a little grated Pnutneg, and ground white pepper, moisten with an egg, and make into small round balls, numbering about two dozen, brown them a little in a fryingpan and add to the soup, together with six egg balls and a few pickled gherkins cut into small pieces. Havo two dozen of good large oysters, put them on in their own liquor, let them just come to the boil, strain them through a sieve, beard them, and add to the soup, taking care not to let it boil afterwards. Have a teacupful of Madeira wine in the tureen, pour in the soup, and serve as hot as possible.

Potato Soup (MAIGRE), -Peel and cut in small dice one Spanish onion, put it on in an enamelled pan with one quart of cold water and half a teaspoonful of sugar, boil slowly one hour, then add a dozen mediumsized potatoes, previously peeled, cut in pieces, put on in cold water, boiled for ten minutes, and drained, also a carrot split up and cut in short lengths, a few pieces of celcry, and a teaspoonful of salt; boil gently for an hour longer, after which take out the pieces of carrot. Moisten one dessert-spoonful of pea flour with a little cold water, stir it into the soup, boil for five minutes, then take off the fire, add half a gill of cream, and, if liked, a tablespoonful of chopped parsley. Serse with whole-meal bread or squares of toast.
If the forcgoing recipe is followed exactly a most delicious potato soup will be produced, nourishing, especially if taken with whole-meal bread, and more digestible than what is usually made from meat, bones, fat or other scraps.
Partridge Soup.-Have a couple of partridges, singe, clean, and bone them; cut the best parts off and lay them aside. Put on in a stew-pan the bones and giblets with three pounds of hough of beef, cut down a little, cover with water and a little salt, skim when it comes to the boil, then add a parsnip, a few sweet herbs, six onions, let lt boil till the substance is extracted from the meat, and strain through a wire sieve, From the strainings pick the liver and any bits of the flesh of the birds which have not quite boiled down, pound these, and with a little soup rub them through a sieve. When the soup is cold, sklm it, return to the pan, add the pieces of the partridges, cut in small scollops and fried, along with what has been pounded, and boil slowly till tender, removing any fat or scum carefully as it rises. Season with ketchup, pepper, and salt, and in the tureen in which it is to be served have a little port wine.
Mulligatawny Soup (MAiGRE). 3 PintsPeel two apples and one Spanish onion, and mince together not too fineiy, brown about one ounce and a
half of butter in a frying'pan, put then in and fry till very much browned and reduced, stirring constantly to prevent burning, then add une tablespuonful of flour, one teaspoonful of curry powder, and half a pint of sweet milk, previously well mixed in a bowl; stir thoroughly; let it boil for a minute, then pour into a clean pan, adkl a quart of vegetable stock, and buif for Half an hour, rennoving the scum as it rises. If convenient the addition of half a gill of cream, just before pouring into the turcen, will be found to be an improvement, But it is good enough without. Serve with boiled whole rice on a separate dish.
Mulligatawny Soup, No. 2,-Clean and bune a dleshy yuung fowl, put it on along with the giblets and bones in four quarts of white stock, lot it boil for twenty minutes, then take it out, and leave the remainder to boil very slowly for an hour. While the stock is loiling, brown two ounces of butter in a frying. pan, then put in four apples asd four onions, both minced, brown then well, constantly stirting and twring with a wooden spoon till very much reduced. Mix three tablespoonfuls of curry powder with the same of flour, moisten with milk, pour into the fryingpan, let it simmer for five minutes, and add to the stock, then rub through a wire sieve, after picking out the bones and giblets. Return the soup to the pan, add the fowl, freed of skin, and cut into pieces about an inch square, let it boil for twenty minutes, or till the fowl is tender, skimming it carefully. Just before it is sent to table add half a pint of boiling cream, and serve with plain boiled rice on a separate dish. Game, veal, rabbit, or fish may be substituted for the fowl ; if game, the soup is called Game Soup aे l'Indienne.

Hare Soup.-Take a large hare, skin and cut it up, taking care not to break the inside, put in your lhand and take out the lungs, holding the hare over a basin so as not to lose any of the blood, and leave tho lungs amongst it; lay the hare on the table, and with a sharp knife cut off the four legs, and from them all the flesh ; next, from both sides of the back bone, take the flesh as clean as possible, then cut off the head, split it in two, and lay it aside on a plate with the flesh. Put the remainder of the hare amongst the blood, and to it add about three quarts of tepid water, pour all through a hair sieve into a large stew-pan, and rub through any of the blood which does not go easily, either with the hand or a wooden spoon. Put it on the fire, and stir into it three handfuls of oatineal, and keep stirring gently till it comes to the boil, to prevent curdling, then add the bones of the hare, stir again till it boils, and put in one carrot, one turnip, one parsnip, a bit of celery, a little whole black pepper, some swect herbs, and two pounds of hough of beef, or three quarts of second stock; let all boil together for three hours, strain it, pick out the bones, and rub through as much as possible in order to thicken the soup. When all the soup has been strained and pressed through the sieve, return it to the stew-pan, cut the flosh into small pieces, and brown it in the frying-pan amongst butter and six: minced onions, add to the soup and boil slowly till the flesh is tender, removing the scum and fat, as it rises in the process of boiling. Season with pepper, salt, and ketchup.
Apple Soup. 3 Pints.-To make a quart, cut four apples into pieces without pceling or removing cores. Put them on in an enamelled pan with one quart of cold water, one ounce and a half of bread, and the thin paring of a lemon; let it boil for half an howr, then pass through a wire sieve, keeping back the lemon pect, and return to the pan. Mix three ounces of sugar with half a teaspoonful of cinnamon, add to the soup; also one glass of sherry: let it again come to the boil, taking off the scum as it rises. Before serving stir in one good tablespoonful of cream, or the yolks of two eggs; if the latter, stir over the fire till it begins to thicken, without allowing it to boil. If liked, slíces of toast may be served on a separate dish.
[The quantity of sugar may be more or less, according to the quality of the apples; if sour, more will be re. quired ; if swcet, less.]
Chestnut Soup (MAIGRE). 3 Rints.-Put on in an enamelled pan one Spanish onion, peeled and cut in small dice, with two pints and a half of cold water; let it boil slowly about threc-quarters of an hour, then
add one pound of chestnuts, previonsly roasted and peeled, one stalk of celery cut in shall pieces, one carrot, lialf a teaspoonfill of sugar, one teaspoonful of salt, and coutinue boiling slowly one hour longer. When ready take out the carrot, pass the soup throngh a wire sieve and return to the pan; let it boil up, renove the scum, add ladf in gill of crean, after which do not boil.

Chestnut Soup, No. 2.-Roast and peel two pounds of Spanish clicstnuts, put them on with three pints of good white stock, then boil gently till quite soft, and pass through a fine wire sieve. Return the purée to the pan, add three pints of good white stock, let it boil till the scum rises to the surface, which must be taken ofl with a spoon; finish by adding half a pint of boiling cream and half a teaspoonful of pounded sugar. Crouttons fried in butter may be served on a separate plate with this soup.

Chestnut-flour Soup.-Peel one Spanishonion and cut it in sinall dice. l'ut it in an enamelled pan with one quart of cold water and half a teaspoonful of sugar, and let it boil slowly for forty-five minutes. Add one carrot split up aad cut in short lengths, and two stalks of celery cut in small pieces. Continue boiling the soup for one hour longer, then remove the carrot, pass the soup through a wire sieve and return it to the pan. Mix three ounces of chestnut flour with half a pint of cold water, stir it into the soup, and continue stirring until it boils. Allow it to boil for five minutes, removing all scum. Add salt to taste. Take it from the fire and finish by stirring in lialf a gill of cream. Serve with croutons of fried bread or toast.
Ziussian Soup.-Make a stock the same as brown soup (see BROWN SOUP), skim and keep back the sediment before returning it to the stew-pan. Have three ox palates boiled till tender, strain them, but do not add the water to the soup, skin them and cut into small pieces about an inch square, put them into the soup, and boil for a little. Have two carrots and two turnips cut into smali pipes or straws, parboil, drain, and add to the soup.
Lobster Soup:-Put on in cold water three pounds of hough of beef, one fresh haddock, two blades of mace, half a dozen of chillies, half an ounce of whole white pepper, and let it boil till it is reduced to three quarts, then strain through a hair sieve. When quite cold skim the fat clean off, and return to the stew-pan. Have two hen lobsters boiled, cut them up, break the toes and take out the flesh, which cut into small pieces; take the soft meat from the middle of the lobster and pound it with the roe, the meat of an anchovy, or one tablespoonful of the essence, a little minced parsley, grated nutmeg, the rind of a lemon, one teacupful of bread crumbs, a little cayenne and salt, moisten with an egg, and form it into little balls. Put on the soup, let it boil, then add the balls and small pieces of lobster, and, just before sending to the table, add one glass of sherry wine.
Sheep's-Yead Broth.-Have a sheep's head and feet singed, split it up, take out the brains, and rub the head and feet with them; let them lie ail night, and in the morning put them on the fire in a pot with cold water. Let it get hot, but do not let it boil; take it from the fire and let it stand one hour, then wash and brush them well before they are put on to boil. Have a pot ready, put in one teacupful of barley, two ounces of whole rice, two pounds of the neck of mutton; put in the head and feet, and plenty of cold water and a little salt. Skim it well, and when it comes to boil, draw it to the side of the fire, and let it boil slowly but constantly for two hours; then add carrots, turnips, onions, cut neatly, and let it boil for other two hours, salting to taste. If the head is tender, take the broth off the fire, dish the head with the feet round it, and pour a little melted butter and minced parsley over them.
Plain Rice Broth.-Put in a pan one pound of boiling beef, and a quart and a half of cold water. Let it come very slowly to the boil, then skim it carefully. When it las simmered for an hour add two ounces of well-washed whole rice, and boil it gently for two hours longer. Carefully skim off the fat, add a tablespoonful of finely-chopped parsley, and serve.
If cabbage is liked, shred down a small one, put it into a pan of boiling water, with a little salt and sugar, and a small piece of soda, and boil it for ten minutes.

Strain it and add it to the soup, after the fat las been skimned off, and let all boil for five minutes longer.

Hotch Potch. -Take six or cight pounds of tle back ribs of mutton; cut off six chops from the best end; trins off the fat and put tlien aside; put the remalnder, with the trimmings from the chops, in a stewpan, with plenty of cold water and a little salt ; skim it clean as it comes to the boil; cut two heads of cauliflower very small, wash it well, and put it in the pot, with one pint of carrots, one of turnips, cut small, two pints of peas, and boil them all togetlier for two hours. Take out the piece of mutton and put in the chops, anotlier pint of very green peas, the white part of one dozen of young onions, and salt to taste. If you find the hotch potch not thick enough, add a few more vegetables, and let them all boil gently for an hour. This soup should never be ready long before it is to be dished, as by standing it loses the green colour. Serve it hot witli the chops in the tureen.
Split-Pea Soup.-Take one pound of split. peas, two pounds of houglh or roast beef bones, and put them in a stew-pan with cold water, a little salt, two or three onions, one small turnip, one carrot, and a bit of celery. Let it boil slowly for two hours, take out the bones and press it through a sieve, put it back into the stew-pan; add a little white pepper, and salt to taste. Have some toasted bread cut in dice, put it in the tureen, and pour the boiling soup oa it.
You may improve this soup by having some spinach leaves boiled and strained, after whicl1 they may be added to the soup.
Leek Soup.-Take two pounds of a hough or roast-beef bones, put them in a stew-pan with a good deal of water and a little salt; boil it for two hours, then take the piece of beef and bones out, and put in a fowl cleaned and cut into pieces. Have two dozen of large leeks, cut off all the green parts from them, cut the white ends in pieces, one inch in length, wash them in water till very clean, add them to the soup, and let them boil until the fowl is tender; then salt to taste, and serve the soup and fowl in the tureen. Prunes stewed till tender in the soup, then taken out and the stones extracted, are sometimes served on a separate dish, two being the allowance to each guest.
Leek Soup (Maigre), 3 Pints.-Put on three ounces of white haricot beans with a pinch of soda in a pint and a half of cold water, and boil gently for three hours and a half. When the beans are half cooked, put on in a separate pan four leeks washed and cut in half-inch lengths, with a pint and a half of boiling water, three ounces of lentils, a carrot cut in pieces, one teaspoonful of sugar, and the same of salt, boil slowly for about an hour and a half, then take out the pieces of carrot, and add the beans along with the water in which they have been boiled.
Cream of Rice.-Make two quarts of white stock from a knuckle of veal, or bones and giblets of fowls, one carrot, one tumip, one onion, a small bunch of parsley, one blade of mace, a few white peppercoms, and one bay.leaf. When cold free it from fat, and put it on with six ounces of whole rice, and a little salt, let it simmer till the rice is soft, then press through a fine wire sieve, return it to the pan, and allow it to boil a few minutes, skimming it carefully. Before serving add half a pint of boiling cream.
Cream of Barley.-Wash in cold water four ounces of pearl barley, put it on in a pan with one pint of water, and let it simmer until it has absorbed the water, then add two 'quarts of good white stock, and let it boil gently for four hours; strain the soup into a basin, bruise the barley in a mortar, then press it through a wire sieve in amongst the soup, return to the pan, and let it boil for about ten minutes, carefully removing the scum as it rises to the surface. Before serving add one gill of good cream, and half a pint of peas boiled green; if more seasoning is required, add a little white pepper and salt.
Puree of Onions.-Peel and slice half a pound of onions, put them on in boiling water for ten minutes, drain and run cold water on them, then put them on in a pan with one gill of milk, a little grated nutmeg white pepper, salt, and a pinch of sugar, let them boil gently about forty-five minutes, or till the onions are quite soft, and press through a fine wire sieve on to
a clean plate. Selt in a pan half an ounce of butter, with the same weight of flour, then add the puree of onions, along with one quart of white stock, stir, and let it boil about fifteen minutes, skinming it cirefully; if more seasoning is wanted, add in little white pepper tand salt, and, just before serving, half a gill of creann.

Fish Soup (White).- Delt in a pin onc ounce of butter with ons ounce of flour, add three gills of milk, let it boil, then add two pints of fish stock, stir carcfuily, and let it boil gently tor ten minutes; have the fillets of small haddock or whiting cist into pisces nbout an inch square, put then into the soup and cootinue to stir till it boils for five uninstes, being careful not to break the fish, Season with a littlegrated nutney, white pepper, and salt, and just at the moment of serving addl a dessert-spoonful of chopped parsley.

Clear Fish Soup with Quenelles.-Brown two ounces of butter in a stew-pan, then put in one sliced carrot, one sliced onion, one small liend of celery cut ioto short lengths, four sprigs of parsley, one bay leaf, and a little thyme, let them simmer in the pan with the cover off till well browned, then add two quarts of tish stock, put on the cover, let it boil gently for an hour, and strim. When cold, skim off the butter, put on the soup in a clean pan, with the fillets of a fresh haddock or whiting pounded in a mortar, along with the white aud shell of one egg, stir with a switch till it comes to the boil, let it simmer for about five minutes, then remove it to the side, let it stand for ten minutes, aod pour through a tamis. To make the quenelles, scrape down and pound in a mortar the fillets of a small fresh baddock or whiting, add to it one-third of its weight in butter, two-thirds in bread panada, one egg, a little grated nutmeg, white pepper and salt, mix thoroughly, and form into quenelles about the size of a gooseberry, on a board with flour sprinkled over it. Poach them in boiling water for ten minutes, then drain and put them into the tureen, pour the boiling soup on them, and serve.

Soupe Maigre--Soak two pounds of haricot beans in cold water for twelve hours. Put them on to boil in one gallon of water sith two parsnips, two beetroots, two onions, one carrot, and a few pepper-corns. Boil until the beans are soft, then add one tin of tomatoes and a thick slice of toasted bread, and boil for half an hour longer: Put all through a wire sieve, and return to the pan to get thoroughly hot before serving.

White Maigre Soup:-Slice four onions and boil for ten minutes, then drain and run plenty of cold water on them, put them on with one gill of milk, let them boil till soft, and pass through a wire sieve on to a clean plate; melt one ounce of butter in a sauce-pan with one ounce of flour, add one pint of milk, let it come to the boil, stirring constantly, then add two pints of cold water, and continue stirring till it has boiled for fifteen minutes, carefully removing the scum as it rises, put in the purée of onions, a pinch of sugar, a little pepper, salt, and grated nutmeg, and stir till it comes to the boil again; have half a pint of boiled green peas in the tureen, pour the boiling soup on them, and serve. Instead of green peas boiled, a tablespoonful of chopped parsley may be added just before dishing; or, instead of a vegetable garnish, small squares of fried bread, served on a napkin, may be handed round with the soup.

Mushroom Soup. 3 rines.-Put on in an enamelled pan six ounces of white haricot beans, with a quart and a half of cold water, one Spanisli onion peeled and cut In small dice, a stalk of celery, half a teaspoonful of sugar, and a pinch of soda; boil gently two hours and a half, adding a little more cold water should the beans absorb too much. Have four ounces of flap mushrooms cut into small pieces, add to the soup, and continue boiling slowly one hour longer, then pass through in wire sieve, return to the pan, stir in a teaspoonful of red-curmint jelly, let it boil up, take off the scum, and salt to taste. Serve with fried croatons on a separate dish.

Pigeon Soup.-Clenn six young pigeons, remove the fillets from the breasts and lay them aside. Brown three ounces of butter with two of four in a stew-pan, add the birds, each cut in two, also the giblets, brown these well on both sides, then add one cirrot sliced, a few pieces of celery, two onions sliced, one bny.leaf,
one sprig of thyme, four sprigs of parsley, and a few one sprig of thyne, four sprigs of parstey, and a few
black pepper-coms, let all simmer together for half an hour, add threc quarts of good second stock, nud let it boil slowly for two hours. Strinin throngh a wire sieve, pick out the bones, and vegetables, nud press through what rennins for thickening. Cut the fllets ncross into thin scollops, fry them in in frying-panl with a litule butter, browning them nicely on both sides. Return the soup to a cloin pin, add the scollops, nind let it boit for a little, or titl they are tender, removing any scuns or grease that may rise to the surface. Finish with one tablespoonful of ketchup, and, if liked, in gliss of port wine. Soup of any kind of game or rabbit may be made in the same way.

Fish Stock.-Put on in cold water the skin, bone, and trimnings of fresh cod, haddock, and whiting, with a bunch of parsley, an onion, a carrot, and a few white pepper-corns. Let it simmer slowly for an hour, strain, and put aside for use. This stock is not so good if kept longer than tweoty-four hours.

To Clarify Soup or Stock.-To each quart of soup allow the white and shell of one egg, four ounces of fresh raw meat finely minced, and a wineglassful of cold water. Switch all together, add to the cold soup, put it on the fire, stir carefully till it boils, and let it boil about twenty minutes. Draw it to the side for a little, and pour through the tamis.

Chicken Soup for Invalids.-liave a nice young fowl or chicken drawn and carefully cleaned. Put it on in a clean pan, with one teacupful of whole rice, and as much cold water as will cover it ; let it come slowly to the boil, skimming it carefully; keep it boiling gently for about two hours, and just before taking it off add a little salt.

Beef Tea.-Take one pound of the juicy side of the round, cut it into very small bits, and keep back the skin; put it on in a clean stew pan with a quart of cold water and a little salt. When hot skim it clean and let it stand at the side of the fire, taking care that it never boils.

Beef Tea, No. 2.-Take the same quantity of beef, or more if required, remove the skin and fat, and cut it in very small bits, put it into a jelly-jar that will hold it easily, sprinkle a little salt over it, and tie a piece of cloth over the jar; put it into a close stew-pan among cold water about two inches deep, and let it simmer for six hours, adding a little boiling water occasionally, and taking care not to allow it to boil into the jar. When ready, pour through a gravy strainer. Of course this method yields a very small quantity, but it is often given, in teaspoonfuls only, to very weak persons.

Beef Tea, No. 3.-Take one pound of fresh beef from the juicy side of the round, remove the skin and fat, if any, cut into small pieces, and mince it. Put it on in a clean enamelled stew-pan with one pint of cold water, let it stand for an hour with the cover on, then place it near the fire, so that it may cone to the boil slowly, and remove the scum as it rises. Keep it simmering for about twenty-five minutes, add salt to taste, and pour through a gravy strainer.

Beef Tea, No. 4.-Put on, in one pint of cold water, one small carrot sliced, one ouion cut in two, and one small piece of celery, let it simmer for forty minutes, add two sprigs of parsley, and allow it to simmer twenty minutes longer, then strain and set aside till quite cold. Proceed now exactly as in the foregoing recipe, using this pint of water with the flavour of the vegetables in it instead of the simple cold water.

Beef Tea, No. 5.-Take one pound of fresh beef from the juicy side of the round, pare away the skin and fat, mince it finely, and put it into a basin with one pint of cold water. Have a basin with a projecting rim, and a snuce-pan just the size to allow said rim to rest on the edge of it, put the meat and water into the basin, then put the basin into the pan about one-third full of boiling water, put the cover of the pan on the basin, and let it cook for three hours, never for one moment allowing the contents of the basin to boil, while the water outside must be kept boiling slowly. Should the water dry up, more boiling water must be added. When ready, pour through a gravy strainer and salt to triste.

## FISH.

Steamed Cod.-Clean, cut of the fins, and skin the piece of cod required, which may be the head and shoulders, the iniddle cut, or the tail; place it into an enamelled baking-dish, just large enough to hold it, then cover with a piece of clean paper, and put another dish of the same size on the top. Hive a fish-pan with boiling water in it to the depth of about an inch; put an open ring or hoop in the middle, on which place the dishes containing the piece of fish, put on the cover of the pan, and stean from half an hour to an hour and a quarter, according to the size and thickness of fish. When cooked enough the flesh leaves the bone easily. It may be served with any of the following sauces: -Oyster, Dutch, ancloovy, or plain butter. The stock used in making the sauce should be the liquor which flows from the fish in the process of cooking. It may be garnished with slices of the roe fried and put round it, or pieces of tomato and olives alternately.
Cod's Fiead and Shoulders.-Take a good cod, cut the head and shoulders the size wanted, put the fish upon a board, pour boiling water upon it, then scrape it gently with a knife to take the black off, without taking the skin. When the fish becomes white, put it in cold water until it gets firm, and lay it in salt for some time. When you are to dress it, have a pan with boiling water and salt; put in the fish on a drainer and boil it for about forty-five minutes. Have the tailpiece skinned and cut into small fillets, brushed with beaten egg, coated with bread crumb, and fried in boiling fat. Drain the head and shoulders, dish on a napkin with the fried pieces and sliced lemon placed alternately round it. Garnish with parsley, and serve with ,oyster sauce, or plain butter sauce in a sauce tureen.

Crimped Cod,-Take a very fresh cod, cut into the bone on both sides, with about two inches between each slice, then lay it in cold water with a little vinegar in it for about two hours. Put it on in boiling water with two handfuls of salt in it, and boil gently till done, skimming carefully. Drain and serve immediately, with parsley and butter sauce.
Cod Steaks,-Cut from the tail end of a fresh cod three or four slices rather more than half an inch thick, remove the skin from them, and lay them on a dish. Mix two tablespoonfuls of salad oil with the same of vinegar, a few sprigs of parsley, and a little pepper and salt, with a spoon, pour this over the steaks, and let them remain in it for two hours. When wanted, wipe them with a clean cloth, dust some flour on both sides, then brush with beaten egg, coat with bread crumbs, and fry in boiling fat till they become a nice brown colour. Serve hot with maitre d'hôtel butter under them and garnished with parsley, or with plain butter sauce in a sauce tureen. For a small party of four or six persons, this way of cooking cod is very much to be preferred to the usual boiling.
Baked Cod.-Clean, trim, and skin a cod rather under the middle size, stuff it with four ounces of grated bread, two ounces of finely-minced suet, a very little thyme, marjoram, grated nutmeg, pepper, salt, two tablespoonfuls of good stock, and one egg. Sew it up and truss with cord in the form of the letter S . Set it on a baking-dish with about two ounces of butter and the liquor of a tin of oysters, put it in the oven till the butter melts, then baste the fish with the gravy frequently. When half done, and just after a basting. sprinkle brown raspings of bread over the fish, and repent twice, thus forming a coating of raspings over it, and bake about an hour in the oven. Prepare the following sauce:-Brown one ounce and a half of butter in a sauce-pan, dredge in a little flour, then strain in the gravy from the baking-dish, add a wine-glassful of ketchup, one tablespoonful of sherry, a few grains oi cayenne, a little grated nutmeg, a few capers chopped, the juice of half a lemon, or a little spiced vinegar, and let it boil five minutes, stirring carefully, then add the tin of oysters (previously bearded), after which do not let it boil. Take two fish slices and remove the cod very carefully on to the dish for the table, pour the sauce round it, and garnish with sliced lemon and
parsley. A linge haddock may lee cooked in the same way.
Cod au Gratin.-Take the remains of cold boiled cod left from the previous day's dinner, take away the skin, carefully remove the bones, and separate the flakes without breaking then much. Butter a flat dish, put in alternate layers of the fish and sauce, spriukling each very lightly with grated cheese, seasoned with a few grains of caycnne. On the top lnyer strew rather thickly brown bread crumbs or raspings, with here and there very small pieces of butter, and put it in the oven long enough to get thoroughly heated. Serve with a border of potato or rice croquettes, or, if something plainer is preferred, a border of mashed potatoes laid on before the dish is put into the oven.

Cod a la Religleuse. -Take three or four pounds of cold boiled cod, and break it into flakes. Have an ashet with a mashed potato border round it, put the smallest of the flakes in the bottom, and the largest on the top, building it high in the centre. Have a sauce made as follows:-Knead with a knife two ounces of butter into two ounces of flour, put it on in a pan with half a pint of cream or good sweet milk, and the same of fish stock, and stir till it boils ten minutes. Have four eggs boiled hard, shell and mince two of them fine; add to the sauce, stir together, and pour it equally over the cold fish. Cut the other two eggs in thick slices, and each slice in four, sprinkle some lobster roe over the sauce in the form of a + ; put the pieces of egg over the roe about an inch apart, and all round inside the border, on the top form a star or cross with boiled beetroot and small sprigs of parsley in between the eggs and beetroot; then put it on a hot plate, let it just come to the boil, and serve on a folded table-napkin. This is a most excellent and economical way of using up cold cod.
To clean and prepare Haddocks.-Have some haddocks, take out the inside, cut them open considerably below the vent; wash them well, but do not scrape the skins; cut off the point of the tail, take out the eyes and gills, put in some salt into the bodies, let them lie until next day, then put them upon a fish heck or a wooden rod put through Ithe eyes; hang them in a foool place in the air; after which they may be either boiled or broiled, taking off the heads and skins.

Steamed rillets of Haddocks:--Clean, skin, and fillet the number of ordinary-sized haddocks required, allowing a fillet for each person; sprinkle a very little salt on the inside of each, and form into neat rolls, beginning at the head part of the fish. Place them in an enamelled pudding.dish just large enough to hold them, back part uppermost, then cover with a piece of clean paper, and put another dish of the same size on the top. Have a fish pan with boiling water in it to the depth of about an inch; put an open ring or hoop in the middle, on which place the dishes containing the fillets, put on the cover of the pan, and steam for about half an hour. Serve with oyster, Dutch, anchovy, or plain butter sauce, either poured over the fillets or separately in a sauce tureen. The scraps of the fish should be used to make stock, which, with the liquor which comes from the fillets in the process of cooking, goes to make any of the sauces.
Boiled Haddocks:-Clean and skin them, put their tails through their eyes, boil, and dish them upon a napkin, garnish with parsley and fried roes, and serve with shrimp sauce (see Shrimp SAUCE).
Stewed Haddocks with Brown Sauce. - Take two or three large haddocks, cut off the heads. skin and bone them into neat fillets, put on the heads, bones, and fins, with two sliced onions, a little whole black pepper and cayenne, corer with cold water, let them boil for twenty minutes, and strain through a sieve. Brown two ounces of butter in a stew-pan, with some flour, brush the fillets over with beaten egg, put them in and brown them on both sides, then add the stock, along with one tablespoonful of ketchup, the same of Chili vinegar, and simmer for fifteen minutes. Place the fillets round the dish, pour the sauce into the centre, and garnish with parsley.
Baked Fish and Tomatoes.--Butter a pie-
dish and put a layer of filleted haddeck, sole, or plaice in it. Sprinkle over the fish a llttle pepper aud salt and a few drops of lemon juice. Cut sonie tontatoes in slices and put a layer of these next, adkling a little more pepper and salt. Fill the pie dish in this way, finisthing tho dish by putting a good layer of bread crumbs on the rop, with a few thy pieces of butter here and there. Bake from thirty to forty minutes.
Fillets of Haddocks with Cakes and Oyster Sauce.-Take four ordinary sized had. docks; clean, and let them lie amonsst a little salt for about twelve hours, then skin and split up the back on each side of the bone, in order to divide them in two; after which turn neatly, and roll them up, then place the rolls in a baking-disll that will just hold them, with a morsel of butter on each; cover first with paper, then witl another dish of the samesize, and put thelli in the oven for half an hour. Take the remaining fish and nuince it down, with two ounces of marrow, a little grated bread, a few grains of cayenne, and moisten with an egg, roll out to a quarter of an inch thick, cut into small cakes about the size of an egg.cup, and fry in boiling fat. Have a browned potato border round the dish on which they are to go to the table, and oyster sauce prepared witb a tin of oysters, pour in the sauce first, tben place the rolls neatly above, sprinkling pounded crab or lobster roe on the top of each; place the fish cakes between them, and small sprigs of parsley alternately.
Fish Balls.-After removing the fillets from haddocks for a separate dish, carefully scrape away every morsel of fish left on the heads, bones, etc. Mince it finely, then add some bread crumbs, a little finely. minced suet, parsley, and a few sweet herbs; moisten with a little beaten egg and a little stock, season with pepper and salt, form into balls, roll in bread crumbs. and fry in boiling fat, drain for a minute in tbe oven, and serve piled up on a napkin. These balls make a nice breakfast dish, or they may be served round a dish of fish as a garnish, or as a garnish for fish soup; if for the last. let them be made very small.
Plain Way to Fry Small Faddocks. (VERY SAVOURY), -Clean, scrape off the scales, and trim the number required; sprinkle a little salt on both inside and out and let them lie for about two hours, then wipe with a cloth to absorb the moisture, sprinkia slightly with pepper, coat them with four, after which shake them, so that what is loose may fall oft. Have a common frying•pan, with tbree ounces of dripping quite hot, put in the fish, shake the pan a little at first, or move them gently with the fish slice, let them fry for eight minutes, then turn and cook the same time on the other side. Serve hot, garnished with parsley.
Eillets of Haddocks à Royale.-Skin and fillet two ordinary-sized haddocks, divide each fillet in two or three according to the size of the fish, and put them into a basin. Mix two tablespoonfuls of salad oil witb two tablespoonfuls of vinegar, a few sprigs of parsley, two bay leaves, and a little pepper and sait. Pour this mixture over the fillets, and let them remain in it about two hours. When wanted wipc them with a clean cloth, dip them in frying batter and fry in boiling fat. Put them in the oven a minote to drain, dish in a circle, the one overlapping the other, with the following sauce in the centre:-Work one ounce of butter into one ounce of flour, put it on in a saucepann, let it melt, add one gill of milk, and stir carefully till it boils, then add one gill of fish stock, and let it boil five minutes. Take it off the fire, add half an ounce of butter, let it melt, then one dessert-spoonful of finely-chopped parsley and one tablespoonful of spiced vinegar. Stir till quite hot without allowing it to boil.
To Fry Haddocks or Whitings on Wire Drainer,-Hare the number required carefully cleaned and slightly salted for two hours, then trim and skin them, taking care not to break the under skin, or handle them too much. Put the tail through the eyes, dip them in well-beaten egg, then roll in bread crumbs, and place them on the wire drainer. Have a stew-pan, which will just hold the drainer, half filled with boiling clripping; put in the drainer with the fish on it, and let them boil till they become a golden brown, then take them out and place them before the fire, or
at the mouth of the oven, for a few minutes, to drain the fat from them. Serve very hot on a napkin, and garnisl: with parsley and cod roe.
Fillets of Maddock in Custard.-Sprinkle fillets of laddock, sole, or plaice with lemon juice, pepper, and salt.' Koll them up and put them in a buttered pie-dish. Beat an egg till light and frothy, add to it a little salt, white pepper, and grated nutmeg, and a small teacupful of milk. Pour this custard over the fish and bake it in a moderate oven from twenty to thirty minutes.
Fried Fillets of Haddocks.-Clean, skin, and fillet two lresh haddocks rather above the medium size, cut each fillet into three pieces, first flour, thent, then dip them in, or brush them with beaten egg, and coat them with fine fresh bread crunbs. [Another way, which is less expensive, looks as well, and is quite as good, is to make a very thin batter of flour and milk into which dip the fish, then coat with bread crumbs, thus saving the eggs.] A short time before serving place them on a wire drainer, and fry them in boiling lat to a nice golden brown with a crisp surface, put them in the oven a minute to drain the fat from them, and serve on a napkin garnished with parsley. They are usually served without sauce, but if desired, plain butter sauce with a little chopped parsley in it is the most appropriate. One haddock makes a neat dish for a small party of four by skinning the head, coating and frying it with the fillets, placing it in the centre and arranging the fillets neatly round it.
To Boil Turbot.-Have a good turbot, lay it in salt and water for a little, scrape and wash it well, make a deep cross cut upon the back, which prevents the skin from breaking on the breast. Have a large fishkettle of boiling water ready, with a good deal of salt ; lay in the fish upon the back, boil it slowly for twentyfive minutes, with the cover off. If the fish is very large, it will require half an hour; when done, draw up the drainer, place it across the pan, cover it up with a dry cloth to keep the steam in, dish it upon a napkin and garnish with parsley and pounded lobster or crab

To Broil Mackerel,-Clean them well, split them and take out the bones, wipe them with a dry cloth, rub them over with butter, and sprinkle thens with salt and pepper; butter a piece of paper, put the paper round them, lay them upon the gridiron on a clear fire; they will take twenty five minutes to broil. Dish upon a napkin, fold them together, so that they may appear whole, and serve then with minced parsley and butter.
To Crimp Skate.-Take a good female skate, which is the best ; after it has been in salt and water. cut thin round the edge of the skate, hang it up, and when dry take the skin off both sides; lay it in cold water and a little vinegar for one hour ; then with a sharp knife cut the skate from the one side to the other, making the slices about an inch and a half broad; cut four or five slices, roll them up in a round ring, and tie them with a bit of tape; put them in the fish-pan, in boiling water, a little salt, and boil them fifteen minutes. Before dishing, cut off the tape, and put the largest roll in the centre with the others around it, garnish with parsley, and serve with shrimp or anchovy sauce.
Stewed Skate.-Clean and skin the skate as above, and cut it into square pieces. Make a stock of the skin and spare piece of the skate, put it on with a little stock if you have it, add two onions sliced, a few sweet herbs, boil until you have all the substance extracted, and strain. Take a stew-pan, put in about three ounces of butter, brown it, shake in some flour, shake the par to keep it from burning, till it becomes a fine light brown. Have the pieces of skate brushed over with a beaten egg, lay them in the stew-pan, brown well on both sides, pour in the stock, shake the pan well to prevent the flour from falling to the botton; add a little spiced vinegar and cayenno, let it boil for fifteen minutes, and add twelve fish balls (see FISH BALLS). When wanted, make the dish very hot, place the skate in a circle, pour in the sauce and balls into the centre, and garnish with parsley.
To Boil Salmon.-Put as much boiling water into al fish-pan as will cover the salmon, add to it salt till you fud it strong enough to float an egg, then put
in the salmon, and, as it comes to the boil, skim it carefully. If a whole fish, it will require to boil for hadf in hour; if in slices, only twenty minutes. There are a variety of sauces with which sihnon is usually served, such as lobster sauce, shrinip, parsley and butter, and Dutch, but the uost suitable are mayonnaise, tartar, or a little of the water in which it has been boiled, with a little vinegar and chopped parsley in it. Sliced cucumber is usually served on a separate plate with boiled salmon.
To Boil a Grilse whole.-Have the grilse cleaned in the usual way, and shape in the form of the letter S , whicl is done with a packing needle and white cord as follows:-Fasten the end of the cord round the tail, then pass the needle througla the middle of the fish, then through the head; put it on in a fishpan with a drainer in as much boiling water as will just cover it ; add three handfuls of salt; when it comes to the boil skim carefully; if a large-sized fish, boil twentyfive minutes, and lift it carefully out of the water with the drainer. Have a table-napkin neatly folded, on which place the fish with the back up, cut the cord and draw it out gently. Garnish with sprigs of green parsley and lobster roe previously dried and pounded. The roe is sprinkled along the back and down the sides, to imitate as nearly as possible the bone of the fish.
Cold Salmon for Wedding Breakfasts or Evening Parties.-For a party of thirty have a head cut weigling about twelve pounds, clean in the usual way, and with a sharp-pointed knife cut up the back to the mouth, then down the other side, dividing equally in two. Put it on in a fish-pan with drainer, cover with boiling water, to which add two handfuls of salt, when it comes to the boil skim carefully, and boil twenty minutes, then take it out of the water and place it on two large ashets with the skin side up, pour a little of the water over each piece, and let them stand till cold, then skin carefully and place them on the two ashets on which they are to be served. Make a sauce as follows:-Knead eight ounces of the finest salt butter into six ounces of flour, add one pint of cream, one pint of the water in which the fish was boiled, and half a pint of vinegar; put it in a stew-pan on a slow fire, and stir carefully till it comes to the boil, then pour it equally over each piece of fish, and garnish with sliced cucumber cut into stars and other forms, lobster roe, parsley, and aspic jelly. If liked, the fish may be coated with mayonnaise sauce instead of the above, and ornamented in the same way.

To Broil Salmon.-Cut the slices from the thickest part of the fish; butter a piece of paper, put in the slices, broil them over the fire for fifteen minutes, take off the paper, dish them on a napkin, and garnish with parsley. Salmon dressed in this way may be put round salmon boiled in slices. Serve with shrimp sauce.

To Kipper Salmon.-Cut the fish up the back and take out the bone. Wipe it clean with a wet cloth, then with a dry one. Lay it upon a large dish; then cover it over with salt and half an ounce of saltpetre, and a handful of raw sugar. Put a large dish over it, and a heavy weight; let it lie twenty-four hours, then take it out and draw it through cold water, tighten the back with wooden skewers, and hang it up to dry where the sun will not strike upon it.
To Pickle Salmon.-Cut the salmon intoslices, boil it as for cating; take it out and let it stand till cold. Take one English pint of the liquor in which you boiled the salmon, half an ounce of whole black pepper, quarter of an ounce of allspice, and boil for fifteen minutes. Lay the salmon into a deep dish, and pour the pickle over it; add a little salad oil, cayenne pepper, and cover it closely. It will keep any length of time.

Fried Smelts.-Take the number required, and see that they are perfectly fresh, as by keeping too
long the flavour peculiar to them will be lost. Do uot wash them, but draw the gills out very carefully and wipe with a cloth, handling them as gently and as little as possible, dust with four on both sides, draw through beaten egg, and coat with fine fresh bread crumbs. Place them on a wire drainer, and fry in boiling fat to a light golden brown, after which lift the drainer with them on it, and put it in the oven only long enough to drain the fat from them. Serve cross-
wise on a folded napkin, and garnish with parsley. Shrimp, Dutch, or lobster sauce may be served with them in a sauce-tureen if desired.
Fried Soles.-Take the skin off both sides, Beat up one egrg upon a plate; take the fish by the eyes and draw it through the egg, coat with bread crumbs, and fry in boiling fat. When they are a fine light brown, lay them upon the back of a sieve before the fire. Dish them upon a napkin, gamish with parsley, and serve with slirimp sauce.
Fillets of Soles Fried.-Take the skin of both sides, bone then, cut each sole in four by cutting up the centre the long way, give them one twist, dip in egg and bread crumbs, and fry in boiling fat. Dish upor a table-napkin in two rows, garnish with parsley and sliced cucumber, and serve with Dutch, shrmp, or lobster sauce.
Sole with Water Souchet.-Clean the sole, take off the dark skin, and put it on a gratin dish. Put on to boil small pipes or strips of carrot and turnip in fish stock. When ready, pour it over the fish, add a little picked parsley and about half a glass of sherry. Put another dish on the top, and bake in the oven from twenty to twenty-five minutes. Serve with brown bread and butter. Haddock may be cooked in the same way, giving it about fifteen minutes in the oven.

Sole a la Cardinal.-Fillet a sole neatly and sprinkle over each piece of fish a little lemon juice, pepper, and salt. Roll the fillets up and lay them on a well-buttered baking tin. Cover them with a piece of buttered paper, and bake them from ten to fifteen ininutes. While the fish is baking make the following sauce:-Melt in a sauce-pan one ounce of butter and stir into it one ounce of four. Mix till quite smooth, and then add gradually half a pint of milk or fish stock. Stir the sauce continually until it comes to the boil, and allow it to simmer for three minutes, that the four may be thoroughly cooked. Draw the pan to the side of the fire and add a quarter of a teaspoonful of salt, a pinch of white pepper, one teaspoonful of white vinegar or lemon juice, and a few drops of carmine. When the fish is ready arrange the fillets neatly on a hot dish and pour the sauce over them. It ought to be thick enough to coat the fish nicely.

Sole au Gratin.-Butter a gratin dish rather thickly with about two ounces of butter, then spread over it a very small onion finely minced, a little parsley also finely minced, a few chopped mushrooms, and some brown bread crumbs. Cleanse, skin, and trim a sole, lay it on the dish, strew a little more parsley and bread crumbs over it, put in a few small bits of butter and some button mushrooms neatly arranged, pour in about it one glass of sherry, the same of ketchup, and a few drops of the essence of anchovies. Bake in the oven twenty-five minutes. It must be sent to table on the dish on which it is cooked. A whiting may be done in the same way, giving it fifteen minutes in the oven.
Fried Whitings.-Skin and put the tail through the eyes, dip in egg and bread crumbs, and fry in boiling fat. If required for a top dish, they may be dished in the form of a pyramid, by having a napkin folded on the dish on which they are to be sent to table. On it lay first eight, four on each side of the ashet, with their heads meeting, above them place three, next two, and on the top one, and gamish with parsley.
Fried Whitings, No. 2.-Skin and tum the tail up the back, pin it, dip them in egg and bread crumbs, and fry them in boiling fat. Fold a napkin on the ashet on which they are to be sent to table, then place a pudding.dish on it bottom up, cover with another napkin, place the whitings all round with the heads up, and garnish with parsley.
Fillets of Whitings au Gratin.-Clean, skin, and fillet six medium-sized whitings, roll up each fillet neatly, and place them on a gratin dish, previously spread rather thickly with butter, sprinkled lightly with finely-ininced onion and parsley, and coated over with bread raspings. On the top of each fillet strew a very little of the fincly-ninced onjon and parsley, then a coating of bread raspings, and a sunall piece of butter. Cut into small pieces a few tinued mushrooms, strew them over the top, pour in about the fillets one winc-
glassful of ketchup, the same of sherry, and cook in the oven for about twenty ninutes. It is better to use a white fire-proof china dish for this, as the fish must be served on the dish on which they have been cooked. Fillets of haddocks or soles may be done in the same way.
Eoiled Dried Fish.-Cut the fish down into pieces above four inchessquare, put them in cold water for a night; wash them well, and brush the skin with a brush; put them in a largo stew-pan, and cover with cold water ; put them upon the fire and let then just come to the boil; then set them upon the side of the fire to simmer for three hours; ponr out the water, and then cover them again with boiling water; set aside to simmer arain for two hours, and have some hard-boiled egrs ready. When wanted, dish the fish upon a napkin. slice the exgs, garnish with then and parsley, and serve with egr sauce in a tureen (see EGG SAUCE).
Fish Pudding. -P repare dried fish exactly the same way as the above; take as many pieces as you think will be required; take off the skin, and pick out the bones and beat them in a mortar; have some potatoes mashed, mix the fish and potatoes, adding four ounces of butter, a little cream, and two teaspoonfuls of mustard ; beat them all up together, place them upon a square dish, and trim them up neatly. With the hack of a knife mark crosswise, in the form of a diamond; put some small hits of hutter upon the top; hrown them in the oven or before the fire, and serve with egg sauce.
Fish Pudding (ANOTHER WAY).-Bone and skin two raw fresh haddocks, pound them in a mortar, and ruh through a wire sieve; then put the fish again into the mortar, with two eggs, a little parsley, and an onion cut small, some white pepper and salt, a teacupful of bread crumbs, and four ounces of marrow. Pound all well together, put it into a shape, and let it steam one hour.
Potted Herrings.-Take herrings perfectly fresh, and clean them well, hut do not wash them; cut off the heads and fins and take the bones out; strew them over with salt and pepper, and a slice of an onion nicely minced to each; roll them up tightly, pack them in a jar, and pour over them in the proportion of a pint of rinegar to two of water, with half an ounce of whole black pepper; tie over the jar a piece of bladder or paper, and hake them in the oven for an hour; take off the cover when they are cold, and pour over them a little cold vinegar and tie them up.

Potted Herrings (ANOTHER WAY).-Clean the herrings very carefully, cut of the heads, fins, and tails. Take out the hones, and sprinkle each fish with flour, pepper, and salt. Roll them up and lay them side by side in a pie-dish. Pour over them three or four tablespoonfuls of vinegar and bake them for forty minutes.

To Fry Trout.-Carefully clean, scale, and wash the fish; season them lightly with pepper and salt, and roll them in dry oatmeal. Melt a little dripping in a frying-pan, and, when it is quite hot, lay in the fish. Fry them from six to eight minutes according to the size of the trout, browning both sides equally.
Fresh Herrings.-Scrape and clean them, then wipe them well, but do not wash them; rub them over with melted butter, dredge them with very small crumbs of bread, and broil them upon a gridiron. Serve them with white sauce made of fresh butter, pepper, vinegar, mustard. and salt.

To Pickle Oysters. - Take as many of the best oysters as you wish to pickle; put them upon the fire in a stew-pan in their own liquor, shake them occasionally; when the liquor boils, take them off and drain through a sieve; let the liquor settle, and pour off the clear part, and put it on to boil, with half an ounce of whole black pepper, a little allspice and salt, and boil it fifteen minutes; put in the oysters and let them boil one minute, then put them into a jar and let them stand till cold, and tie them up.
To Prepare Crab or Lobster Roe for Garnishing. - Wash the roe carefully in cold water, put it on in boiling water for five minutes, then take it off and break into small pieces, dry it slowly in a hot press or on the end of a hot plate mutil it becomes crisp; then pound it in a mortar, and sift through a fine
gravy strainer. Put aside for use in a bottle with a wide houth, such as ans old plekle one.

To Prepare Bread Crumbs for Frying Eish. -Yoast and dry on the hot plate all the old crusts and pieces of stale bread, then pound them in a mortar, and sift through a fine sieve or gravy strainer. This is an economical way to use up any left pieces of bread or crists, and suitable for frying fish of any kind, and wilk keep good for a long time in a dry place.

To Clarify Dripping.-Put the dripping on in a stev-pan, and as it colues to the boll sklm carefully, and let it boil five minutes, then pour through a gravy strainer into a large basin half filled with boiling water; let it stand till set into a firm cake on the top, then take it off and scrape away the sedinent from the botton; break the cake of fat in pieces, put thein into a clean carthenware jar, and put it on the hot plate to melt. It may be kept for any length of time after this process in a cool dry place.

## SAUCES.

Apple Sauce-Take six good baking apples, peel and cut them in four, take out the core; put thern either in a hrass or enamelled pan, with a little water; let them hoil to a pulp, and press through a sieve. Return to the pan with one ounce of butter, two ounces ${ }^{*}$ of sugar and a little lemon juice; stir well, and serve hot in a sauce-tureen. This is always served with goose and roasted pork.
Mint Saucea_Take twelve stalks of green mint; pick off the leaves, wash well; mince them very small, take a small teacupful of vinegar, add two tablespoonfuls of raw sugar, and mix them well to dissolve the sugar. Serve in a sauce-tureen, with roast lamb, either hot or cold.

White Sauce.-To make white sauce for a boiled turkey, take one breakfast-cupful of cream, mix in two tablespoonfuls of flour till very smooth, a little pounded mace, nutmeg, and salt; add a breakfastcupfut of the water in which the turkey was boiled, put it on the fire, stirring all the time till it hoils and becomes very thick and smooth; then pour it over the turkey. This sauce may be served with boiled fowl or chickens.
Celery Sauce.-Wash two large heads of celery, cut the white parts in half-inch lengths, put them on in an enamelled pan with equal measures of milk and white stock, and hoil till tender. Put on in a sauce-pan two ounces of butter with the same of flour, let it melt, stirring it well with a wooden spoon, drain the celery, add the milk and stock to the butter and flour, and continue stirring ; let it boil about ten minutes, if too thick add a little more white stock, then add the pieces of celery, half a gill of cream, and season with white pepper, salt, and grated nutmeg, after which it must not be allowed to boil. This sauce is very much liked with boiled or braised turkey, and the quantity given here will he found sufficient for one.
Bread Sauce.-Boil in a pint of water a tbick slice of hread, a minced onion, and some white pepper. When the onion is tender pour off the water, pick out the pepper-corns, and rub the bread through the sieve, then put it into a pan with half a pint of cream, a pat of butter, and a little salt, stir till it boils, and serve.
Bread Sauce, No. 2.-Boil one pint of good milk, pour it over a breakfast-cupful of bread crumbs, in a basin, and cover it with a plate; let it stand one hour, and press through a sieve. When wanted, put it into a small sauce-pan; if too thick add a little cream to it, a little nutmeg, two drops of the essence of cloves, and a little sait, let it boil one minute, and serve in a sauce-tureen.
Bread Sauce, No. 3.-Boil for ten minutes in a pint of white stock one onion, with two cloves stuck in it, and one blade of mace. Strain this into a basin on a breakfast-cupful of bread crumbs, cover with a plate and let it stand. When wanted, put it on in a clean sauce-pan with one gill of cream, a little white pepper and salt, stir till it boils, and serve in a sauce-
tureen. Bread satuce is served with grame and some. times with roast fowls.
Browned Bread Crumbs ior sorving with Game.-? oven on a bakiug dish till it becones a fine light brown colour, then take it ont and rub in a little bit of butter. Serve hot on a napkin.

Panada.-Put on in a small sauce-pan lalf a pint of water, with an ounce of butter and a little salt. Let it come to the boil, then stir in flour till pretty stiff and snooth, and put it out on a dish to cool.

Bread Panada.-Soak six ounces of bread in tepid water for fifteen minutes, then wring it in a clean cloth to take the water from it, put it on in a pan with one ounce of butter and two tablespoonfuls of white stock, stir till it becomes a smootli paste and leaves the side of the pan.
Bigarade Sauce-Pare the outside rinds from three sweet oranges, put them on in a small sauce-pan with cold water, boil till tender, and drain. Brown in a sinall stew•pan one ounce of butter with the same of flour, add half a pint of brown soup, let it simmer for ten minutes, stirring it occasionally, then add the juice of the three oranges with the rinds, after which it must not be allowed to boil. If necessary, season with a little pepper and salt. This sauce is served with wild duck, and sometimes with roast ducklings when served instead of game.
Plain Butter Sauce.-Put on in a sauce-pan one ounce of butter with one ounce of flour, let it melt, then add half a pint of cold water, let it boil gently for about ten minutes, removing the scum carefully as it rises, and stirring constantly one way. After it has boiled the specified time for the purpose of cooking the flour sufficiently, take it off the fire; take three ounces of butter, divide it into three equal parts, add one to the sauce, stir till it melts, then a second, stir again till it melts, and so with the third piece, never on any account allowing it to boil. Season with a little pepper and salt, and, if liked, finish with the juice of haifra lemon.
Parsley and FennelSauces.-Makea plain butter sauce as in the foregoing recipe, and just at the noment of serving stir in one tabiespoonful of chopped parsley or fennel.
Dutch Sauce. - Put on in a sauce-pan four tablespoonfuls of vinegar, and reduce it by boiling to about half the quantity, then take it off and add two tablespoonfuls of white stock along with the yolks of two eggs, put it on again and stir till thick like custard, but do not let it boil. Divide three ounces of butter into four pieces, add one to the sauce, put it on the fire and stir till melted, then take it off, add another, and repeat till all the butter has been put in. Whiite adding the butter, the addition of a tablespoonful of white stock occasionally serves to keep the proper consistency or thickness, which should be somewhat like meited butter. Season with pepper and salt, and, if liked, a few grains of cayenne. Great care must be taken not to let this sauce boil, as if allowed to do so it will be sure to curdile.
Plain Fish Sauce (White), -Work one ounce of butter into one ounce of flour, put it on' to melt in a sauce-pan, add half a pint of good sveet milk ; let it come to the boil, stirring it very carefully, then add gradually half a pint of fish stock, and let it boil from ten to fifteen minutes, stirring occasionally. Season with white pepper, and salt if necessary,
Plain Fish Sauce (Brown). - Brown two ounces of butter in a stew-pan wikh one ounce and a half of flour, after which add to it about three gills of fish stock, two tablespoonfuls of ketclup. one of spiced vinegar, a little black pepper, one tablespoonful of cayenne sauce, and salt only if necessary. Let it boit gently for about ten minutes; if too thick add a little more fish stock, if too thin reduce by boiling a little longer, and serve in a sauce-tureen with fried haddocks or whitings.
Oyster Sauce (white) - Put on in a saucepan with the liquur a bout them two dozen fresh oysters, let them just come to the boiling-point in order to scald them, then drain and remore the beards. Melt in a sauce-pan two ounces of butter with one of flour, add to it one gill of milk, stir till it boils, then add onegill of
fish stock, the liquor of the oysters, half a gill of cream, one teaspoonful of cayenne sauce, a little white pepper, and salt if necessary. Let it boil gently for ten minutes, stirring constantly; if too thick add a little more fish stock, let it come to the boil again, then take it off the fire and put in the oysters, after which it nust uot be allowed to boil. If liked, a little lemon juice may be added just before serving.

Oyster Sauce (Brown),-Prepare two dozen fresh oysters as in the foregoing recipe, then brown two ouuces of butter in a stew-pan with one ounce of flour, add to it one gill of gravy soup, one gill of fish stock, the liquor of the oysters, one teaspoonful of cayenne sauce, a little black pepper, and salt if required. Let it boil gently for ten minutes, stirring constantly if too thick add a little more brown soup or fish stock, let it come to the boil again, then take it off the fire, put in the oysters, aud heat thoroughly without allowing it to boil. This sauce is often served with beef-steaks and broiled slices of cod. Tinned oysters may be used instead of the fresh ones, in which case no scalding is necessary; they have only to be taken out of the tins, clrained, and bearded, the liquor about them being reserved for the sauce.

工obster Eutter,-Pound together in a mortar the spawu and coral of a boiled hen lobster, add to it the double of its weight in butter and a pinch of cayenne, pound a little longer in order to mix it, pass through a wire sieve, put it into a jar, and set aside in a cool place for use.

Lobster Saucen-Cut into smail square pieces about the fourth part of the white meat of a freshlyboiled lobster, and put them on a plate. Melt in a sauce-pan one ounce of butter with one ounce of flour, add one gill of milk, stir till it boils, then add half a pint of fish stock, one teaspoonful of cayenne sauce, a little white pepper and salt, let it boil ten minutes, stirring constantly, then take it to the side of the fire, stir into it lobster butter sufficient to colour it, one tablespoonful of cream and the pieces of lobster, after which be very careful that it does not boil. If liked, a little lemon juice may be added before serving.

Lobster Sauce, No. 2,-Make a plain butter sauce (see recipe for it), stir into it lobster butter enougl1 to give it a fine colour, a pinch of cayenne, a little lemon juice, and the same quantity of the white meat of the lobster as in the foregoing recipe, and heat without allowing it to boil.
Anchovy Sauce.-Make a plain butter sauce oi four ounces of butter, add enough of the essence of auchovies to flavour it, or two pickled anchovies, washed, boned, trimmed, and pounded, and a little lemon juice, or one tablespoonful of Chili vinegar ; let it become quite hot without boiling.

Anchovy Butter.-Take the number of pickled anchovies required, wash them well, cut of the heads. remove the bones, and pound them in a mortar, add sufficient butter to make a nice soft paste, pound a little more, then pass through a wire sieve, put it into a jar, and set aside in a cool place for use.

Green Butter,-Blanch for five minutes in boiling water, tarragon, chervil, parsley, and chires, one handful of each, press them in muslin to take the water from them, pound them in a mortar with four ounces of fresh butter, adding a little cayenne pepper and salt, pass through a fine wire sieve, and put aside for use. This butter is used for colouring and flarouring sauces, and sometimes it is moulded into little pats and handed round with cheese after dinner.
Bernaise Sauce.-The ingredients are the yolks of five eggs, four ounces of fresh butter, one full tablespoonful of tarragon vinegar, the same of chopped tarragon, and a very little pepper and salt. Divide the butter into four equal pieces of one ounce each, put the yolks into a sauce-pan with one piece of butter, and stir over a slow fire till it begins to thicken, then remove a little from the fire and add one piece of butter, stir till it melts, then add another piece of butter, repeating the melting till the pieces of butter are all added and well mined. The chopped tarragoll, tarragon rinegar, salt, and pepper are now put in and mixed well.

Ege Sauce:-Boil two eggs very hard, take them out and lay them in cold water for five minutes, take off the shells, and mince then very fine; beat four ounces
of butter, put in the egrs amongst the butter, ancl make it hot. This sauce is always served with salt tish.
Cucumber Sauce.-Have one or two green cucumbers, put theminto boiling water with a little salt and winegar, let then boil for tem minutes, take them out, peel them, and cut them in slices, about half an incb thick. Take a little white stock, a pat of butter. a tablespoonful of lemon pickle or winegar, and a tablespoonful of sugar, put them in a stew-pan on the fire, and shake it until it becomes hot, then add the cucumbers and a little white pepper This sauce is served in a sauce-tureen with lamb cutlets.
Caper Sauce.-Make a plain butter sauce, add some French capers and a littlo wincgar; stir, ant make it hot. Serve over boiled mutton or in a sancetureen.
Shrimp Sauce, Tako two dozen of shrimps, put them in boiling water, and let them boil for five ruinutes, then strain and pick them nicely; put them in butter sauce, add a tablespoonful of temon pickle or hot vinegar, and shake tbe sauce-pan until it is hot. Serve in a sauce-turcen.
Hiorse-Radish Sauce for Cold Meat.Mix a teaspoonful of mustard, two tablespoonfuls of cream, and one of Chili vinegar; add a little salt, a tablespoonfut of grated horse-radish, and a teaspoonful of brown sugar. Mix all together, and serve in a sauce-tureen.
Plain Brown Sauce.-Put two ounces of butter into a clean stew-pan, melt it, and let it boil, then dredge in about an ounce and a half of flour, moving the pan very carefully, as it has a strong tendency to burn. Wben it is a dark brown colour add two breakfast-cupfuls of stock, and stir with a wooden spoon. IF too thick, add a little more stock; season with a little ketchup, black. pepper, and salt, and let it simmer slowly for ten minutes. If wanted very smooth pour it through a gravy strainer.
Salad Sauce.-Have two hard-boiled eggs, bruise the yollss till very smooth, add a tablespoonful of cold water, mix them with a teaspoonful of mustard, one of satt, and one of black pepper, a teaspoonful of cayenne sauce, a tablespoonfut of vinegar, one of the essence of anchories, and a small teacupful of cream.
Mayonnaise Sauce.-Separate very carefully the yolks of two eggs, drop them into a clean basin, and with a wooden spoon stir for a few seconds; then take tbe salad oil bottle, and, placing your thumb over the top, pour in very slowly about half a pint of oil, stirring constantly till it becomes thick and smooth; season with pepper, salt, vinegar, and mustard. When you begin to mix the oil with the yolks, the oil should be added in drops at short intervals. This sauce is used for dressing cold salmon and lobster salads.
Piquant Sauce.-Chop together one tablespoontul of capers, the same of pickled gherkins, and one small onion; put them on in an enamelled pan with two tablespoonfuls of vinegar, and let sunmer for about ten minutes, or till the vinegar is reduced to half the quantity. Brown one ounce of butter with one ounce of flour, add about half a pint of stock, and let it boil slowly for ten minutes, then add the chopped capers, etc., etc.; season, if necessary, with pepper and salt, and if liked one teaspoonful of anchovy sauce. This sauce is suitable either for meat or fish; but, if for fish, it is better to prepare a plain butter sauce instead of the brown, to which add the piquant mixture.
Lyonnaise Sauce.-Pecl and cut into smali dice one large Portugal onion, put it on in an enamelled pan with one ounce of butter, and let it simmer till soft, then add one gill of tomato pulp, a piece of glaze about the size of a walnut, one dessert-spoonful of vinegar, half a teaspoonful of sugar, a little black pepper, and salt; let it boil up and serve. This is a very goorl sauce for mutton cutlet.
Tomato Sauce,-Put on the fire in an enamelled pan one tablespoonful of vinegar, and let it boil till reduced to half the quantity, then add half a pint of tomato pulp, one ounce of meat or chicken glaze, a pinch of sugar, and the same of salt if necessary, let it simmer for two or three minutes and serve.
Tomato Pulp.-Cut two ounces of fat ham into small pieces, put it on in a sauce-pan with onc bay leaf and a sprig of thyme, put on the cover, and let it simmer
for a few minutes without allowing it to brown. Cut six fresh tomatoes through the micllle crosswise, squecee out the sceds and water, add them to the ham, let them stew for fifteen minutes, or till tender, skinuming off the fat as much as possible, take out the pieces of ham, pass the tomatoes through a wire sieve and set aside for use. When fresh tomatoes are expensive, or not in season, conserve of tomatoes, as well as whole ones, may be got very grod in tins,
Mussel Sauce.-Wash the shells in several waters, scraping them well, then put them in a colander and run cold water on them till it comes away quite clear and free of sancl, after which put them to stecp in coll water for two lours. Driun the water from the mussels, put them on the fire in an iron stewpan, closely covered, shake them occasionally until the shells open, then remove from the fire immediately, strain the liquor into a basin, take tlie muscles out of the shells, and remove the beards and black parts. Melt one ounce of butter with half an ounce of flour in a sauce pan, add the liquor of the muscles, a little pepper, nutineg, and one teaspoonful of cayenne sauce, let it boil for ten minutes, stirring constantly, and fiuish with half a gill of creann, a dessert-spoonful of chopped parsley, and a little lemon juice.
Plain White Sauce.-Melt in a sauce-pan one ounce of butter with one ounce of flour, without allow. ing it to brown in the least degrec, add about three gills of good white stock, and let it boil for ten minutes, stirring constantly, season with white pepper, grated nutmeg, and salt, and finish with half a gill of cream, after which let it come to the boil again.
Maitre d'Yotel Sauce.-Mix together two ounces of butter with one tablespoonful of finclychopped parsley, add the juice of half a lemon and a little pepper and salt, take the foregoing white sauce just after it is off the boil, stir this Maitre d'Hôtel butter into it, let it get as hot as possible without boiling, and serve.
Cardinal Sauce,-Make a plain white-sauce, and when just off the boil stir into it enough of lobster butter to make it a bright red colour, add a little essence of mushrooms, or the liquor of a a tin of muslirooms, one teaspoonful of cayenne sauce, a little lemon juice, and heat thoroughly without allowing it to boil : if for baked fish a little of the liquid about them should be added to the sauce to give it a characteristic flavour.
Tartar Sauce.-Drop into a basin thelyolks of two eggs quite free of the least portion of the whites, add one teaspoonful of French mustard, a little pepper and salt, and mix well with a wooden spoon; take the best olive oil in bottle, and, placing your thumb on the mouth of the bottle, add about one gill of oil, at first in single drops with short intervals between each, stirring constantly one way till it becomes thick and smooth, after which add half a gill of tarragon vinegar, one dessert-spoonful of chopped capers, one teaspoonful of the essence of anchovies, and the same of fresh tarragon leaves previously blanched and chopped. If fresh tarragon leaves cannot be got, the dried ones reduced to powder may be used instead, Should this sauce get too thick before the quantity of oil has been stirred in, add a little of the gill of tarragon vinegar, which never fails to bring it back to the proper consistency. In hot weather this sauce, as well as the mayonnaise, should be made in a cool place.
Soubise Sauce (White).-Peel and slice six onions, scald for ten minutes in boiling water, drain through a colander, and run cold water on them, after which boil them in milk till soft, and press through a wire sieve. Melt in a sauce-pan one ounce of butter with one ounce of flour, add the milk in which the onions have just been boiled along with enough of white stock to make it the proper consistency, then the purée of onions, and one cooked potato mashed, let it boil for about ten minutes, and season with pepper, salt, and nutmeg. This sauce is served with roast nutton, mutton cuttets, and braised pheasant.
Soubise Sauce (Brown).-Proceed exactly as in the foregoing recipe, only let the onions be boiled in stock instead of milk, and the butter and flour browned in the sauce-pan instead of being kept white.
Chestnut Sauce.-1'ecl off the outer skin from
oighteen large chestnuts, scald thein in boiling water for about ten minutes, then scrape off the inner skiu, and put them on in a stew-pun with haif a pint of milk along with the same measure of water; let them boil slowly till soft, then drain the milk and water from thenl, and press through a wire sieve while hot. Stir this.s purce ento about one pint of good plain but rather thin white sauce. If wanted brown, the chestnuts must be boiled in brown stock instead of milk, and the purce mixed with brown sance instead of white; iu either case the sauce must be rather thin, as the puree of chestnuts has a tendency to thicken it. To be served with turkey, fowl, chicken, or pheasant.

Sharp Sauce for Venison.-Brown one ounce of butter with one ounce of flour in a stew-pan, add two ounces of ham chopped small, a few sprigs of parsley, one onion sliced, one bay leaf, and a little thyme, let all simmer together for ten minutes, then add three gills of good brown soup or stock, half a gill of vinegar, and a little black pepper and salt, after which let it boil for ten minutes, stirring occasionally to prevent burning. Pass through a gravy strainer into a clean sauce-pan, add one glass of port wine, one dessertspoonful of red-currant jelly, and stir till the jelly dissolves and the sauce just comes to the boil.
Roast-MEat Gravy.-When the roast is done, take away the dripping-pan, pour off the fat, leaving the savoury jelly which has come from the meat in the process of roasting in the bottom. Pour into this jelly enough of boiling water with a little salt to make sufficient gravy for the size of the roast, mix well, let it come to the boil, and pour over the meat. To most people this is the most acceptable gravy with roast-beef or mutton, and ought always to be served with it, even when other sauces and accompaniments are served.
Sauce Royale for Plum Pudiding.-Beat four ounces of fresh butter to a cream, add four ounces of fine ground sugar, and beat a little longer, then stir in gradually one glass of brandy and the same of sherry. The mixing must be done very carefully, adding the brandy and sherry at first in drops at short intervals, so as to make it blend with the butter. This sauce should be made shortly before it is wanted, and served cold in a sauce-tureen, or in little pats on a plate, like butter.
St. Michael Sauce.-Squeeze the juice from two sweet oranges, then strain into a small enamelled pan, dissolve one teaspoonful of potato flour in half a gill of cold water, add to the juice along with one ounce andla half of ground sugar, stir over the stove or slow fire untll it has boiled about three minutes, then take it off the fire; add one tablespoonful of rum, and serve with any pudding to which the flavour is suitable.
Raspberry Sauce.-Put half a pint of hot water well flavoured with raspberry jain into a small sauce-pan. Mix one teaspoonful of potato flour with a

- little cold water and stir it into the water in the pan, stirring until it has boiled three minutes. A few drops of cochineal or carmine should be added, and a little sugar if the sauce is liked rather sweet. Strawberry and other jam sauce may be made in the same way.
Albert Victor Sauce for Puddings.Switch up in a small brass pan one whole egg, or two yolks, with one dessert-spoonful of ground sugar, till light and frothy, then add a glass of cowslip wine, and continue switching till very much risen. This sauce is suitable for almost any sweet pudding, and must be served immediately, as it falls quickly.

## Wine or Custard Sauce for Puddings.

 - Beat one egg with one dessert-spoonful of white sugar and half a teaspoonful of corn flour in a small sauce-pan, put it near the fire, add a teacupful of good sweet milk, stir till it becomes thick, but do not allow it to boil, then add one glass of sherry.German Sauce for Puddings.-Switch up in a basin inside a pan with boiling water in the bottom, on the stove, one egg, half a glass of sherry, the same of water, and one tablespoonful of sugar, till it gets quite light and spongy, and pour over the pudding.
Almond Sauce,-Mix together in a small saucepan one egg with one ounce of sugar, one gill of milk, one ounce of ground sweet alnonds, and one tablespoonful of orange-flower water, put it on a slow fire, and stir witl a switch until it becomes like thick cream. taking care not to let it boil.

Apple Sauce for Puddinge. - Put in a pan hauf a pint of water in which the skins and scraps of the apples have been boiled. Add one teaspoonful of potato flour mixed with cold water, and sugar to taste. Stir this mixture till it has boiled for three minutes, and colonr with a few drops of carmine.

Ginger Custard Sauce.-Mix half a tenspoonful of corn flour with two tablespoonfuls of ginger syrup, add a well-beaten egg and a gill and a half of sweet milk, and stir constantly over a slow fire till it thickens.

Lemon Sauce.-Pour half a pint of hot water over the grated rind of a lemon, and let it stand for twenty minutes. Add the juice of half of the lemon with one teaspoonful of potato flour mixed with it, Stir all over the fire till it has boiled for three minutes. Sweeten to taste.
Apricot Sauce.-Put on one small tin of apricots in a brass pan, with their own juice, and ground white sugar enough to sweeten them, let them simmer till soft, then pass through a wire sieve, add the juice of a lemon, and, if approved of, one glass of rum or brandy. Pine apple sauce may be made in the same way. When jam is used instead of fresh or tinned fruit it nust be heated and diluted with water to the proper consistency, without adding any sugar. When fresh fruit is used it requires more sugar to sweeten it than tinned fruit, and to be simmered till soff in a brass pan with a little water.

## BEEF.

Stewed Rump of Beef.-Let the beef hang for some days to make it tender, bone it, and lard it thickly with bits of bacon ham. Take a pan that will hold the beef, put some slices of pork in the bottom of the stew-pan, have the beef rubbed over with fresh drippings, brown it before the fire for an hour, lay it in the stew-pan, and put it on a slow fire, adding two quarts of good stock, some whole black pepper, six small onions whole, three bay leaves, and a few sweet herbs. Let it simmer at the side of the fire for three or four hours; one hour before dinner take out the beef and put it in the oven or before the fire to keep it hot; glaze the beef, have the gravy in which you stewed the beef reduced to a quart, strain it, and skim the fat clean off. Take a small stew-pan, brown a bit of butter, shake in flour, and make it a nice light brown; pour in the stock, let it boil a little, add a tablespoonful of mushroom ketchup, and one of lemon pickle; dish the beef and pour the sauce over it, garnish with sliced cucumbers or pickles, and spinach (see SPINACH).
Stewed $\mathbf{B}$ eef, $\mathbf{N o} \mathbf{2}$. -Take from ten to twelve pounds of the middle part of a brisket of beef, remove the bones, sprinkle a little pepper on it, roll it up neatly, bind with a piece of cord, and put it before the fire one hour to brown. Take a stew-pan large enough to hold it, put in it two quarts of second stock, then lay in the beef, add one head of celery, four onions, a handful of parsley, half an ounce of black pepper, cayenne, and salt. Let it stew slowly for three or four hours, have some carrots and turnips cut out, and boil them in a little stock with a little salt and sugar. The carrots will require double the time the turnips take, therefore you will require to put in the carrots one hour before you add the turnips. Take out the beef, glaze it, strain the stock, and skim off the fat, then brown a bit of butter in a small stew-pan, shake in a good deal of flour, add a pint of the stock and a little of the water in which you boiled the vegetables, stir till it boils, drain the vegetables, put them into the sauce-pan, adding a tablespoonful of spiced vinegar, and salt to taste. Cut the cord off the beef, lay it on a dish, and serve with the sauce and vegetables round it.
Salted Round of Beef Boiled.-Hare a round of ox-beef, from sixteen to twenty pounds, niccly cut; take out the bone, rub it over with common salt, and let it lie two or three days upon a lange flat dish. Have a pickle prepared of the following:-Three pounds of bay salt, one ounce of saltpetre, one ounce of salt prunella, each pounded, one pound of corrse sugar, and two gallons of water; put it upon the fire, stir
occasionally to prevent the ingredients falling to the bottom; skim it well when it begins to boil, let it boil twenty minutes, take it off, and let it stand till cold; then put the beef iuto a small pickling tub or jar, pour the pickle over it, keeping back the sediment, lay a cleanl heavy stone upon it, put on a close cover, and turn it every alternate day. The meat will be excellent in fourteen days, and it will uot be too salt, although you should keep it for six weeks. A little cochineal improves the colour when it is in the pickle. When you are to use it, hind it tightly with a cord; put it into a large stew-pan with plenty of cold water, put it on the fire till it begins to boil, remove the scum as it rises, draw it to tho side of the fire, and let it summer slowly for four hours; after which leave it in the water for some time. Before it is wanted, have some vegetable greens and carrots boiled. Before dishing the beef; make it hot, and take off the cord; put in a silver or iron skewer, garnish with boiled greens and carrots alternately round the beef, and pour over it a little of the water in which it was boiled.

To Corn a Briskot of Beof:-Have from fourteeu to fifteen pounds of the hrisket of heef; ruh it over with common salt, and let it lie for three days; put it inflie above pichle with a heary weight upon it, and turn it every day; it will he ready for use in ten days. When your are to boil it, do not soak it in water; put it in a stew-pan, and cover with cold water; when it boils, draw it to the side of the fire, and let it boil slowly until the ribs draw out. Have some carrots and greens boiled separately to garmish with; or if you wish it cold, when it is done take it out of the water, take out all the bones, roll it in a clean cloth, and put a heavy weight upon it all night. If wanted for breakfast, trim it neatly, and garnish with green parsley.

Stowed Brisket of Be日f.-Take from twelve to fourteen pounds of the nine-holes of beef, bone neatly before rolling up and cording, sprinkle sonte pepper and salt on the inside, put it on a very slow fire in a stew-pan that will hold it easily, turning it occasiomally till it is all a nice light hrown, then cover up and let it simmer slowiy for two or three hours; add one quart of good stock, and let it simmer two hours longer. Take a small stew-pan and brown two ounces of hutter and a little flour; just before dinner take out the beef on a dish, taking care to keep it hot; pour the gravy out of the large stew-pan into the small one, put it on the fire, stir till it boils, then stam the fat clean off, and add one tablespoonful of ketchup, one of India soy, one of Chili vinegar, and one dozen of minced truffies. Take off the cord, dish the heef, pour the sauce over it, and garnish with parsley.

Stewed Brisket of Beef, No. 2. Take twelve pounds or more of the nine-holes of beef, bone it, and sprinkle with pepper, then roll up and cord it; have a large stew-pan or pot, place the bones in the bottom to prevent the meat from burning, put it in, cover up, and let it simmer slowly on a hot-plate, or very slow fire, for four hours, tuming occasionally, then add a little second stock, and let it simmer an hour longer. For the sauce, brown three ounces of butter in a stew pan, with as much flour as it will take in; add a little brown soup or stock, let it boil five minutes, then add some pieces of pickled cucumbers, one dozen of large oysters or button mushrooms, a litele ketchup, cayenne, and salt to taste. Take the cord off the meat, place it on the dish on which it is to be sent to tahle, and pour the sauce over it.

Boiled Brisket of Salt Beef.-Have from twelve to fourteen pounds of the nine-holes of beef salted, bone neatly, roll up, and cord tightly. It may havel a force-meat stuffing, if liked. Put it on covered with cold water, let it boil for three hours, and let it stand in the water till cold, then take it out, take off the cord, trim neatly, and garnish with shred lettuce or parsley.

Roast SIrloin of Beef.-To sixteen pounds of heef allow three hours to roast. Have a good clear fire ; put the ronst hefore the fire, about ten inches dis. tant from it. If you have not a spit, turn the bone side to the fire first, and gradually draw it nearer. Have a piece of paper put round the roast, and fix it with a wooden skewer. Baste it with a little rich drippings at first, and keep basting it with fat all the time you are
roasting it. The flavour and richness of roast meat de. pend greatly upon basting it while roasting. Ififteen ininutes before you dish it, sprinkle a little salt, and clredge it with flour; put it close to the fire till it froths up, then dish it, and have a littic of the gravy, with water and salt; pour it over the beef, and garnish witl grated horse-radist.

Beof-Steaks. -Get two pounds of tender beef, or whatever quantity you want; slice them thin, ind longer than they aro broad; beat them with a roller, and season them witl black pepper and salt. Mince two onious very fure, sprinkle them over the steaks, roll and tie then up with a piece of thread. Take a stew-pan with a piece of butter, brown it with a little flour, put in the steaks, brown them a nice light brown, and add in little boiling water or stock. Put the cover on close, and let then stew for one hour slowly. Before serving cut off the threads, add a tallespoonful of ketchup, dish them neatly, and pour the satuce over them.

Beer Olives.-I Iave very thinly sliced one pound of beef from the juicy side of the round, pare away the skin and fat, and divide equally into ten oblong pieces. Have a stuffing prepared of one ounce of finely-minced suet, two ounces of bread crumbs, a little minced parsley, one tablespoonful of stock, half an egg, pepper, salt, and nutmeg; put a small teaspoonful on each piece of meat, roll up, fasten each with a very short skewer and braise for two hours, same as Mutton Cutlets à Ia Soubise, page 554. Before serving strain off the gravy into a small sauce-pan, skim off the fat, let it reduce a little, then add one teaspoonful of potato flour dissolved in a very little cold water, and boil for three minutes. Draw out the skewers, arrange neatly in a circle, on a mashed potato, pour the sauce over them, and put some vegetahle in the centre.

Stufied Steak.-Have one pound of thinly.cut steak off the round cut in a square complete piece. Mix together half a pound of sausage meat, one teacupful of bread crumbs, a teaspoonful of finely-chopped parsiey, quarter of a teaspoonful of mixed sweet herhs, half a teaspoonful of salt, a little pepper, and a little grated lemon rind. Beat an egg and add it to this, mixing all thoroughly together with the hand. Lay this stuffing on the meat and roll it up, not too tightly. Tie it fimmy to keep it in shape while it is cooked. Meit a dessert-spoonful of dripping in a stew-pan, and when it is very hot (a faint blue smoke will be seen rising from it when it is hot enough) brown the roll of meat in it, turning it ahout to get brown all over. Mix a dessert-spoonful of flour with a little cold water till quite smooth, then add a little salt and pepper and half a pint of second stock or water. Pour this into the Stew-pan in which the meat was fried, and stir it until it boils. Put the meat back in the pan, and stew it very gently for two hours. Three tablespoonfuls of finely:chopped suet may be substituted for the sausage meat if desired.

Grillod Boof-Stoak:-Have the steak cut from the heuck-bone or ribs. Have a clear fire and clean gridiron; let it become hot, then rub it with a little suet, lay on the steak, and with a pair of collop-tongs keep turning it constantly, from seven to ten minutes, according to the thickness of the steak. Have the dish before the fire very hot, put the steak on it, sprinkle with salt, put on the cover, also heated, and serve with horse-radish.

Scotch Collops.-Have some pieces of tender beef, ahout three inches square; take a little beef drippings, brown it, shake in flour until it becomes a light brown, put in the collops, brown them on both sides; put on the cover close, and draw to the side of the fire. Have one dozen of onions stewed amongst stock, pour both into the stew-pan with the collops, and let them stew slowly for an hour, season with black pepper, salt, and a tablespoonful of ketchup, and dish in a circle with the sauce in the centre.

Stewod Besi-Steak.-Take the weight re. quired in thin slices from the round, pare away the skin, divide into pieces sufficient for a helping, sprinkle eacli witl a very little black pepper and salt, put them into a pan, cover well with hoiling stock, and allow it to boil up so as to cnclose the juices, then pour into a milk-scalder or clouble pan, with about an inch and a
laalf of boiling water in the outside pan, and let it cook for two hours. The water must be kept constantly boiling, and added to shoukd it reduce too much, while the contents of the iuner pan does not boil at all. When ready, arrange neatly in a circle on a hot dish, serve with brown or sonbise sauce poured over it, using the stock, or part of it, to make either, and fill the ceutre with some prepared vegetable, sucli as baked Spanish onions, Brussels sprouts boiled, or carrot and turnip cut in balls and previously boiled in water with a 引little salt and sugar in it. Another way is to pile the meat in the centre of the dish, pour the sauce over it, and put small hour dumplings alternately with vegetables round it. The object of this method is to cook the meat without boiling, and so render it easier of digestion. The milk-scalder being somewhat expensive, it is sometimes done in a bowl and pan, or earthenware jar and pan, but is not so satisfactory.
Minced Collops.-Mince finely one pound of beef cut from the round, put it into a basin with half a pint of cold water, and mix well with a wooden spoon. Brown one ounce of butter with one ounce of flour in a stew-pan, pour in the collops and water, and stir constantly with a wooden spoon till thoroughly browned, then put on the cover and let them stew till reduced to a proper thickness, stirring occasionally to prevent burning. Season with black pepper, salt, and one tablespoonful of ketchup, and serve with a border of fried croutons of bread round the dish. If liked, a small onion finely minced may be browned with butter and flour before the meat is put in. Instead of the border of croatons, one of boiled whole rice, or mashed potatoes browned, may be substituted.
Beer Balls.-Mince half a pound of beef, one ounce of suet, and a little parsley, add a few sweet herbs, salt, pepper, grated nutineg, a breakfast-cupful of bread crumbs, one egg well beaten, and mix them all together. Form into balls, fiour and fry them in boiling fat. Serve them with toasted bread or brown gravy.
To Cure Beef for a Ham.-Have the ham cut as much in the form of a sugar-loaf as you ean, without the bone, when it is quite fresh, rub it with common salt, and let it lie three days. Prepare a pickle of the following :-Four gallons of water, six pounds of bay sait, two ounces of saltpetre; pound the salt and saltpetre together; two pounds of raw sugar ; put it on the fire, skim it well, and stir from the bottom. Let it boil for an hour; take it off and let it stand till cold. Rub the beef with a dry cloth and put it into a pickling tub, pour the pickle over it, and put a weight upon the beef, in order that it may be entirely covered with the pickle; turn it every two days, and let it lie in the pickle for four weeks, then take it out and cord it up very tightly. If you wish to have it smoked, hang it up in an out-house or open chimney, with a fire made of hard-wood-tree leaves and sawdust. When it has hung for two or three days. wrap it in paper, and hang it in a dry cold place. This pickle answers for pickling pork, ham, and tongues. Tongues should be rubbed with salt and saltpetre six days before they are put into the pickle. You may preserve this pickle as long as you please, by boiling it up every six weeks, and adding to it a little sugar and common salt.

To Salt Beeffor Immediate Use.-Take whatever piece of beef you want, and rub with common salt for half an hour as much as you can rub into it. Take a washing tub, fill it half full of cold water, and lay two small sticks across it, place the beef upon them, and in one night or two it will be fit for use.

Stewed Tonguen-Get a good fresh tongue, rub it well with common salt and, saltpetre, and let it lie four days, wash it well, put it on the fire, with as much cold water as will cover it ; let it boil slowly for two hours; then take it out, skin, and trim it neatly. Brown a little butter in a stew-pan, then put in the tongue and brown it, add one pint of the liquor in which it was boiled, two whole onions, two slices of turnip, a few pieces of celery, and let it simmer by the side of the fire. When wanted, take out the tongue. glaze, and keep it hot, pick the vegetables out of the sauce, add a spoouful of mushroom ketchup, one of lemon "pickle, pepper and salt to taste. Dish the tongue, which you can either send up plain or garnished with spinach.

Exidneys and Sheirts.-Cut up the kidneys, wash and put then on in cold water, and let then boil for an hour, then strain them. The water they are boiled in is of 110 usc. Take the skirts, skin and cut them in suall pieces with the kidneys, and dust them well with flour. Put a piece of butter in a stew-pan and brown it a little; put in the kidneys and skirts, with an onion finely minced, and a pint of good stock or gravy, simmer them an hour at the side of the fire, then scason with salt and pepper, and a spoonful of ketclupp, and serve hot.

To Make Glaze.-If you have the liquor in which hams or tongues luave been boiled, take a whole hough of beef, and an ox•foot or any scraps of veal, and put them into a large pot and boil slowly for ten or twelve hours, then strain it, put back the bones and meat, cover with boiling water, let them, boil slowly for two hours, strain, and when cold skim very clean. Put it into a sauce-pan, set it upon the fire and let it boil slowly, without a cover, till reduced to a small quantity. Youmust attend to it lest it should boil over or burn. When it is done sufficiently, dip a spoon in it, toucln it with your thumb and finger, and if it cause them to stick together it is ready. Put it into jelly-pots. When you are to use it, set the jelly-pot in warm water, till it becomes liquid; have a brush, and glaze hams, tongues, fowls, stewed beef, cutlets, sweetbreads, etc.
To Make Glaze (ANOTHER WAY).-Take two large ox-houghs weighing about twenty pounds each, and two feet, cut them in pieces, and put on in a large pot, cover with cold water, add a little salt and cayenne, and skim very carefully as it comes to the boil. Let it boil slowly for twenty-four hours, then strain through a hair sieve into an earthen jar. Return the meat and bones to the pot, cover with boiling water, let it boil four hours, and strain into a separate jar. When both are cold, skim carefully, and put them together into a pan, taking fare to keep back the sediment. In the process of heating, as the scum arises, take it clean off. Let it boil till it becomes sufficiently strong. When it is off the boil, pour it into weasands, and hang up in dry place.
Braised Ribs of 8 eef.-Take two or three ribs of beef according to the quantity required, and saw off a piece of the chine-bone, so as to flatten it for dishing. Mix two ounces of salt with one and a half of brown sugar, rub it well into the beef, and let it stand for two days. Brown three or four ounces of butter in an oval stew-pan, put in the beef and brown it nicely all over, being careful not to let it burn. When it is well browned add about a pint of stock, or more if necessary, one tablespoonful of vinegar, the same of ketchup, and a little pepper. Cover closely, and simmer slowly for an hour and a half, then take out the beef, skim off the fat, and thicken with com flour. Return the beef to the pan along with balf a pound of sultana raisins, and balls of carrot and turnip previously scooped out, and cooked separately in water with a pinch of brown sugar. Let it simmer slowly for nearly an hour. Have a dozen smalt onions peeled, and add them half an hour before dishing, or long enough to cook them thoroughly without breaking. Serve with the sauce poured over the meat, and the regetables neatly arranged around it.
Eraised Fillet of Beef,-Remove some of the fat from a fillet, trim it neatly, and bind it round with cord or tape to keep it firm. Put a few slices of Wiltshire bacon in the bottom of a pan just large enough to hold the fillet, then place it in, and surround it with one carrot sliced, two onions sliced, one bunch of parsley, one small head of celery cut in short lengths, two bay leaves, a few sprigs of thyme, a little whole black pepper, and a blade of mace. Have some second stock boiling, pour it in round the fillet till it reaches the bottom of it (not higher), cover with buttered paper, put on the lid, which must be very close-fitting. and let it simmer for rather more than two hours, basting it frequently with its own gravy. A short time before dishing, strain off the gravy into a clean saucepan, put-it on and boil rapidly till reduced to a half glaze ; meanwhile, have the fillet in the oven to brown it a little, basting it several times with the gravy from the sauce-pan, in order to gire it a bright glossy appearance. When ready place it on the dish on which
it is to be served, arrange a garnlsh of prepared vege. tables in groups round it, and pour the boiling reduced gravy over it. The fillet spoken of in this recipe is wot the under part of the sirloin, which cannot be bought separate from that joint in this country, but the under part of the heuck-bone, and which generally weighs about four pounds as it connes from the butcher, and is called by them filtet steak. There are many varieties of garnish, such as stuffed tomatoes, fried balls of potatoes, mushrooms, croquettes of potatoes, as well as all sorts of yegetables, with which to servo this dish. If liked, a pint of wine may be poured over it when put into the braising-pan.
To Cook Tripe.-Have tho tripe well cleaned and soaked in water for some time; cut it into small pieces, and put it into a pot, with a marrow bone in the bottom, or two pounds of hough of beef, along with as much water as will cover it, but no salt, and let it boil slowly for six hours. If wanted to keep for some days, dish into a number of dishes. If wanted with a brown sauce, brown butter and flour, with some onions, then add the tripe, stew for half an hour, and season with salt. If wanted white, mix a tablespoonful of flour witb a teacupful of cream, or knead a little butter and flour together, and dissolve in milk and add to the tripe.

Boiled Pickled Tongue.-Put the tongue on in hot water, and, after coming to the boil, let it boil gently front two and a half to three hours, according to the rweight, then take it out, peel off the skin, and fasten into shape with cord. If to be served bot, keep it in tbe water by tbe side of the fire till wanted; if cold, then allow it to stand in the water, taking it away from the fire, till cold, after whicb take it out and put it aside for a few hours to firm. Trim the root neatly away, coat it with meat glaze, garnish with parsley, and put a frill of white paper round the root part. If wanted to look like a small round, it must be rolled while hot, just after skinning, with the point in the centre, then corded and put between two dishes, with a weight on the top to press it. When wanted, trim and glaze it, then put a frilling of white paper all round it, beginning at the bottom and passing it round till the top is reached, and garnish with parsley. Dried or smoked tongue will require to be soaked in cold water for twelve hours, and boiled from four to six hours. As tongues vary much both in tenderness and weight, it is not easy to determine tbe exact time for boiling, but if, after removing the skin. tbey feel bard and tough, they ougbt to be returned to the pot and boiled a little longer.
To Steam a Ham,-Have a pan large enough to bold the ham, witb an inch of bolling water in the bottom, put a ring about two inches deep in the middle, over it place the ham, put on the cover, and let it steam from four to five hours, according to weight, keeping up the measure of boiling :water by adding more if required. When ready take off tbe skin, and when cold, trim, glaze, and garnish.

## MUTTON.

reast Gigot of Mutton.-Have the mutton cut in the form of a bacon ham; cut about three inches off the point of the shank ; if to roast upon a spit, two hours and a half will do before a clear fire; if in the oven, about two hours, basting it frequently, Before dishing, melt a little butter, dust the roast with flour, baste it with the butter, and when it froths up, dish it and put a frill of paper round the shank. Have a little gravy in a small stew-pan, a little salt, a tablespoonful of vinegar, and when it boils, pour it over the mutton. Serve with melted red-currant jelly in a sauce-tureen.
To Roast a Fore-Quarter of Mutton. Have a fore-quarter of mutton, take out the rib-bones first, then the brenst, split up and take out the shoulder blade, then the shank to the first joint, sprinkle with pepper and salt, roll up neatly, and cord. Roast from two and a half to three hours, basting it well. This also makes a very good dish by boning in the same way, and laying in salt for three days, then cord it, and boil for two hours aud a half. Serve with a little
of the water in which it is boiled, and a tablespoonful of vinergar.
To Boil a Gigot of muttor,-llave the mutton cut as the above; cut a piece olf the point of the shank-bone, and put it into an oval pot with plenty of water, slightly saltecl. When it boils again, draw it to one side of the fire, and let it boil slowly two and a half hours. Some like it underdone, and in that case two hours will do it. Gamish the shank with a frill of white paper, and servo with caper sauce.
[The water in which any fresh meat has been boiled ought to be kept either for stock or making broth.]

To Dress a Shoulder of Mutton.-Have n small shoulder of mutton, bone it, roll it neatly, and bind it with tape. Put it on the fire with boiling water, and boil it two hours. Have a white sauce (see WHITE SAUCE) ready; have some pickles minced and add them to the sauce, with a teacupful of cream. Make it hot, stirring all the time, but do not let it boil. Cut off the tape, clish the mutton, and pour the sauce over it.

To Roast a Shoulder of Mutton.-Have the mutton cut large or small as you require it, bone it, sprinkle a little salt and pepper over it, roll it up, and bind it neatly with a piece of cord, rub it over with fresh drippings, put a piece of white paper round about it, and put it beforo the fire at a good distance. It will require three hours before the fire before it will be ready. Half an hour before you clish it, take off the paper, let it brown a little, put in a little melted butter with flour until it froths up. Cutloff the cord, and have a little gravy and a tablespoonful lof vinegar poured over it.

To Roast a Saddle of Mutton.-Have the saddle neatly cut, take the skin off, then fix the skin on the mutton with a wooden skewer, and hang it before the fire to roast. It will require two hours and a half before a clear fire. Fifteen minutes before you dish it, take off the skin, and brown it with butter and Hour until it froths; or, in place of frothing it, you may glaze it, and serve with melted red-currant jelly in a sauce-tureen,
Saddle of mutton (ANOTHER WAY).-Have a saddle, weighing about fourteen pounds, split up the rump, cut on each side of the back-bone in the iuside of the saddle, take out the cbop-bones, then the backbone, commencing at the chop end, and going on till you come to tbe rump. Sprinkle the inside with pepper and salt, cord, but not tightly, so as to keep it in the form of the saddle, turn round the rump on each side, and fasten with a skewer; roast from two and a half to three hours, and serve with melted redcurrant jelly.
Nock Venison.-Have a loill of mutton, cut off all the kidney fat, take off part of the flank, skin it, and either bone or notch it; mix a little raw sugar and black pepper, and rub it into the mutton; moisten with port wine, cover with the skin, and let it lie for four days. Take two pounds of flour, a quarter of a pound of dripping, pour in boiling water, and make a paste, and roll it out large enough to cover the mutton. Take off the skin and place the mutton in the paste, cover it all over, have a piece of strong paper, butter it, and tie it round the paste. It will require three hours to roast before a clear fire, or two hours in a quick oven. When you dish it, take off the paste, glaze it, and serve with rich gravy over it, hot claret in a sauce-tureen, and melted red-currant jelly.
Boned Neck of Mutton,-Have a neck of mutton of three pounds weight, and take out the bone. Make a stuffing of one ounce of suet, a teacupful of bread crumbs, one onion, and a little parsley minced fine, some sweet herbs, pepper and salt, and a little cayenne, mixed up with one egg, and put this into the neck of mutton in place of the bone. Roll it neatly, tie with a piece of a cord, put it into boiling water, and boil for two hours. Before dishing cut off the cord, and serve with caper sauce.
Haricot Mutton.-Divide a neck of mutton into cutlets about half an inch thick, trim away part of the fat, and chop off the larger pieces of bone. Scoop out a number of balls from carrot and turnip, put these into boiling water with a little salt and a pincli of sugar and boil till lalf tender. Brown two ounces of butter

In a stew-pan witl two ounces of four, put in the cutlets 'and brown carefully on both sides, then add nbout a dozen small onions peeled, and the vegetables along with the water in whicli they have been boiled. Season with black pepper, salt, and one tablespoonful of ketchup, let it boil gently with the cover on for about one hour and a half, disle in a circle witl the gravy and vegetables in the centre, and garnish with parsley and beetroot round the border.

To Fash Mutton or Beef.Take cold roast meat, cut it in neat slices, and lay them aside. Take all the bones and trimmings, and put them on with a little water and salt, one onion, one carrot, and one turnip, and boil it until you have reduced it to one pint, then strain it. Brown a little butter and four, fay in the slices of meat, and brown them on both sides; skim the stock, and put as much of it to the hash as will make it a proper thickness. Season with pepper and salt and a little ketchup. When wanted, make it hot, but do not boil it more than two or tliree minutes.
To Cure a Mutton Ham,-Have a hindquarter of mutton cut into the shape of a ham. Take one ounce of saltpetre, one pound of bay salt, six ounces of brown sugar, one grated nutmeg, and half an ounce of white pepper, mix them all together and rub it well into the ham daily, until you have rubbed in all the mixture, then put a heavy weight upon it to press it. Turn it every three days, and rub it well with the pickle every time you turn it. Let it lie for eighteen days, then take it out and hang it up in a dry kitchen. If you wish to have it smoked, hang it up where you can have a fire of hardwood and sawdust. Peats are better, if you can procure them. Keep the ham a good distance from the fire for two or three days. When you are to boil it, soak it for some hours in water, then put it on with cold water and boil it quickly for two hours.
Hot Pot.-Cut one pound of cold mutton in neat slices, parboil eight or ten good-sized potatoes, and cut them in slices also. Peel an onion, put it into a small pan of boiling water, with a little salt in it, and boil it for ten minutes, then take it out and chop it. Butter a pie dish and put a layer of potatoes in it, sprinkle over some of the onion and a little pepper and salt. Lay the slices of meat in next; put the rest of the onion over it, and some more pepper and salt. Cover with a layer of potatoes, and pour over a gill of stock, 'gravy, or water. Brush the tops of the potatoes with melted butter, and if the meat is very lean put little bits of dripping here and there. Bake for an hour and a half.
Irish Stew.-Take any thin pieces of mutton that have been cut off the loin or breast, and cut them in pieces four inches square, put them in a stew-pan and cover them with boiling water, add two dozen whole onions, pepper and salt, put on the cover close, draw it to the side of the fire, and let it boil slowly for one hour. Add a little boiling water to it. Wash and pare two dozen of potatoes, put them in the stew-pan amongst the mutton, and let them boil till quite soft. Stir the potatoes with the mutton till it becomes smooth, and dish it hot.
Scotch Haggis.-Clean the bag and let it lie in cold salted water for twelve hours, then put it aside with the rough side turned out. Wash the sheep's pluck well and put it on to boil covered with cold water. Carefully remove all scum as it rises, add a little salt, and boil the pluck for one hour. When cold trim off any hard or discoloured parts, chop up the heart and the lights and grate half of the liver. Put all these in a bowl and add to them half a dessert-spoonful of salt, half a teaspoonful of Jarnaica pepper, and half a teaspoonful of black pepper. Toast a breakfast-cupful of oatmeal in the oven for ten minutes, and chop very finely half a pound of suet. Add these to the other ingredients and mix all with some of the water in which the pluck was boiled. Put the mixture into the prepared bag, being careful to leave plenty of room for the:haggis to swell. Sew it up securely and put it in a large pan of warm water with half a pint of milk in it. For a short time keep piercing it now and then with a large needle to let the heated air escape, and so prevent bursting. Let it boil steadily for three hours without the lid, and serve very hot without garnisli of any kind.

The milk in the water tends to wake the outside of the lhaggis white.

If onions are liked a few can be minced, scalded in boiling water, and added. Should the haggis be made some time before it is wanted and so require to be heated argain, it slould, when wanted, be put into a pan of boiling water, and allowed to boil for an hour and a half with the lid off.

## LAMB.

Lamb's Head and Mince,-Wash the head and pluck thorougluy in cold water, then put it on in a large pot or stew:pan with cold water and a little salt, leaving the windpipe hanging over the outside, remove the scum as it rises, and, after coming to the boil, let it boil gently for an hour. When ready, take out the head and pluck, and leave the water to boil till reduced to a quart, then strain it into a basin, and set aside to cool. Cut the head from the neck, divide each, take out the tongue and brains, skin the tongue, trim it and the pieces of head and neck neatly, brush them with beaten egg, and coat thickly with a mixture of bread crumbs, minced parsley, and onion, a little thyme, pepper and salt, put them on a baking-dish with a few small pats of butter scattered over them. Cut about a dozen small slices from the liver, of the brains make cakes (see recipe for them), and put both on a wire drainer to be ready for frying. Brown about two ounces of butter in a stew-pan with the same of flour and an onion finely minced, put in the pluck previously minced, stir together till well browned, then having taken the fat off the water in which the head and pluck were boiled, add it, with a little black pepper, one table spoonful of ketchup, and salt if necessary, and let it simmer gently till it becomes a proper thickness. While the mince is cooking, have the head browning in the oven, and the pieces of liver and brain cakes fried in boiling fat. Have the dish on which it is to be served as hot as possible, put the mince on it, arrange the head, neck, and tongue over it, and place the brain cakes and the fried pieces of liver alternately round the border, with sprigs of parsley between.
Hind-Quarter of Iamb,-Have the gigot cut out neatly; wash it well in warm water, put it into a pan with boiling water and a little salt, and let it boil for one hour and a half. Cut the loin in chops, brush them over with beaten egg, strew them with bread crumbs, and fry them till well done, a fine light brown. Add a little pepper and salt while frying. Dish the gigot of lamb, lay the chops neatly round it, and garnish with parsley and sliced cucumbers. Serve with melted butter and mint sauce.
Boned Eore-Quarter of Lamb,-Have a fore-quarter, take out first all the ribs, then the breastbone, slit up and take out the shoulder-blade, then the shank-bone to the first joint ; roll up neatly, and cord. Roast about an hour and a half, basting it well. If served cold, garnish with sliced cucumber, radishes, and cresses.
Lamb Chops.-Cut a loin or best end of the neck in chops, flatten them, brush over with beaten egg; and coat with a mixture of bread crumbs, minced parsley, pepper, and salt. Have plenty of drippings in the frying.pan, put in the chops, and fry them nicely on both sides for twenty minutes. Put them before the fire on a sieve, and keep them hot. Have some spinach boiled (see SPINACH), turn it out, and place the chops neatly round it, and serve with cucumber sauce.
Lamb with Rice.-Have a fore-quarter of lamb, wash it well, and half roast it. Cut it up into steaks and season with pepper and salt, add a teacupful of stock; boil half a pound of whole rice, strain it, put in two ounces of butter to the rice, beat up the yolks of three eggs, stir them together, and cover the lamb with the rice. Put a border of paste upon the dish, then put it into the oven, and bake it until the paste is done. The rice by that time will be a fine light brown.
Shoulder of Lamb.-Have it boned and stuffed, then put it into boiling water, and let it boil quickly for one hour. Take it out and glaze it, and put it in the oven or before the fire until required.

Dish it upon spinach and turnips. Serve it with melted butter, a little lemon pickle, and garnish with sliced cucumber.
Roast Lamb.-Have a hind-quarter of lamb. notch it at the loin, cover with buttered paper, ankl roast for two hours before a clear fire, basting it well. Take off tbe paper fifteen minutes before you remove it from the fire, to let it brown. Dish it with a frill of white paper on the shank. Have a little boiling water and salt, witb the gravy in a dripping.pan ; let lt boil, pour it over the lanb, and serve with mint sauce.

## VEAL.

Galantine of Veal, No. 1.-Have a breast of veal from six to eight pounds, take out the bones, and sprinkle with pepper and salt. Have half a pound of pork bam, slliced very tbin, pare off the skin, spread it over the veal, with a few pickled cucumbers and four dropped eggs (see Dropped EGGS). Put each egg in between the slices of bam, and strew all over with ruixed pickles, some sweet berbs, and parsley. Grate one nutmeg. two blades of mace, a little white pepper, cayenne, and salt; mix these together and shake them all over the breast of veal, roll up neatly and cord it firmly. All tbis should be done the day before it is to be used. Put it into a fat deep dish, and, to keep it straigbt, put a heavy weight upon it all night. When wanted take it out; keep the sauce in the dish; rub it over witb fresh drippings or butter, put a piece of white paper round it, and put it before the fire two hours. baste it well; take off the paper, and have a stew-pan that will bold it with some boiling stock; lay the veal in it, draw it to the side of the fire, and let it simmer for an bour. An hour before dinner take it out and glaze it. and put it into the oven or before the fire to keep it hot. Strain tbe stock in wbich you stewed the veal, and skim the fat off, mix in a little flour, adding the sauce you kept, and boil till it is the thickness of cream. Disb the veal, cut of the cord, pour the sauce over it. and garnish with sliced cucumbers.
Galantine of Veal, No. 2.-Have a breast of yeal boned the same way as the above. Make a force-meat as follows :-Mince four ounces of beef suet, add one teacupful of bread crumbs, the grated rind of a lemon, one onion minced, a nutmeg grated, some sweet herbs, a little wbite pepper and salt; moisten with an egg, and lay it thickly over the veal. Roll it up firmly, and sew it into a piece of cloth ; put it in boiling water and boil slowly for three hours. Take the bones and trimmings of the veal, put them into a sauce-pan witb as mucb boiling water as will cover them, with a litle parsley and two onions, and boil till reduced to a pint, then strain and skim it well. Mix two tablespoonfuls of four with a little of tbe stock till very smooth, add it to the stock, put it upon the fire, stir till it boils, and season with white pepper. Before serving, put in a teacupful of cream, and make it hot, but do not let it boil. Dish the veal, and pour the sauce over it, gamished with sliced lemon, and serve with bread sauce (see Bread SaUCE).
Galantine of Yeal, No. 3.-Have a breast or loin of veal weighing about eight pounds, bone it and trim round the edges, lay it lat on the table, inside upwards, and sprinkle a little white pepper and salt over it; have a little force-meat made from the trimmings of the veal parboiled. spread it equally over it, then half a pound of sliced ham with eight or ten pickled gherkins, one or two placed between each of the slices. Divide some picked parsley into six equal quantities, arrange these at equal distances over the ham, and into the centre of each put a poached egg. Roll it tightly, taking care not to displace the eggs or stuffing. Put a skewer in at each end, then lace it with. a piece of cord; after which remove the skewers, and put it between two dishes with a weight on the top; let it remain all night to datten as well as press the various seasonings into the meat. When wanted it may either be roasted or boiled; if roasted it will requlre two hours with frequent hasting, and if boiled, let it have two hours and a half rather slowly in a stock made from the
bones. [Braising is very much to be preferred to either roasting or boilhig, in which case it will require two hours and a half.] When cold remove the cord, trim the ends neatly, ind garnish with ispic jelly and buter icing. This is an appropriate dish cither for a wedding breakfast or an evening party.
Bombarded Veal.-Take a fullet of veal, from ten to twelve pounds weight, and cut out the bone neatly. Make a force-meat of one pound of veal parboiled, half a pound of ham minced, one teacupful of grated bread, a little lemon, thyme, and parsley; season with white pepper, cayenue, and salt, mix well together, and moisten with two eggs. With this force-meat fill up the place where the bone was taken out. Make eight notches round the fillet three inches deep; fill one with force-meat, another with prepared spinach, another with prepared oysters, another with clopped eggs, and so on till you have filled up all the notcbes; tben bind all round with the caul, cord it neatly, and rub all'over with butter or clarified dripping; put it in the oven until it becomes a beautiful light brown ; take a stewpan that will hold it easlly; make a sauce of three ounces of butter browned with a little flour; add a pint of good stock, one tablespoonful of ketchup, one of India soy, and one of lemon pickle. Put a plate in the bottom of the pan, place the veal on it, and let it simmer slowly till tender, which will be in about two hours. Before dishing, add some minced truflies or pickles. Dish on a very hot dish, cut the cord off gently, pour the sauce over, and garnish with sliced lemon or cucumbers.
To Roast a Breast of Veal.-Notch a breast of veal at the joints, and take the blade-bone out, put in stuffing, sew it up, rub it over with good drippings, cover it with paper, and put it to the fire for two hours. Keep it at first a good distance from the fire. Wben done take off the paper, and froth with butter and flour. Have a little butter melted, add some brown gravy, a tablespoonful of lemon pickle, boil the sauce, and pour it over the veal.
To Roast a Loin of Veal,-Notch the backbone of the veal, rub it with dripping, and take a plece of white paper and tic about it. Two hours before dinner put it before a clear fire, basting it frequently. You cannot baste it too much. When done, take off the paper, have a piece of bread toasted, dish the veal upon it, and serve with sauce the same as the last recipe.
To Stew a Fillet of Veal.-Have a fillet of veal from eight to ten pounds weight, and take out the bone. Have ready force-meat (see FORCE-MEAT), or plain stuffing, and put it in where the bone was taken out, tie it up neatly with a cord, rub it over with fresh dripping, and put it to the fire. Let it brown for one hour, basting it well, after which put it in a stew-pan witl' two pints of white stock, draw to the side of the fire, let it simmer for one hour, turn it over, add a tablespoonful of lemon pickle, and one of ketchup, give it another hour, when it will be done, then take it out, glaze, and keep it hot. Strain the stock, skim it, mix in a little four with a tablespoonful of browning, and put it on the fire until it boils up. Dish the veal, cut off the cord, have ready force-meat balls, put them round the veal, pour the sauce over it, and garnish with sliced cucumber or lemon.
Veal Cutlets, No. 1.-Have two pounds of veal sliced either from the loin or fillet, cut it into neat square pieces, brush them over with beaten egg, and dip in bread crumbs. Have a stew-pan with some boiling lard or dripping; place the cutlets on a wire drainer, and put them into the boiling fat for three minutes; then take them out and put them on a dish before the fire, or in the oven, to drain off the fat. Put two ounces of butter into a clean stew-pan, let it boil, then dredge into it about one bunce and a half of flour: keep moving the pan over the fire till it gets brown, taking care not to let it burn. Add two ladlefuls of stock, and let it come to the boil ; season with a little ketchup, white pepper, ground mace, salt, and the julce of half a lemon; put the cutlets into the sauce, and simmer slowly for half an hour, taking care they clo not stick torthe pan. If the sauce gets too thick, add a little more stock. Serve the cutlets round the dish, with the sauce in the centre poured through a

## BOOK OF COOKERY.

fravy strainer; gamislı with sliced lemon, pickled beetroot, and parsley. Serve as lot as jossible.

Veal Cutlets, No. $\mathbf{Z}^{\prime}$-Ilave the veal cit froul the same part and sliced in ib similar way. Jrown about two ounces of butter in a stew-pan with one ounce and a half of flour, put in the cutlets and brown then carcfilly on both sides, then add about a pint of white stock, is littlo white pepper, two tablespoonfuls of ketchup, and onc of spiced vinegar, put on the cover and simmer slowly for about an lour. Should the sauce get too thick, add a little more stock; if too thin, take off tho cover and reduce by boiling. Dish the cutlets in a circle with green peas in the centre and the sauce poured over them; garnish round the cdge of the dish with sliced lemon, beetroot, and parsley.

To Cure a Teal Hams-Take the bones from a large fillet of veal, rub it over outside and inside with plenty of silt, let it lie for two days with a weight upon it, pound two pounds of bay salt, one ounce of allspice, and half an ounce of saltpetre; with this rub the ham every other day, turning it at the same time, and continuing the pressure for three weeks, then cord tightly and hang it up. When you wish to dress it, rub over with lard, and make a paste with three pounds of barley-ineal or coarse four, and one pound of dripping, in which roll the hain, put it in a quick oven, and bake for three hours, then take off the paste, and either glaze or brown it.
To Make a Shape of Veal.-Take two pounds of the fillet, stew it in a little stock for one hour along with one pound of lean ham, then take both out | |when cold, trim and cut into thin slices about an inch and a half long, boil three eggs hard and cut them through the centre, and the white parts into rings, to fill which have beetroot boiled and cut in slices to the size. Have mixed pickles, such as onions, gherkins, etc., and parsley. Take a large tin mould, and place the wlite rings with the beetroot, yolks, and pickles tastefully in the bottom, then put veal, ham, pickles, and eggs alternately until the mould is filled. Have the stock in which the veal was stewed seasoned and reduced to fill the mould. When cold, turn out, serve for breakfast, luncheon, or supper, and garnish with savoury jelly and parsley.
Fricandeau of Yeal.-Cut a piece from the fillet of veal, the quantity you want, and lard the top and sides of it. Take a stew-pan that will hold it, put some slices of bacon in the bottom, one pint of good white stock, two onions, two blades of mace, one carrot, one turnip, some parsley, and half of a lemon. Put in the veal with a piece of buttered paper over it, cover it closely, let it stew gently for three hours, then take it out and keep it hot in the oven, basting it frequently. Strain the sauce, skim off the fat, put it into a smali stew-pan, season with white pepper and salt, and reduce to a half' glaze. Dish the fricandeau either with green peas round it, a purée of spinach, or a puree of tomatoes.
Veal Cake, No. 1.-Take a pound of cold roast veal, a slice of lean pork-ham, mince and pound them well' together, with one onion, and a teacupful of bread crumbs soaked in a little milk. Beat up two eggs, mix them all together, season with white pepper and salt. Butter the mould and fill it; bake one hour in a quick oven, turn it out ; when cold, cut it in slices, and garnish with parsley.
Veal Cake,No.2.-Slice down threehard-boiled eggs, and with some of the slices garnish a well-buttered plain round mould. Put aiternate layers of veal, ham, and hard-boiled eggs till the mould is nearly full, seasoning well with pepper and salt, and sprinkling in here and there a little finely-chopped parsley. Fill up the mould with nicely-flavoured white stock, and allow all to bake for four hours $\ln$ a steady, moderate oven. Let it stand till quite cold, then turn it out carefully and garnish with parsley.
Veal Mince.-Cut some slices of cold veal, and mince them with a little boiled ham, season with white pepper and salt, some nutmeg, and grated lemon. Put It into a sauce-pan with a little white stock, stir it well, but do not let it boil, and let it simmer at the side of the fire till wanted. Add a teacupful of cream, and serve with poached eggs on the top (see POACHED EGGS).

Sweet-Breads Plain.-llave three or four sweet-breads, scald and wash theil! ; boil them for half an hour, then take them out, trim when cold, and slice them. Beat one egg, season with white pepper and nutineg, draw them through the egg, and rof thein in bread crumbs, fry a nice light browu, put them before the fire to drain, and keep them loot. Have a dish of spinach, or boiled whole rice, place it in the centre of the dish and the sweet-breads around it, or you may dish them on a napkin.
Sweet-Breads, No. 2.-Waslu and stew them as in the above. When cold have a white sauce ready (see White Sauce) ; when it boils, put in the sweetbreads, keep them lot, put a potato border round the dish, and place the sweet-breads in the centre.
Sweet-Breads, No. 3.-Blanch as the above. When cold, trim them, but do not slice them; lard and stew them in a little stock for half an hour. Take them out and glaze them well, keep them hot, and dish them upon stewed peas or celery sauce.

Veal Olives.-Cut some slices of veal off the thick part of the fillet, three inches long and two inches broad. Have ready some force-meat (see FORCEMEAT), and put a little upon each slice, roll them up neatly with a piece of tape, brown a piece of butter and flour, and brown the olives nicely, add a little boiling stock and the juice of half a lemon. Cover them closely, and let them simmer for one hour. Season with white pepper, salt, and a teaspoonful of lemon pickle, cut off the tape, dish them hot, and garnish with sliced lemon.
To Bone a Calf's Mead. -Take a good large head, scald and clean it, taking care not to break the skin, cut up the under part of the head by the windpipe, separate the skin from the cheek bones gently, taking care not to make holes in the skin. Tase out the tongue, boil for half an hour, and skin it. Have one pound of sausage meat prepared, the same of veal minced with a quarter of a pound of ham, chestnuts minced may be added according to taste, season with white pepper, nutmeg, and salt, mix all together with one breakfast-cupful of grated bread and moistenfwith two eggs. Place the tongue in the centre, and the stufing around it, then form the head into its original shape, fasten with a skewer, cord neatly, and fringe the ears with scissors. When you wish to dress it, place it before the fire for an hour, basting it well, then take a piece of butter, and brown with four in a large sauce-pan, add a little boiling stock, then put a snall plate in the bottom of the pan, to prevent the head from sticking, lay in the head, and stewv slowly for two hours. Season with white pepper, ketchup, and a tablespoonful of vinegar. Have a border of stuffed tomatoes round the dish on which it is going to table, cut off the cord, pour the sauce over, and garnish the head with slices of lemon.
To Dress a Calf's Head.-Scald and clean the head, lay it in water for an hour or two, wash it and put it into a pot with water, skim it when it comes to the boil, let it boil slowly for one hour, then take it out, and be careful not to break the skin. Let the water remain upon the fire to reduce it. When the head is cold, cut the meat of both sides of it, skin the tongue, and take out the brains. Put the bones in the water in which you boiled the head, and boil it until you have reduced the stock to two pints, then strain it. When the head is wanted, trim it neatly, cut the ears with a pair of scissors in strips, but do not cut them off, brush over with beaten egg, and shake bread crumbs mixed with flour over it. Put a piece of butter in a stewpan that will hold the head (it is much better, as well as easier, to brown the head by frying it a minute or two in boiling fat before putting it into the sauce), put in the skin side of the head and brown it well, turn it over, and
when the other slde is done, add the halfof the stock you have strained. Shake the stew-pan well, and when it boils, cover it close and let it simmer for half an hour. Have ready one dozen of force-meat balls (see FORCEMEAT BALLS), and add them to it. Have the tongue hot and !glazed, season with pepper and salt, and a little cayenne, one tablespoonful of browning sauce. and oue glass of sherry wine. Have a border of fried croatons of bread round the dish, dish the head with the tongue placed in the centre, and pour the sauce
with the force-meat balls round it. Serve braln cakes on a separate dish (see Brain Cakes). The head may be dressed in a differcut nanner by cutting it in pieces two inches square, with the tongue split in two and laid on the top.
Plain-Boiled Calf's Head.-Split it up. wash it well, take out the brains, and blanch them for two or three hours. Put on the head in a sauce-pan with water and salt, let it boil for one hour and twenty minutes. Parboil the brains, and rub them through a sicve, have sonte parsley ninced; melt a piece of butter with a little cream, and add to it the brains, senson with white pepper and salt; shake, and make it hot. Dish tho head, draw out tho bones, skin the tongue, and pour the sauce over it.

## PORK.

To Pickle a Leg of Pork.-Pound half an ounce of saltpetre, one pound and a half of salt, and four ounces of sugar, rub it into the ham, and turn it daily for fourteen days, when it will be ready for use. But if the weather is hot, in place of rubbing it dry make a pickle of salt and water, strong enough to carry an egg, and pour it over the pork. When you are koing to boil it, wash it with cold water, and put it on the fre with as much cold water as will cover it. When it boils, skim and draw it to the side of the fire, and boil slowly but constantly for two hours. Serve with pease pudding or green peas.
To Roast a Leg of Poxk.-Have the roast neatly cut, which should be of very young pork; rub over the skin with salad oil, put a piece of white paper over it, and put it down to roast, at a good distance from the fire, for one hour, then draw it nearer to the fise, and give it two hours more. Half an hour before dinner take the paper off, so that it may become a nice brown. When you dish it, pour salt and water over it. Serve with apple sauce in a tureen.

To Roast a Loin of Pork. - Notch it at the joints, cut the skin in strips, and rub it over with a bit of butter and some sage leaves rubbed into a powder. Rub it into the pork before putting it to the fire; give it two hours' roasting, and serve with apple sauce.
To Roast a Pig's Head.-Bone it, put in stuffing, the same as used for a sucking pig, roll it up, and tie with cord. Hang it up before the fire to roast, baste it well, and give it three hours. Serve with apple sauce.
To Roast a Sucking Pig.-Take a pig three weeks old, stick it above the breast-bone. Rub it over with beaten resin, let it lie for a few minutes, then put it into a pan of scalding water, and when you find that the hair will come off easily, take it out. The hair should come off without a knife; but if it should not, repeat the scalding. Wash the pig well in cold water, and take out all the entrails. Wash it again in cold water, and dry it thoroughly, outside and inside. Have a stuffing of grated bread, minced suet, one onion, and a bit of sage; season with pepper, salt, and cayenne, put it into the inside, and sew it up. Have the white of an egg well beaten, and brush the pig over with it, put it to roast before a clear fire for nearly two hours, have a dish below it to preserve the gravy, and, when done, cut off the head, divide it, and take out the brains. Cut the body up the middle. Have a little minced sage, boil a little butter and the gravy which ran from the pig, mix them all together, and make them hot. Dish the pig, and serve the sauce in a saucetureen; or you may send it to the table whole, by skewering it so as to stand upon its feet, with a roasted apple in its mouth. Serve with apple sauce.
To Cure Pork Hams.- For each ham pound two ounces of saltpetre, one pound of bay salt, and rub it into the hams daily until you have rubbed it all $\ln$. Lay them in is pickling jar, pour one pound and a half of treacle to each ham, turn them every two days, basting them with the liquor for four weeks. Take them out, wash them with cold water, wipe them, and sew them up into a piece of scrim. Smoke then, with
hardwood and sawdust, or peats, for three or four dinys If these instructions are attended to, the launs will keep for years.

## POULTRY.

Roast Turkey.-Hive a young cock turkey, singe, pick, and rub it well with a dry cloth; cut the head over hy the shoulder, leaving the skin long in the front of the neck; cut through the skin only, all round, below the first joint of the legs, break the bones, draw the fect away to pull the tendons from the bird, and then draw it, taking care not to break the gall nor the gut; if properly done, it will not require to be waslied; break the back-bone, and dislocate the thigh joints; put in a little salt and pepper into the inside, and put the vent over the rump. Have a stuffing ready, and put it in where the crop was taken out; sew it up, and put a large skewer through the wing, the under side of the thigh, and the body, to the thigh and wing of the other side; press down the legs and put another skewer through them, down the side of the vent; have a piece of tape, put it firmly round the turkey, and fasten it on the point of each of the skewers, to keep the skin of the bird from giving way; fix a piece of paper upon the breast of the turkey, and put it to roast before the fire for one hour and a half. When the steam draws towards the fire it is nearly done; dredge with four, baste with butter, dish it, garnish with sausages, and pour the gravy over it.
Boiled Turkey.-Having cleaned the turkey nicely, draw and truss it, with the legs drawn in under the skin, fasten them with tape round the joints, and tie it round the rump to prevent the legs from starting. Have a stuffing prepared with a few chopped oysters (see STUFFING FOR TURKEY), and put it in where the crop was taken out; sew it up, put the turkey, tied in a cloth, into a pot which will just hold it, with the breast down; cover with boiling water, add a teacupful of milk, skim as it comes to boil, remove to the side of the fire, and let it boil slowly ; if the turkey is young, one hour will boil it, but if an old one it will require two. When you dish it, take off the tape, and serve with either oyster, celery, or plain white sauce, along with one of the usual accompaniments, such as fried rolls of bacon, boiled tongue, or sausages.

Galantine of Turkey,-Have a good large turkey, bonc it, take a pickled tongue, and boil it for an hour, skin, and trim off all the fat, turn up the point of the tongue, place it inside of the turkey, putting the root end in the breast. Have a veal stufing prepared, stuff it neatly and sew it up; run a skewer through the turkey and tongue, to keep the bird in a proper shape; tie it into a cloth, put it in boiling water, with a little milk in it, and let it boil slowly but constantly for an hour. Dish it, and serve with white sauce and boiled cauliflower. If this galantine is intended for an evening party, let it get quite cold, then coat equally all over with white glaze, and ornament with aspic jelly of various colours, such as rose, green, and amber. Instead of boiling, it may be roasted, and served hot with its own gravy, or allowed to get cold, then coated with meat glaze, and ornamented with butter icing and parsley.
Braised Turkey.-Clean and truss a fine fleshy young turkey as for boiling and stuff according to taste. Put a few slices of wiltshire bacon in the bottom of a stew-pan large enough to hold the bird, let them simmer for a few minutes, then put in the turkey, with the breast uppermost, place around it the giblets, three bay leaves, two sprigs of thyme, three sinall onions, a bunch of parsley, a carrot sliced, a few pieces of celery, and a little whole white pepper. Pour in boiling stock sufficient to touch the turkey, cover with buttered white paper, put on the lid of the pan, which must be very close fitting, and let it simmer gently for at least three hours, basting it frequently with the grayy about it. When done, which should be about half an hour before the time of serving, take out tho turkey, strain the gravy into a clean sauce-pan, and put it on to boil quickly till reduced to a half glaze. While the sauce is reducing, haye the turkey in the oven browning a little, pour a little of the gravy from the sauce-pan at short intervals over it, to givo it a glossy
appearance. Serve with the sauce poured over it, and groups of mixed vegetables, alternatcly with small rolls of ham arranged neatly round it.

Stewed Fowl_-IIave a nice young fowl cleaned and trussed as for boiling ; put on in a clcan stew-pan two ounces of butter, let it cone to the boil, then dredge in about one ounce and a half of four; put in the fowl and brown it uicely, first the breast, then the back, over a slow fite; after which add one pint of stock, made from the giblets, or any other scraps, a little pepper and salt, two tablespoonfuls of ketchup, one of spiced vinegar, a small bunch of cleaned parsley, and one onion peeled and cut in two. Put the cover on the pan, and let it simmer slowly for three-quarters of an hour, then take out the fowl and put it into another clean pan that will just hold it, strain the gravy over it, keeping back the parsley and onion, add a little more stock or water, and half a pound of lean ham cut into neat square slices, and rolled like wafers; let all simmer slowly for half an hour, or until the fowl is tender, turning it occasionally. Dish the fowl, place the rolls of ham round it, and pour the sauce over all. This is a very savoury as well as economical way of cooking a fowl.

Braised Fowl.-Draw and truss a fleshy young fowl as for boiling, and lard it with thin strips of fat bacon. Put a few slices of fat bacon in a stew-pan, let them melt, then put in the fowl, add two bay leaves, one sprig of thyme, a small bunch of parsley, two small onions, one smail carrot sliced, a few pepper-coms, and enough of boiling second stock to come up to the fowl. Cover closely, and let it simmer for two hours, basting it frequently with the gravy about it ; then take it out, strain and skim the fat off the sauce, and put it on again to reduce a little. While the sauce is reducing, put the fowl in the oven to brown the strips of bacon with which it is larded, then take it out, and serve with the sauce poured over it, and quenelles or croquettes of veal round it.

Boiled Fowls with Tongue.-Singe and draw the fowls, wash and wipe them, put them on the fire with hot water, and one teacupful of milk; skim when they come to the boil; if young fowls, fifty minutes will do them; if old, they will take two hours. Have a boiled tongue, skin and glaze it. Dish the fowls with the tongue in the middle; have a white sauce ready, add a teaspoonful of lemon pickle to it ; pour the sauce over the fowls, or you may serve it up in a separate dish, and garnish with parsley.

Foast Fowl.-Have a young tender fowl-an old one will not roast to be good; singe, draw, and cut through the skin only, all round below the first joint of the legs, draw the feet away to pull out the tendons, break the back-bone and dislocate the thigh joints; put a little pepper and salt in the inside, press a skewer through the wing and under side of the thigh, through the body, into the thigh and wing of the other side; take a piece of cord, put it firmly round the fowl, and fasten at the point of each skewer; put a skewer through each of the legs to keep the skin of the fowl from giving way; fix a piece of paper on the breast, put it before the fire to roast for an hour; basting it well with dripping. Before dishing, shake a little flour on it, a spoonful of butter melted to froth it, and serve with a little boiling water and salt over it.

Galantine of Fown.-Proceed in the same way as for galantine of turkey, omitting the tongue, and stuffing with force-meat only, then boil, braise, or roast according to taste, and, if to be served cold, ornament according to the directions given for turkey.

Boiled Chickens:-Have small white-skinned chickens, singe and draw them, but do not wash them much; put a little pepper and salt in the inside, put the vent over the rump, and turn the wings; if liked, you may put a little veal stuffing ; sew them up, then put thein on the fire with boiling white stock, and let them boil fifteen minutes; you should not have them ready long before they are wanted. Dish thern upon boiled rice or mushrooms; have a little white sauce, and pour over the chickens.

Roast Chickens:-Chickens are a very good substitute for game, when it cannot be had. Take three or four small clickens, singe and draw them: cut off the points of the toes, scald the upper skin of the legs, put a little stuffing in the breast; sew it up,
skewer then as above for roasting, put thent to a clear fire, and baste them well with butter while roasting; they will require twenty minutes; dish them, pour a little rich brown gravy over them, and serve up with bread sauce in a tureen. Turkey pullets are done in the same way.

Broiled Chicken.-Singe and pick the chicken, cut it up the back, take out the inside, and truss as for boiling. Flatten it with your hand, put a little salt and pepper in the inside, and lay it on the gridiron on a clear fire, putting the inside of the chicken next tle fire. Melt a little butter, take a few feathers, and keep basting it for twenty minutes; turn it on the other side, and baste it well for ten minutes. Serve it hot with melted butter and minced parsley.

To Roasta Goose.-Singe and draw the goose, leaving the skin long enough to turn over the back. Take the upper skin off the feet, turn them round upon the back, and cut off the wings at the first joint. Have some sage, two onions minced, some bread crumbs, pepper, and salt; mix them all together, and put the stuffing into the goose. Put the vent over the rump, to keep the stuffing from dropping out ; pass the skewer through the wings and body, fix a piece of paper over the breast, and roast one hour and a half beiore a clear fire. Ten minutes before serving take off the paper to let the goose brown, then dish it, with a little salt and water poured over it. Serve with apple sauce in a tureen. A duck is dressed in the same manner; only, one hour's roasting will serve.

To Roast a Gosling--Singe, pick, draw, and truss as above. Instead of onion and sage, have soine parsley minced, a teacupful of bread crumbs, a bit of butter, pepper, and salt. Put the stuffing in the goose, and put the vent over the rump; put a skewer through the wings and body, roll it in a piece of paper, tie with cord, put it to a clear fire, and baste occasionally. It will require fifty minutes; take off the paper, let it brown a little, and serve with apple sauce.
Stewed Duck.-Pick, singe, and draw the duck, and put some salt and pepper inside, also one onion and a small bit of sage minced, and hang it before the fire to roast for half an hour. Brown a bit of butter with flour, put the duck into the stew-pan, add a little boiling water, season with pepper and salt, and stew till tender. Have two pints of green peas boiled in salt and water, strain, and put them in the stew-pan with the duck, and let them simmer till wanted. Dish the duck, and pour the sauce and peas round it. When peas are out of season, onions stewed the same way are a good substitute.

Gaiantine of Duck.-Pick, singe, and clean the duck, cut off the feet and wings by the first joint, then take off the head and neck, and with a sharp knife cut up the back close by the back-bone, take out all the bones, but do not break the skin. Have ready a stuffing of force-meat (see FORCE-MEAT), stuff the legs and wings, and likewise the body, where the bones were taken out, taking care not to put in too much, as it is apt to burst. Sew up the back, then fasten the skin over the neck, and put a small lskewer through the body, to keep it in a proper shape. You may either stew or roast it, and serve with stewed peas.
No Roast Pigeons:-Singe, pick, and draw them; keep the feet on, season with pepper and salt, put a little bit of butter and a small bit of veal stuffing in the insides. Sew them up, put a skewer through the wings and body, fasten the legs with cord round the rump, making the feet to stand up. Rub them over with butter or dripping, put them to a clear fire, baste well, and in half an hour they will be ready. When you dish them cut off the cord; serve with toast under and melted butter over them.
Broiled Pigeons.-Pick and singe as many pigeons as you require. Cut off the necks and feet, cut them up the backs, take out the insides, truss as for stewing, take out the breast bones, and flatten them. Season with pepper and salt in the inside, and rul) them over with butter, put them on the gridiron, with the skin side up, for twenty minutes, then turn over, add pepper, salt, and butter, and in ten minutes more they will be done. Have ready stewed muslirooms, or plain butter sauce, with minced parsley, put the sauce upon the dish, and lay the pigeons over it.

Stewed Pigeons.-Truss six pigcons neatly, with their heads and feet cut off. d'ut a little pepper and salk inside. Brown three ounces of butter In a stew-pan, shake in flour, and, when it is a nico ught brown, put in the pigeons wheh the breast down ; when they are browned, turn them upon the back, add boiling water or stock, and, when they boil, draw them to the side of the fire, cover them close, aud stew slowly for one hour. Add pepper and salt, n tablespoonful of ketchup, and one of Clili vinegar. Have the yolks of three hird-boiled eggs, wach cut in two, dish the plgeons round the dish, with the yolks and sauce in the centre.
Pigeons with Rice.-Pick, singe, and clean six pigeons, and cut them into quarters. Brown two ounces of butter with the same of four, and put the pigeons in the stew-pan to brown; when they are browned on both sldes, add a pint of stock, two onions minced small, a litte pepper and salt, and stew till tender, then take them out, and and a spoonful of lemon pickle or vinegar. Boil half a pound of whole rice, place the plgeons upon the dish on whlch they are to be served, pour the shuce over them, and cover them neatly with the boiled rice, put a small bit of butter on the top, and some grated cheese, brush it over with a beaten egg, and bake it in a slow oven to a fine light brown.

## PIES.

Pigeon Pie.-Pick, singe, draw, and wash as many pigeons as you require. Cut off the polnts of the wings, necks, and feet, and truss them as for stewing ; put a little pepper and salt in the inside. Season the giblets and put them in the bottom of the pie-dish, with one slice of tender beef. Lay the pigeons neatly in the dish, with their breasts up, add black pepper and salt, and put in a pint of good stock. Boil three or four eggs very hard, take out the yolks, cut them in two, and put them in the dish amongst the pigeons, with a tablespoonful of ketchup, one of Chili vinegar, and a glass of port wine. Make a paste of half a pouncl of butter and a pound of flour; egg the edge of the piedish. put a border of paste round it, lay the cover on it, and notch it round the edge. Cut a small bit out of the centre of the pie, put in a rose cut out of the paste, and arrange round it four of the pigeons' feet. With in small knife, draw some leaves on the top of the pie, brush it over with egg, put it into a quick oven, and, when the paste is done, fold some paper and put over it. Open the oven door, and let it stew for one hour longer.
Pigeon Pie, No. 2.-For a party of ten or twelve, have four pairs of pigeons, singe, draw, and wash them, cut up the back, dividing each in two, then press the legs uncler the skin, the same as a fowl trussed for boiling, and sprinkle on them a little pepper and salt. Have three hard-boiled eggs, shell and mince fine; put the giblets in the bottom of the ple-dish, then half the number of the pigeons, strew over them the half of the eggs, then put in the other half of the pigeons, and on the top the remainder of the eggs, pour over the whole a pint of stock seasoned with ketchup and spicerl vinegar, and cover with a pie paste (see Pie PASTE) in the usual way. Bake in a hot oven for an hour, then draw it out, and cover with thick white paper. Return the pie to the oven and bake it for an hour longer. Gamish with the pigeons' feet, previously hoiled and skinned.

Beef.Steak Pie.-Cut the steaks off the rump. or any nice piece of beef, fat and lean together, and beat them a fittle with a rolling.pin. Mix some pepper and salt together, season the steaks with it, roll them up, and pack them neatly into the dish. If liked, a sticed onion may be added, with a tablespoonful of ketchup (a quarter hundred of oysters is a great inprovement), and a half.pint of good stock or gravy. Cover the pie with a good thick paste as above; it will require one hour after the paste is done. Pastry should be always put into a qulck oven, and the door not opened for half an hour at least.
Veal Pie.-Cut into steaks a breast or toin of veal, season well with white pepper and salt. Put some
prieces ln the bottom of the pie-dish; lave some lean slices of pork ham, cut ofl tho skin, put the slices of pork lu the dish; have two eeggs liard bolled, ralnce them small, shake one half of them above the meat, then add the other pleces of the veal and hann, and the other half of the eggs upon the top. Put In half a pint of stock and a tahlespoonful of temon plckle. Put a border of ple paste (see PASTIE FOR COVERING lites) on the edge of the dish, cover with the same, and put it lu a quick oven. It will require an hour after the paste is done.

Mutton Pie.-Cut into chops the shoulder or loin of mutton, and cut off the fat and skin, season highly with pepper and salt, and, if liked, add a mineed onion. Make a little stock of the trimmings of the ntutton, acld It to the pie, with a tablespoonful of ket chup, one of hot vinegir, cover with a good paste, and bake as above
Chicken Pie.-Pick, singe, and clean the chickens (if very small they may be kept whole), and truss then as for boillng; if large, cut them into joints. and season with pepper, salt, and grated nutmeg. Make a stock of the giblets, boil three eggs hard, mince them, then lay the back and thin parts of the chicken in the bottom of the dish, add some of the minced eggs, and some slices of ham or force-meat balls. Put the best parts of the chickens on the top, the remainder of the eggs. with plenty of pepper and salt and a tablespoonful of lemon pickle, add the stock which you made from the giblets, and cover with a pie paste (sce PASTE FOR Covering Pies); it will be done in three-quarters of an hour after the paste is ready.

Rabbit Pie.-Wash the rabbits, put them in boiling water, and let them boil for two minutes, then take them out, and, when cold, cut them into joints. Brown a piece of butter in a stew-pan, brown the pieces of rabbits on both sides, and lay them in the pie-dish, with plenty of pepper and salt. Mince two onions small, and brown them in the stew-pan where you browned the rabbits, put a little boiling water in it, and, when it boils a minute, pour it ozer the pie. Add a tablespoonful of hot vinegar, and one of ketchup. Cover the pic with a thick paste, and bake for two hours in the oven. When the paste is done, put some folds of paper over it to keep it from burning.

Rabbit Pie, No. 2.-Skin and cut up into small joints a pair of good rabbits, lay them in salt and water for a short time, wash well, and drain. Put them on a clean board, keeping back the eyes, fat, and flank pieces ; sprinkle equally over them a little black pepper, salt, and two small onions finely minced; place the heads and lean pieces in the bottom of the pie-dish1, then fill up with the remaining jolnts, sprinkle a little flour on the top, and pour in about a pint of stock. made from roast-beef bones or other scraps, seasoned with two tablespoonfuls of ketchup. Take one pound of flour, and half a pound of butter, and make it lnto a paste (see PIE Pastry), cover the dish with it, and glaze on the top with beaten egg. Bake in the oven for about two hours.
Hare Pie.-Cut the hare in Joints, divlde the back into six pieces, and take out the largest bones. Take the thin pieces and ribs of the hare, put them on the fire with a little boiling water, salt, and sone Jamaica pepper, boil it until you have extracted alt the strength from the bones, and, when reduced to a pint, strain it. Wash the pieces of hare well in cold water, and dry and season highly with pepper and a little salt. Lay two slices of ham or plekled pork in the bottom of the dish, with the pieces of hare nently packed, pour in tho stock you strained, add a glass of port wine, cover it with a thick paste, and bake two hours in the oven.

Grouse Pie.-Fick and clean as many grouse as you require, and truss them as chickens are done for boiling. Take the giblets, heads, and necks, put them in a small stew-pan, cover them with boiling water, add salt and Jamaica pepper, or any trimnuings of meat of any kind, boil it for an hour, and strain. Mix some pepper and salt, roll a small bit of butter in it, and put a small bit in each bird. Lay them neatly in the dish, with the yolks of three hard-boiled eggs cut in two, put in the stock yon strinecl, addl a glass of port wine, cover with a puff paste, and bake an hour and a half in a quick oven,

Partridge Pie.-Clenn and truss as for boiling as many partridges as you require. Toke the giblets and trimmings, put thein on with water for stock, and soason with pepper, salt, and a little pounded mace. Lay two slices of pork-ham in the bottom of the dish, put in the partridges, pour in the stock you have made. with two tablespoonfuls of lemon pickle, one glass of sherry wine, cover with puft priste, and bake an hour and a halr in a quick oven.

Venison Pien-Cut the shoulder or breast into small steaks. liave a seasoning nade of the following : -Some sweet herbs, the grating of a lemon, grated nutmeg, pepper, and salt, and mix them all together. Rub the steaks over with the seasoning, brown them nicely on both sides with butter, and pack them neatly in the pie-dish, Have a rich gravy made, fill the piedish to the top with it, add a glass of port wine, and a tablespoonful of hot vinegar. Put a thick border of paste round the edge of the dish to keep the gravy from boiling over, cover it with a thick paste, and bake two hours in a quick oven.

Sheep's-I男ead Pie.-Have a couple of whitefaced sheep's heads, the younger they are the better; scald and clean them well, split them up, and lay them in salt and water for a night. Put them in a stew-pan, with as much cold water as will cover them, one turnip, one parsnip, a few onions, and a little salt, boil till quite tender, then take out the heads and feet, and add some parsley and sweet herbs. Boil down the stock until you have reduced it to two pints, and strain it through a sieve. When you are to make the pie, take out all the bones from the heads and feet, trim and cut the meat in pieces about three inches square, season well with pepper and salt, and two sliced onions; skim the stock you strained, and fill up the baking-dish, add a tablespoonful of ketchup and two of vinegar, cover it with nice thick paste, and bake in a quick oven for one hour.
Shepherd's Pie.-Take cold dressed meat of any kind, roast or boiled, slice it, break the bones, and put them on with a little boiling water, and salt, boil until you have extracted all the strength from them, and reduced it to very little, then strain it. Season the sliced meat with pepper and salt, lay it in a baking dish, pour in the sauce you strained, and add a little mushroom ketchup. Have some potatoes boiled and nicely mashed, cover the dish with the potatoes, smooth it on the top with a knife, notch it round the edge, and mark it on the top the same as paste. Bake it in an oven, or before the fire, until the potatoes are a nice brown.

Small Mutton Pies.-Mince a quarter of a pound of beef suet very small, and dissolve in a stew* pan; when it boils, pour in lialf a pint of sweet milk, let it come to the boil again, then pour through the hair sieve among one pound of four and a little salt, and work Into a smooth dough. Divide in six, and work them up in a round shape with your thumb to the height of three inches, which must be the size of your shape. Form the pie inside by pressing in a baking roller a little smaller than the shape; fill them with lean mutton, cut in small pieces, well seasoned with pepper and salt, and pour in a little gravy. Cut out thin covers with the shape in which the pies were formed, and stick on with an egg, brush over with the same, and bake in a quick oven. During the process, keep the dough warm, in case it should harden and crack while the pies are being formed. Pork pies are made in the same way, only in seasoning add a little sage.

Smail Mutton Pies (ANOTHER WAY),Mince six ounces of mutton suet, melt it in a stew-pan, add about one pint and a half of boiling water, strain through a wire sieve amongst two pounds of flour and a little salt, then knead into a very stift dough, and divide into eight or nine pieces. Make each of the pleces of dough round and smooth, and with a rolling. pin roll the edge thin, leaving the centre as thick as possible, press the centre down with the right hand, keeping up the edge with the left in order to form the shell. When the shells are finished, let them stand till firm, then half fill them with lean mutton cut in small pieces, and season with pepper and salt, moisten with cold water or a littie stock, roll a piece of tbe dough out thin, and form it into covers to suit the shells, wet the uncler side witl? water, put then on the top, press firmly
round the edge withithe finger and thumb, make a iole on the top to let out the stean, glaze with cold water, and bake in a very hot oven for half an hour. leeef pies are made in the same way, by substituting beef for mutton.

PGrigord Pie.-Clean and bone four grouse or six partridgres, divide each bird into four, and sprinkle with aromatic spices, pepper, and salt. Put on the bones and giblets in a stew-pan with white stock, let then simmer for two hours, then strain into a basin, and, if necessary, scason with a little pepper and ketclhup. Line the pie-dish with very thin slices of Wiltshire bacon, inside of which put another lining of nicely-seasoned veal and han, force-meat (force-meat of game is better, but, being very expensive to purchase, the veal is named as a substitute), with as many sliced truffles and mushrooms (chiefly truffles) as possible stuck into it; now put in the half of the game in a layer, filling up the spaces with force-mcat, truffes, and mushrooms, then the other half of the game. Cover all over with force-meat, and then with thin slices of bacon. Make a sufficient quantity of flour and water paste, with which cover the pie, making one or two holes in it for the escape of the steam, and bake in a moderate oven for three hours. When ready, take it out of the oven, remove the paste, and pour the previously prepared stock, which should be boiling, over it, let it stand till cold and set, then cover with clarified butter, and put aside for use. When wanted remove the cake of butter, cover with aspic jelly, arranged in strips of rose and amber, with a wreath of parsley round the border of the dish. The dish itseff, being perfectly plain, may be ornamented with bands of gold or silver paper, or a wreatb of evergreens, or anything the occasion or taste may suggest. Fireproof stoneware dishes, rather deep and quite plain, are used for this pie, and may be had at any good china shop. Game of any sort may be used instead of what has been named in the recipe, or, when it is quite out of season, pigeons or poultry may be substituted, but the truffles cannot be omitted, as it is owing to the quantity used in the making of this dish, that it is called Périgord pie.

## GAME.

To Roast a Pheagant.-Pick and singe it very clean, cut a slit in the back part of the neck, and take out the crop, leave the head and feet on, draw and wipe it, but do not wash it. Turn the head under the wing, put a skewer through the wings and under part of the thigh, through the body, to the thigh and wings of the other side, twist the feet closely to the body, and fasten them with a skewer. Put it to a clear fire, baste well with butter, and roast for an hour. Dish it and pour rich gravy over it, and serre with bread sauce in a tureen. Partridges are dressed in the same way, and toasted bread put under and melted butter poured over them. Half an hour at the fire will cook them.
To Roast Grouse.--Pick and draw them, but do not wash them if they will do without. Put some pepper and salt and a small bit of butter $\ln$ the inside. Turn the head under the wing, put a sketwer through the wing and under part of the thigh, through the body, to the thigh and wing of the other side ; twist the feet closely to the body, fasten them with a skewer, put them to a clear fire, baste well witb butter, and roast for nearly an hour. Shortly before dishing, shake some flour and a little salt over them, have some toast ready, about half a slice for each bird, dish them, and pour melted butter over them.
Blackcock are dressed in the same way, but served with bread sauce in a sauce-tureen.
To Dress a Woodcock.-Pick and singe it clean; take the bone out of the neck, leaving the skin and head attached to the body, twist the skin of the neck round the wing, and put the bill through the wing and body instead of a skewer. A woodcock or snipe requires no drawing, as there is nothing in the inside. Put it to a clear fire, baste well with butter, and put a piece of toasted bread under each bird, to catch the trail while they are roasting. A woodcock will require half an hour to ronst, a smipe twenty minutes. When
wanted, put the toasted bread on the dish, and pour melted butter over it and the bircl.

To Foast and Stur a Hare.-Skin the hare and clean lt, lay it in salt and water for an hour, wash, and dry it well. Have a stuffing made of the following: -Parboil tbe liver and grate it, add a teacupful of bread crumbs, three ounces of fat bacon, minced; season with nutneg, lemonthyure, pepper, and salt, and bind it with all egg; put it into the hare, sew it up, and truss It properly. Cut the under sinews of the hind legs, ancl bring theni up to meet the fore legs, then run a skewer through one of the hind legs, the body, and leg on the other side. Do the same with the fore legs. The head must be skewered back, running a skewer through tho back of the head, and fastening it to the shoulders. Fasten a piece of cord round the body to keep it in its proper shape. Put into the dripping-pan before tho fire some salt and water; put the hare to roast, and baste it with the salt and water until all the blood is out of it. Clean out the dripping-pan, put half a pound of butter in it and a quart of milk, and keep basting the hare constantly till it is done. It will require nearly one hour at the fire, then froth it with butter, dish, and pour rich gravy over it. Serve with red-currant jelly in a sauce-tureen.
To Roast and Stuff a Hare (ANOTHER WAY).-Skin and stuff it with grated bread, minced suet and parsley, some sweet herbs, one onion minced small, salt, pepper, and one egg, and mix all together. Stuff and skewer the hare as above, put it down at a clear fire, and baste it well with butter. It will take one hour to roast. Dish it, and pour melted butter over it, and serve with red-currant jelly in a sauce-tureen.
Stewed Hare. -Bone a hare, take nll the bones and a bit of beef, and put them in a stew-pan, cover them with boiling water, add a little salt, some sweet herbs, black pepper, and two onions. Stuff the hare with force-meat (see FORCE-MEAT), sew it up, and, with small skewers, make the hare the same shape as for roasting. Put it in the stew-pan, and let it stew with the bones and seasoning for two hours. When wanted, take out the hare and put it before the fire to keep it hot, stmin the soup In which you have stewed the hare, thicken it with browned butter and flour, add a glass of port wine, make it hot, dish the hare and pour the sauce over it.
A. Jugged Hare.-Skin and cut up a hare, take out the inside, preserve the blood, cut off the legs'by the joints, the head, and ueck, cut up the back on each side of the bone, and take of all the flesh, lay it aside with the head and joints; wash the bones of the hare with cold water: put the water with the blood in a stew-pan on the fire and stir it till it boils, then put in the bones, a few sprigs of parsley, some sweet lierbs, one small carrot, one turnip, and one parsnip, cover it up, boil slowly for two hours, then strain, and rub the blood through the sieve with a wooden spoon. Brown a piece of butter with flour in a stew-pan; cut the hare In small pieces and brown it in the stew-pan, add half a dozen minced onions, brown them a little, pour in the stock which you stralned, stir it about a little, let it stew for two hours, taking care it does not burn: add pepper and salt to taste, and a little ketchup. Dish it hot, putting the pieces of hare round the dish, with the sauce, which should be very thlck, in the centre.

Minced Hare. - Skin and clean it, cut the flesly off the bones, and preserve the blood of the hare. Break the bones, put them in astew•pan, with as much water as will cover them, along with the blood, two or three onions, a bit of parsley, and some whole blach: pepper. Let lt boil slowly for two hours, then strain lt, mince the flesh of the hare small, with four ounces of suct ; pick out all the skin and parts you cannot mince, brown a piece of butter in a stew-pan with flour, put in the minced hare, stir with a wooden spoon till it is hot, then pour in the stock which was strained amongst it, and stir constantly till it boils. Put the cover on, stew It slowly for an hour, and season with pepper and salt. If you find it is not thick enough, take off the cover and let it boil for a little, to reduce it; add a glass of port wine, and flish it hot. If liked, serve with poached egges on the top (see POACHED ECGS).
To Roast Rabbits.-Truss them for roasting, the same way as a liare, but cut off the cars; stuff them
with the following:-Mince the liver with a bit of han or suet, some parsley, and leuron-thyme, a teacupful of bread crumbs, pepper, and salt; uilx all together with one egs; put the stuffing lu the rabbirs; sew them up, and after you have skowered them, fasten then with a plece of cord to keep theru in shape; rub then over with butter or fresh drippligg, and put them to roast at in clear fire, busting them well while they are roasting i two will take one hour to roast; if one, three-quarters of an hour will clo it. Dish thein, and pour over them melted butter, with lemon pickle in it,

Stowed Rabbit. - Skin and cut off the head, then the four legs, divide the body lnto five pieces, and steep them for a few minutes in cold water, with a little salt In it, after whlch drain then. Brown two ounces of butter in a stew pan with the same of flour, and two onlons finely minced, then put in the pleces of rabbit and brown then nicely on both sides, add about $n$ pint of second stock, a little black pepper, and a tablespoonful of ketchup, and let them simmer slowly with the cover on till tender. Should the gravy get too thick before the rabbit is tender, add a little more stock, dish neatly in a circle, with the sauce in the centre.

Rabbits Smothered in Onions:-Take one or two rabbits as you require, wash them well, cut off the feet and ears, truss them, cut the joints, and bring the hind legs forward, and press the fore legs back: turn the head round upon the shoulder, and fasten a piece of cord round the body; put them in a stew-pan, with as much boiling water as will cover them, add one pound of onions cut in four ; put the cover on, and let them stew till the rabbits are tender. Mix a tablespoonful of flour with a teacupful of cream. take out the rabbits and put in the cream, and stir it with a wooden spoon till it boils; add pepper and salt to taste. Dish the rabbits, and cover them with tho sauce mixed with the onions.
Curried Rabbit.-Skin, divide, wash, and drain a rabbit same as for stewing; put it on in a small stew-pan, just large enough to hold it, cover with white stock, put on the lid, and let it siminer slowly for an hour, or till tender. Make a curry (as in recipe for Savoury Dish of Curry), using the stock in which the rabbit has been cnoked to inix it with, when finished put in the pieces of rabbit, and let it simmer by the side of the fire for a few minutes. Before dishing add two tablespoonfuls of cream, and a little salt if necessary. Serve on an entrée dish, with a wall of boiled rice round it, garnished with parsley and beetroot.

## ENTREES AND MADE DISHES.

Force-Meat.-Mince very fine the following in-gredients:-Four ounces of beef suet, the same quantity of cooked veal or beef, a teacupful of bread crumbs. one grated nutmeg, pepper and salt, a little minced parsley, a sprig of marjoram minced or rubbed to a powder, mix all together, and inoisten with the beaten yolk of eggs; form into balls, and fry them in fresh dripping a light brown, or use it for stuffing.
Forcempeat for Fowls, Veal, and Turm keys:-Mince fine half a pound of veal, previously parboiled, and four ounces of ham, add one teacupful of grated bread, and moisten all together with an egg and three tablespoonfuls of white stock. Season with a little grated nutmeg, lemon, and white pepper.
Chestnut Stufing.-Prepare forty chestnuts as for chestnut sauce, and mix with veal stuffing as described in the foregoing recine, omitting the bread, or with fincly-minced fresh pork, highly seasoned: This stuffing is very unucl liked with turkey.
Force-meat for Fish.-Take the meat of a large haddock, pick out all the small bones, mince it finely with four ounces of beef suet, a breakfast-cupful of grated bread; chop a dozen tinned oysters, with some parsley, a small onion, and season with cayenne pepper and salt ; mix all together, bind it with a beaten egg and a little of the oyster liquor, form into loalls, and fry them a nice light brown, or use it for stufling.

Plain Stuffing.-Mix four ounces of minced beef suet with a breakfast-cupful of bread crumbs, mhluced parsley, a little stock, snlt, and pepper, and blnd it with one egg. This stuffing is used for veal and fowls, and sometimes for fish
Stuong for Turkey.-Mince one pound of veal, prevlously parbolled, together with four ounces of lean haul; add one breakfast-cupful of grated breid, scald and beard one dozen oysters, then mince them, and add to the stuffing, with a little of the liquor; season wlth a little white pepper and salt; a little pounded mace may be added, if liked, and moisten all together with an egg.
Brain Cakes.-Mince two ounces of suet, a little parsley, and sweet marjoram, and some grated bread; have the brains parboiled and mix them all together. Season with white pepper, salt, and grated nutmeg, and bind it with an egg; make them into small round cakes, about half an inch thick, and brown them in the frying pan wlth fresh dripping. Put them before the fire on a sieve to drain before dishing.

Rissoles.-Mince very fine some cold fowl, chicken, or veal, and a little lean ham; season with the grating of half a lemon, pepper, and a little salt, and noisten with white stock. Make a paste of the follow-ing:-Four ounces of flour, two ounces of lard or butter, and a little salt, molsten with an egg, and a little water to inake it a proper stiffiness; roll it out twice, cut it with a round tin cutter four inches wlde, brush them round the edge with beaten egg; put a little of the mince in the centre of each, turn them over, and bring the edges together; press it down to make it stick, then brush them wlth egg, and strew over them elther some vermicelli boiled and dried, or grated bread. Fry in boiling fat to a nice light brown, lay them on a sleve before the fire to drain; keep them hot, and, when wanted, dish on a napkin, and garnlsh with parsley.

Veal Ringlets.-Mince finely any scraps of cooked veal, rabblt, or fowl, along with a little boiled ham; season whlth white pepper, salt, and a little nutmeg, add a tablespoonful of bread crumbs, one egg, and two tablespoonfuls of white stock, and mix well together. Take four small tin shapes, or tea-cups, butter them well inslde, take a few pickled. French beans, cut them in small strips, cut some slices of lean ham or tongue the same size, and all one length ; place round the tin or cup one strip of beans, and one of ham or tongue, alternately, at a small distance from each other; fill them with the mince, cover them with a piece of clean paper, and set them in a stew-pan wlth bolling water, two inches deep; let it boll slowly, taking care that the water does not boll into the cups, and steam for half an hour with the lid on. Have the dish you are to serve them up on very hot, turn them upside down, and let them stand a little; have a teacupful of milk, a tablespoonful of flour, a little pounded mace, and salt ; stir it until it boils, draw off the shapes, and pour the sauce round the ringlets.
Casserole of Rice.-Wash half a.pound of whole rice, melt one cuarter of a pound of beef suet. taking care it does not brown, put the rice in the stewpan amongst the fat; add as much water or white stock as will cover lt, and a little salt. Let lt stew till it gets soft, stirring occasionally, to prevent it from sticking or burning. If you find it too thick, add a little more water; beat it well till it gets thick and smooth; let it stand till cold; butter a plain mould, and line it wlth the rice about an inch in thickness. When it is firm, fill it with mince of any kind, curried rabbit, oysters, or macaroni. One hour before dinner put it into a stew. pan or steam-pan ; cover it close, and let it remaln till wanted. Turn the mould upon the dish, let it stand for five minutes, then draw it off, when the casserole will drop out. It may be served as it is, or the top may be cut off, leaving the rice border; or, If wanted brown, beat up an egg with a little fat, brush over with it, and put it in a quick oven to brown
Croquettes of Rice and Forcemeat. Put on ln a stew-pan two ounces of the best whole rice and one ounce of beef suet in two pints of water; let it,boil, stirring occaslonally, till it becomes very thlck, then add about one breakfast-cupful of force-meat, break an egg into it, and let it stand till cold, Dịvide isṭo
cight pieces, form each like a jargonctle pear, dip in cgg and bread crumbs, and fry in boiling fat, stlck a clove into the thick end of each, and a small point of a quill into the olher, so as to complete the appearance of the jargonelle. Dish upon a table-napkin, with the points mecting in the centre, and garnisli with parsley.

Croquettes of Veal.-Take the remains of cold dressed veal, remove the skin and gristle, and mince It finely with cold ham or tongue, a little grated bread, and a few mushrooms, season will grated nutineg, pepper, salt, and a few grains of cayenne. Put it on in a sauce-pan with a little strong stock made from the yeal bones and trimmings, and let it simuler foriten minutes, then put it out on a flat dish to cool When, quite cold form into balls or corks of an equal size, roll them in beatell egg, then in fine bread crumbs, and fry in boiling fat. Put them in the oven a minute to drain, serve on a napkin, and garnish with parsley.

Croquettes of Sweet-Ereads.-Cut equal quantities of parboiled sweet-breads and cooked mush. rooms into quarter-inch dice, Mix together in stiff white sauce, make it quite hol, but do not let it boil, then put it out on a dish till cold. Prepare some fine bread crumbs, divide the mixture into balls of an equal size, and dip them in beaten egg seasoned with white peoper and salt, then roll them in the bread crumbs, and fry in boiling fat. Serve on a napkin, and garnish with parsley. This is a good way to use up the trimmings of sweet-breads from the shaping of cutlets of sweet-breads, as well as the mushroom stalks left from mushroom toast.

Cannelon.-Have very finely minced one pound of cold meat and half a pound of bacon or ham. Add six ounces of bread crumbs, a little pepper, salt, and finely-chopped parsley. Beat two egrs, and add to them a teacupful of stock. Mix all thoroughly with this liquid, and form the mixture into a roll. Tie it up in a pudding cloth, and steam or boil it for two hours. Serve hot with a good gravy or tomato sauce, or, if pre ferred cold, press it between two plates, and when cold cover it with brown or tomato sauce to which a quarter of an ounce of leaf gelatine has been added. Garmish it with tomatoes or any salad.

## Croquettes of Cold Beef or Mrutton.

 Take any scraps of cold ronst meat, free it from skin and gristle, and cut it Into quarter-Inch dice, then mix with it about a third of its quantity in tinned or cooked mushrooms, also cut in small dice. Brown one ounce of butter with the same of flour in a small stew-pan. add about half a pint of strong stiff stock, season with black pepper, one tablespoonful of ketchup, one dessertspoonful of special vinegar, and salt if necessary ; after which let it boil gently for ten minutes, stirring constantly, then add the meat and mushrooms, and heat thoroughly, without hoiling. When ready pour it on to a large flat dish, and let it stand till cold and quite set, then form into balls of an equal size, roll them first in flour, then in egg and bread crumbs, and fry in boiling fat to a nice golden brown. Put then in the oven to drain for a minute or two, serve as hot as possible on a neatly-folded napkin, and garnish with sprigs of green parsley.Croquettes of Potatoes.-Boil and peel six large potatoes, pass through a wire sieve into a basin, add one egg or the yolks of two, and season with black pepper and salt. Mix well, and let it stand till nearly cold, then form into twelve or fourteen balls, roll them in flour, then in beaten egg, and lastly in bread crumbs. Fry them in boiling fat to a nice golden brown, then put them in the cven for a minute to drain, and serve neatly dished on a napkin.
Stewed Ox Palates.-Get from four to six ox palates, wash them well with salt and water, put them on to boil slowly for an hour, then take them out and skin them, let the water remaln, reduce it to half a pint, and strain it. When the palates are cold, trim then neatly, spread them over with force-meat or plain stuffing, and roll or tie them with a bit of tape. Brown a piece of butter with flour, brush the palates over with a beaten egg, put them in the stew-pan and brown them, pour in the stock which you straned, shake them till they boil, and let them simmer till wanted, Before dishing, add a teaspoonful of ketclup,
cut off the tape, place them neatly round the clish, and pour the sauce in the centre.

Haro Cutlets.-From the back of a parbolled hare take halt a pound, and mince it fine with six ounces of fat bacon or ham, add to these one onion minced separately, six leaves of sage bruised, and one teitcupful of grated bread, season with $n$ piuch of cayenne and a little salt, moisten with an egg, knead a little and flatten, cut from It with a cutlet-cutter nine cutlets, fry them in boiling lard or dripping, and put on a dish to drain. Turn out into the centre of a corner slish a breakfast-cupful of mashed potatoes or boiled whole rice, garnish the top with beetroot and parsley. place the cutlets around it on thelr ends, and between each put little sprigs of parsley. It will be easily understood that it is more economical to make those cutlets when making hare soup.

Darioles of Beef (FOR A SINGLE ENTREE). -Irim the skin and fat from three-quarters of beef, cut from the juicy side of the round, scmpe it down on a board, extracting the sinews, pound in a mortar, pass through a wire sieve, then weigh and put on a dish. Put a third of the weiglat of the meat in butter into a mortar, pound a little in order to soften it, add twothirds in four panada, pound together, then add the beef and pound again, drop in two eggs, one at a time. mixing well between each, and season with black pepper, salt, and ketchup. Butter ten dariole moulds, fill with the mixture, and cook in water just off the boil for about half an hour. When ready turn out in a circle, put stewed muslirooms in the centre, pour a little hrown sauce over the darioles, and sprinkle a few chopped truffles on the top of each. To make the panada, brown two ounces of flour in the oven, put on in a small sauce-pan half a pint of brown stock with half an ounce of butter; let it boil, then add the flour, stirring quickly till it thickens and leaves the sides of the pan, after which put it out on a dish to cool before making use of it .

## Blanquette of Lambs' Sweet-Sreads.

 -Make a casserole or border of mashed potatoes about three inches deep, brush it with beaten egg, and brown in the oven. Soak and scald ten sweet-breads in the usual way, and cook them in a little white stock about fifteen minutes, put them out on a dish to cool, then cut them into scollops a quarter of an inch thick. Make a nicely-seasoned white sauce, put the scollops into it along with a few cooked mushrooms cut in small pieces. Toss them a little till quite hot, but do not let them boil; dish in the casserole with the sauce poured over them.Little Soumés of Oysters.-Take six ounces of boiled whiting, cut it down sinall, and pound it in a mortar with the beards of six raw oysters. Melt one ounce of hutter and mix smoothly into it one ounce of flour: add half a gill of oyster liquor and a little of the water in which the whiting was boiled. Stir it till it boils, and allow it to boil for three minutes, then clraw it aside and stir in the yolk of one egg, a little pepper and salt, and the pounded fish, mixing all thoroughly. Adll half a gill of switched cream, and the six ousters,
cut in small pieces. When the mixture has cooled a little stir in gently the whites of two eggs, which have been heaten to a stiff froth. Butter seven small sliell tins, fill them, and cook for half an hour, In water just off the boil. Dish them in a circle. with white oyster sauce poured round, and a suitable garnlsh in the centre.
Lobster Quenelles.-Remove the meat from a freshly boiled hen lohster, pound It well in a mortar, then adtl to it an equal proportion of butter, one teacupfisl of grated bread soaked in a little white stock, the yolks of three eggs, and the whites of two. Season with white pepper, salt. grated nutineg, and a small pinch of cayenne. Mix all well together, and pass through a fine wire sieve with a wooden spoon. Before filling the moulds. it is hetter to ascertain whether it is firm enough, ly trying a dessert-spoonful in boillng water: and if too soft, the additlon of another egg will he necessary, 111 the quenelle monlils nearly to the top, cover with white paper, and conk In water flist of the bril for thirty minutes. Dish neatly with prepared prawns or shrimps, heated in a little stock, in the centre, and white fish sauce sligltyly flavoured with
essence of anchovies poured round them; garnish the top of each quenello with a pinch of finely chopped green parsley.

Creaned Lobster:-For a double entrée, put a grood hen lobster on in boiling water with a little salt, let it boil for twenty minutes, thon take it out and allow it to cool. When quite cold, take off the claws, break up the body, remove the spawn and soft meat, which pound together in a mortar; then add to lt the fillets of three freshl whitings previously scraped down, also four tablespoonfuls of fish stock made from the bones and skins of the whitings. When thoroughly pounded and passed through a wire sieve, weigh, put It into a basin, and to a pound of the mixture allow one pint of cream switched a little, mix thoroughly, adding the crean by clegrees, and season with white pepper. silt, and grated nutmeg. Have the firm meat of the lobster broken into twenty sinall pieces, brush with butter as many small tin sliells or moulds, line each thlekly with the cream, put one of the pieces in the centre, then fill up with the crean, covering well in the pieces of lobster, and cook, with a buttered paper over them, for half an hour in water just off the boil.
Lobster Cutlets.-Make a force-meat same as recipe for LOBSTER QUENELLES (sce above). Butter the number of cutlet pans required, then ornament with small pieces of the lobster reserved for the purpose, fill with the force-meat, and cook in water just off the boil for twenty minutes. Dish in a circle on a border of mashed potatoes, fill the centre with prawns or other suitable garnish, and pour white fish sauce round the base.

Quenelle Forcemeat.-This preparation is made of raw fish, meat, poultry or game, bread panada, butter, eggs, stock, and seasoning. For a double entrée eighteen ounces of the raw material is required, which must be weighed exactly after having been scraped clown, pounded in a mortar with about one gill of stock, and passed through a wire sieve. Pound slightly in a mortar six ounces of butter, add twelve ounces of bread panada, pound and mix a little more, then add the pounded fish, meat, or fowl, as the case may be; pound thoroughly together, dropping in at intervals of a few minutes two eggs, and the yolks of other two. pounding well between ench, and finish by seasoning with white pepper, salt, and grated nutmeg.

The stocks used for mixing with the pounded fish, meat, fowl, or game, and also to make the panada, should be made from the bones and rejected parts of the same, and reduced to make it strong.

Roman Pudding.-Put six ounces of Italian macaroni in a stew-pan, cover with cold water, let it come to the boil, then draw to the side and simmer slowly for tivo hours, occasionally adding a little water, strain through a sieve, and cut the pipes into pieces about an inch long. Have six ounces of double Gloncester cheese grated, cut in strips six ounces of cooked fowl or rabbit, and mix all together in a basin with two dessert-spoonfuls of made mustard, a plnch of cayenne, and a little salt, and moisten with a tea.cupful of cream. Butter a melon mould, sprinkle it over with vermicelli, then line with puff paste, pressing it gently, that It may take the form of the mould, fill with the mixture, covar with puff paste, and bake in a moderate oven for ina lionr and a half, then turn out into a corner-dish, and pour round it half a pint of hot brown soup.
Beef-Steak Pudding. - Take one pound of flour, and half a pound of beef suet. mince it very fine: put them in a basin with a little salt, and mix it with cold water, make it Into dough, and roll it out about half an inch thick: butter a basin, and line lt with the paste. Have some steaks cut of a rump of beef, beat them a little with a rolling-pin; season them with pepper and salt, mince two onions small, mix thein with the pepper and salt: roll up the steaks and pack them neatly in the basin, add a little gravy and a tablesponnful of ketchup, ege the elge of the paste, and fold it over closely. Butter the middle of a purldingcloth. shake some flour on it, tie it over the month of the basin, put it in a pan of boiling water, and looil it three hours. A quarter of an hour before you clish it, take it out of the water, take off the cloth, and turn it on the dish on which you are to send it to table. When wated. draw off the basin, and the pudding will dropout.
Steamed Ebef-Steak, -Takic one pound of
steak from the round and remove from it all skin and fat. Cut the meat into cight or nine pieces; put them in an enamelled ple-dish and sprinkle them with a little salt. Put a plece of paper over the dish, and then another dlsh of the same size. Have ready a pan with about an inch of boiling water in it ; put an open ring or hoop in the centre of the pan, and set the dish with the meat on it. Put the lid on, and steam for two hours. Cut one dozen green onions in small pieces, and, after the steak has been steaned for half an hour, put them into a pan of boiling water with a little salt and sugar in it, and boil them for an hour and a half. There should only be enough water in the pan to barely cover the onions. Half an hour before the steak is ready, brown in a small pan one ounce of butter, with one ounce of flour, and put it aside. Just before dishing the steak, stir the juice from the meat into the four and butter, and boil it for a few minutes. Add a cessert-spoonful of ketchup, a little black pepper, and the onions, with the water in which they were boiled. Dish the steak and pour this sauce over it.
A Savoury Dish of Curry.-Pcel two onions and two apples, extracting the core from the latter and mince very fine. A stalk of rhubarb may be used instead of apples. Melt one ounce and a hall of butter in a frying-pan, put in the apples and onions, hold it over the fire, stirring carefully with a wooden spoon till they become a dark brown. Mix in a basin one tablespoonful of curry powder and one of flour, with a little milk or white stock, add to the mixture in the frying. pan, along with a small lump of sugar, mix together and let it simmer for five minutes. If too thick add a little more stock. Pour into a clean stew-pan, then put in the meat to be curried, such as veal, chicken, or mutton, previously parboiled, trimmed neatly of fat, skin, or gristle, and cut into small square pieces; let it simmer slowly till tender, stirring occasionally, taking care not to break the ment. Before dishing add a little salt, and three tablespoonfuls of cream. It may be served either on a flat dish, or in a corner-dish with a wall of boiled whole rice round it, garnished with parsley and pickled beetroot, or pieces of tomato.
Dry Curry.-Take some sweet-breads, chicken, or veal, and fry them with a piece of butter: mince four onions and fry them; shake two tablespoonfuls of curry powder over them, and put all in a small stew-pan. Wash out the frying-pan with a teacupful of boiling water, pouring the contents into the stew-pan amongst the curry, add a little cayenne and salt, cover lt closely, and let it stew till tender. Have the sauce reduced, add a tablespoonful of lemon pickle, and two of cream, stir, and let it boil for five minutes. Serve with boiled rice round the dish and the curry ln the centre.
Dry Curry, No. 2.-Mince two onions and two apples very small, brown two ounces of butter in in small stew-pan, add the onions and apples, and brown them well, taking care that they do not burn; mix a large tablespoonful of curry powder and one of flour, put into a stew-pan, stir constantly, and add one teacupful of cream ; have a quarter of a hundred of pandore oysters bearded, and add to the curry, mix well together, and salt to taste. An hour before dinner, bleter a round jelly-monld, and press the curry into it. Have some rice boiled dry, and with it fill four buttered tea-cups, pressing it down so that it may keep the form when turned out. Serve all up in a corner-dish, the carry in the centre, and the rice round about, and garnlsh with parsley.
A Dish of Curry, with Cocoanut,-Have one pound and a half of lean mutton or veal, or any other meat, cut down into small pieces, put it on in a stew-pan with two ounces of butter, shake over it one dessert-plateful of finely-minced onions, cover and let it simmer slowly for an hour, then add the half of a cocoanut grated, with the milk, two tablespoonfuls of dry curry powder, one apple minced; let it sinmer gently for one hour longer, and add salt to taste.
To Boil Whole Rice,-Have a clean pan half filled swith boiling water and one dessert-spoonful of calt. Put in the quantity of rice required, boil for fifteen minutes, stirring occasionally with a clean wooden spoon, then strain through the colander, and run cold water on it ; let it drip for a few minutes, then put the colander into an empty stew-pan, and put it on the
hot-plate or near the fire, turning it lightly till perfectly free and dry.

Rice and Beef Timbales.-Mince half a pound of beef cut from the round and add to it one ounce of finelyminced suet and onc and a half ounces of bread crumbs, slightly moistened with a little cold water. Mix these well together and season them with a teaspoonful of ketchup, a little salt, aud Llack pepper. Have two ounces of rice boiled as in the foregoing recipe. Butter six small cups or dariole moulds, and line them carefully with the rice; fill them up with the beef mixture, pressing it down firmly, but taking care not to displace the rice. Put the cups in a pan with about an inch of boiling water in it; cover them with a round of buttered paper; put the lid on the pan, and steam them for three-quarters of an hour. Turn them out carefully, and arrange them neatly on an entrée dish; pour brown sauce round them, and fill up the centre with any suitable vegetable.

To Dress Coid Roast Beel.-Cut and trim into neat slices, about a quarter of an inch thick, one pound of cold roast beef, and make a sauce as follows : -Put on in a stew-pan one ounce of butter, with four tablespoonfuls of vinegar and a very small onion finely minced, stir with a wooden spoon till the vinegar is absorbed, then mix in one ounce of flour, go on stirring till it browns a little, then add one pint of stock, and black pepper to taste. Let it boil slowly for fifteen minutes, then add three chopped pickled gherkins and one tablespoonful of finely-minced parsley, let it again come to the boil, and skim. Put in the slices of beef and heat thoroughly, but do not allow it to boil.

Miroton of Beef.-Cut one pound ot cold beef into slices about a quarter of an inch thick, removing the outside skin and fat, set them neatly in circular order in a gratin dish, and sprinkle on them a very little salt and black pepper. Peel and slice half a pound of onions, blanch them in boiling water for five minutes, then drain, and run cold water on them. Brown one ounce of butter in a small stew-pan, add the onions and brown them; then dredge in about half an ounce of four, add a little salt and black pepper, and cook for five ninutes. Remove the pan to the side of the fire, add half a pint of stock made from the bones and trimmings of the cold meat, let it simmer slowly for fifteen minutes, then add half a teaspoonful of made mustard, and pour it over the slices of beef in the gratin dish, sprinkle with bread crumbs, bake in a slow oven for twenty minutes, and serve hot on the dish in which it has been cooked.
Banffshire Potatoes-Beat one ounce of butter to a cream, add the yolk of an egg, or the half of a whole one, beat a little longer, then mix in three ounces of bread crumbs, a few powdered sweet herbs, a little minced parsley, three-quarters of a gill of milk and a little pepper and salt. Have seven good-sized potatoes well washed and brushed, fatten them at one end by cutting off a slice to make them stand when dishing, also a slice from the other end to form lids, scoop out the hearts. fill the spaces thus made with the mixture, put on the lids, bake in a quick oven for an hour, and serve hot on a napkin.

GermanPotatoes.-Takesevenoreightpretty large potatoes all the same size, pare neatly, and cut a thin slice off the stalk end in order to make them flat, cut another about half an inch thick, and with a vege-table-cutter scoop out the inside of the potatoes, taking care to keep the outside whole; fill up the holes thus made with minced beef highly seasoned with pepper and salt; then wet the half-inch slices with an egg. dust with flour, and stick on the parts of the potatoes from which they were cut off; put them into a stew-pan that will just hold them about half filled with boiling dripping. and boil them for half an hour. Serve on a tablenapkin, and garnish with parslev.

Stuffed Vegetable Marrow. - Hare an ordinary-sized vegetable marrow, skin and cut a small piece out of the side of it, with a teaspoon take out the seeds gently, fill the space with force-meat made of veal or fowl (see FORCE-MEAT), nnd fit in the piece again which you cut out. It may either be stewed in a rich sauce, or baked from an hour to an hour and a half. Serve with white sauce, with plenty of lemon pickle in it,

Cream of Mushrooms,-Peel and chop very finely four ounces of fresh mushroons; put then in an enamelled pan with half an ounce of butter, antl simmer till tender. Scrape down four ounces of chicken or any white ineat, ponnd it in a mortar with the mushroons, and pass all throngh a wire sieve. Add one gill of switched crean, a litele pepper and salt, and mix well. Fill sunall buttered moulds with this mixture, and cook for twenty minntes in water just off the boil. Turn them ont on an entree dish in a circle, and pour round a light brown sauce flavoured with mushrooms. Fill the centre with a suitable garnish, such as green peas, tomatoes, or French beans.
Potato Fritters.-Have grated one teacupful of boiled salt tongne, one breakfast-cupful of mashed potatoes, and one tablespoonful of finely-pounded bread crumbs, audd a little white pepper, grated mutmeg, and salt to taste, drop in an egg, pound all together in a inortar, then roll out half an inch thick, and cut with a cutter about two inclies in cliameter into round cakes. Mix together a little grated tongue, minced parsley, bread crumbs, a little white pepper and salt, brush the fritters over with a beaten egy, then dip them into the mixture, and fry then in boiling fat to a light brown. Cut a round slice of bread an inch thick and five in diameter, cut a hole in the centre two inches in diameter, and fry also to light brown. Have an egg boiled hard, mince the yolk and white separately, colour the half of the white with cochineal, then mix together. When the fritters are to be served, put the bread in the centre of the entrée dish, fill the hole with the minced egy, arrange the fritters tastefully around it, and garnish with a little parsley.
Potted Head.-Clean the half of a bullock's head, with one foot, and put them in salt and water for some time, then wash them out of it, cut in pieces, put them in a large stew-pan amongst cold water and a little sait, skim clean as it comes to the boil, let it boil for about six hours, and strain through a sieve. When the stock is quite cold skim off all the fat, return it to the pan, cut the ineat of the head and foot into small pieces, and add it to the stock, taking great care that no small pieces of bone get in along with it. Season with pepper and salt, let it boil ten or fifteen minutes, and dish in small basins or moulds.
Oatmeal Puddings. - Allow one pound of finely-minced beef suet to two pounds of dried oatmeal, four onions minced very small, and pepper and salt to taste. Have the skins thoroughly cleaned, and soaked in salt and water, stuff and tie them, put them in boiling water, pierce them on both sides with a skewer to prevent them breaking, and let them boil for about one hour with the cover of the pan.
Currant Puddings.-Mix together with one pound and a half of finely-minced beef suet, two pounds and a half of grated bread, half a pound of flour, one pound and a half of cleaned currants, three-quarters of a pound of soft sugar, season with a little ground white pepper and fine salt, and one grated nutmeg; with this mixture fill the skins, and boil the same as oatmeal puddings.

Scollops of Hare.-Remove the fillets from the back of a hare, cut them across into slices about half an inch thick, and flatten them slightly with the handle of a knife dipped in water, then brush them with egg, coat with bread crumbs and fry in boiling fat. Brown one ounce of butter in a sauce-pan with a little flour, add one gill of brown stock or hare soup, which is generally making at the same time, of the hare from which the fillets were taken, one dessert-spoonful of reclcurrant jelly, one tablespoonful of spiced vinegar, a few cloves, and a smail onion. Stir and let it boil slowly for five minutes, then pass through a fine gravy strainer into a clear sauce-pan, put in the scollops, add a glass of port wine, and a few chopped mushrooms, and let them simmer slowly for a minute or two. Dish the scollops piled up in the centre, pour tho sauce over them, and for a border put croquettes of potatoes, with small sprigs of parsley between each. The croquettes for this dish should be oval and fat, not round, as they generally are

Zephyr of Hare, When making hare soup keep back six ounces of the finest of the flesh, and from it carefully extract all the sinews, then pound it well in
a mortar with two tablespoonfuls of stock, pass it throngh a fue wire sieve with a wooden spoon into a basin. Mix with it one eggr, a little grated nutneg; pepper, and salt to taste. Switch up till very stift and ight half a gill of crean, and mix carefully and lightly. Ornament the monkls with trufles or hard-boiled white of egg. cut in small dice, then three-quarters fill them with the mixture; put them in a pan with a little boiling water in the botton, cover with white paper, and cook till firm in water just oft the boil. Turn out and arrange neatly round a centre of fried chips of potatoes. Make a little brown sauce sane as for scollops of hare, and pour round the zephyrs.
Russian Timbales,-For a double entrée, cut into small dice one fillet of sole and six crayfish tails. Cook them in a little butter, taking great care that they clo not brown. Add a few trufles, a few green French beans, a small tomato, and a few cooked oysters, all cut into snall dice. Mix all with a good, thick, white satuce, and set aside to cool. Scrape down the fillets of three fresh, good-sized whitings; pound them in a mortar, and pass through a wire sieve. Pound slightly in a mortar four ounces of butter ; add eight ounces of bread panada (see p. 534) and pound with the butter, then add the whiting aud pound again. Add two whole eggs and the yolk of another, one at a time, pounding and mixing well as each is added. Season all with nutmeg, white pepper, and salt, and mix thoroughly again. Butter eighteen or twenty small timbale moulds; line them thickly with the whiting force-meat, and fill the centres with the prepared sauce. Cover in with the force-meat, and cook in water just off the boil for half an hour. When ready dish in a circle on two entrée dishes; strew on each timbale a few bits of chopped truffle; fill the two centres with prawns or crayfish tails heated in white sauce. Pour white sauce round, coloured with pounded lobster roe.

Macaroni Timbalo:-Have six ounces of macaroni boiled in water till it is soft; then take it out and cut into pieces about an inch long. Have a round mould or small bowl well buttered; line it closely with the macaroni pipes, placing them endwise; fill up the centre with force-meat made of cold veal or chicken, minced ham, and grated bread, seasoned with white pepper and salt ; cover the mould, and put it on to steam for one hour, then turn out ; pour white sauce round it, and garnish with a wreath of pickled beetroot.

Cucumber Pátés.-Peel and cut a fresh cu. cumber into slices about an inch and a half in thickness, making them all an equal size, Scoop out a little from the centre of each, leaving a sole at the bottom to hold the fmeat. Put them on in white stock with one teaspoonful of vinegar, and the same of sugar in it, and let them simmer slowly till tender, but not broken. Fil! them with hot mince, such as chicken or veal, and serve with white sauce made of the stock in which they were boiled.

Veal Cutlets, with Ham and Mush rooms.-Cut from the fillet, or any nice piece of veal. with a two-inch cutter, ten round or oval cutlets about half an inch thick, and the same number, with the same cutter, from sliced ham, making them a little thinner than the veal. Brush the veal cutlets with beaten egg, cont them with fine bread crumbs, and cook thein in boiling fat. Fry the pieces of ham, or cook then in the oven. Put on a tin of mushrooms in a small sauce-pan, with a small piece of butter, a little of the mushroom liquor, the juice of half a lemon, a little white pepper and salt, and let them simmer till tender. Brown one ounce of butter with a little flour, then add one gill of stock, a little ketchup, spiced vinegar, and white pepper, and let it boil five minutes. Dish the cutlets in a circle, veal and ham altemately, with the mushroons in the centre and the sauce poured in under the cutlets.
Cutlets of Ox Cheek.-Steep an ox cheets two hours in cold water, put it in bolling water for fifteen minutes, then take it out and bone it. Break the bones, put them on in cold water, with some slices of carrot and onion, a bunch of parsley, a few peppercorns, and a little salt ; let thens boil down to a strong stock, and straln. Put a few bones in the bottom of a stew-pan, lay the ox cheek on them, cover with tho stock, cover the pan closely, and let it simmer gently till tender, then take it out and press between two flat
dishes, with a weight on the top, all night. If for a single entrée, cut ten slices from the check two lnches long, one and a loilf hroad, and three-cighthes in thickness. Coat them with sanue sauce ins for cutlets of sweetbrends, lay then on bread crumbs till cold and firm, brusla with the whites of eggs left from making tho sauce, beaten slightly, cover wlth bread crumbs nuxed with a little grated cliceso, and fry in boiling fat. Have carrot ancl turnjp cut in small dice, and bolled with a pinch of brown sugar in the water. For the sance, brown onc ounce of butter with a little flour, add a little stock, pepper, salt, and ketchup; boil for tell suinutes, then add one tablespoonful of spiced vinegar, and a little finely-minced parsley. Dish the cutlets in a circle, put the vesctables in the centre, and pour the sauce round them. One ox cheek is sufficient to make two double entrees.
Cutlets of OX Choel, No. Z.-Prepare the slices of cheek as above, only making them a little thicker, say half an inch instead of three-eighths. Put them on in a small stew-pan with stock enough to cover them; let them get thoroughly heated without boiling. Take three fresh tomatoes, cut each in two, and take out the seeds without breaking them; stuff them with a little minced ham mixed with a few chopped mushrooms, some bread crumbs, an egg, and a little pepper and salt. Place them on a dish, strew bread crumbs over them,'and on each put a very small piece of butter ; put them in the oven for fifteen minutes, then take them out and cut each half in two. Dish the cutlets in a circle, fill the centre with the tomatoes, and pour the same brown sauce as in the foregoing recipe round them.
Fillets of Rabbit.-Take the fillets from the back of a good-sized rabbit, cut each across into three, and slice the four thick pieces lengthwise, thus making ten altogether. Put them in a small stew-pan with a little butter; season them with pepper and salt, and let them cook for ten minutes, turning them once. Cut the liver of a fowl and an equal quantity of bacon in small dice. Fry them a little, then allow them to simmer for half an hour. Pound them in a mortar with a tablespoonful of brown sauce, and half their weight in cold fowl, roast meat, or rabbit. Pass this through a sieve, thell season with pepper and salt, and heat thoroughly without boiling. Cut ten pieces of stale bread half an inch thick, two inches long, and an inch and a half broad. Mark each picce with the point of a knife within a quarter of an inch of the edge all round, and fry them a light brown. Scoop out the centre of each by the mark, and fill with the prepared puree. Coat the fillets with brown glaze, and place one on the top of each piece of bread. Dish in a circle with small croquettes of rice or potatoes in the centre.
Cutlets of Rabbit. -Remove the fillets from the back of a young rabbit, take off the under skin, cut each across, then from the two thick pieces make six slices longwise, and from the two thin four, making in all ten cutlets. Dip thern in a mixture of beaten egg and finely-minced parsley, then in equal quantitios of grated bread and Parmesan cheese, seasoned with a fittle pepper and salt. Fry in boiling fat, and dish in a circle with thin slices of fried bacon of the same size, one between each cutlet. Pour brown sauce round them, and fill the space in the centre with green peas or dressed macaroni.

Cutlets of Rabbit., No. 2.-Remove the two fillets from the back of a young fleshy rabbit, divide them into ten cutlets, put them on to simmer in clarified butter, with a sprinkling of pepper and salt, till white and firm, then take them out and put aside till cold. Prepare the following sauce:-Chop three tinned mushrooms, a few sprigs of parsley, and a very small piece of ham, add a pinch of finely-minced onion; put all into the frying-pan with a little scraped fat bacon, and stir over the fire for five minutes, then dredge in a little flour, add half a pint of good stock, the juice of half a lemon, a little nutmeg, white pepper, a plnch of sugar, and salt if required; let it boil about ten minutes, then remove from the fire, stir in the yolks of two eggs, then pour on to a flat dish and allow it to cool a little. Coat the fillets with thls sauce, and allow it to set on them, then brush over with the whites of the eggs, and cover with fine fresh bread crumbs, fry in boiling fat to a fine
llght brown, and dish neally in a circle, with small quenelles made from the remainder of the rabbit in the centre, and the following sauce poured under the fillets: - Break the rabbit bones, and brown them In a little butter, with a bay-leaf and a little thyme, add half a pint of weak stock, let them simmer about an hour, and strain. Brown about an ounce of butter with a little flour, add the stock, let it simmer for five minutes, then take off the fire, and add one dessert-spoonful of sherry, a little white pepper, and salt if required.

The quenelles are made in the usual way, the flesh scraped down, pounded, and passed througli the wire sieve, then mixed with two-thirds of its quantity in bread panada, and one-third in butter, one egg, scasoned with pepper, salt, and nutmeg, and poached in boiling white stock or water till firm.

Cutlets of Reabbit, No. 3.-From the back of a young fleshy rabbit remove the two fillets, and procecd exactly as in the foregoing recipe to the frying in clarified butter, and setting aside till cold. From the remainder of the rabbit scrape down all the flesh, carefully extracting the sinews, pound it in a mortar, and pass through a wire sieve. Weigh this purée, put it in a basin, then add to it by degrees, in the proportion of a gill of cream switched to four ounces, stirring it vlgorously, and season rather highly with white pepper, salt, and grated nutmeg. With this cream coat the cutlets thickly with a palette knife, put them on a large flat dish previously buttered, cover with white buttered paper, then put another dish of the same size on the top, and cook in a slow oven for about twent y minutes. Have a little stock made from the bones of the rabbit, of which make a plain white sauce (see recipe for it). Arrange the cutlets neatly in a circle, with green peas in the centre, and the sauce poured over them.

Boudins of Whiting.-To make a double entrée, skin, bone, and fillet two good fresh whitings, pound the fillets in a mortar, and pass through a fine wire sieve. Weigh this purée of fish, return it to the mortar, and add to it two-thirds of its weight in bread panada and one-third in butter, pound well together, after which add the yolks of two eggs, pound for a minute or two longer, then put in two whole eggs, one tablespoonful of white sauce, a little white pepper, salt, and grated nutmeg, and mix thoroughly. Sprinkle some flour on a board, divide the force-meat into twenty equal parts, form them with the hand into small oval sliapes, and place them in a pan spread with butter; cover them with boiling stock, and poach tIll firm, which takes about ten minutes. When ready, drain them, and dish in a circle, with prepared shrimps or inushrooms in the centre, and the following sauce poured over them:-Nelt two ounces of butter in a sauce-pan, with one ounce of flour, add about half a pint of strong white stock, a little of the liquor from a tin of mushrooms, the juice of half a lemon, two tablespoonfuls of cream, and about a gill of fish stock made from the skins, bones, and trimmings of the whitings. Let it boil for five minutes, and, if necessary, add salt and pepper. If the boudins are wanted brown, they must be brushed with egg after being floured, then coated with fine bread crumbs, placed on a wire drainer, and fried in boiling fat. If fried, the sauce may be dispensed with, but if particularly desired, it must be poured under the boudins, not over them.

Cream of Whiting.-Pound well in a mortar half a pound of whiting with two tablespoonfuls of fish stock made from the trimmings of the whiting, then pass through a fine wire sieve. Mix it with half a pint of switched crean, and season with white pepper, grated nutmeg, and salt. Have ten zephyr moulds well buttered, fill them three-quarters full with the mixture, put them on in a stew-pan with a little boiling water in the bottom, cover with white paper cut exactly the size of the pan, and let them steam slowly for twenty minutes, without boiling. Turn out and dish them in a circle, filling the space in the centre with fried parsley: Have some white fish sauce prepared, pour it over the zephyrs, and on the top of each sprinkle a little pounded lobster roe, or finely chopped parsley If sinall zephyr moulds are not at hand, a single border mould may be used.
Oysters in Shells.-Remove the beards from a tin of oysters, and cut them in quarterinch dice,
nlong with a few tinned mushrooms, and mix together. Melt one ounce of butter in a sauce-pan, with onc ounce of thour, add a gill of the liyuor of the oysters, and about the sarne of the mushroom lignor, season with grated nutmeg, white pepper, and, if necessary, a little salt; let it boil for ten minutes, stirring constantly. then reniove to side of the fire, and stir lin the yolk of an ege for thickening. Mix the oysters and mushrooms with the sauce, fill the china shells, strew them on tho top with browned bread crumbs (see recipe for browned bread Crumbs), warm in the oven, and serve innmediately. The shells ought to be fire-proof, and may be had at any chlua sloop, the cost varying from four to six shillings a dozen.

Oystors and Bacon.-Take two dozen large fresh oysters, sprinkle a little white pepper on them, then roll each into a very thin slice of bacou just large ennugh to cover the oyster. Dip them in beaten egg. then in fine bread crumbs, and fry in boiling fat. Lace them on six short silver skewers, four oysters on each, and garnish with parsley.
Bouchées of Oysters.-For a double entrée take four dozen blanched oysters and eighteen tinned mushrooms, and cut them in small dice, make a white sauce of two ounces of butter melted with two ounces of flour, then add the oyster liquor, half a gill of cream, a piece of glaze, made from white stock, about the size of a small egg, season with pepper, a plach of cayenne, and salt, let it simmer gently for about eight famutes, stirring it carefully, then add the oysters and mushrooms, and mix with the sauce till thoroughly heated without boiling. Spread this preparation on a flat dish, about half an inch thick, and set it aside to cool and get firm. While lt is cooling, scrape down, pound in a mortar, and pass through a wire sieve the fillets of two wbitings, of this take nine ounces, and pound it in the mortar with six ounces of bread panada, threc ounces of butter, one egg, and the yolk of another, mix well and 'season with nutmeg, pepper, and salt. With a cutter an inch and three-quarters in diameter, stamp out twenty rounds from the oyster preparation, and coat them with the wbiting mixture, flour them lightly, brush with egg, then cover with fine fresh bread crumbs, and fry in boiling fat, to a golden brown. Arrange neatly in circular order in the entrée dishes with fried parsley for the centres.
Bouchées of Oysters, No. 2.-With a round cutter one inch and three-quarters in diameter, stamp out from slices of stale bread the number required, then witb a cutter half an inch less, mark them slightly on the top, deepen this mark a little with the point of a knife, and fry them in boiling fat to a nice golden brown. After frying, put them in the oven a minute to drain, then take them out, take off the tops or lids where the mark was made, scoop out the sof insides, taking care not to break the croustades. Prepare the oysters same as the mixture in recipe for OYSTER PATES, with it fill the croustades, put on the tops, serve as hot as possible on a neatly folded napkin, and garnish with sprigs of parsley. For a single entréc, eight or ten will be required, for a double sixceen or twenty.
Creamed Oysters.-For a double entrée blanch and beard twenty of the finest and largest oysters, and set them aside to cool. Scrape down the fillets of two whitings, pound it in a mortar with four tablespoonfuls of the oyster liquor, then pass it through a fine wire sieve, take of this twelve ounces, mix it thoroughly with threc gills of good cream, switched till very stiff, and season with white pepper, salt, and grated nutmeg. Coat the oysters with this preparation, place them on a large buttered dish, cover with buttered paper, then with another dish of the same size on the top, and cook in water Just off the boil for twenty-five minutes, For the sauce, melt $\ln$ a sauce-pan two ounces of butter with two ounces of flour, add one gill of milk, and the oyster liquor, let it boil gently about ten minutes, stirring constantly, then take it off, add half a gill of cream, and season with white pepper, salt if necessary, and a suspicion of cayenne. Arrange the oysters neatly in circular order in entrée dishes, with fried parslcy in the centres, pour the sauce over the oysters, and strew on centre of each a bittle lobster roe or finely chopped green parsley.

Oysters au Gratin. - Take the number of cleep china shells recpuired, butter the insides, and strew then
thickly with bread raspings mixed with a little grated Jarmesan cheese, and scasoned with white pepper. s:alt, and a few grains of cayenne; then into eacli shell put one oyster, pour in some of the liquor with a little lemon juice in it, cover thickly with the mixture of bread raspings and clecese, and on the top of each put one or two thy morsels of butter. Place them on an oven tin or large flat dish, put them in the oven for about five minutes, and serve inmuediately, neatly arranged on an entrée dish.

Oyster PÁtés.-I'ut on two dozen of oysters witl their own liquor, let them just come to the boillng point, not more, then drain and reserve the liquor. Beard the oysters, and cut them into quarter-inch dice. l'ut on in a sauce-pan one ounce and a half of butter, with one ounce of flour, let it melt, then add the liquor of the oysters, half a plint of milk, one teacupful of bread crumbs, one teaspoonful of cayenne sauce, a little white pepper and salt, and let it boil gently for about ten minutes, stirring constantly. When ready, move to the side of the fire, and put in the oysters, after which it must not boil. Make a small piece of puff paste, and roll it out till about a quarter of an inch thick, for each paté stamp out two rounds with a cutter about two inches in diameter, then with a smaller cutter stamp a lid out of one of the rounds, brush the whole one with beaten egg, put the one with the hole in it above it, and brush with egg on the top. Brush the lids with egg. and bake both cases and lids in a quick oven. When ready, fill the cases with the prepared oysters, put on the lids, arrange neatly on a folded napkin, garnish with parsley, and serve very hot. Tinned oysters may be used for patés, in which case one tin will be equal to the number given in this recipe, and, of course, will not require scalding.

Erried Oysters,-Scald and beard three dozen large pandore oysters; dip them in beaten egg, then in fine bread crumbs, and fry them to a light brown. Have some parsley fried in boiling fat, and turned into an entree dish. Lace the oysters on eight short silver skewers, and arrange them so as to make all the points meet in the centre on the top of the parsley.

Greamed Prawns.-For a double entrée, boil and shell twenty fine large prawns, and proceed exactly as for Creamed Oysters, the only difference being that the cream must be coloured with pounded lobster roe, and the sauce with lobster butter.

Scalloped Oysters.-Take two dozen of the best oysters; drain them through a hair sieve, pour the liquor into a small stew-pan, with two ounces of butter kneaded with a little flour, three blades of mace, and a little cayenne; put it on the fire, stir until the butter melts, and let it boil slowly for fifteen minutes; then pick out the blades of mace. Have the oysters bearded. put them in the liquor, let them just boil up; draw them aside, have a breakfast-cupful of bread crumbs ready, then scason the oysters with white pepper and salt; butter the scallop shells or dish, put a layer of bread crumbs, then one of oysters, and part of their liquor: and then bread crumbs, then oysters, and so on, until you have filled the dish; place over the last layer of bread crumbs a few small pieces of butter, and brown them in the oven or before the fire for twenty minutes.

Macaroni Cutlets.-Put on six ounces of macaroni with a little salt in cold water enougb to cover it, boil till soft, then drain and cut into half-inch lengths. Peel and cut small a Spanish onion, put it on with four ounces of lentils in half a pint of cold water, boil till soft, then add half an ounce of butter, a few sweet herbs, a little pepper and salt, mix well, after which stir in one egg and cook till firm without boiling. Stir the macaroni gently with the lentil mixture, divide into cqual portions, form these into cutlets, flour, fry In boiling fat, and dish in a circle witb boiled Brussels sprouts in the centre.

Plain Mutton Cutlets.-For one entrée. prepare seven cutlets from the back ribs of mutton as follows. If bought from the butcher, the rib-bones ought to be sawn off, leaving the cutlet-bones abont three inches and a half long. Having got the pieces thus described, saw off the chinc-bone, without in the least touching the tender fillet, then divlde into as many cutlets as there are bones, trim away the fat and sinews neatly down to the lean fillet, leaving about an
inch of the bone at the end quite bare, and flaten them with the clopper dipped in cold water. [T] e bones and trimmings may cither be used in the stock pot, or made into Irish stew.] Beat up an egg, season it with pepper and salt, dip the cutlets in it, ind coat with fresh bread crumbs, plice them on a wirc drainer, and fry in boiling fat for about five mimutes, iffer which put them in the oven a minute to drain. Serve neatly dished in a circle, wilt mixed vegetables in the centre, aud brown snuce ponred under then.
sintton Cutlets à la Réforme.-Cut out of carrot, turnip, hard-boiled white of eggs, boiled haun, and green gherkins or French beans, narrow strips about two inches in length, also a few of a sumall diamond shape, and parboil the carrot and turnip. Make a snuce of one ounce of butter browned with Mour, add half a pint of stock, one shred onion, one tablespoonful of spiced vinegar, one dessert-spoonful of red-currant jelly, and about one dozen cloves; stir, and let it boil five ninutes, then put it through a fine gravy strainer; return the sauce to the pan, and add to it a few of the cut vegetables, eggs, han, and pickles. a little cryenne, one tablespoonful of sherry wine, and let it just boil. Haye seven cutlets prepared as in the foregoing recipe, dip them in egg first, and then in a mixture of minced ham, parsley, bread crumbs, pepper, and salt, and fry them in boiling fat for five minutes. Arrange the cutlets tastefully in an entrée dish, pour the made sauce into the centre, and strew the remainder of the cut vegetables, eggs. ham, and pickles on the top, the various colours of which give this dish a beautiful appearance.

Mutton Cutiets à Ia Soubise.-Prepare seven cutlets from the back ribs in the usual way, then lard thent with bacon, and put them on to braise in stock, with a small carrot sliced, a few sprigs of parsley, one onion sliced, some sweet herbs, and a few pieces of celery. The stock should only come well up about the cutlets, but not to cover them much; cover closely, and let them simmer about an hour and a half. Prepare the following sauce:-Peel and scald for ten minutes six onions, boil them in a little milk, and press them through a wire sieve. Melt in a sauce-pan one ounce of butter with one ounce of flour, add the milk in which the onions have just been boiled; if too stiff, add a little more, then the puré of onions, and one cooked potato mashed. Stir over the fire till reduced a little and rather stiff, and season with pepper, salt, and a little grated nutmeg. Take the cutlets out of the braising pan, trim away the bacon ends, keep them hot in another pan, with a little of the gravy about them, while the remainder is being strained and reduced to a half glaze. Dish the cutlets in a circle on a layer of mashed potatoes, put the purée of onions in the centre, and pour the reduced gravy over them,
Mutton Cutlets a la Soubise, No. 2.Prepare the cutlets from the back ribs in the usual way, and put them on to braise in stock, with sliced carrot and onion, a few pieces of celery, and a few sprigs of parsley. Cover closely, and simmer slowly for about one hour and a half. Take out the cutlets and reduce the stock in which they have been braised to a half glaze. Make a Soubise sauce as in the foregoing recipe, add to it some of the half glaze, in order to make it stiff, then coat the cutlets with it . and put aside to cool, or till the Soubise is set, then dip them in beaten egg, afterwards in bread crumbs, and fry in boiling fat. Dish in a circle, with mixed vegetables in the centre, and the remainder of the half glaze made hot, and poured under them.
Mutton Cutlets à Ia Maintenon.-Mix one breakfast-cupful of grated bread with one dessertspoonful of minced parsley, one teaspoonful of very finely-minced onion, a little black pepper and salt. Prepare seven or eight cutlets in the usual way, dip them in beaten egg, and coat with the mixture. From white note paper cut as many pieces as there are cutlets, making them about eight inches square, take away three of the corners, brush them with melted butter, place a cutlet on each, twist the papers neatly and closely round them, and cook on the gridiron over a clear but not fierce fire, for about fifteen minutes, turning the gridiron constantly. Serve immediately, arranged in a circle on a napkin, with fried parsley in the centre,
and the following sauce in a tureen:-Make a plain brown sauce of one ounce of butter, with the same of flour, and about half a pint of stock, add to it a few sprigs of parsley, one onion cut lit two, laalf a teaspoonful of made mustard, one dessert-spoonful of spiced vinegar, and a little black pepper ; let it simner for a few minutes, and pour tlirougli a gravy strainer.
IIutton Cutlets Alimatimeas.- Mince and pound together about a half of a cold clicken and a few mushrooms, add a little grated nutneg, white pepper, salt, and the white of an egg. Have six or eight inutton cutlets neatly trimned, dip them in egg. then put the mince on both sides, dip again in egg, then in bread crumbs, and fry in boiling fat to a nice light brown. Serve on a laypkin, and gamish with parsley and mushrooms.
ZRutton Cutlets with Tomato Sauce. For one entrée prepare seven or eight cutlets, and put then on to braise, in the same way as for CUTLETS A LAA SOUBISE. When done, take out the cutlets, put them on a clean dish, pour the gravy through a strainer into a clean sauce-pan, put it on the fre, and let it boi: rapidly till reduced to a strong glaze. Make a tomato pulp, as described in recipe, page 535, add to it one dessert-spoonful of vinegar, the glaze made from the grayy, and a pinch of sugar, let it simmer for five minutes, then pour out on a lat dish, and set aside to cool a little. With this preparation coat the cutlets rather thickly, and lay them aside to firm or set, after which brush with beaten egg, coat with fine fresh bread crumbs, and fry in boiling fat to a nice golden brown. Dish in a circle, with tomatoes au gratin in the centre.
Mutton Cutlets with Tomato Sauce, NO. 2.-Prepare seven or eiglit cutlets in the usual way, dip them in egg seasoned with pepper and salt, coat them with bread crumbs, and fry in boiling fat. After draining in the oven or before the fire for a minute or two, dish in a circle, with green peas in the centre, and tomato sauce (see page 535 ) poured under them. If preferred, they may be braised instead of fried, in which case the sauce should be poured over them, not under.
Nutton Cutlets à la Périgord.-From the remains of roast pheasant or any other game, take off all the meat from the bones, carefully remove the skin and gristles, chop the meat finely, and pound it in a mortar with a small piece of butter, add about a gill of reduced brown sauce, and season with aromatic spices and salt. Have the bones, skin, and gristles boiled in strong stock to extract the flavour from them; the stock then strained; put on again in a small sauce-pan, and boil quickly till reduced to a strong glaze. Put the force-meat into a small stew-pan, add to it the glaze, along with some chopped truffles, stir over the fire till well mixed, and put it on a dish to cool a little. Have seven or eight nutton cutlets prepared and braised, coat them with the force-meat, brush with beaten egg, then bread-crumb them, and fry in boiling fat to a nice golden brown. Arraoge neatly in a circle, with mush. rooms au gratin in the centre.
Mutton Cutlets in Ratter. -Mix together two tablespoonfuls of olive oil, two of vinegar, two bay. leaves, a few sprigs of parsley, a little thyme, a blade of mace, a sliced onion, and a little black pepper and salt. Prepare the cutlets in the usual way, put them in a basin, pour the mixture over them, and let them remain in it for two or three hours. For the batter, separate the jolk front the white of one egg, mix the yolk with six ounces of flour, one ounce of melted butter and a little salt, then work into a nice smooth batter, with about one gill of tepid water. Switch up the white of the egg till very stiff and light, and mix with the batter just before it is to be used. Wipe the cutlets with a clean cloth, dip them in the batter, and fry in boiling fat. Serve neatly arranged on a napkin, with plain brown sauce in a sauce-tureen.
Mutton Cutlets or Chops on the Grid-iron.--Have the chops cut at least an inch thick from the loin of the best mutton, which in cold weather has hung for about a week; renove the skin from the outside fat, taking just a little of the fat along with it, with which rub the wires of a double gridiron, then place the chops on it, and cook them overa clear bright fire from seven to ten minutes, turning them constantly. Have
the dish on which they are to be served very hot, put the chops on ir, sprinkle then with salt, put the cover on, having heated it well, aud serve iumnediately.

Fowl à la Marengo:-Skin a tender young fowl, cut off the legs, rentove the bones from then, and divide ench in two, thus making four pieces; then cut the breast into five, which, with the wings, will make eleven altogether. From the renains of the fowl, that is tha skin, bones, and giblets, maku a good stock, strain $i_{\text {s }}$, put on the pieces of fowl in it, and let them simmer slowly till tender. With a cutlet-cutter, round, square, or oval, cut out about a dozen pieces of stalo bread, half an inch thick, fry them in boiling fat, and lay aside to drain. Cut a carrot and turnip into very small dice, put these on separately to boil, with a little salt and a pinch of sugar in the water. Make a brown sauce with two ounces of butter, and flour sufficient to thicken it; add a litte of the stock in which the fowl has been simmering, a few chopped mushrooms, a little white pepper, and salt if necessary, and let it boil gently for ten minutes. Dish the pieces of fowl in a circle, clrain the carrot and turnip, and put them in the centre: pour the sauce over the fowl. on which neatly arrange the pieces of bread, the one overlapping the other, and serve as hot as possible.

Fowl a la Polignacn-Bone a chicken or young fowl, and put it on in a stew-pan with three ounces of butter; cover it with a plate and two pounds' weight on it, so as to keep it in the right form, and let it simmer till tender. Have a border of crottons of bread round the dish on which it is to be served, and within it a wall of boiled whole rice. Pound or mince very fincly lalf a pound of parboiled veal or fowl, with a quarter of ham, a little parsley, marjoram, bread crumbs, pepper, and salt ; moisten all together with an egg. From this forcemeat make twenty-four quenelles, dip them in egg and bread crumbs, and fry them a light brown. Have a sauce made of two ounces of butter browned with flour; add to it a little stock made from the bones of the fowl, one shred onion, a little parsley, marjoram, grated nutmeg. cayenne, and a few cloves; stir, and let it boil five minutes, then put it through a fine gravy strainer. Return the sauce to the pan, and add to it six large oysters or mushrooms, three pickled gherkins cut in snall pieces, a little ketchup, and one tablespoonful of sherry wine. Dish the fowl in the centre of the dish. pour the sauce over it, and put the quenelles into the wall of rice around the dish. Serve all up as hot as possible

Fricassée of Fowl.-Cut up and divide a fleshy, tender young fowl in the same way as for FowL A. LA Marengo. Put on the bones, skin, and giblets in a stew-pan, with a sliced earrot, a few sprigs of parsley, a few pieces of celery, one sliced onion, one blade of mace, and a few white pepper-corns, cover with cold water, let it boil gently for two hours, and strain. Put the pieces of fowl into a small stew-pan, cover with this boiling stock; cover closely, and simmer for about three-quarters of an hour, when the fowl should be tender. Melt in a sauce-pan one ounce and a half of butter with one ounce of flour, without allowing it to brown, then add three gills of the stock in which the fowl has been simmering, and a few mushrooms cut in small pieces, season with white pepper, grated nutmeg, and salt, and let it boil for ten minutes, stirring constantly, after which , remove it to the side of the fire, and add half a gill of cream, with the yolk of an egg, and stir until the egg thickens, without allowing it to boil. Place the pieces of fowl neatly in the centre of an entrée dish, pour the sauce over it, and surround it with groups of stewed button mushrooms, with a border of three-cornered crontons of bread outside. Fricassée of Rahbit may be made in the same way.

Fillets of Fowl à la Suprôme.-Clean and skin a fleshy, tender young fowl, divide the breast from the back, and from the breast cut ten fillets. Fry these in clarified butter, tiking eare not to let them get brown. Remove all the flesh from the remainder of the fowl extract the sinews, pound it in a mortar, and pass through a wire sieve. Switch up half a pint of crean till quite stiff and light, mix with the pounded flesh, and season with grated nutmer, white pepper, and salt. Coat the fillets rather thickly with this mix ture, then omanent them tastefully with stars or
dianonds cut from truftes and tongue, and put them again in the clarified bnteter in the trying-pan, or in a slow oven till tender. If in the oven, cover with a disld to prevent browning. l'ut on the skin, bones, and giblets with a small onion, a few sprigs of parsley, a few blades of nace, and about three gills of water, let It boil slowly till the substance is extracted and the licuicl reluced to half the quantity, then strain and skim. Melt two ounces of butter with one onnce of flour, add the stock, with a little essence of mushrooms and two tablespoonfuls of cream. Let it boil five minutes, and, if necessary, add a little white pepper and salt. Fill a croustade with prepared green peas or suall mushrooms, put it in the middle of the entrese dish, place the fillets neatly round it, and pour the sauce over thein. A pheasant may be cooked in the sante way, only let it be young and tender.

Galantines of Legs of Fowls, as Ducke's.-Have two large chickens, singe and pick then, cut off the lieads with the necks, leaving plenty of skin; cut off the feet, leaving about an inch of the leg to form the duck's bill; cut the skin of the fowl right up the back and down the breast, then take the whole of the skin from one side till you come to the joint above the knee, where leave it attached. Separate the joint and the part which you have skinned, and bone it neatly, put the sides of the skin together, and cut it neatly, so as to form the bill of a duck. This do to the other side of the fowl, and the same to the other fowl. Mix some force-meat with crumbs of bread and seasoning to taste; stuff the legs with it, leaving space for it to swell while stewing; sew it up neatly, put a skewer in below the joint through the stuffing, which mould into the shape of a duck, and cord it to keep it in the form. This do with the other legs, and you complete the dish of four small ducks. Have a stock made from the bones of the fowls, and in it boil them till tender. While they are undergoing this process, cut a piece of bread quite round, about an inch and a half thick, slightly toast it, then with a small cutter take a piece from the centre, leaving a space, into which put some prepared spinach or parsley, place it in the centre of the entrée dish, to serve as a receptacle for the food of the ducks. Take the ducks out of the stew-pan, and place them neatly around the receptacle, as if in the act of eating, and pour as much good brown sauce as will set them swimming

Fillets of Fowl.-Cut of the wings at the joint, and with them cut neatly the large fillets from the breast; under this is another fillet, which renove, and ornament with three rows of pickled French beans and chilies alternately. The fillets which were joined to the wings lard with neatly cut pieces of bacon. Theso fillets inay be done in the same pan with the ducks. Have an entrée dish with a layer of boiled whole rice, about an inch thick, round the edge, and a hole in the centre, which fill up with white sauce, and on the top lay the wings in the form of a diamond, and the smaller fillets in the spaces between them.

Zephyr of Chicken.-Remove the fillets from the breast of two chickens, scrape the flesh clean from the sinews, pound it well in a mortar, then rub through a fine wire sieve, and season with a little grated nutmeg, white pepper, and salt. Weigh the puree of fowl, and to the half pound allow half a pint of cream, switch it till very stiff, and add by degrees to the fowl, stirring vigorously. Have the zepliyr pans carefully rubbed with clarified butter, and ormauented with truffles, fill a little more than half, giving them a shake; place them in a pan, cover with white paper, cook in water just off the boil from twenty minutes to half-an-hour, then turn out and clish in a circle, filling the space in the centre with green peas or mushrooms, and pour white sauce about the zephyrs. The above quantity should be sufficient for a double entréc.

Little Souniés of Grousen-Cut the flesh of a goorl-sized grouse into small picces, also two ounces of bacon. Put them in a pan with a bay leaf and sufficient water to keep them moist; sinmer them for half an hour, and put the mixture aside in a basin to cook a little Strain off tho grivy and put the meat throngh a very fine mincing machine. Melt three ounces of butter in a sauce-pan, and mix smoothly with it three ounces of flour; add a gill and a half of stock hado from the
bones of the grouse, also the gravy just strained, and stir till it has boiled for three minntes. Driw the pinn aside, ind add, one by one, the yolks of four eggs, stirring well till they are cooked, without allowing the mixture to boil again. Season with salt and white pepper, and stir in the minced grouse and bacon and a gill and a half of slightly.switched cream. Beat the four whites of eggs to in stif froih, and stir them through the mixture very lightly. Butter eighteen or twenty small moulds, fill them with the mixture, and cook for half an hour in water just off the boil. Dish them in circular order on two entrée dishes, with stewed muslirooms in the centre, and brownsauce poured round. Souffés of pheasant or other game may be made in the same way.
Chicken Souffié.-To fill sixteen or eighteen cases, pound well in mortar six ounces on the remains of cold chicken, mix with it four tablespoonfuls of French white sauce (see SAUCE FOR CUTLETS OF SWEET-BREADS), and pass through a sieve. Separate the yolks from the whites of four eggs, mix the yolks with the chicken, and season with grated nutmer, white pepper, and salt, switch the whites to a stiff froth, mix together carefully, fill the paper cases, strew a little grated cheese on the tops, and bake in a moderately quick oven from ten to fifteen minutes. Serve immedi. ately on a napkin.
Chicken!IX a cold chicken, a few cooked mushrooms, and a few truffies, and cut them in very small dice. Put them on in a sauce-pan with a little nicely-seasoned stiff white sauce, stir till quite hot, pour out on a flat dish, and set aside to cool. Cut very thin slices of fat bacon two inches long, and an inch and a half wide, put a teaspoonful of the mixture on each, and roll them up like corks. Dip them in frying batter, and fry in boiling fat till nicely browned; put them in the oven for a short time to drain, serve on a napkin, and garnish with parsley. Sweet-bread Kromeskies may be done in the same way, by substituting cooked sweet-breads for chicken.
Boudins of Fowl à la Reine.-To make sufficient for a double entrée, clean a fleshy young fowl, roast the two legs, and allow them to cool, then remove the skin, bones, and gristles, mince the meat finely, and pound it in a nortar with half an ounce of butter and four tablespoonfuls of reduced white sauce; season with white pepper, salt, and grated nutmeg, then pass through a fine wire sieve, after which put it into a small stew-pan; add to it about half a gill of good crean and an ounce of chicken glaze, stir it over the fire until the whole is well mixed, then spread it out in a square form on a flat dish to about a quarter of an inch in thickness, and set it aside till cold and quite stiff; then cut it into oblong slices about two inches long and fully an inch broad. Remove the raw flesh from the breast and remainder of the fowl, scrape it down, extracting the sinews, and pound it in a mortar with a little white stock, pass througl a wire sieve, return it to the mortar, add the third of its quantity in butter, and twothirds in bread panada, pound well together, then add one whole egg and the yolk of another ; mix well, and season with white pepper, salt, grated nutmeg, and a few grains of cayenne. Put a thin coating of this force-meat on the oblong slices, already prepared, dust flour on them, then dip them in beaten egg, and cover with fine fresh bread crumbs. Place them neatly on a wire drainer, and fry in boiling fat to a fine light brown. Dish in a circle, with green peas in the centre, and Suprêne sauce poured under them (see SUPREME SAUCE in recipe for FILLRTS OF FOWL A IA SUPREME).

The chicken glaze is made by reducing the stock, which is made from the giblets, bones, and skin, etc., of the fowl.
Chicken Custards:-Remove all the meat from the leg of a cold roast fowl, free it from skin and gristle, chop and pound it in a nortar with two tablespoonfuls of white sauce, then force through a wire sieve; add to it the yolks of three eggs, a little grated nutmeg, and salt, and mix thoronghly ; then add about one gill and a half of stock made from bones and giblets of fowl, mix well again, and pour into small buttered moulds. Put them on, and let them steam from ten to fifteen ininutes, Dish in a circle, witl: peas or mush-
rooms in the centre, and white sauce poured over thein.

Chicken Custard Fritters.-Make the cus. tarcls and cook them as in the foregoing recipe, then allow thenl to get cold, after which brush them lightly with beaten egg; then cover with fine fresh bread crumbs, and fry in boiling fat to a nice grolden brown. Serve hot, neatly arranged on a folded napkin, and garnish with parsley.

Bouchées à la fieime.-For one entrée, make ten small croustades exactly as for BOUCHides or OYSTERS, From the leg of a cold fowl remove all the meat, free it from skin and gristle, then mince it finely, and pound it in a mortar with one ;tablespoonful of white stock, and pass through a wire sieve. Make a very little plain white sauce, add to it the pounded neat and two tablespoonfuls of cream, season. with grated nutmeg, white pepper, and salt, and sti: over the fire till quite hot, without boiling. Fill the croustades, put on the lids, and serve as hot as possible on a folded napkin.

Bouchées of Fowl à la Périgord.-For a double entrée, make a white sauce of one ounce of butter and one ounce of flour, three gills of strong white stock, and a little mushroom liquor; let it Loil for five minutes, after which stir in a small bottle of truffies, finely chopped, then pour out on a flat dish till about half an inch thick, and set aside to get cold and set into a jelly. While the sauce is cooling, remove the flesh from the breasts of two young tender fowls or good chickens, free it from skin and gristle, scrape it down, pound in a mortar and pass through a wire sieve, after which weigh it, and add to it one-third of its quantity in butter, and two-thirds in bread panada, mix well, then add one whole egg and two yolks, repeat the mixing, and season with white pepper, grated nutmeg, and salt. From the truffie mixture cut out twenty rounds with a cutter, an inch and a quarter in diameter, coat these with the force-meat of fowl, poach them for five minutes in white stock, and set aside to cool. When cold and firm dip in frying batter made as follows:-Mix in a basin the yolk of one egg, with six ounces of flour, a little salt, and milk enough to make a very stiff batter, then add a gill of cream switched, and the white of the egg switched to a stiff froth. After dipping the bouchees in the batter, fry them in boiling fat to a fine light brown. Dish in a circle, with cooked asparagus points or green peas in the centre, and a little white stock made from bones and giblets of fowls, and reduced to a half glaze, poured under them.

Chicken Cutlets.-For one entrée bone the legs of one chicken, and put them on to braise till tender, then take them out, and press them between two dishes till cold. Cut them across at the joints, then each piece in two, which will give eight cutlets. Make a strong white sauce of the stock in which the legs were glazed, add the yolks of two eggs to it, allow them to set, then pour it out, dip, or rather coat the cutlets with it, and allow them to get cold and stiff, then brush them with the whites of the eggs, coat with bread crumbs, and fry in boiling fat to a nice light brown. Dish in a circle, with green peas in the centre, and white sauce poured under them.

Bouchées of Salpicon.-For one entrée prepare ten or twelve small croustadeş exactly the same as described in recipe for BOUCHEES OF OYSTERS. Cut equat quantities of cold fowl, tongue, truffles, and mushrooms into small dice. Melt one ounce of butter with one ounce of flour, add half a pint of white stock, season with white pepper and grated nutmeg, and let it boil gently for ten minutes, then add the cut up fowl, tongue, mushrooms, and truffies, and stir till thoroughly heated, without allowing it to boil. With this salpicon fill the croustades, put on the lids, and serve hot on a neatly folded napkin.

Bouchées of Lobster.-Prepare the small croustades as directed in the foregoing recipe. Cut the meat, or part of it, of a boiled lobster into quarterinch dice, heat it in lobster sauce (see LOBSTER SAUCE) without allowing it to boil, fill the croustades, and serve hot on a napkin.

Cutiets of Sweet-Breads. - Soak tho sweetbreads for three hours in cold water, then put them in boiling water long cnougli to zet firm but not hard,
after which boil them gently in white stock till tender, which takes an honr and ten minites, put them between two flit dishes or boardls, with a weight on the top to press them into shape; cut longwise finto slices about quarter of an iuch thick, and form into neat cutlets of an equal size. Make a sauce as follows:-Melt in a pan two ousces of butter, stir in flour till pretty stiff, then brown t , add about a pint of stock, two bay-leaves, a few whte pepper-corns, a few blades of mace, a little yround white pepper, and salt, let it boil about teuminutes, taze it off, add the yolks of two egrs, and put it through a fine wire sieve. Coat the cutlets with the sauce, then with fine fresh bread crumbs, and lay them aside for an hour or ceven longer; brush them with the whites of the euggs beaten a liftle, coat again with bread crunbs, and put them aside for about an hour, or long enougi to get from. Fry then in boiling fat, and serve with sreen peas or musliroonis in the centre of the dish, witin the cutlets neatly arranged around them. If wanted, they may be served with white sauce, made the same as the foregoing, ouly crean is added instead of yolks of exgs.
Chartreuse of Sweet-Breads. - Take abrut three-quarters of a pound of the fillet of veal, fre: it from skin and gristle, scrape it down, pound it in a nortar, and pass through a wire sieve, after whiclt weigh, and add to it one-third of its weight in butter and two-thirds in bread panada, mix thoroughly with two whole eggs aod two yolks, and season with white pepper, salt, and grated nutmeg. Brush a plain round mould with melted butter, then decorate with pieces of tongue and truffes, after which line with the veal forcemeat rather more thao half an inch in thickness, prepare the sweet-breads as in the forgoing recipe, without pressing them; when cold, trim and cut then crosswise into scollops about a quarter of an inch in thickness, then warm them in a plain white sauce (see WHITE S.LUCEE, which should be rather thick, fill the mould till within fully half an inch from the top, cover with the force-meat, then with a buttered paper, and steant slowly for about an hour and a half. When ready, turn out on an entrée dish, let it stand for five minutes, then draw the mould off, and serve with white sauce round the base. A Chartreuse of Rabbit may be made the same way, using the coarse parts for the force-meat, and the fillets from the back for the scollops.
Scollops of Sweet-Breads.-Prepare the sweet-breads as in the foregoing recipe, and cut crosswise into scollops about half an inch thick, coat them with veal force-meat same as described above, place them on a buttered flat dish, cover with buttered white paper, then with another dish of the same size, aod cook in a slow oven for about twenty minutes or half an hour. Dish in a circle with a croaton of bread the same size and shape between each, with grecn peas in the centre, and plain white sauce poured under then.
Veal Pâtés.-Take some dressed veal, a small bit of ham , a little parsley, a small sprig of marjoram ; mince and mix them altogether, grate a little lemon, nutmeg, salt, and white pepper, and moisten it with some gravy or stock. Put it on the fire till thoroughly heated, then fill the patés, made as follows:-Line the paté pans with puff paste, about half an inch thick, put in a crust of bread, wet the edge of the paste, cut out a piece of the same size with a paste-cutter, and put it upon the top. Put them into a quick oven, and bake them; then with a knife cut the top and take out the crust of bread, fill them with the meat; put on the tops, and serve on a napkin. The cases are generally made the same as for oyster patés (see OYSTER PATES).

## COLD ENTRÉES AND MADE DISHES

Aspic Jelly.-Put on in an enamelled pan one pint of good white stock with half an ounce of gelatine previously soaked in a very little cold water, the white and shelf of one egg slightly beaten, a little ground white pepper and salt, one bay-leaf, a few sweet herbs, one ta blespoonfol of tarragon vinegar, and a little infusion of hay saffron, just sufficient to give it a bright
auber colour. Stir with a swith over a stove or slow fire until it boils; cease stirring ancl let boil for thret minutes, then cover, and set aside a litele back from the fire for ahout tell minutes, after which pour gently through a jelly bag, when it should come quito trans: parent. Shonld the stock be weak a little more gelatine must be used; but the jelly will he more agreoable to the taste as well as superior in quality if made of strong stock, requiring as little gelatine as possible; to givo it the necessary stiftness.
White Glaze for Turkeys or Fowls.For one turkey moisten four ounces of flour with one pint of thin crean or food milk, and season with a little grated nutineg and salt. Put it Into a clean brass or enamelled jan on a slow fire, aud stir very carefully till it boils, then add a little more crean. Have onc ounce of gelatine first soaked in a very little cold milk, then dissolved in nearly half a plnt of boiling mllk ; add it to the glaze, and let it again just come to the boil, stlring and watchlng very carefully, lest it should singe; take it off the fire and put it in a cool place, stirring occasionally till nearly cold, in which state pour all over the turkey a coating of an equal thicknoss; wheo it has set (which it will do very quickly), garnish with two colours of aspic jelly, such as rose and amber, cut ioto various devices, butter icing, and small sprigs of parsley. This glaze is very suitable for boned turkoys, and if tastofully done, makes a very handsome dish for a wedding breakfast or evening party.
Potted Veal.-Cut one pound and a half from a fillet of veal, in thin slices, and put it in a stow-pan, with a quart of good white stock, some white pepper whole, the rind of a lemon, and salt, cover it closely. let it stew for three-quarters of an hour, then strain it, and pick out the pieces of veal. Boil three eggs hard, slice them, and have some slices of dressed ham, some pickled beetroot. cut with a paste-cutter, and some curled parsley boiled. Take a large mould, wet it with water, trim the veal neatly; lay some slices in the bottom, some slices of ham, some beetroot, and eggs, with little sprigs of parsley here and there; then veal, ham, beetroot, cggs, and so on alternately, until you fill up the mould. Then skim the stock which you strained, put it on the fire, make it hot, season with salt and white pepper, and whon it is nearly cold, pour it into the mould to the top. When it is quite cold, it will he firm; turn it out, and garnish with parsley and sliced beetroot.
Fowl or Chicken in Aspic Jelly, No. 1. -Clean and bone a young fow or chicken in the usual way, stuff it with force-meat, boil it for thirty-five minutes, and let it stand till cold. Have a large mould, pour into it two or three tablespoonfuls of aspic jolly, et it set, then omament in various designs with pickled beetroot, hard-boiled whites of eggs, cucumbers, and parsley, add more jelly, and allow it to set, then place in the fowl, and fill up to the top with jelly and omaments. When wanted, turn out on an ashet, and garnish with aspic jelly in various colours, A turkey mav be done in the same way.

Fowl or Chicken in Aspic Jelly, No. 2. -Line a plain round mould with aspic jelly running the cold jelly round the sides of the mould till it is well coated. Fill up the centre with lettace and other salad vegetables shred small, putting pieces of cold chicken among the salad. Pour in some mayonnaise, and cover with cold aspic jelly that is just beginnlng to set. Turn out carefully when quite firm and set, and garnish with chopped salad and sliced tomatges. Cold salmon or other cold fish may be used in the same way.

Chaudfrod of Fowl.-Clean, cut up, and divide a fleshy, tender young fowl pr large chicken exactly as directed in recipe for FOWI $\mathrm{X}_{\text {LA MARENGO. }}$ Put on the bonos, giblets, and skin in a stew-pan, with a sliced carrot, a few sprigs of parslcy, a sllced onion, a few white pepper-corns, and a little salt, cover with cold water, and boil gently for two or threo hours. Have the pleces of fowl in a clean stew-pan, the coarser parts in the bottorn, strain the boiling stock over them, cover closely, and slinmer till tender, whlch will take about threc-quarters of an hour at least. When done, pour both stock and fowl into a large basin, and set them aslde till next day. When wanted, take out tho picces of fowl, cleatl from the iellied stock put tho
stock on in a clean pan, with lialf inn onnce of gelatine, previously soaked in half a gill of cold water, and let it boil till reduced to about a gill. Mix two ounces of flour with three gills of good milk, put this on in a stew. pan, let it come slowly to the boil, and boil for five minutes, stirring carefully, is it has a strong tendency both to singe and get lumpy, which must be avoided; then add the reduced stock, let it just come to the boil, after which pour it into a basin, and stir till nearly colld, but not set. Coat the pieces of fowl very carefully with this sauce, and lay them aside on a dish till quite firm; then dish on an ornamental paper, in a circle, the one overlapping the other, with lettuce or endive in the centre, and croatons of aspic jelly in various colours laid tastefully on the pieces of fowl and round the border.

Wayonnaise of Eowl.-Roast a young fowl, nnd when cold divide neatly into joints, making eleven pieces altogether. Make a Mayonnaise sauce as directed in recipe, add to it about a third of its measure in aspic jelly quite cold, but not set, mix well, coat the pieces of fowl, then lay them aside till quite firm, and finish as in the foregoing recipe.

Fowl in Tomato Sauce.-Clean, divide, and cook the fowl, also prepare the reduced stock, adding the gelatine, exactly as for CHAUDFROID OF FOWL. Melt one ounce of butter with one ounce of flour in a stew-pan, add the stock. stir till it boils, then add about three gills of tomato pulp, one tablespoonful of spiced vinegar, a pinch of sugar, and a little salt if necessary; stir till it boils for five minutes, after which pour it into a basin, and stir till cold, but not set. Coat the pieces of fowl with the sauce, and dish the same as In the foregoing recipes. The ornamenting may be done wilh hard-boiled white of egg cut into stars and various other shapes, instead of aspic jelly. If done with aspic jelly, it must be in one colour only, namely, amber.
Lamb Cutlets in Tomato Saucen-Trim, prepare, and braise eight lamb cutlets in the same way as directed for mutton cutlets, only giving them an hour in the braise, instead of one hour and a half; then put them aside to cool, and reduce the stock in which they were braised to a strong glaze. Mix with this glaze while hot half a pint of tomato pulp, add one tablespoonful of spiced vinegar, and a pinch of sugar, let it just come to the boil, pour into a basin, and stir till cold, but not set. With this sauce coat the cutlets, leaving the end bones bare, and set aside till firm. Dish neatly in a circle on an ornamental paper, with green peas in the centre, previously mixed with a little aspic jelly. Place some chopped aspic jelly of an amber colour round the border, and over it a wreath of sliced cucumber, with here and there a small sprig of green parsley.
Lamb cutlets may be done in the same way with brown sauce, by adding it to the glaze instead of the tomato pulp, and in dishing, put mixed vegetables, mixed with a little aspic jelly, instead of green peas.

Cream of Whiting in Aspic Jelly: Make eight zephyr moulds of cream of whiting, as directed in recipe, and, after turning out, set them aside till cold. Have a casserole or border mould, into which pour a very little aspic jelly, next place very neatly a wreath of tiny sprigs of green parsley, with a pinch of lobster roe between each, pour a few drops of jelly all round, in order to fix the parsley, and let it stand till set; after which pour in more aspic jelly, to cover the parsley well, and again allow it to set. Now place in, at equal distances, the moulds of cream of whiting, pour in enough of jelly to fix them, allow it to set, then fill to the top. When quite stiff turn out on a dish laving an ornamental paper on it, with chopped lettuce, mixed with a little tartar sauce in the centre. Zephyr of chicken, game, or rabbit may be done in the same way. The aspic jelly must be quite cold, but not set, when making a shape like the one described in this recipe.

Salad of Cold Meat.-Trim and cut into thin, delicate slices one pound of cold beef or mutton, mix it in a salad dish with two stocks of lettuce or endive, washed, drained, and shred small, four ounces of cold boilod white haricot beans, and one finely-minced pickled ghorkin. Mix together one teacupful of any good roast meat gravy, free of fat, a teasporiful of salad
oil, a wine-glass of vinegar, half a teaspoonful of made mustard, the same of black pepper, and one teaspoonful of salt. Inmediately before serving pour this over the salad, and mix well with a salad fork and spoon.

Italian Salad.-Trim and cut in delicake thin slices any cold meat, and put them into a salad bowl or dish. Mix four tablespoonfuls of roast meat grary, free of fat, with half a teaspoonful of made mustard, cie teaspoonful of salad oil, two tablespoonfuls of vinegar, and pepper and salt to taste. Two or three hours before serving pour this over the cold meat, and garnibh with parsley, hard-boiled whites of eggs, and beetrort.

Lobster in Aspic Jelly --For one entée, cut the tail of a cold boiled lobster in square pieces. Have ten small zephyr moulds, into each of which pour a little aspic jelly; allow it to set, after which pit in a piece of lobster, then a little more jelly, to fix it ; again allow it to set, and fill to the top. When wanted turn out and arrange in a circle, with shred lettuce or endive in the centre, mixed with a little tartar or Mayomaise sauce.

Lobster Salad.-Take the meat from the tail and claws of a cold boiled lobster, being careful net to break it, cut it into oblong pieces, and lay them asde. Take the meat from the body, and mix with shied lettuce and tartar sauce, pile this up on a silver entée dish, then cover with Mayonnaise sauce, on which sprinkle some pounded lobster roe; place the heart of a lettuce in the centre, and surround it with the pieces of lobster, with heart lettuce leaves between each, and garnish round the border with hard-boiled eggs, cut into quarters, and croutons of aspic jelly.

Fillets of Soles a la Cardinal--Clean, skin, and fillet a medium-sized sole, divide each fillet in two, making in all eight pieces. Put these on a buttered dish, with a morsel of butter on each, cover with buttered paper, then with another dish of the same size, and cook in the oven for ten minutes, after which take them off the dish, and put them aside till quite cold. Have ready about half a pint of Cardinal sauce (see recipe for it), add to it about a gill of stiff savoury jelly, with a little of the gravy from the dish on which the fish was cooked, mix well, pour into a basin, and stir occasionally till quite cold, but not set. When ready, coat the pieces of sole, and put them aside to firm; then arrange neatly in a circle on an ornamental paper, with prawns stewed in a little stock, and mixed with aspic jelly in the centre, and a wreath of parsley for a border.

Imitation Foie-Gras,Cut in small pieces equal quantities of fat bacon, veal, and livers of chickens or fowls, say four ounces of each, put them on in a stew-pan, with a few pepper-corns, two cloves, one bay-leaf, two sprigs of parsley, a few mushrooms, and a very small onion sliced. Let it fry all together for a minute or two, but not too long, as the liver has a tendency to barden, then remove to the side of the fire, and let it. simmer for twenty minutes. When ready, add a little salt, then pound in a mortar, after which force through a wire sieve, spread out on a dish, and set aside for use. If wanted for a shape, cut into small round cakes, place them in circular order in a border mould, with aspic jelly, proceeding very much in the same way as described in the recipe for CREAM OF WHITING IN AspIC JELLY. In addition to the parsley and lobster roe, hard-boiled whites of eggs and truffles, cut into small pieces, may be used for ornamentine.
Plain Salad-Take the number of lettuces required, pick of the outside and blemished leaves, lay the stocks in salt and water for about half an hour, then drain and shred down into pieces not too small, after which shake them well in a dry cloth, to take the water from them. Have a little mustard and cress washed and drained, mix them with the lettuce, put altogether in a salad bowl, and ornament with milishes and hard-boiled eggs cut in quarters. Immediately before serving, pour over it the following sauce: take the yolks of two hard-boiled eggs, bruise them in a basin, add a teaspoonful of mustard, one of sugar, a little salt, two tablespoonfuls of vinegar, a little salad oil, two tablespoonfuls of thick cream, and mix all together.

## VEGETABLES.

To Boll Green Peas.-Shell and wash the peas, fit them into a stew-pan in iplenty of boiling water: dd salt, a teaspoonful of pounded loaf sugar, and boililhena twenty minutes, when they will be tender, if young if old, they will require a longer time. Drain then in. colander, and dish immediately. If peas are allowed: :o stand in the water after being boiled, they lose the colour.
To Stew Young Peas and Lettuce.Take to heads of cabbage lettuce, pick oll the outside leaves, nd lay them in salt and water for an hour; cut them dwn in slices, run cold water on them, pat them in a sace-pan with a teacupfall of rich gravy, slake in a litdefour, some pepper and salt, a tablespoonful of sugar, one quart of green peas, and let them stew closel covered, at the side of the fire, until thic peas are set and the sauce much reduced; add a little cream. shak'the sauce-pan, but do not stir it. Serve hot on a dish y itself, or under chickens, sweet-breads, or any dresed neat you cloose.
DBoil Asparagus. - Wash and scrape them wel tie them up in small bundles, cut then all even at the white ends, and lay them in cold water; when wated, put them on in boiling water, with salt, and bal them quickly for fifteen minutes. Have a slice of tasted bread cut in four, and the crusts cut off; dish be asparagus with the tops meeting in the middle of ae dish, cut off the strings, and serve with butter sauce

## n a sauce-tureen.

To Boil Sea-Kale.-Cut off any part that may be at all green, lay it in cold water and wash it clean; put it on in boiling water, with salt, and boil it quickly for twenty minutes; have a slice of toasted bread in the dish, take out the kale with a fish-slice, and dish it upon the toast, laying it all one way, and pour butter sauce over it.
To Boil Artichokes: - Cut off the stalks close to the bottom: let them lie in salt and water for two hours, wash them well, put them on in boiling water with salt and a snall bit of potash; boil them constantly for about one hour and a half, when they will be tender, if young; if old, they will' require another half hour; take them out of the water with a fork, put them in the dish and serve with butter sauce in a sauce-tureen.
To Boil Caulifiower.-Cut them neatly, and lay them an hour or two in salt and water, rinse them in plenty of cold water, put them in boiling water with some salt and a pinch of soda, and boil for fifteen or twenty minutes, When you dish them, take them out of the water with a fork and fish-slice, lay them in the dish, and pour butter sauce over thein.
To Boil Spinach.-Fick it carefully, lay it in water, and when you are to boil it, wash thoroughly in plenty of cold water; have a pan with boiling water. some salt, and a bit of soda ; put in the spinach, boil it swenty minutes, pour it into a colander, then run cold water on it ; when cold, let it stand till the cold water runs from it ; set the drainer in a basin, and with a heater or wooden spoon beat it perfectly smooth; put an ounce of butter in a small sance-pan, put in the spinach, two tablespoonfuls of cream, a little pepper and salt; put it on the fire, and stir till very hot. When dished, it is marked in squares with the back of a knife; if for sinpper, serve with poached eggs on the top.

## To Dress Young White Turnips:-Clean

 and peel them, and hoil them in salt and water; when they are tender, pour melted butter over them; or they may be stewed in milk till tender, thickened with cream and flour mixed together. Season with white pepper and salt. Dish them, and pour the sauce over them.To Boil French Boans.-Cut of the stalks, and string them, cut them into very thin slices, and put them into cold water with a little salt; lialf an hour before dinner put them in boiling water and salt, boil them quickly for half an hour, drain, and dish them immediately; kecp them hot, but do not allow them to lie in the water, else they will lose their green colour. Serve with hutter sauce in a sauce-tureen.
To Boil Windsor Beans.-Shell and skin them, put them in boiling water and salt, let them boil
till tender, pour the water from them, and served with plekled pork or minced parsley and butter sauce.
To DressJerusalem Artichokes.-Clean and pare them, put them in boiling water and milk, with salt, and boil them untill they are soft. Pour the water off tiren, and serve with butter sauce over them, or mix a tablespoonful of flour with a teacup ful of cream, season with white pepper and salt, a little nutneg, and stir till it boils, then pour it over the artichokes.
To Stew Cucumbers.-Skin and slice the quantity of cucunbers you require, and lay then in winegar and a lite salt. Have a pint of white stock, a little parsley and thynuc, and a piece of hutter rolled 'hin flour, shake it natil it looils, then auld a tablespoonful of vinegar, drain the cucumbers, put them in tho stew. pan, and let them stew slowly till tender. When you are to serve them, take out the parsley and thyme, add a teaspoonful of sugar, and make it hot. Dish the cucumbers, and pour the sauce over them.
ToStew Red Cabbage. - Take off all the out. side leaves, slice it as for pickling, put It into a stew-pan with a pint of good stock, a little pepper and salt, cover it closely, and let it stew one hour, then add two tablespoonfuls of vinegar, let it boil for fifteen minutes, and serve liot.
To Stew Beetroot.-Take a pint of good stock, wash one beetroot, and scrape it clean and cut it in slices about half an inch thick. Have the stock boiling, with a little salt and pepper in it ; put in the sliced beetroot, cover it closely, and let it stew for half an hour; add two tablespoonfuls of vinegar, let it stew another half hour, then dish it neatly, and pour the sauce over it.
To Boil Beetroot.-Wash it well, taking care not to break the points, as it will spoil the colour, put it in a pan, cover with boiling water, and boil till tender, which takes about forty minutes, then skin and trim the heads neatly, put them in a jar, and when cold cover with vinegar. Serve it in slices in a corner-dish, with a little of the vinegar poured over it
To Stew Onions with White Sauce.Pecl as many large onions as you require, put them into a sauce-pan, and cover them with white stock, a little white pepper and salt; cover them, and let them stew for an hour. Mix a small teacupful of cream with a tablespoonful of flour; add this to the onions, shake it well until it boils, and dish the onions with the sauce over them. If you wish to have them stewed with a brown sauce, brown two ounces of butter, add a pint of good stock, with salt and pepper, put in the onions and stew them for an hour. Dish them hot with the sauce解.
To Mash Turnips:-Wash and peel the number required; cut each iuto four, put them on in boiling water with a littie salt, and boil them quickly until they are soft, put them upon the back of a sieve, and with a wooden spoon press them through it. Put a little bit of butter in a stew-pan, put in the turnips, a litule white pepper and salt, and stir until very hot and dry. A little before disling. put in half a teacupful of thick cream, and mix it well. Dish them by themselves, or under dressed ineats.

To Dress a Cucumber to be Served with Salmon.-Peel and slice the cucumber very thin; sprinkle the slices with pounded salt and surar; let them lie for two hours, and pour off the juice. Have a little vinegar, a tablespoonful of salind oil, and beat up together, pour it over the cucumber, and sprinkle a little white pepper over it.

To Boil Brussels Sprouts. - Take the quantity required, pick off the withered leaves, and steep them in cold water with salt in it for half an liour : then drain, and put them on in boiling water, with a pinch of soda and a little salt, let them boil for ten minutes, then drain and serve. If to le taken alonethat is withont meat-serve with melted butter in a sauce-tureen.

## SAVOURY ENTREMETS AND BREAKFAST DISHES.

EgE Balls.-Boil four egrss for fifteen mimutes. take them ont and lay then in cold water for ten minutes,
then tako of the shells and whites, and pound hac yolles fu a mortar, drop in the white of one cgg, add a little flour, beat it up with a spoon, and form into eiglit little balts.

Buttered EcEs.-Ineat up as many fresh eggs as you requlre, put 2 plece of butter in a sauce-pan, shake it one way until melted, acld two tablespoonfuls of cream, put in the beaten eggs and stir constantly matil they become thick. Have slices of toasted bread buttered and hot, cut into square pieces, of which pile the eggs, and serve on a napkln.

Minced Izam with EeEs.-Take someslices of boiled ham, and mince very fine; put a little pat of butter In stew-pan, with a little flour, and brown it, then put in the minced ham, with a spoonful of stock, stir, and make it hot. When wanted serve with poached eggs on the top.

Savoury Omelette.-Take three eggs, separ. ate the yolks from the whites, put the yolks in a basin, and beat the whiltes on a dinner-plate to a snow; beat up the yolks with a little salt, a tablespoonful of four, and two tablespoonfuls of thick cream; mince a little green parsley, one onlon, with some sweet herbs, add them to the yolks, and mix in the whites. Have a clean frying-pan with a piece of butter hot, pour in the omelette, and hold it over a slow fire, at a good distance, until fastened and well risen; then hold it before the fire, brown it, and dish on a napkin. You may make another omelette the same way by substituting grated ham, tongue, or pounded chicken, keeping out the parsley and herbs.

Cheese Fritters.-Beat up two tablespoonfuls of flour with one teaspoonful of inade mmstard, add half a teacupful of sweet milk, a little salt, two ounces of Parmesan cheese grated, and the whites of two eggs, beat up till very stifi, and mix allgently together. Have some lard boiling in the frying. pan, drop them in with a dessert-spoon, fry them to a nice light brown, drain in the oven, and dish them on a napkin.

Welsh Rabbit.-Take half a pound of Dunlop or Gloucester cheese, cut of the skin, take a small frying-pan, put in it lialf a teacupful of strong ale, and when it boils put in the cheese, and let it boil for a minute or two; then stir in a teaspoonful of mustard when it becones a liquid; toast a thlck slice of bread, cut off the crust, butter It well, and set it before the fire to keep it hot. When it is wanted, have a dish and cover very hot, put the cheese on the toast, and send it to table inmediately.

Macaroni with Cheese.-Put four ounces of macaroni into a stew-pan, cover it with cold water, and let it stand for an hour, then put it on the fire, let it come to the boil, and boil slowly till soft, after which drain through a colander. Melt in a stew-pan one ounce and a half of butter, with the same of nour, add to it about half a pint of good milk and a llttle salt, stir till it boils, then add the macaroni, and move the pan till well mixed. Have an ornamental paste border round the dish on which it is to be baked, and two ounces of cheese grated, put a little of the prepared saacaroni in the dish, on which strew thickly grated cheese and dry mustard, then another layer of macaroni, and so on, finishing on the top with grated cheese and morsels of butter placed here and there, Bake in a hot oven till the border is ready, when the macaroni will be done also, and serve hot on another dish, having a folded napkin on it.

Kedgeree. - Remove the bones from a cold boiled haddock, break it into sinall flakes, add one breakfast-cupful of boiled whole rice, prepared as for curry, two hard-boiled eggs shelled and minced, a little salt, and one teaspoonful of dry mustard. Melt and brown a little in a frying-pan about two ounces of butter, add the mixture to it, with one teaspoonful of cayenne sauce, and heat thoroughly, stirring constantly with a fork. Serve hot with three-cornered croatons of bread neatly arranged round the dish, with sprigs of parsley in between each, and vermicellied yolks of eggs strewn on the top. Cold cod may be cooked in the same way. Vermicellicd yolks of egges are simply hard-boilod yolks passed through a wire sieve.

Coylon Savoury,-Make a little cheese pastry according. to directions given for CHEESE STRAWS. Cut it in small rounds, and bake these a golden brown.
liave some spinacl cooked according to the recipe given for BOILED SPINACH, and put a layer of it on each biscuit, allowing a narrow edge of the pstry to show all round. Switch a little double cream verstimly. Scason with a little white pepper and salt, ani put a rose of this on the top of the spinach on eachoiscuit. Serve hot.
Cheese Ramalcins,-For cighteen caes, sep. arate the yolks from the whites of five eggs. leat two ounces of butter to a cream, the:1 add by legrees, while beating, three of the yolks. Make a latter of one good tablespoonful of flour and a little silk, mix with the butter and yolks, then add about thre ounces of grated Parmesan or Gruyere cheese, peppr, salt, and a very little cayenne. Switch up to a sti froth the five whites of eggs, and mix all togethr very gently and lightly. Have the ramakin cases olld with a little salad oil, fill them a little more than half, srinkle on each a little grated cheese, aud bake in aquick oven for about seven minutes. Arrange them ieatly on a folded napkin, and serve immediately.
Nudels with Cheese.-Melt in an enarelled pan one ounce of butter with one ounce of flouradd five tablespoonfuls of nullk, a pinch of salt, and afew grains of cayenne, stir well till it becomes a titick pste and leaves the sides of the pan; then remove fromshe fire and stir in two ounces and a half ot grated chese, mixing thoroughly, drop in two eggs, one at a tile, stirring well after each, put on the fire again and sir till the eggs are cooked without allowing it to bd, Have a pan with boiling water in it and a good te: spoonful of salt, drop the mixture in dessert-spoonful into it, after which remove from the fire to take it of the boil. Let them poach for fifteen minutes, drain, and serve hot on a napkin with brown bread crumbs sprinkled on them.
Cheese Straws.-Rub two ounces of butter into four ounces of flour, then snix with it four ounces of finely grated cheese, a teaspoonful of dry mustard, a pinch of cayenne, and make into a smooth dough with two eggs; roll this out, and give it a few folds similar to pastry; let the last fold form it into a square, then with a knife or paste runner cut it into straws about four inches long; put them on a cleas oven tin, and bake in a nooderate oven to a nice light brown. Have a table napkin neatly folded on a dish, pile them on it crosswise, place them before the fire to toast, and serve hot.

Cheese Aigrettes:-Grate three ounces of Parmesan cheese, ind put it aside on a plate. Put on in a sauce-pan half a pint of water with two ounces ot butter, let it come to the boil, then stir in two ounces of fine flour, and continue stirring until it thickens and leaves the sides of the pan. Remove it to the side of the fire, add one egg, mix well; then a third of the cheese, mixing again ; repeating this process till three eggs and all the cheese have been put in; season with one teaspoonful of dry mustard and a little pepper and salt. With a dessert-spoon drop the mixture into boiling fat, and let them cook until very much risen and a nice brown, then take them out, drain for a minute in the oven, and serve very hot on a napkin. The above will make, twenty
Celery Souffée with Parmesan.-Clean one pound of white celery carefully, and cut it in small pieces. Put it in an enamelled pan with as little milk as possible, and let it simmer till tender, then boil rapidly to reduce the liquid. Pass it through a wire sieve and put it aside to cool. Beat two ounces of butter to a cream, and add to it the yolks of four eggs, one at a time beating each one well in. Add the celery, gradually, mixing well, also an ounce and a hals of grated Parmesan cheese, and season with a little celery salt. Beat the whites of five eggs to a very stiff froth, and stir them into the inixture very gently. Fill small paper cases about three-quarters full, and sprinkle on each a little of the cheese mixed with a very little celery salt. Bake in a hot oven for seven minutes. Arrange tastefully on a napkin and serve immediately. Sufficient for a double entremêt.
Cheese Custards in Shells.-Boil a red herring for five minntes, cut off the head and tail, skin it, remove the bones, pound it in a mortar with a few drops of cochincal sufficient to colour it. Pass it through
a wire sieve with a wooden spoon, then dry on the stove, and put aside for 11 se. Makea custard with three egrs and six tablespoonfuls of milk, add to it two ounces of grated Paruesan cheese, a little white pepper and grated nuturg. Fill the shells with the custard, strew some of the red herring crumbs on the tops, warm in the oven, and serve. The above is sufficient to fill as dozen of shells.
Iced Cheese. - Separate the yolks from the whites of three eygrs, beat the yolks with one teaspoonful of dry mustird, al little white pepper and salt, then add half a pint of cream and fonr ounces of grated Parmesin clicese, and mix well. Switcla nup the whites of the egrs till very stilf and light, and mlx together carcfully nud lightly. Freeze in the usual way in a suuare or oblong mould, and, just before serving, thirn out and cut into pieces oue incla and threc-quarters long, one inch broad, and a quarter of an inch thick. Disht lu a clrcle, the slices overlapping each other, with lettuce or endive in the centre.
Iced Cheese, No. 2.- Melt in a sauce-pan three ounces of grated l'armesan clicese, with half $h$ pint of nuilk, then let it get cold, and nix, itf with a small tencupful of crean, one teaspoonful of dry mustard, and a little pepper and salt. Pour into a square mould, and freeze in the usual way. When wanted, turn out and cut into sunall cakes about two inches long by an inch and a quarter broad, and dish in a circle, the one overlapping the other.
Cheese Canapés.-From thin slices of "stale bread cut, with a cutter about two inches long and an inch and a half broad, as many croatons as you require, and fry to a light brown in clarified butter. Spread a little made mustard on each, then a thin slice of cheese, on which sprinkle a little pepper, and put them in the oven or before the fire till the cheese is melted, and serve hot.

Scotch Woodcock, Mix in a pan on the stove two ounces of grated Parmesan cheese, one teaspoonful and a half of anchovy paste, half a teacupful of cream, and a small pinch of cayemne. Let it melt and just come to the boil. Have three slices of bread fried in butter to a nice light brown. Cover each with the mixture, and serve as hot as possible.
Celery Toast. - With a cutter two and a half inches long, by one and a half broad, stamp out ten tonsts from slices of bread about half an inch thick. Then with a cutter a little smaller mark them sliglitly on the top. Deepen this mark a little with the point of a knife, and fry theon in boiling fat to a golden brown. After frying put then in the oven for a rew minutes to dry, then scoop out the centres by the mark, taking care not to break the toasts. Cut the white parts of two heads of celery in two-inch lengths; put them in a sauce-pan with enough white stock to barely cover them, and stew gently for one hour. When ready, put the celery in equal proportions on the toast. Moisten half a teaspoonful of potato flour with a little ketchup and stir it into the stock. Season it with pepper and salt ; let it boil for three minutes, then pour it in equal proportions over the celery. If liked, a little grated cheese may be sprinkled on them before serving.
Ham Toast.-Cut thin slices of bread from a stale loaf, take off the crust, divide into pieces from two to three inches long, and fully an inch wide, and fry in boiling fat. Cover half the number of the pieces of toast with lean ham, sliced as thin as possible, sprinkle over them some grated Parmesan chcese, and lay on that the remaining slices of toast. Put them in the oven till thoroughly heated, and serve very hot on a folded napkin.
Mushroom Toast.-Take as many mushrooms just opened as will be wanted, remove the stalks, wash and drain them, and place them on a flat dish with the hollow part upwards. Put a small piece of butter into each mushroom, sprinkle a little pepper and salt on them, and put them in the oven for about fifteen minutes, or till they are tender, With a cutter two inches in diameter cut out as many rounds of bread, half an inch thick, as there are mushrooms, scoop a little hollow in the centre of each, and fry them in boiling fat. Place a musluroom on each round of toast, with a llttle of the gravy, and serve hot.

Green Onion Toast.-Cut small one bunch of
green onfons and put them in a pan barely covered with builing witer, Add a small half teaspoonful of s.alt, the same grantity of suggr, and boil genny for ono hoor and a hal!. Then add from four to six sage lenves, powlered, quarter of an ounce of butter, and more s.alt if needed. IIave ready two slices of toast buttered, divile eacli slice lato four, and spread with equal proportions of the onion. Serve very hot, This can be made also with Portugal onions.
Craigio Toast.-Beat three eggs, add one grecu chili and the inside of two tomatoes, both finely minced. a little nuilk, one ounce of butter, and a little salt. Mix all together, and put on in a pan to get thoroughly heated. Ilave small pieces of stale bread cut out half an inch thick, with a cutter either round or square, and fried in boilling fat. Cover the tonst with the mixture, and serve hot.
Stuffed Eges.-To make twelve, boil slx eggs for ten minutes, and put then in cold water for a sloort tinne. Take theun out, and divide each crosswise, taking care not to break the white part, take out the yolks, and flatten the white cups at the ends by slicing off a very little. Pound the yolks wilth one ounce of butter, three anchovies, washed and trimmed; chop together eight olives, one teaspoonful of capers, and three pieces of truffle ; add these to the yolks, scason with pepper, salt, and a few grains of cayemne, and mix well. Fill the cups with this mixture, raising them towards the centre, and sinoothing them with a knife dipped in water. Garnish them on the top with chopped truffles, and put them in the oven till thoroughly heated; place each egg on a round croâton of bread, and serve. If preferred, they may be served cold, without being put in the oven.
Anchovy 玉ggs.-For a party of twelve have six large eggs, boil them ten minutes, let them cool, and take the shells from them carefully. Divide them in two crosswise, scoop out the yolks, and cut off the points from the white, In order to flatten them for dishing. Wash, scale, and bone twelve ancloovies, cut a long fillet from the back of each, which divide in two, and lay aside for garnishing. Pound the anchovies in a mortar, then add the yolks, and pound them together. adding a few drops of salad oil, a little finely chopped parsley and shalot, a few grains of cayenne, a little grated nutmeg, and white pepper and salt to taste. With this mixture fill up the cups made from the white of the eggs, raising them a little towards the centre. and making them smooth with a knife dipped in cold water. Ornament with two strips of anclovy and one of boiled white of egg, placing the strip of egg in the middle, and one strip of anclovy on each side of it. Chop some lettuce or endive, put it on a dish, arrange the eggs neatly on it, and serve cold.
Supreme of Eggs.-Boil five eggs for ten minutes, let them cool, and tiake the shells from them carefully ; cut them across, scoop out the yolks, and cut the points off the whites to fiatten them for dishing. Pound the yolks in a mortar with one ounce of bitter. two ounces of grated Parmesan cheese, the raw yolk of one egg, a teaspoonful of dry mustard, two tablespoonfuls of thick cream, a pinch of cayenne, and a little white pepper and salt. Pound all well together, fill the cups made from the whites, raising them towards the centre, and smoothing with a knife dipped in cold water. Strew a little grated cheese on them, and put them in the oven for ten minutes, but do not colour them. Spread what is left of the yolk mixture on the bottom of the entrée dish, arrange the eggs on it neatly, put a small diamond of beetroot or pickled gherkin on the top of each, and serve with Chil vinegar.
Einnan Haddock Canapés.-Cook a little on the gridiron, or in the oven, a good-sized fimman laddock, remove from it the bones, skin, and trinmings, pound it well in a mortar, with three ounces of butter, and pass through a wire sieve with a wooden spoon. Cut out eighteen or twenty rounds of stale bread, three-eighths of an incli thick, with a two-inch cutter, and fry them in butter to a mice golden brown. Cover them with the milxture, raising it towards the centres, put in the oven long enough to get thoroughly lieated, buy not to brown, and serve lot.
Soumé Potatoes. - Wash and brush eight
potatoes of an ordinary size, flatten them at one end by cutting a slice from each, and roast them in the oven. When quite ready take then out, cut a slice from the other end of each, scoop out the potatoes, taking care to keep the skins whole, and put then through a colander into a basin. Switch then till very light, with an ounce of butter, half a gill of cream, and one eggr add ketchup, pepper, and salt to taste. With this mixture, refill the skins, sprinkle a little grated cheese on the top, and put them in the oven till they rise and get brown. Serve hot on a table-uapkin, and garnish

## with parsley.

Dressed Crab. - Take a large freslly-boiled crab, break it up, take out all the meat from the body, then rub it through a sicve, add one teaspoonful of salad oil, a little dry mustard, a few grains of cayenne, and pepper and salt to taste. Break the thick ends of the small claws, and the whole of the large ones, take out the white meat, break it very small, being careful that no small bits of shell are left in it, add one teaspoonful of salad oil, the same of vinegar, and season with pepper, salt, and a few grains of cayenne. Cleanse and brush the large round cell, break away the inside white part till within about an inch of the edge, fill the t wo ends with the prepared white meat, and the middle with the yellow. Ornament with finely-minced parsley and pounded lobster roe, and serve on a napkin, with the small claws placed neatly round it.

Caulifiowers au Gratin.-Take away the green stalks from the cauliflowers, divide them into quarters, throw them in cold water with a little vinegar in it, to draw away the insects, then put them on in boiling water with a little salt in it, and let them boil about fifteen minutes. Drain on a sieve, and place them neatly on a vegetable dish, flowerets up. Mix one ounce of butter with one ounce of flour, put it on in a saucepan to melt, then add half a pint of milk, season with pepper and salt, and let it boil five minutes, stirring constantly. Have about two ounces of cheese grated, mix an ounce and a half with the sauce, pour it over the caulifowers, then sprinkle the remainder of the cheese on the coating of sauce, then bread crumbs, with here and there a morsel of butter. Put the dish in a quick oven till nicely browned, and serve hot.

Sardine Canapés.-Bone, skin, and trim three or four sardines, and mince very fincly, add about half an ounce of butter, one teaspoonful of flour, one of Worcester sauce, one of ketchup, one of essence of anchovies, two eggs, a little cayenne, and salt if•necessary. Mix all together, and put it on the fire in a sauce-pan to heat and thicken, but not to boil. Cut out as many rounds of stale bread as will be required, with a two-inch cutter, fry them in boiling fat; cover them with the mixture, and serve hot

Italian Polpetti.-Take about six ounces of any cold meat, free it of skin and fat, and chop or cut it into very sinall dice; mix with this two ounces of cold ham or tongue, a few tinned or cooked mushrooms, or truffles, also cut in small dice, one ounce and a half of grated cheese, a little grated nutmeg, and one dessert-spoonful of Oude sauce. Make a sauce of one ounce of butter with one ounce of flour, add nearly half a pint of stock, and let it boil from five to ten minutes. Season with nutmeg, pepper, a pinch of sugar, and the juice of half a lemon, remove to the side of the fire, add the yolks of two eggs, put it on again, and stir till the eggs set, but do not let it boil. Put in the mixture of chopped meat, etc., into the sauce, and stir till thoroughly heated, but do not let it boil. Spread out on a flat dish till about a quarter of an inch thick, and let it stand till quite cold and stiff; then, with a round cutter an inch and a half in diameter, stamp it out into as many as the quantity will make, cover these with bread crumbs, then brush them with the two whites of eggs, again cover them with bread crumbs, and fry in boiling fat to a nice light brown. Dish in circular order, with prepared cheese and macaroni in the centre, and serve as hot as possible. This is sufficient for a double entrée.
Small Macaroni Timbales.-To make twenty, put on four ounces of Lest huacaroni in cold water, let it simmer till soft, which will take nearly an hour, and drain it. When cold cint it into half.inch lengths, put these on in a stew-pan with one ounce of
butter, fisur ounces of grated clieese, a little dry mus. tard, pepper, and salt. Stir over the fire for a ininute, or till the cheese is melted. Line the small moulds with common paste or trimmings of puff paste, then fill with the prepared macaroni, sprinkle grated checse on the top of each, buke iu a quick ovell to a nice brown, turn out, and scrve lot on a mapkin.

Nushroom Timbales.-Beat one ounce of butter to a cream; add the yolk of an egg and heat a little longer. Mix in four ounces of tinned mushrooms finely chopped, three ouuces of bread crumbs, and one gill of mushroom liquor. Season with pepper and salt, and grated nutmeg. Beat the white of an egg to a stiff froth, and mix it in very lightly. Butter eight small moulds or cups; ornament them with strips of French beans; fill them with the mushroom mixture, and cook in water just off the boil for one hour. Turn out in a circle on an entrée dish; fill the centre with cooked tomatoes, and pour tomato sauce round.

Mushroom Souties.-To fill eighteen paper cases, put on the fire in a small sauce-pan a pint basket of mushrooms, with a little salt, and let them sinmer gently for ten minutes, to soften them, then strain off the liquor into a basin, pound the mushrooms in a mortar, and pass througll a wire sieve. Make a white sauce witl a little butter, flour, strong white stock, and the mushroom liquor; allow it to cool, then add four tablespoonfuls of it , along with the yolks of three eggs, to the puree of mushrooms, and mix thoroughly. Switch up the whites of four eggs to a stiff froth, and mix all together very carefully and lightly, season with pepper, and, if necessary, a little salt, fill the previously oiled cases about two-thirds, bake in a moderate oven until very much risen and slightly browned, and serve immediately.

Olives and Anchovies:-Cut from slices of stale bread, about a quarter of an inch thick, with a round cutter an inch and a half in diameter, twelve rounds, and fry them lightly in boiling fat. Take one dozen of anchovies. wash and wipe them, then remove the fillets, put aside twelve on a plate, pound the other twelve with a pat of butter. Take a dozen olives, peel them clean of the stones, breaking them as little as possible, then stuff them with the anchovy butter, and restore to their original shape. Spread the crontons lightly with anchovy butter, place a stuffed olive neatly on the centre of each, then twine round the olives the fillets of anchovies, one for each, with the skin side out, and serve cold on a neatly-folded napkin or ormamental paper.

Croustades of Cheese.-Beat one ounce of butter to a creani, then nix with it one ounce of grated cheese and an ounce and a half of flour. Roll this out on a baking board, and make it into ten cases as for OYSTER PATÉS. Bake in a moderate oven, and fill them with a mixture made in the following manner:Melt half an ounce of butter in a sauce-pan, and stir into it half an ounce of potato flour, and half an ounce of corn flour. Add gradually one gill of milk and let it boil for one minute, then take the pan from the fire and mix in one yolk of egg and one ounce of grated cheese. Add a little pepper and salt, and lastly mix in lightly one white of egg beaten to a stiff froth.

Cheese Custards.-For a party of eighteen or twenty, beat up iu a small sauce-pan five eggs, add to them half a pint of milk, season with white pepper, grated nutueg and salt, then put on a slow fire, and stir until it begins to thicken, after which take it off, and stir in four ounces of grated Parmesan cheese. Brush eighteen smail zephyr moulds with melted butter. fill them with the custard, put them in a stew-pan with boiling water in the bottom, cover with a round of buttered paper, and steam slowly till firm, which takes about twenty minutes. When ready turn oit and serve on two dishes, with powdered red herring sprinkled on the top of each. (For the RED HERRING POWDER, see Cherse Custards in Shells.)
Cheese Custard Fritters. - Prepare the custards as in the foregoing recipe, and set then aside to cool. When quite cold, brush them with beaten egs, scasoned with a little pepper and dry mustard, then coat with fine fresh bread crumbs, fry to a light brown in boiling fat, and serve hot on a folded napkin.
Savoury Cheese Cakes.-Put on in a sauce-
pan a gill of sweet milk with one ounce of butter ancl a little salt. let the butter mele and come to the boil, then stir in two ounces of four with a wooten spoon, and go on stirring till quite sunvoth. Beat it on the ire for a minute, then tike it off, and add to it three ounces of grated Parmessan checese, half a teaspoouful of dry nustard, and a little white pepprer, then stir in two eggs. adding one at a time. Take about a quarter of a pound of pulf. paste trinnuings, roll it to about nn eighth of in1 inch in thickness, stainp out two dozen of rounds with a cutter two inches in dianeter, put then on an oven tin, about an inch apart from each other, brush then1 with beaten egg. put a teaspoonful of the prepared mixture on the centre of each round, then turn up the sides so as to form them into the shape of a threecornered hat, brush them lightly with egk, bake in the oven to a aice light brown, and serve hot on a folded napkin.
Tomatoes au Gratin.-Take the number of fresh tomatoes required, cut each through the middle crosswise, squeeze out the seeds and water, taking care to keep the outsides of the tomatoes whole, then stuff them with minced haun. mixed with a few chopped mushrooms previously cooked, some bread cruinbs; season with a little pepper and salt, and moisten with an egg. Place them on a baking dish, strew brend crumbs over them, and on each a morsel of butter, then put thent in the oven for about fifteen minutes.
Mushrooms au Gratin.-For this dish take the best large mushroons, remove the stalks, and peel them carefully without breaking them, then put them into a colander and run cold water on them to free them of sand. Fill them with the same stuffing as described in the foregoing recipe, put them on a baking-dish, strew with bread crumbs; place a morsel of butter on each, and bake in the oven for about fifteen minutes.
Anchovy Canapes.-Prepare the croatons of bread in the same way as described in recipe for Olives and Anchovies. Wipe, trim, and fillet the anchovies, cut each fillet in two the long way, and lay them aside, pound the remainder with a little butter, with which spread the croutons of bread, then lay on crosswise like lattice-work the fillets cut in strips to suit the canapé or cusbion, and heat in the oren for a minute or two, taking care not to let them brown. Serve as hot as possible on a folded napkin Cold anchovy canapes are done in the same way, the only difference being that the fillets are tadd on in long strips, with chopped green parsley and hard-boiled eges minced, placed alternately between.
Canapes of Herring.-Prepare the croutons of bread as already described. Trim and skin a red herring. remove the fillets and cut thera in strips, pound the remainder with a little butter, with this spread the croftons, then lay on the strips of herring crosswise, and cook in the oven for about ten minutes. Serve hot on a folded napkin.
Cream of Celery:-For a double entremêt, clean and cut into small pieces the white part of two heads of celery. Put it in an enamelled pan with enough milk to cover it, and let it boil till tender. Strain it and pass it through a wire sieve, reserving the milk. Break five.egts into a sauce-pan; season them with white pepper and celery salt, and beat them a little. Add one gill of cream and the milk in which the celery was boiled, filling it up to the measure of one gill by addling more milk. Stir over a slow fire till it begins to thicken without boiling. Then add the celery and mix together. Butter eighteen small timbale moulds, fill with the mixture, and stearn in water just off the boil. They should be covered with huttered paper before putting on the lid of the pan. When ready, turn out on two entrée dishes in circular order, filling in the centre with cress, lettuce, or endive. Put a few finely-chopped truffes on the top of each cream.
Cream of Asparagus.-For a douhle entre. mét, put on in boiling water one bundle of asparagus, with a very small pinch of soda and a little salt. Boll till tender, then strain and pass through a wire siere. Brask fire eggs into a pan; season witb pepper and salt, and bent them a little. Add one gill of cream and the same quantley of good milk. Stir over a slow fire till it thickens, taking care it does not boil, then draw

It aside and stir in the innaragus, Butter eighteen smanll moulds and fill then with the mixture. Cook. and serve iu the same wiy in Cronm of Celery.

Tomato Souffié.-To fill terl or a dozen paper cases nele one ounce of butter with one ounce of hour, idel to it about a gill and a hailf of tomato puly, a liette powdered thyme, white pepper, and satt, let it boil gently for five minutes, stirring coustantly, after which remove to the side of the fire, mix in the yolks of two egrgs, then pour into a basin, and set aside to cond a little. While it is cooling, switch up the whites of the eghes to a stiff froth, and mixix gently together. Fill the paper cases illout two-thirds, bake in the oven for about ten minutes, matl serve liot on a najkin.
Soufté Tomatoes.-The.tomatoes inust be of the mediun size, well sliaped, and not too ripe; cut a very thin slice off the top of each, squeeze out the seeds and water, then with a teaspoon scoop out the insides, heing very careful to keep them whole, and sprinkle with a little pepper and salt. Prepare a soufle nuixture as clescribed in the foregoing recipe, using the slices cut off and what was taken from the insides of the tomatoes to make the pulp. Fill the tomatoes nearly to the top with the souffle mixture, and bake in the oven for fifteen or twenty minutes, and serve immediatcly.
Devilled Legs of Turkey.-Mix together a tablespoonful of Freach mustard, one of silad oil, one teaspoonful of essence of anchovies, and one tablespoonful of cayenne sauce. Score with a knife the legs of the turkeys, then rub in the mixture, ind cook on the gridiron till crisp and brown without burning.
Savoury Iced Souffe.-Make about a gill of highly-seasoned tartar sauce, switch up till stiff one gill of cream, do the same with the whites of two eggs, then cut into quarter-inch dice some cold lobster or prawns, chicken, or game; if chicken, a little cold tongue and trufles cut in the same way should be mixed with it. Mix all these ingredients carefully and light! together, fill the paper cases, sprinkle on the tops with lobster roe or powdered red herring, and freeze in a cave in the same way as sweet iced souflé.
Savoury Croquettes of Rice. - Put on three ounces of the best whole rice with one pint of white stock, one ounce of butter, a little pepper and salt, and let it simmer gently by the side of the fire till soft, which will take about forty five mimutes. When ready, stir in one ounce of grated Parmesan clieese and the yolks of two eggs, stir over the fire till the eggs begin to thicken, then pour out on a flat dish, and set aside till quite cold and stiff. Form into balls of an equal size, roll them in flour, then brush lightly with beaten egg, coat with bread crumbs, and fry in boiling fat, drain in the oven for a minute or two, and serve hot on a neatly-folded napkin, with sprigs of parsley for garnish.
Porridge.-Put in a pan one quart of cold water with one tenspoonful of salt. When it boils sprinkle in five" ounces of oatmeal, stirring all the time. Boil this gently for half an hour, stirring it now and then. The porridge can be made thinner or thicker according to taste.

## PUDDINGS AND PASTRY.

Split-Pease Pudding,-Take onc pound of split'peas, in ounce of butter, a little sodn, and tie them up in a cloth, leaving plenty of room to swell; put in a stew-pan with boiling water, boil for two hours, and rub them through a sieve. When all pressed through, put it into a stew-pan, with a little salt and white pepper; put it on the fire with an ounce of butter, add a little of the witer in which it was bolled, and stir till thick. Butter a basin and press in the peas to wake it a nice shape; when wanted, turn it out in a corner-dish hy itself, or slice it, and lay it round boiled pork Pease pudding should always be sent to table with boiled pork.
Suet Dumpling.-Mince half a pound of good beef suet, mix it with one pound of flour, a quarter of a pound of brown sugar, half an omnce of ground ginger,
and two teaspoonfuls of baking powder, three gills of milk, a little salt, and mix them all together. Butter a basin or tin mould, put in the mixture. Put it into a pan with an inclo of boiling water in the lootton, cover with buttered paper, and steant for three lsours. As the dumpling rises in the process of cooking, the mould minst not be filled more than three quarters. When ready, turn ont ind serve with fruit sauce.
Essex Pudding. - Put in a bowl threcounces of butter imd four ounces of sugar, and beat them to a crean. Add gradually five ounces of flour, two eggs, and enomph milk to make all into a smooth batter. The eggs shond be dropped in from the shell, ind the inixture beaten well for a few miuutes after eacli egg is added. Enough milk shond be added to make the batter of the consistency of very thick cream. Mix through it lalf a teaspoonful of baking powder and quarter of a teaspoonful of vanilla. Butter a mould or pudding basin, put a good layer of thick jam in it, and pour the batter over it gently, so that it does not inix with the jam. Cover with a piece of buttered paper, and stean for an hour and a half.
Marmalade Pudding.-Grate six ounces of loaf-bread into a basin, pour over it three gills of boiling nuilk, and set aside till nearly cold. While the bread and milk are cooling, separate the yolks from the whites of three eggs, beat the yolks with two ounces of raw sugar for ten minutes, then add a full tablespoonful of marmalade, and mix with the bread and milk. Have the whites switched on a dinner-plate to a stiff froth, mix gently with the pudding, then pour into a melon mould previously buttered and ornamented with stoned raisins. Have a pan ready with enough of boiling water in it to reach the height of the pudding inside the nould-no higher ; place it immediately after finisl:ing in the water, then remove the pan just far enough froin the fire to take it off the boil-no more; and let it cook in this way for one hour and three quarters. [This method of cooking should be adopted for all puddings having eggs in them, for the simple reason that it prevents the hardening of the eggs, and so renders them easier of digestion and produces a finer consistency.] When ready, take it out of the water, take off the lid, let it stand from five to ten minutes, then turn out and serve with custard sauce poured round it.
Forkshire Pudding.-Take six tablespoonfuls of flour, a teaspoonful of salt, and mix it with a little cold milk. Have three eggs well beaten, mix them with the flour, boil one plnt of milk, and pour it in amongst the eggs and flour, stirring all the time. Have a square tin pan greased, pour in the pudding, and set it upon a gridiron a few minutes, then place it under beef while roasting, and send it to table, cut in small square pieces.

French Sago Pudding.-Put on three ounces of sago with one pint of milk; let it boil for ten minutes, stirring constantly, and just before taking it off the fire stir in half an ounce of butter; then pour into 'a basin to cool, during which stir occasionally. Beat the yolks of three eggs with two ounces of sngar, then add one tablespoonful of marmalade and mix with the sago, switch the whites to a stiff froth, mlx all gently together, pour into a well-buttered pudding mould, and cook same as Marmalade Pudding (see above).

Queen's Pudding. - Pound two ounces of orange peel, with one of blanched bitter almonds ; put it on the fire in a brass pan with a pint of sweet milk, and stir till it boils five minutes, pour it through a fine drainer in amongst two ounces of arrowroot, previously dissolyed in a little cold water; add a pint of creann, and stir occasionally till nearly cold. Have a quarter of a pound of ground white sugar beat up with sis" eggs, adding one at a time, and mix all together. Butter and ornament a melon mould with cut angelica, pour in the pudding, and steam for two hours. Serve with custard and sweetmeats round it.

Queen of Puddings.-Put half a pint of milk in a sauce-pan and let it come to the bosl. Put in a bowl a breakfast-cupful of bread-crumbs, one ounce of butter, and one ounce of sugar, and pour the 'boiling milk over them. Mix well and add half a teasponful of vanllla, and two well-beaten yolks of eggs. Put this mixture into a pie-dish, and bake it in a moderate oven for half an liour. Let it cool a little, and then spread a
layer of jun or marmalade on the top. Beat two whites of eggs to a very stiff frotlo; stir into them a tablespoonful of castor sugar and beat thein again for a few minutes. Spread this roughly over the jam, and put the pudding back in a cool part of the oven for five minutes, taking care that the white of egg does not brown too mucls.
Woderato Pudding. Mix together a break. fast-cupful of minced beef suet, two ozs of bread-crumbs, four ounces of currants, half a pound of raisins cleaned, and two ounces of almonds. Beat up four eggs, then add two tablespoonfuls of raw sugar, half a nutmeg, a little pounded mace, a little cinnamon, and one teacupful of milk. Butter a melon shape, and ornament with raisins, mix the currants, and the remaining part of the raisins with the bread, suct, and half of the almonds; the other half to be kept to ornament the outside of the pudding. Add a glass of brandy or rum, put the pudding in the shaje, butter the cover, fix it on, put it in boiling water, and let it boil for three hours. When wanted, turn it out ; place sliced almonds in rows between the raisins, and serve with wine sauce in a tureen.

Bread and Butter Pudding.-Stone four ounces of rasins, wash and dry four ounces of currants, cut some slices of bread very thin, pare off the crusts, and butter them. Butter the shape well, and put the raisins in rows on the inside, then put in a slice of bread, the butter side next the shape; lay in some raisins and currants, then a slice of bread, then fruit, and so on, alternately, until the shape is three-fourths full. Beat up three eggs with one tallespoonful of sugar, add a little lemon juice, grated nutmeg, a little milk, and one glass of brandy or rum, mix them well together, and pour into the slrape, butter the cover, and boil or steam it for two hours. Serve with wine sauce poured round it.
Welcome Guest Pudding, Mix together six ounces of bread crumbs, three ounces of sugar, and three ounces of finely-chopped suet. Put half a pint of milk in a sauce-pan and let it come to boiling point. then pour it over the bread crumbs, etc., and let all soak for ten minutes. Cut up in very small pieces two ounces of citron peel, and chop an ounce and a half of shelled walnuts. Add these to the ingredients in the bowl. Add also half a teaspoonful of vanilla and the yolks of two eggs, which have been beaten till frothy. Whisk the two whites of eggs till very stiff; stir them very lightly through the mixture, and turn it into a well-buttered mould. Cover it with buttered paper and steam for three hours. Serve with a custard or wine sauce.
Newcastle Pudding.-Take six ounces of rice flour, six ounces of pounded white sugar, four eggs, a little carbonate of soda, put them all in a small basm, and beat them up with a spoon, till very light and white. Have four ounces of butter beat to a cream, mix with the pudding, add ten drops of the essence of almonds, and beat thein all together for about fire minutes, then butter a mould, pour in the pudding, butter the cover, put it on to steam or boil for two hours, and serve with wine sauce poured round it.
Plum Pudding.-Mix together one pound of stoned raisins, one pound of cleaned currants, one pound of beef suet minced, one pound of bread crumbs, two apples cut in small dice, a teaspoonful of ground ginger, one of cinnamon, one of salt, one nutmeg grated, two ounces of orange peel minced, and three ounces of flour. Beat four eggs with half a pound of brown sugar, add a teacupful of milk, and one glass of brandy, mix this with the pudding, and if you find it too stiff, add a little more nilk. Butter the middle of a pudding cloth, shake a little flour over it, put the cloth over the top of a basin, put in the pudding (this gires it a round shape), put it in boiling water, and boil it nine hours, taking care it does not get off the boil: add boiling water when required, and send it to table rery hot. Serve with wine sauce poured round it.
Plum Pudding; No. 2.-Mix together in a large basin half a pound of bread crumbs, half a pound of finely-chopped suet, half a pound of sugar, half a pound of raisins, half a pound of currants, quarter of 2 pound of almonds, finely-chopped, one teaspoonful of ginger, half a teaspoonful of cinnamon, half a teaspoonful of mixed spice, quarter of a teaspoonful of carbonate of
soda, and two ounces of four. Beat four eggs till light; add to them two tablespoonfuls of brandy; adke these to the other ingredients and mix all well torether with the hand. Butter it uoteld and put this mixture into it ; put on the lisl of the mould or cover with a piece of buttered paper, and stean the pudding for seven hours. This puclding is better to be nade some time before it is wanted: it should be steamed again for three lours the day it is to be serwed.
Tapioca Pudding. - Take sixounces of tapioca, soak in thalf a pint of milk for an hour. l'ut it on the $^{\text {sen }}$ fire in a stew-pan, with one pint aucl a half of mitk, stir till it boils, then clraw it to the slde of the fire, and let it simmer till soft. Beat up two eggs with two tablespoonfuls of suyar, and one of marmalade, mix all together, put it in a baking dish, and bake before the fire or in a slow oven. If you boil this pudding, put in six eggs instead of ewo.
Cocoa-nut Pudding, -Grate three-fourths of a cocoz-nut on a fine grater. Beat to a creall two ounces of butter with four ounces of sugar, then add the yolk of one cege, and beat for a few ninutes, add another, and so on till you have put in four. Have one breakfast-cupful of tinely-grated bread soaked in a pint of boiling milk, mix all together, adding the cocor-nut, the juice of a lemon, the white of the eggs switched to a froth, and one glass of brandy. Butter a nelon mould, into which pour the pudding, boil it for two hours, and serve with brandy sauce.
Cabinet Pudding.-Slice thin nine penny sponge cakes; pound in a mortar four ounces of ratafia biscuits; mince three ounces of citron peel and three ounces of sultana raisins. Have a melon mould carefully brushed with half melted butter, and orwamented with preserved cherries ; place in a layer of the sliced sponge cake alternately with the minced fruit and pounded biscuits until the mould is filled up; then with a switch beat up four eggs with four ounces of sugar for five minutes; add one pint of sweet milk; put it ? on the fire in a pan till it nearly boils, add two glasses of sherry, or one of brandy, anl pour over the pudding. Steam for one hour and a half, and serve hot with a wine sauce. Half the foregoing quantities is enough for a good-sized pudding.
Apple Custard Pudding.-Stew till soft two pounds of apples, with the juice and rind of a lemon, four tablespoonfuls of sugar and a tablespoonful of water. When quite tender put the apples through a sieve, to make them quite smooth and to keep back the lemon rind. Mix the yolks of two eggs and a dessert-spoonful of corn flour with a little milk; put three-quarters of a plnt of milk in a pan, and when quite hot stir into it the yolks of eggs and corn flour. Stir it till it comes to the boil, then take it from the fire at once, and add a dessert-spoonful of sifted sugar, and quarter of a teaspoonful of vanilla, or a few drops of essence of lemon. Beat the two whites of eggs to a stiff froth, and stir it through the custard. Put the apples in a glass dish, pile the custard over and set it aside to cool. Thls pudding is delicious with any kind of stewed fruit.
Custard Pudding. -Put on $\ln$ a pan one pint of milk, three ounces of sugar, half an ounce of cinnamon, and the rind of one lemon. Let it come to the boil, then take it off, let it stand about two minutes, and straln through a piece of muslin. Switch up in a basin for a little eight eggs, leaving out three whites. When the milk is cold mix all together, and pour into a well-buttered custard pudding mould, let it steam slowly for about forty-five minutes, then turn out, and serve with custard sauce.
Whole Rice Pudding. - Wash four ounces of whole rice, put it on In a quart of good milk, boil until quite soft and smooth, and set aside to cool. Beat up one egg withltwo ounces of sugar, add the grating and julce of a lemon, or a wlass of rum, mix with the rice, pour into a pudding-dish, and bake an hour in a slow oven.
Whole Rice Pudding, No. 2.- Put in a pan one large tablespoonful of rice and ono pint of milk. Set the pan at the side of the fire where the milk will get quite hot, but where there is no chance of lt boiling, as that makes it thin and poor. Leave it there for two hours so that the rice may swell out and thlcken the
milk. Beat the yolk of an egg; stir it inn;and let all stand at the side of the fire for another hour, when the thix ture should be thick and creamy like a boiled custard. Pour it into a basin and add to it a dessert-spoonful of sugar and quarter of a teaspoonful of vanilla. Beat the white of an egg to a stiff froth, stlr it very lightity through, and turn the pudding into a pie-disll and bake it for twenty or thirty minnutes.

Ground Rice Pudding.-Put a guart of good milk in a stew-pan, stir in four ounces of ground rice, put it on the fire and stir constantly until it boils, then set aside to cool. Beat up one egg with a large tablespoonful of sugar, add a little marnalade, wix in the boiled rice amonyst it, pour it into a baking. dish, and bake before the fire, or in a slow oven, for about an hour. Corn Flour Pudding is done exactly in the same way.
German Rice Pudding.-Put on in a stew. pan one ounce and a half of whole rice with one pint of tuilk, stir occasionally till it boils and softens a little, then take it off and mix it in a basin with a teacupful of grated bread. Beat to a cream one ounce of butter, add two ounces of ground sugar, beat a little longer, then add the yolks of three eggs, one at a time, beating three minutes between each, mix with the rlec and flavour with the juice of half a leumon. Switch the whites of the eggs to a stiff froth and mix all together very gently, pour into a buttered mould, steam for one hour and a quarter, and serve with the following sauce, beat the yolk of one egg with a tablespoonful of ground sugar, put it on to heat, but do not let it boil; add one glass of sleery wine and the white of the egg. beat up till very light and stiff.
Macaroni Pudding.-Steep four ounces of macaroui for one hour: pour the water off, add a quart of good milk, and set it on to boil. When it boils, draw it to the side of the fire, and let it simmer until it is soft. Beat two ounces of butter to a cream, add two ounces of sugar, beat a little longer, then three eggs, one at a time, add the tnacaroni to it, and bake in a slow ovell for one hour.
Erench Apple Pudding.-Melt in a saucepan one ounce and a half of butter; stir into it till quite smooth two ounces of flour, add gradually three gills of milk, stirring constantly. Let it boil for three minutes, then pour the mixture into a basin, and add to it one ounce of sngar, and half a teaspoonful of vanilla. Beat in two yolks of eggs, one at a time. Whisk two whites of eggs to a stiff froth, and stir lightly in. Put a thick layer of stewed apples in a pie-dish, pour the batter over, and bake for forty nimutes.
Aunt IKary's Pudding.-Stone four ounces of raisins, the same of currants washed and dried, a quarter of suet minced, a quarter of apples, a quarter of bread crunbs, the same of raw sugar, and mix all together. Beat up two eggs, add half a gill of milk, a teaspoonful of pounded ginger, a little salt, half a nutmeg grated, and one glass of brandy. Butter a slape, put in the pudding, put on the cover, and boil or steain it for two hours. When wanted, turn it out, and serve with wine sauce.

J'ut on a slow fire in a smatd brass pan one ounce of sugar, and brown it well without allowing it to burn, then add one gill of milk, and stir till the sugar melts. lieat three eggs with three ounces of ground sugar, add to them one gill of sweet milk, then pour in annooyst the brown sugar and anilk in the pan, stir with a switch till quite hot, taking care not to let it thicken ; add one glass of sherry with a few drope of ratafia, after which, pour it over the hread, and let it soak for about an hour. Switch up till stift and light one gill of cream, and mix well with the pudding, then pour into a mould previously buttered and ornamented with orange peel cut in small diamonds, and put it on to steam for one hour and a lialf. When ready, turn ont on a dlsh, let it stand for ten minutes, then draw off the inould, and serve with wine sauce poared round it.
Victoria Pudding.-Line an open tart tin or dish with some good short crust, ornamenting the edge with the scraps of pastry. Put a layer of jam in the centre, then take the weight of two eggs in butter and castor sugar; beat the butter and sugar to a cream. then beat in the yolks of the two eggs, and the grated rind of a lemon and a little of the juice. Spread this over the jam, and bake until the pastry is done. Whisk the whites of the two eggs to a stiff froth, mix them lightly with a little castor sugar, and whisk again for a few minutes. Spread this over the pudding, and put it back in the oven for a few minutes, taking care the white of egg does not get too brown.
Apple Dumpling.-Take a pound of flour, half a pound of beef suet, minced very fine; put the suet in the flour, add a little salt, pour in a little cold water, and work it Into a dough, take it out and lay it on the table, roll it out, fold it up, roll it out again till about half an inch thick. Butter a quart basin, and line it with the paste. Have as many large apples, pared and cut into four, as will fill the basin, core them, and pack them closely. When half full, put in a hand. ful of brown sugar, and a little pounded cinnamon or ginger, then fill it with apples, add more seasoning and sugar on the top, cover it with the paste, and wet it with an egg at the edge. Butter the middle of a pudding cloth, shake a little flour on it, put it over the top of the basin, and tie it firmly, set it in a pan of boiling water, and boil it for two hours, or bake for one hour in the oven. When wanted take it out, and let it stand for ten minutes, turn it "pside down, and take care not to break it. Serve with crean in a saucetureen.
Roly Roly, Apple,-Mix six ounces of flour with three ounces of finely minced suet, a small teaspoonful of baking powder and a little salt; put it on a baking table, make a bay in the middle, add cold water eoongh to inake a soft dough, roll out, give it five folds, letting the last be to the size wanted, namely. ten inches long and five broad; on this spread the jain or half-stewed fruit, brush the edges with egg, then roll up, pressing the ends together. Have a Balmoral mould buttered, put in the roll, put it on in a pan with two inches of boiling water in it, cover with a piece of luttered paper, then put on the pan lid and steam for three honrs. When ready, turn out and serve lot with fruit sauce poured round it.
Minced Meat for Pies.-Stone a pound of raisins, wash and dry a pound of currants, mince a pound of beef suet very fine, and one pound of tender beef, one pound of apples pared and cored; mince them with the raislns, and mix them all together; season with half a pound of sugar, one teaspoooful of salt, a little pounded ginger and cimmanon, and a teaspoonful of inixed spices; mix them all together, put them Into a stone jar, press it down with a sponn, pour a teacupful of brandy over it, and tie it up
closely with a piece of bladder. You may use this limmediately, but it is mach improved by keeplng for some months. When you are to make a pie, have a pulf paste ready, roll it out tull it be about half an lach larger than the dish, and half an inch thick; lay the dish upon the paste, and cut round by the edge of the dishl, lay thls ploce of paste aside : take the cuttings and fold them together, and roll then the size of the dish; brush the edge of the dish with egg, and line it with the paste cut neatly round the edge; then fill it with the minced meat in the jar, pour a glass of brandy over it in the dish, egg it round the edge; take the paste you laid aside, and put it over the dish; press them closely together, notch it round the edge with a small knife; put a flower on the top, cut the paste through when you cut out the flower or leaves, to let the meat appear; brush over the top with egg, and put it in a quick oven for hatf an hour. When you send it to table, fold a table-napkin, lay it over the clina dish, and put the pie on it. Smath mince pies are made in paté pans, the same way as above; twenty minutes will bake them in a quick oven.
Scotch Pancakes,-Beat up four eggs, yolks and whites, with two tablespoonfuls of sugar; have six tablespoonfuls of flour, and one pint of sweet milk or cream; mix a little of the milk with the four, till it is very smooth; put in the flour and all the milk amongst the eggs, add a little salt, and mix them well together. Have a clean frying-pan, put a bit of butter in it, and make it hot, stir the batter from the bottom, and fill a tea-cup with it, pour it into the frying-pan, hold it oyer a slow clear fire, untll it fastens : slake the pan; if the cake sllp from the edge of the pan, turn it over, and sprinkle a little sugar with a knife. Roll it up, and put it on a hot dish before the fire; put a bit of butter in the frying-pan, stir the batter, and fill the tea-cup, and go on till you have made all the pancakes. Dish them neatly the long way upon the dish, sift white sugar over them, and serve hot.
French Pancake or Omelette.-Take three eggs, separate the yolks from the whites, beat up the whites on a dinner-plate to a snow; beat the yolks with one tablespoonful of sugar, one of flour, and a small teacupful of crean! ; mix all together tuli very smooth; add a little salt, put in the whites of the eggs, and mix them gently. Have a very clean frying.pan, put in an ounce of butter ; when it is hot, pour in the whole of the pancake, and hold it in your hand at a good distance from the fire for about five minutes; it will then be fastened and risen; then finish in the oven. Serve immediately on a napkin, with marmalade, or any preserved fruit you choose, spread over it.

Omelette Souffé,-Beat the yolk of one egg with as much ground sugar as it will take in, add one teaspoonfill of corn flour and a little vanilla sugar, switcla the whites of four eggs till very stiff and light, and mix together very gently and lighlty. Butter a souffé dish slightly, pour in the souflé, bake about ten minutes in a slow oven, and serve immediately.
Chocolate Soumie.-Stir together over the fire one ounce and a half of fresh butter, two ounces of castor sugar, and a gill of milk. Mix one ounce and a half of chocolate and an equal weight of flour with half a gill of cream, and stir it into the milk and butter in the pan. Continue stirring until it has boiled for three minutes; then let it cool a little. Add a little grated lemon rind, half a teaspoonful of vanilla, and a teaspoonful of brandy: stir these well in. then add one by one the yolks of three eygs, and lastly the whites, stiffly beaten. Pour it into a well-buttered souflé mould and bake.
A Plain Omelette.-Break three eggs into a basin, add three tablespoonfuls of good milk or cream, one teaspoonful of chopped parsley, a little pepper and salt; then beat with a spoon for a few seconds only. not more else the omelette will be watery. Put a little salad oil or butter into a clean omelette pan, let it get thoroughly heated over the fire, then paur it out, and wipe the pan with a piece of paper. Put a fresli pat of butter into the pan, say about an ounce, let it froth, taking care not to let it brown; then pour in the onelette, ancl hold it over a clear fire, scraping
constantly with the spoon from the lootton of the pan, till it begins to set, atter which gather it as quickly as possible to the side, lotd it over the fire for a few seconds, or long enough to brown; then brown on the other side before the fire, and serve hmmediately.
An omelette pan should not lee washed, but wiped; then scoured with finely powdered Lath-brick, and polished with a clean cloth.
Smail French Pancak6s.-Separate the yolks from the whites of three cygs, beat the jolks with four ounces of ground sugar, then add one cunce and a lalf of four, and flavour with lemon, orange, or vanilla sugar, after whict add half a gill of cream switched till very light. Switch up the whites till very stiff and light, and mix gently all together. Put the mixture into saucers or tins, sprinkle fine sugar on the to, and bake in the oven for about ten minutes.
Baked Apple Pudding. Take one dozen of small baking apples all olle size; peel and take out the cores, fill the holes with sugar, a little pounded cinnamun, and place thein In a baking-dish. Y'ut a paste border round it. An hour before dinner have a phain custard ready, pour in as much as will cover the apples: put it in the oven, and let it remain till wanted. Sift pounded sugar over it, and serve with cream in a sauce-tureen.
Meringue Tart of Apples.-Line and border a ten or twelve inch ashet with puff paste, made of three ounces of butter and three ounces of four, bake in a quick oven, and put aside to cool a little. Put on in a brass pan one pint of cold water, with four ounces of loaf sugar and the peel of a small lemon: let it cone to the boil, then put in four apples previously peeled, quartered. and cored; let thern simmer gently till soft, but not broken, take them out with a spoon, and place them in the paste case, building them highl in the centre, reduce the syrup in the pan by rapid boiling to a jelly, strain and pour over the apples. Mix in an enamelled pan two ounces of ground sugar with one good tablespoonful of flour, the grated rind of one lemon, a quarter of an ounce of butter, a pinch of salt, and half a pint of milk; put it on the fire and stir constantly till it has boiled ten minutes, after which remove to the side, add the yolks of two eggs, continue stirring till it thickens without again bolling, then take it off and spread over the apples. Switcl the two whites till very stiff, adding a few drops of vinegar, then mix in gently two ounces of ground sugar, spread this over the custard, reserving a little for ormamentation, dust with sugar, and brown it slightly in the oven. Put the reserved mixture into a bag with pipe, and ornament according to taste.
Italian Pudding. - Line a small ashet or tart tin with short crust, decorating the edge nicely. Prick the centre of the pastry with a fork, to prevent it blistering and rising too much in the oven: bake it for twenty minutes or half an hour. Put a layer of jam in the centre, and cover it with three or four tablespoonfuls of bread crumbs. Beat the yolks of two eggs with half a teacupful of milk, and stir over the fire in a sauce-pan until thick, bit taking great care the custard does not boil ; add half a teaspoonful of sugar, and a few drops of vanilla, and pour the custard over the bread crumbs. Beat the two whites of eggs to a stiff froth, mix through them a tablespoonful of castor sugar, and beat again for a few minutes. Pile this roughly over the custard, and return the pudding to the oven for a few minutes to cook the white of egg.
Plain Custard for Cups.-Switch up in a small brass pan the yolks of four eggs, with two ounces of ground sugar, then add half a pint of milk, and stir with a switch over a stove or slow fire till it vegins to thicken without allowing it to boil; pour immediately into a cold basin, stir it once or twice, and flavour to taste.
Charlotte of Apples. - Take three pounds of baking apples, peel and core them, put them in a little water and sugar, put them on the fire, stew till soft. and press them through a sieve, then put them back into a brass or copper pan, with half a pound of sugar, let them sinmer at the side of the fire till very thick, taking care they do not burn. Cint some stale bread in thin slices, cut off the crusts, cut them about
an inch and a half broad, and dip them in meited butter. Have a pudding mould well buttered, make the strips of bread the clepth of the mould, then place them round the moukd, the ono edge over tho other; with a small biscuit-cutter, cut as many pleces as will cover the bottom, clip them in butter, place the one over the other untll you have covered the bottom of the mould; shake in some bread crumbs, brush it all with a leaten egg, to keep In the juice of the apples. An hour betore dinner inake the apples hot. and pour them into the mould until yon have filled it to tho top, put it in the oven and bake for an hour. When wanted turn it upside down on the dislt, and let it remain for a feiv ninutes, then draw off the mould, and serve with cream in a sauce-tureen.
亡emon Pie. $\rightarrow$ Pour a breakfast-cupful of cold water over a quarter pound of bread crumbs, and let theut soak for half an hour, then add one teacupful of sugas, the julce and grated rind of one lemon, and two well-beaten yolks of eggs. Melt one ounce of butter and add it also. P'ut this in a pie-dlsh, and bake it for half an hour in a moderate oven. Whisk the whites of two eggs to a stiff froth, stir through them two tablespoonfuls of castor sugar, and beat them again for a few minutes. Spread this smoothly over the pudding, and return it to the oven for a few minutes.
Leman Fritters, - Put on in a sauce-pan one ounce and a laalf of butter with a third of a pint of water, let it come to the boil, add two ounces of sifted flour, stir it up for half a minute, then take it off and beat it up with two eggs, adding one at a time, along with half an ounce of sugar, and flavouring to taste. Drop with a tea-spoon into boiling fat,'and hoil about four minutes. Serve on a napkin piled up high, with ground sugar sprinkled on them.

Apple Fritters.-Mince two apples, mix two tablespoonfuls of flour and the same of ground sugar with half a teacupful of good milk or cream and a very little salt, add the minced apples, and the whites of two eggs beat up till very light, drop with a dessertspoon amongst boiling lard, and fry to a nice light brown on botit sides. Drain them on a sieve hefore the fire, dust with fine sifted sugar, and serve on a table-napkin. Orange fritters are made the same way, by substituting the juice of two ripe sweet oranges for the apples.
Apple Fritters, NO. 2.-Peel five or six apples, remove the core with an apple corer, and cut the apples across into slices of about half an inch thick. Put them on a flat dish, dust ground sugar over them, pour a little white wine, with the juice of two lemons, all over them, and let them stand a short time. For the batter take half a pound of flour, put it into a basin with two tablespoonfuls of salad oil and a little salt, work it into a paste rather thicker than cream, with tepid water, switch up to a stiff froth the wlites of three eggs, and add to the batter a short time before it is wanted. Dip the slices of apple in the batter, and fry them in boiling fat to a nice light brown, drain them on blotting. paper, or in the oven, and serve on a napkin with sugar sifted over them.

Vanilla Fritters.-Put in a bowl three ounces of flour, and one ounce of macaroon or ratafia crumbs. Add the yolk of an egg, a dessert-spoonful of the best salad oil or melted butter, and a pinch of salt. Stir in gradually three quarters of a teacupful of luke warm water, beating the mixture till smooth. Add half a teaspoonful of vanilla, and two whites of egg beaten to a stif froth. Drop spoonfuls of this batter into boiling fat, and fry light brown. Serve hot, piled on a napkin, with suzar sifted over them.
Aimond Custard Fritters.-Cut a cold custard pudding into slices about two inches long, one inch and a half broad, and half an inch thick, and brush with beaten egg. Dlanch and chop some sweet alnonds, dry them a little in the oren, or on the stove, and strew them thickly on both sides of the slices of custard. Fry ln boiling fat to a nice light brown, and serve hot.

Roastod Apples,-Take the number of bak. Ing apples required, rub then with a dry cloth, put them in the oven on a dish, or before the fire; turn them when soft, and serve on the same dish, with sifted sugar over them.

Eoastod Apples, No. 2-Take as mary baking apples as you require, and with an apple-corer core them half-way through, beginning at the top: then fill the hole thus made with fresh butter and sugar, previously mixed together. While roasting bs sure to keep the top up, in ordor to keep in the butter and sugar, and serve on the dish on which they were ro.isted.
Apples with Rice.-Boil two ounces of the best whole rice with one pint of mitk, one ounce of butter, a little sugar, and the rind of a lemon. When sufficiently, boiled take it off the fire, take out the lemon rind, and add the yolk of an egg; stir for a mimate or two, but do not let it boil, then pour it out and 'set aside to cool a little. Ilave four apples of ant equal size peeled and cored, cut three of them into quarters, keeping the fourth whole, put them on in a syrup made of one pint of water and four ounce; of sugar, with a few small pieces of dried ginger in it for flavouring; let them boil gently till soft, but not broken. Dish the prepared rice neatly in the centre of a glass dish, arrange the quarters of apples round it, placing the whole apple on the top; reduce the syrup a little by boiling, then pour it through a gravy strainer over the apples, and ornament with dried cherries, or ginger and angelica.
Sweet Croquettes of Ricen-Wash two ounces of whole rice, put it on in a sauce-pan with one pint of milk, two ounces of ground sugar, half an ounce of butter, and the thin rind of a lemon. Any other flavouring may be used if preferred. Simmer gently until the rice is soft and the milk absorbed, which will take from twenty to twenty-five minutes, then take it off, add the beatell yolks of two eggs, nix well, and allow it to stand till cold and stiff. Make it into a dozen balls, roll in bread crumbs, then in egg; and again in the bread crumbs, and fry in boiling lard till equally browned. Serve them piled high on a dish, with a folded mapkin under them.
Stewed Rhubarb. - To four pounds of rhubarb allow one pmit and a half of water, and one pound and a half of sugar. Wipe the rhubarb with a clean towel, but do not peel it, and cut it into pieces an inch and a half long. Put on the sugar and water in a brass pan, let it boil, then put in the rhubarb, and let it simmer till tender, taking care it does not break. It is better to watch it while cooking, and lift out the pieces with a spoon as they become tender, before breaking down. When it is all dished reduce the syrup by boiline a little longer, and pour over it.
Stewed Prunes.-Put on one pound of prumes in a brass pan, with cold water to cover them, boil for one mlnute, and drain. Extract the stones from them, return to the pan along with the water in which they were boiled, and two ounces of sugar, and boil slowly for fifteen minutes. If liked the kernels may be extracted by breaking the stones, then blanching and removing the skins, and served with the prunes on a glass dish.

Japanese Tart.-Line a shallow tin with short crust, and bake it for twenty minutes. When cool, turn it out and put a layer of jam or preserved apricots in the bottom. Then fill up with a nice thick custard made with the yolks of two eggs and three quarters of a cup of mik, and return to the oven to set. Beat the whites of two eggs to a stiff froth; mix through them two ounces of castor sugar, and beat them again for a few minutes. Take the souffle from the oven, spread an even layer over the custard, put the remainder into an lcing.bag with tube, and ornament with fancy scrolls. Put it back in the oven for a few ninutes, but take great care it does not brown too much.
Tart of Whole Apples.-Have a paste case made of puff paste: then peel and core six apples all one size, put them in a syrup made of four ounces of sugar, one pint of water, and a few pieces of rough ginger, let them boil slowly till soft, but not to break; then take them out, and arrange tastefully in the case. Reduce the syrup to a small quantity, and strain over them. Sprinkle colouring sugar on the top of each apple, or cover with a sugar frame; and put a small piece of citron or orange peel into the hole on the top of each apple.
Apple Pien-Have as many good baking apples
as will fill the pie-dish, peel and cont them in four, cut out the cores, pack then in the dish closely, add sugar and ground ginger to taste. Ileap the apples high in the centre of the dish, add more sugar ; lave a piece of puff paste ready, and with a paste-hrush egg the edge of the dish; set the piedsh on the paste, and run the knife romid the ousside of the dish, to cut the paste the same size ; take it off, and cut a small lit of paste the breadth of the borcler of the pie-dish, lay it on lightly, and brush it with beaten egg. Lay on the cover, press the paste and border gently together with your fingers: nick it round the edge with a penknife, cut a surall bit out of the centre of the ple, and draw some leaves on the top. Cut a neat rose and put it in the hole in the centre, brush it over with water, then dust with sugar, and put it in a moderate oven for one hour.
Apple Tart.-Take two pounds of baking apples, pect and cut them in four, and take out the cores, put then1 in a brass pan, with four ounces of white sugar, the grating of a temon, and a bittle cold water. Let theni stew slowly till quite soft, then rnb them through a sieve, adding a little juice of lemon, and more sugar if required. Have a piece of pulf paste ready, about a quarter of an inch thick; have a paste-cntter, cut out one dozen and a half of leaves with it, cut them in two, fold the cuttings together, and roll them out the size of the dish. Line the dish, cut it neatly round the edge, brush over the edge of the paste with beaten egg, and lay the cut leaves round it, with the cut side next the dish, the one a little above the other, and so on till yougo round the dish; then fill it with the stewed apples, and with a knife make them smooth on the top. Cut out some leaves, lay them in a regular form on the top, with a large one in the centre; brush it over with egg, put it in a quick oven for half an hour, and serve with a little grated sugar over it.
Apple Tart, No. 2.-Prepare the apples as the above, have a piece of puff paste ready, fully a quarter of an inch thick, lay the dish in which you are to make the tart on the paste, cut it round the edge of the dish with a knife, to make it the same size. Take off the dish, and with a round cutter, four inches wide, cut a piece out of the centre of the paste. Lay the cover aside, and take the cutting and roll it out the size of the dish; line it, and cut it neatly round the edge ; fill it with the apples, and heap them in the centre. Take a small bit of paste and a little four with water, work it with your hands till very tough, roli it into small straws between your hands, lay then over the centre of the dish, closely together, crossing them. Egg the edge of the paste, and lay on thie cover, nick it round the edge, draw some small flowers on the top, bake it half an hour in a quick oven.

Wine Souffle. - Put on in a brass pan half a pint of white wine with four ounces of lump sugar, two tablespoonfuls of the flour of rice, stir constantly, and let it boil till thick and smooth, then pour it into a small basin. Add a little of the essence of cinnamon to it when cold. Separate six eggs, the yolks from the whites, beat the whites to a snow, beat the yolks with a tablespoonful of white sugar, put the yolks in the wine and mix them well. Half an hour before dinner add the whites, and mix them gently. Have a paste border round the dish, put the souffé upon it, heap it in the centre like a pyramid, put it in a quick oven from twenty to thirty nimutes.
Ornamented Souffé.-Make an open tart of any kind of fruit or preserves; beat up the whites of six eggs till yery stiff, shake in six ounces of ground sugar, and with a palette knife lay it gently on the top of the fruit, within the paste border, sift a little sugar over it, and put it in the oven till it becomes a yery light brown. With a tea-spoon spread red-currant jelly on the top; have a pipe with icing, and with it draw flowers on the jelly.
Richly Ornamented Souffié.-To make the above for a party of eighteen, have a mediumsized ashet covered with thin, sweet paste (see SWFBT PASTE), brush the border with egg, put a puff paste border fancifully cut around the edge of the dish, bake it in a quick oven for about twenty minutes, then put intọ it a sufficient quantity of any kind of preserved
stone frnit, sucir as greengages, apricots, cherries, or dannsons. Drop the whites of fourtcen eggs into a clean copper or brass pan, and with a switch beat them up for ten minutes, then add one dessert-spoonful of winite wine vinegar, and go on beating till very stif and white. Sift twelve ounces of the finest grouncl loaf sugar, and mix gently with the beat-up whites, put about three-fourthis of this mixture on the top of the preserves, and with a palette knife smooth it round the sides and on the top. It can be formed into any shape-round, sçuare, or oblong, according to taste. If wantel browno dust a little fine sugar over it, and put it into the oven for ten minules; if pink, strew over it very thickly pink sugar. Put the remaining fourth of the mixture into an leing-bag, with a pipe attached to it, and with it draw tlowers or any other tasteful design, then into these drop from a tea-spoon various colours of jelly, such as red-currant and apple. Have a clean brass pan, with one pound of loaf sugar dissolved in half a pint of cold water, put it on the lire, let it come to the boil, add one talle. spoonful of vinegar, cover it, and let it boil briskly from six to eight minnutes, dip a spoon into it, then in cold water, and if you find the sugar which adheres to the spoon hard and brittle, it is ready for spinning, which do in the usual way. After the sugar is spun, take the half of it, roll it lighty between your lands, and put it neatly round the border of the soutfet; take the remaining half, flatten it, and with a pair of scissors cut out stars and diamonds, dip these in pink sugar, and arrange tastefully on the top of the roll of spuls sugar, then ornament with the bag and pipe, and finish with cut angelica and red-currant jelly. The above makes a handsome top dish for the secoud course, and may be finished in a variety of ways, according to taste.
Cheese Soumé.-Grate eight ounces of Parmesan cheese, beat up the yolks of six eggs with a tablespoonful of sugar and four ounces of butter, till very light; add one tablespoonful of made mustard, a little cayenne and salt, two tablespoonfuls of ketchup. and a teacupful of very fine bread crumbs. Beat up the whites of the eggs to a snow, and mix them in along with the grated cheese. Have a tin shape buttered that will hold it easily, as it rises very much, and pour in the souffle. While the dinner is disling, put it in a quick oven, and let it remain until you are to send it to table. Serve on a table-napkin, ornamented with frilled paper.
Cheese Pudding.-Put in a sauce-pan three. quarters of a pint of inilk, and allow it to come to boiling point. Mix together in a basin one breakfast-cupful of bread crumbs, three ounces of grated clieese, one ounce of butter, half a teaspoonful of salt, and a little pepper. Pour the boiling milk over these. Beat two eggs till light and frothy, and add them. Pour into a buttered pie-dish, and bake for twenty or thirty minutes.
Puff Paste. - To one pound of flour take one pound of butter; if fresh butter, put in a little salt amongst the flour; pour in water, and work up the flour with your hand to a dough. Take it out, and lay it upon the table or on a marble slab, knead it till smooth, and divide it in two, roll one piece out, then make it round and lay it aside. Roll out the other piece of dough the same size, and take the butter and roll it out the same size, lay it in between the two pieces of dough, press it round the edge with your fingers to prevent the butter from bursting out, put a little flour under and over it. and roy it out lightly, as thin as you can make it. Fold the four sides in the centre, double it over and then roll it out again. Fold it once more, and roll it out a third time, when it is ready for any purpose. Paste shonld always be put in a quick oven when it is ready; if it has to stand for any time, cover it up to keep from the air. You may bake paste in winter anywhere; but in summer, when the weather is hot, you should bake it in as cool a place as possible. Common paste for meat pies is made exactly the same way as the above, but only half a pound of butter to one pound of flour.
Purf Paste, No. 2. Take equal weight of butter and flour, cint the butter in small pieces, and mix freely and lightly with the four, and as unucle cold
water as will make it a nice soft dough, hamdling it as little as possible. Roll out to a large sheet, clusting it now and then with a little flour to prevent it from stick. ing either to the table or rolling-pin. Give it six folds, roll out again, then five folds, when it is finished. it is much improved by keeping in a cool place for some tine.
Puff Paste, No. 3.-Rub four ounces of butter freely mino one pound of flour, mix it with as nuch cold water as will make it a nice soft dough, roll it out, give it five or six folds, then roll it out again to a large sheet, and on one side of it spread twelve ounces of butter; cut into small pieces, fold the other side over it, and press it round the edge, then roll it out again and fold it six times. Put it in a cool place to firm for about half an hour. then roll it out again, and give it four folds, when it will be finished. German, French, and American are the best kiuds of flour for making paste.

Rich French Paste,-Rub four ounces of salt butter into one pound of flour, thent take twelve ounces of fresh butter, cut it into small pieces, and mix with the four, being careful to rub it as little as possible with the hands. Make a circle in the middle of the flour, and into it put the whites of two eggs, with three ounces of ground sugar and nearly a piut of cold water; mix the water, eggs, and sugar together, then draw in the flour and butter, and mix all up freely and lightly; roll it out to a laree sheet, dusting it occasionally with flour to prevent it from sticking to the table or rollingpin, fold it six times, roll it out again, give it other four folds, and put it in a cool place to firm for about half an hour. This pastry is generally used for fancy dishes, built up with barley-sugar, and covered with spun sugar, in warious styles, according to taste.

Pastefor Mutton or Raised Pies.-Put two pounds of flour with one tablespoonful of salt on the table, make a circle in the middle of the flour, and into it put six ounces of butter or lard cut into small pieces, then pour over the butter rather more than a pint of boiling water; mix the water with the butter till quite dissolved, then knead it all together till very stiff and smooth, adding a little flour occasionally. This is a nice paste for raised French pies or venison pasties. If salt butter is used, you do not require to put salt amongst the four.
Paste for covering Veal or Beefsteak Pies.-Cut half a pound of butter into small pieces and mix it with one pound of flour, make a circle in the middle, and pour in nearly a pint of cold water, mix it lightly with the butter and flour, taking care to handle it as little as possible. Roll it out to a large sheet, fold it six times and roll it out again, dusting it occasionally with flour, give it other five folds, and put it in a cool place to firm for half an hour. This quantity will cover a large dish. Banffshire or north-country butter is the best for this kind of paste.
Suet Paste for Dumplinges. - Take half a pound of beef suet, finely minced, one pound of flour, a little salt, and mix it with cold water. Work it with your land till it is all wet, then take it and roll it out on the table; fold it up, and roll it a second time, when it will be ready for use. This piste answers for any kind of boiled fruit puddlng.

Short Crust. - Rub from four to six ounces of butter-iccording to the richness of pastry desiredinto half a pound of flour: add a dessert-spoonful of castor sugar, Beat the yolk of an egg with two tablespoonfuls of cold water: add it gradually to the flour. and mix to a paste. A little more water may be added if necessary, as the pastry must not be too stiff and firm, but the less water used the shorter the crust will be. This pastry is used for fruit tarts or any other sweet dish.

Sweet Paste.-Take a pound of four and six ounces of white sugar. beat up the whites of two eggs, and mix them all together with cold water: knead it well with your hand until it is smooth, divide it in two, and roll out cach piece a quarter of an inch thick. Take half a pound of fresh butter, roll it out the size of the pieces of paste, lay it in between them, dust the rolling-pin with flour, press it round the edges with your finger, to prevent the butter from bursting
out, roll it out gently as broad ins yon can make it, fold up the four sides in the centre, double it over, dust the roller whth tlour, roll it out again and give it one fold, and roll it out a third time, when it will bo ready for any purpose.
Sweet Paste, No. 2.-For gooseberry, riubarb, apple, or crauberry tarts, rub six ounces of hutter and three ounces of sugar into one pound of flour, make it into a dough with cold water, and either roll or knead it till smooth and pretty stifl, dusting flour on it occasionally, to keep it from sticking to the hands or table.
Jam Tartlets,-Take a piece of puff or swect paste, roll it out about a quarter of an inch thick; lave a paste-cutter a size larger than your paté pans;'cut out a piece of paste, put it into the pans and press it down : put in some small bits of bread, press it down at the bottom, but not at the sides; put them in in quick oven; when they are a light brown they are done; take out the piece of bread, and fill then with jant or jelly.
Jam Tartlets, No. 2.-To make elghteen, have half a pound of butter and the sante of flour made into puff paste (see PUFF PASTE), roll it out to the eighth of an inch in thickness, and with a round fluted cutter cut out the number, put the one on the top of the other, and press them in the centre with the end of the rolling-pin. Dust the tartlet pans with flour, put one into each, then about half a tablespoonful of any kind of jam, and, with a brass runner, cut a stripe for each, twist it on the top of the jam, and bake thein in a quick oven from ten to fifteen minutes. Glaze on the top with melted sugar.

Jam Puffs.-To make eighteen, have threequarters of a pound of very light pufi paste (see PUFF PASTE), roll out to the eighth of an juch in thickness, and with a round fluted or plain cutter cut the number required, dust lightly a little flour over them, give them a roll with the rolling-pin, so as to make them an oval shape, dip a brisli in egg and draw across each; then put on the centre a teaspoonful of thick jam, turn over with thumb and forefinger, so as to raise the edges, dust them with ground sugar, and bake in a quick oven from eight to ten minutes. Glaze on top with melted sugar.
Sausage ERolls.-To make a nice dish, have a piece of light puff paste (see PUFF PASTE), roll out to the thickness of an eighth of an inch, then with a cutter five inches square cut out as many as required, and brush round the edges with egg. Have some ninced beef seasoned with pepper and salt. put about two ounces of it on each of the squares of paste, roll them up from the one side, press with the thumbs at each end, to prevent the meat from coming out, brush them carefully on the top with egg, and bake in a quick oven from twelve to fifteen minutes.
Rice Paster-Take lalf a pound of rice flour, rub in a quarter of a pound of fresls butter and one ounce of sugar; mix it up with cold water; rol! it out and dust it with flour; roll ont another quarter of a pound of fresh butter, put it inside and foid it up; roll and fold It three times; dust with white flour, cover the tart or pie, and glaze on the top with eggs. This does not require a very quick oven. It should he used hot, and on the day it is baked.
Spanish Pastry.-Put on in a sauce-pan one ounce of butter with a gill of water, a pinch of salt, and the same of sugar, let it melt, and come to the boil, then stir in three ounces of flour, and go on stirring till very smooth. Beat it over the fire for a minute, then take it off, and stir in three eggs, one at a time. Drop into boiling fat one tablespoouful of the paste for each puff, and keep turning them, to brown them equally: Let them remain in the boiling fat till very much risen and of a nice golden brown. Profiteroles for garnishing soup are made of this pastry, only they must be made very sinall, ssy about the size of a pea, and haked in the oven.
Vol-au*vent.-lioll out a piece of ligbt puff paste half an incl! thick, and with a slamp knife or cutter cut two pieces, round, square, or oblong. according to the slape of your entrée dish, from the middle of one cut in piece, brush the other over with beaten egg, and lay the cut one on the top, brush it
also, roll out a littlo larger the sinall piece cut from tho centre, and bake in a guick oven from ten to fifteen inlnutes. When wanted, fill the space in the centre wlth lobster, crab, oyster, or veal and liam prepared as for patés. Dish on a table-napkin neatly folded, and garnish with parsley.

## CREAMS, JELLIES, COLD PUDDINGS ICES, AND ICED SOUFFLEES.

Calf's-foot Jelly.-To make two shapes of jelly, have four calfs feet and one ox foot, clean and wash thoroughly, cut them up, put them on the fire in a clean soup pot with plenty of cold water, skim well ns it comes to the boil, let it boil till the meat and bones are ; separated, and the substance extracted, then strain through a hair sieve, and let it stand for twenty-four hours. When wanted, skinn it clean, and with a cloth wrung out of hot water take off every particle of grease. For one shape, put into a brass pan the laalf of the stock, with half a pound of loafsugar, half an ounce of whole cinnamon, a few cloves, the juice of two lemons, the rinds also peeled very thin, the whites and shells of six eggs beat up a little; put it on a clear fire, stir occasionally, and let it boil slowly for ten minutes, then take it off and add one pint of sherry wine; put it on the fire again to heat, and take it off as it comes to the simmering poilto. Have the jelly bag soaked and well wrung out of boiling water, fix it to the stand, pour in the jelly, and let it run into a basin, return it again into the bag, and let it run till clear. If you find it not quite transparent, put it on again in the brass pan with the beatup whites and shells of two eggs, let it come to the boil, and pour though the bag. The jelly stand should be kept near the fire and covered up to exclude the cold air. When it has all run through, and nearly cold; pour it into a mould previously wet with cold water, turn out by dipping in tepid water, put it on a glass dish, and draw of the mould.
Jelly made with Gelatine.-To make a large sliape of jelly, soak two ounces of gelatine (in) hot weather two ounces and a half is the rule, which applies to all jellies made with gelatine) in a pint of cold water until all is absorbed into the gelatine, then pour over it one pint of boiling water, stirring all the time. Have a clean brass or copper pan, pour into it the gelatine and water along with ten ounces of the finest loar sugar, three-quarters of an ounce of whole cinuamon broken into small pieces, eighteen cloves, the rind and juice of one large lemon or two small ones, and the whites and shells of two eggs beaten up together. Soak in half a teacupful of boiling water for ten minutes a pinch of hay-saffron, and add to the other ingredients. Put all on the fire, stir it carefully ; when it comes to the boil, let it boil five minutes, then draw it to the side of the fire, and add fully half a pint of sherry wine, let it come to the boil again, then pour through the jelly bag, which slould be previously soaked in and well wrung out of boiling water. If at the first running through you find the jelly not clear enough, return it through the bag. When the jelly lias all run through, let it stand till nearly cold, and poirr into ajelly mould previously wet with cold water.
Jelly la Russe.-For a whole shape, take half a shape of solid jelly, melt it and let it stand till cold, but not set; whisk it up till spongy and very light, and pour it into a mould. When wanted, turn out into a glass dish.
Silver Jelly. - To make one shape, dissolve two ounces of gelatine in a quart of cold water ; put it on the fire in a brass pan, with ten ounces of loaf sugar, a few drops of the essence of cinnamon, the juice of four lemons, and the whites and sleells of six eggs a little beat up; stir till it boils, then add two wine-glasses of milk punch, and run through the , jelly bag. If not quite clear, return it to the pan with the whites and shells of two eggs, stir gently till it boils, and pour again through the jelly bag. When cold, but not set, pour into a felly mould, and turn into a glass dish.

Ox-Foot Jelly.-Have two feet scalded and cleaned, cut themup, and wash them well, put them on in a sauce-pan with plenty of water, and boil them from six to eight hours, thll the stock is reduced to two quarts, then strain and set aside for twenty-four hours. When wanted, skim it clean, and with a cloth wrung out of hot water remove every particle of grease; then take half of the stock, put it lin a brass pan, take the rinds off three lemons, squeeze the juice, andadd to it. Beat up the whites of four eggs, break the shells, put both into the pan along with one ounce of stick cinnamon, six cloves, and eight ounces of loaf sugar, put it on the fire, stir till it boils, and let it sinmer for fifteen minutes. Wring the jelly bag out of lot water, fasten it to the jelly stand. pour int the jelly, and let it run till clear. If you wish to make a slrape of it, add a breakfast-cuplul of white wine, and wet and fill the mould. Without wine, this is an excellent jelly for invalids.

Orange Jolly:-Soak two ounces of gelatine in one pint of cold water for an lıour, during which time grate the outer rinds of three pounds of sweet aranges and one lemon, then divide each througli the middle crosswise, and squeeze the juice from them into a clean basin. Pour over the soaked gelatine Thalf a pint of bailing water; stir till quite dissolved, then pour into a brass pan, add the grated rinds and juice of the fruit, ten ounces of loaf-sugar, and the whites and shells of two eggs, slightly beaten, put the pan on the fire and stir till it comes to the boil, after whicl cease stirrlng and let it boil for five minutes. Have the jelly bag soaked in clean boiling water, and well wrung out of it, fix it to the stand, pour the jelly through it into a basin, returning it again if not perfectly transparent. When nearly cold pour into a mould previously wet with cold water. A glass of curacoa added just before pouring lnto the mould is a great improvement to the flavour, but as this is a little expensive it may be left cut, if not wanted.
Orange Jelly with Oranges.-Soak two ounces of gelatine in one pint of cold water for two hours, then pour over it one pint of boiling water, stirring all the time. Put it on in a clean brass pan with eiglit ounces of the finest loaf sugar, the thin rind of six oranges and the juice of five, two eggs, whites and shells only, slightly beaten together ; stir till it boils, let it boil five minutes, then take it off, and add one glass of curaçoa. Let it stand by the fire a minute, then pour through a heated jelly bag, returning it a second time if not sufficiently transparent at first. Carefully peel the white skin of the orange from which the juice was not squcezed, divide it into quarters, take out the pips, tahing care not to break the thin skin between the sections. Pour a little jelly into a mould, allow it to set; then a layer of the orange sections, with a little more jelly, let it again set : pour in more jelly, let it set ; then a layer of oranges with a little jelly, let lt set, and fill up the mould.
Orange Sponge.-Pare very thinly the best part of the rind of two oranges; put it in a sauce-pan with a gill of cold water and three tablespoonfuls of sugar, and let it come to hoiling point. Strain it and put it aside to cool. Cut half an ounce of leaf gelatine in small pieces, and soak it for half an hour in a gill of cold water, then stir is over the fire till it is welted. Strain it into the other water that is cooling, and add the juice of two large oranges. When cold, but before it has begun to set, add the whites of two eggs, and whisk for fifteen or twenty minutes till very light and frothy. Wet a mould with cold water; pour the sponge into it, and put it aside to set.

Claret Jelly:-To make a quart shape, soak two ounces of gelatine in lialf a pint of cold water, then pour over it the same of boiling, stirring all the time. Put it on in a clean hrass or enamelled pan, with half a pound of finest loaf sugar, the rind and juice of one liuge lemon, a sixpenny pot of red-currant jelly, and the whites and sliells of two eggs beaten up together. Stir carefully till it boils, let it boil five minutes, then take it off the fire, add one glass of brandy, let it again come to the boil, and pour through the jelly bag, which ought to be previously soaked in and well wring out of boiling water. If not clear enough at the first running througl, return it to the jelly bag. When it

Las all run through, and nearly cold, add ono pint of good claret, and pour into a mould.

Lemon Jelly.-Suak two ounces and a half of gelasine in a piut of cold water for an hour, then pour in the same measure of boiling. I'ut it in a brass pan, add three-quarters of a pound of loaf sugar, the juice of three lemons, the whites of two eggs beaten a little, the shells also, and put it on the fire. Stir gently tlll it boils, boil five minutes, then pour it through a jelly bag, return till quite clear, then pour it into a jelly mould. When set turn out lnto a glass dish.

Shape of Apple Jelly.-Tiake three pounds of baking apples; peel, core, and cut them lin four. laying them in cold water as you cut them. When all cut, put then in a brass pan, cover with cold water, put in the peel of one lemon, and boil thenu till soft, then drain them through a hair sieve. Add threequariers of a pound of loaf sugar to the liquid, and the juice of one lemon. Beat up the whites of two eggs, put them all in a brass pan together with an ounce of gelatine dissolved in a gill of cold water, stir with the switch till it boils one minute, then run it through a piece of muslin, wet the mould and fill it. When you are to turn it out, follow the directions as above.
Strawborry Jelly.-Have one pint of the juice of strawberries and two ounces of gelatine dissolved in a pint of water. Put the Juice of the strawberries into a stmall brass pan, add the gelatine. three-quarters of a pound of lump sugar, and the juice of two lemons. Put it on the fire, stir it with a spoon till it boils, add a'few drops of cochineal, run it through a silk sieve, and wet and fill the mould. Raspberry and red-currant jees, etc., do not require any cochineal for colouring.

Cherry Jeliy.-Squeeze two pounds of ripe cherries with a few red currants through a flannel bag. Hove half a pint of syrup, made of three-quarters of a pound of sugar, one ounce of isinglass dissolved in water, reduced to half a pint ; mix them all together, run them througli a silk sieve, and fill the mould.
Pine Apple Jelly.-Pound a pine apple, and strain the pulp through a piece of muslin. Add a pint of syrup and one ounce of isinglass, dissolved in half a pint of water ; put it on in a brass pan, stir it with a whisk till it just boils, and run it through a silk sieve; add the juice of two lemons, a few drops of cochineal, and fill the mould.

Grape Jelly.-Have the juice of two pounds of grapes and the juice of two lemons, strain them through a flannel bag, add half a pint of syrup and one ounce of prepared isinglass; mix them lightly, wet and fill the mould, and follow the same directions as above. Apricot jelly is made in the same manner, only keep out the lemon juice.
Venus Pudding,-Line a melon mould witls calfs-foot jelly-this is done by pouring in some jelly first, and then put a small oval plain mould or basin, within about an inch of the bottorn of themelon mould, so as to form a space for the pudding to be poured in afterwards. Let the jelly come nearly to the top of the melon mould. After the smaller one is put in, make a blancmange of somewhat less than half a sixpenny package of gelatine soaked in cold water, boil half a pint of sweet milk, the same of cream, and two ounces of fine sugar. When it boils, pour it over the gelatine, and stir occasionally tlll cold, but not set, add slx drops of the essence of ratafia, or eight of the essence of cinnamon. Draw out the shape you placed in the melon mould, it being understood that the jelly is set before doing so. It will come out quite easily by pouring within the smaller mould a little lukewarn water, then put in a few preserved cherries, or small pleces of preserved ginger and angelica cut in small diamonds, with a little of the blancmange; let it set, then the preserved fruit agaln, and so on alternately, till you come to the rop, over which pour some calfsfoot jelly; let it set, and turn out into a crystal dish, in the same way as a jelly.
Iced Pudding,-Beat up the yolks of eight eggs with three-quarters of a pound of sugar ; boil ono pint and a half of cream or good sweet rilk, pour It in amongst the yolks and sugar, stirring all the time, add a little salt and one pound of pine apple grated,
put it on the fire and stir constantly until lt just comes to boll ; have a clean halr sieve over the basin, and rub it all througl with a wooden spoon. Freeze in the usual way, and put into the mould previously orna. mented with angelica cut to taste. Whicn to be served, dip the mould in cold water, take off the cover, shake it, and turn over on the dish.

Iced Pudding, No. 2. - Break ten eggs amongst one pound of ground sugar in a basin or copper pan, and beat up on a stove till quite light; add one pint and a half of good sweet nilk, and a half plnt of cream, set it on a sluw fire and stir gently till it comes to the boil, then pour into a basin, ind stlr occasionally till quite cold. Put it Into a freezer, and freeze in the usual way. When you find it beconing stiff, add half a pound of preserved ginger, and plite apple cut in sinall pieces, one glass of brandy, the grating and juice of two lemons, nind go on freeaing till stiff enough. Have a mould ornamented with angelica cut in stars, put in the pudding, cover up, and immerse amongst ice and salt. Let it stand about two hours, and, when wanted, turn out in the usual way.

Venetian Pudding.-Dip a mould in cold water, and ornament it with preserved cherries and pieces of angelica previously dipped in a little jelly. Soak one ounce of gelatine in one gill of cold water for an hour, then pour over it one gill of bolling water, and stir until it has cooled a little. Separate the yolks from the whites of three eggs, mix the yolks with three ounces of sugar, and one gill and a half of good milk, put it on in a sauce-pan, and make custard of it, then pour into a bowl; flavour with one glass of sherry, one tablespoonful of rum, and mix with the gelatine. Switch up half a pint of thick cream till very stiff, also two of the whites of eggs to a stiff froth, add the cream by degrees to the custard, mixing very gently and lightly, then the whites also by degrees, and with equal care, and continue mixing until it begins to set, then pour into the mould, and turn out on a glass dish when sufficiently set.
American Snow Pudding.-Soak a six. penny package of gelatine in one pint of cold water for an hour, then dissolve with one pint of boiling water; add the juice of four lemons, with half a pound of loaf sugar, and stir till it is melted, then pour through a gravy strainer, and switch for five minutes; drop in the whites of two eggs, and continue switching in a cool place for about twenty-five minutes, or till it gets white and spongy. Have a clean melon mould, pour in the pudding, and when it has set, turn it out on a large glass dish. Make a custard as follows:Switch up the two yolks with an additional egg and two ounces of ground sugar in a small brass pan, till it gets light ; add one teacupful of good milk, put it on the fire, and stir carefully till it becomes thick, then pour into a basin, and stir till quite cold; season with three drops of ratafia, or any other seasoning that may be preferred. Pour this custard round the pudding in the glass, dish, and ornament with preserved cherries and plak sugar.

Swiss Rudding,-Slice a small sponge cake, cover eacli slice with strawberry jam, or any other preserve that may be preferred, lay the slices in a glass dish, one on the top of the other, then pour over it about two glasses of sherry. As the sherry soaks through the cake to the bottom of the dish, take it up with a spoon again, and pour it over the :ake until it is all absorbed. Switch up, till very thick and light, about half a plnt of good cream, and pour over it, and ornament with pink sugar. The cream should set on the top and sides of the cake as it is poured over it.

Casserole of Grapes.-Have one pint and a half of clear calf'sfoot jelly melted; put three tablespoonfuls of it into the botton of a clean casserole mould; let it set, then place agreen and purple grape alternately into each flute of the mould, and nearly cover them with a little more of the melted jelly, taking care not to move them; let it set again, and repeat the process till the mould is nearly full, then colour the remaining jelly with a few drops of cochmeal, and fill it to the top. When it has set, turn it out on a glass dish, and fill up the centre with frothed cream, on which sprinkle a little pink sugar.

Casserole of Prunos.-Take ten ounces, put thens nito a brass pan, cover with cold water, put them on the fire, and let them boll tor a mimute; take them off, and dran through a sieve, then open up and extract the stones, which break, take out the kernels, and hanch motling water 10 a mmute, and take of the bruwn skins. Dissulve half an onnce of gelatme in half a pint of cold water, then put it on in a brass pan along will the stoned prunes, two ounces of sugar, a few drops of ratafia, and one glass of port wine. L.et it boil tor five minutes, after which dran the prunes in a gravy strainer, and set the liquid aside in a basin to cool, but not to jelly. Place the prunes in rows, with a blanched kernel on the outside of each, round a casserole mould; colour the half-cooled jelly with a few drops of cochineal, put four tablespoontuls of it into the mould, allow it to set, then another four spoonfuls, and repeat till the mould is flled up. When set, turn out into a glass dish, and fill the centre of the shape with switched cream, on the top of which strew a little pink sugar.

Casserole of Apples. - Dissolve half an ounce of gelatme in halt a phat of cold water, add four ounces of sugar and a few pieces of whole ginger, put it in a brass pan, and let it boil for five suinutes, taking care not to let it burn. Have three-quarters of a pound of apples, pare, and cut each in four, put them in the syrup, and boil till soft, but not broken, then take thent out and place them in a casserole mould, strain, and colour the syrup, when cold, with hay saffron, and pour over them by degrees, as with the prunes in the foregoing recipe. Whell set, turn out into a glass dish, fill the centre with switcled cream, and on the top strew a little pink sugar.
Casserole of Oranges.-Dissolve half an ounce of gelatine in half a put of cold water, put it on in a brass pan with six ounces of sugar, and let it boil five minutes, taking care not to let It burn. Have four large St. Michael oranges, peel and separate all the yuarters, taking out the seeds, add to the syrup, and let then boil ten minutes. Take them out, and when cold place them into a casserole slape, reduce the syrup, just to fill the mould, and pour it in. When set, turn out into a glass dish, fill the centre with switched cream, and on the top strew a little pink sugar.
Blancmange, - Melt a quart of calfs foot stock, add a pint of good thick cream, six ounces of lump sugar, a stick of cinnamon, four bay-leaves, one dozen of bitter and two dozen of sweet almonds, blanclied and sliced, or a few drops of the essence of almoncls. Put it on a clear fire, and let it boil for five minutes; then run it through a piece of muslin into a basin, stirring occasionally till cold. Wet a mould with water, and fill it; when you are to turn it out, follow the directions as in calf's-foot jelly.
Blancmange with Gelatine.-To make a slape, soak two ounces of gelatine in a little milk; put on the fire, in a brass pan, a pint of cream, the sane of sweet milk, a quarter of a pound of loaf sugar, and stir till it boils; then add the gelatine, stir for some minutes, then add six drops of ratafia, or eight of the essence of cinnamon ; pour it into a basin, stir occasionally till cold, but do not allow it to set, and pour it into the mould.

Blancmange むggs.-Have six small eggs, make a small round hole in the end, and let the whole inside drop out. Put in a little cold water and wash them out ; have a small filler, fix the egg shells in a dish amongst salt, and fill the eggs with the blancmange. When you are to serve them, break the shells, taking care not to injure the blancmange. You may put them in a glass dish by thenselves, or put them round a shape of jelly. The proper way to dishl them is to have the form of a bird's nest made of calf's•foot jelly; proceed as follows:- Take a china quart basin, wet it with cold water, fill it half full of calf's-foot jelly, hold a small basin within an inch of the bottom, and fix it so as to remain until the jelly is cold and set. When you are to send it to the table, drave ont the small basin, run a pin round the jelly and edge of the large basin, do not shake it, turn it over upon a flat dish. Take a cloth wrung out of tepid water, lay it over the hasin for a minnte, then take off the basin, put the glass dish on the jelly, turn it up, and lay the
cggs on the bottom. Have some jelly coloured with coclineal, break it small, and lay it round the edee of 1 .
Chartreuse of Apples.-Cut twelve apples Whth a suath fipe nito sinps about two fuches long;
Loil then in tour cunces of surar, a quarter of an Loil them in sour unnces of sugar, a quaster of an ounce of gelatine previously dissolved in lralf a pint of witter; idd one tablespoontul of the essence of pluger. or a few pieces of whole ginger; boil theut till soft, but ly no means allow then to break down. Take out half of the strips, and colour the remainder with a little cochineal; fhen drain them out. Have a round mould with calrs-foot jelly in it to the clepth of half an inch, and when the apple strips are cold, put the white ones round the mould on their ends, the one close to the other; place the pink above in the same way. Have as much white ginger cream made as you think sufficient to fill the nould, and pour it in. When all is set, turn into a glass dish.

Chartreuse of Prunes.-Put on in a brass pan one pound of the best prunes, with a little cold water, let them boil tor a ninute, and drain through a gravy strainer, then take out the stones, break them, extract the kernels, blanch them in boiling water, and peel off the skins. Dissolve a quarter of an ounce of gelatine in half a pint of cold water, put it on in a brass pan with two ounces of sugar; the stoned prunes, a glass of sherry wine, and a few drops of ratafia. Let all boil together for five minutes, then pour througla a gravy strainer, put the liquid aside to cool a little, after which colour it with a few drops of cochineal. and leave it to jelly. On the outside of each prune put a white kernel, then line both bottom and sides of a plain round mould with them, arranging thent neatly in rows, and so that the kernels may appear when the shape is turned out. Fill the mould with rice cream (see recipe for it), and set aside to get firm. When wanted, dip the mould in warm water, turn out on a glass dish, and serve with the jelly chopped a little round the base.

Bavarois of Iemons.-Soak one ounce of gelatine in one gill of cold water for two hours, then pour over it one gill of boiling water, and stir occasion. ally till cold but not set. Beat with a switch five ounces of ground sugar with the yolks of tiree eggs in a small brass pan on the stove, then add one gill and a half of milk, will the rind of a lemon grated into it, stir carefully till it begins to thicken, taking care not to let it boil, and pour through a gravy strainer into a cold basin. While cooling it ought to be stirred occasionally at first, to prevent skin gather. ing on the top. When the gelatine and custard are nearly cold mix them together, then add the juice of two lemons, one glass of sherry, and one gill and a half of cream previously switched till light and spongy, mix gently, and pour into a jelly mould. When set turn out in the usual way on a glass dish. and serve.

## German Custard for rarts, Cakes,

 etc.-Grate on a plate the outer rind of one lemon, peel two apples, and grate them also, add three ounces of sugar, mix and put it on in an enamelled pan, stir constantly until it has boiled for about four minutes, then remove a little from the fire, add one egg, put it on again, stir till it begins to thicken without allowing it to boil, and set aside for use.Tipsy Cake.-Make a sponge cake of four eggs, four ounces of sugar, and filly four ounces of four (see recipe for SMALL SPONGE CAKES), hrush a melon mould with butter, then dust with white sugar, pour in the cake, and bake in a moderate oven for ahout three-quarters of an hour. When ready, and while hot, turn it out on a dish, then pour into it as much sherry wine as it will absorb, and set aside till cold. Blanch and renove the skins from one ounce of sweet almonds, then cut them into thin slices, put these in rows between the flutings made by the mould, then on the centre of the flutings put rows of preserved cherries cut in two, or angelica cut in diamonds, or both together. Serve with a little switched cream, flaroured with sleerry wine round the base.
rrifie.-Cut into halfinch dice the quantity of stale sponge cake required, put it into a glass dish for the centre of the table, pound a few ratafa biscuits, and strew them over the cake, then soak with sherry
wine, and spread all over with strawberry or raspberry jan. Swltch up till stiff and light one piut of good cream, with two ounces of ground sugar, two tablespoonfuls of lemon syrup, and one glass of sherry, lay this In spooniuls on the trifle, heaping it up in the centre, sprinkle with pink sugar, and fimsle with a row of ratafia biscuits round the dish.
Apricot Erifle.-Cus four perny sponge-cakes in slices, and lay them in a crystal dlsh. Take is tin of preserved apricots, put the truit and syrup in il pall with a littlo sugar, and smmer till the fruit is soft. Let it cool a little, then pour it over the spouge-cakes, and let them soak for half an hour. Whip half a pint of chlck cream ill stiff, and pile it high over the fruit. Decorate with fincly chopped plstachio tuts.
Apple Trille.-Pcel, cut into quarters, and take out the cores of four good apples. Put on in a brass pan four ounces of loaf sugar, with one pint of cold water and a few pleces of whole ginger, let it come to the voil, then put in the apples, and boll gently till soft, but not broken, turning them constantly. When ready take them out, put them aslde to cool, and boil the syrup till reduced a little, thell pour through a grayy strainer into a basin, and set aside to cool also. Beat up two eggs a little, put them on in a brass pan, with one gill and a half of milk, one ounce and a half of sugar, and a few drops of the essence of lemon, stir over a slow fire till it begins to thicken, swithout allowing it to boil, then pour out and set aside to cool. Swisch up till stiff and light three gills of good cream, with two or three tablespoonfuls of lemon syrup, put the apples in the bottotal of a glass dish, pour the syrup over them, then the custard, after it the switched cream roughly in spoonfuls, and sprinkle pink sugar on the top. Put a border of German wafers round the edge of the dish, with a little of the switched cream in each.
Bavarois of Apples.-Soak three'quarters of an ounce oi gelatine in half a pint of cold water for two hours, then put it on in a brass pan with four apples peeled and sliced, two to four ounces of sugar, according to the quallty of the apples, stew till soft, stirring constantly, and pass through a wire sleve on to a flat dish. Switch in a small brass pan the yolks of three eggs, with two ounces of ground sugar, then add one gill and a half of milk, stir with a switch over a slow fire till it begins to get thick, without boiling, and pour into a cold basin. Switch till light and spongy one gill of cream, mix the custard with the apples and gelatine when cold, just before it begins to set, then add the cream, mix together thoroughly but lightly, and pour into a mould.
A bavarois of pine-apple, apricots, or peaches is made as the foregoing, the only difference being that the frnit should be stewed separately from the gelatine. and added at the last before ponring into the mould.
The tinned varieties of the aforesaid fruits answer quite well when the fresh cannot be conveniently obtained, but they ought always to be stewed for a little in their own liquor, with a little sugar, then passed through a wire sieve and allowed to cool.
French Sweet.-Pound in a mortar a dozen and a half macaroon biscuits, add a sponnful or two of cream, and pound again till all is a smooth moist paste. Lay this in the bottom of a crystal dish: whip half a pint of thick cream till stiff; put three-quarters of it over the macaroon paste; colour the remainder a pretty pink, shade with one or two drops of carnine, and put it over the white in rocky lumps.
Rice Creanm. - Soak three.quarters of an ounce of gelatine in one gill of cold water for an hour, then pour over it the same of boiling water, and stir occasionally tilt nearly cold. When the gelatine is preparing, put on in a sauce-pan three ounces of whole rice, with one pint and a half of milk, one ounce of sugar, and the rind of a lemon, let it simnier gently for about forty minutes, then take ont the lemon rind, pour it Into a basin, stlr occaslonally till nearly cold, and mix with the gelatine. Switch up one gill of thlck cream till spongy and llght, adding two tablespoonfuls of lemon syrup, and one ounce of finely gromen sugar; mix this gently and thoroughly with the rice and gelatine till it begins to set, then pour into in quart moukd, previously wet with cold water, When firm,
turn out on a glass dish, and arrange any kind of prepared fruit around it.

Tapioca Cream.-Soak three ounces of the best trpioca in vie pint and a half of mullk for two hours, then put it on with one ounce of ground sugiar and the rind of one lemon, let it simmer slowly for about twenty minutes, then romove the leanon rind, pour it into a basla, and mix with the same quantity of gelanine (prepared in the samo way as for RICE CREAA), and stir both together occasionally till nearly cold. Add this to the crean (same in quantity and preparation as for RICE CREAM), and puur lito a mould, using the samo precaution in the nixing. Servo also in a sinilar manner.
riacaroon Cream.-Cut lialf an ounce of leaf gelaine in small pieces, aud soak it in a gill of milk for half an hour, then stir it over the fire till it melts, taking great care that it cloes hot get too hot, in case of curdling. Whip one pint of donble crean, add the melted gelatine and milk, half a teaspoonful of vanilla, and one ounce of sugar. Colour it slightly with a few drops of carmine. Grate two ounces of macaroons, and pass them through a coarse wire sieve into the crean. Mix carefully, and pour into a mould chat has been wet with cold water, and put it aside to set.

Cream la Romaine.-Blanch, peel, and chop two ounces of sweet alntonds and half ationce of bitter, brown then in the oven, then pound them in a mortar, and put them on in a sauce-pan, with half a pint of milk and two ounces of cround white sugar, let this boil, then take it off the fire, add the yolks of three eggs, stir till it thickens, but do not let it boil again; pass through a fine wire sieve, and put aside to cool. Soak three-quarters of an ounce of gelatine in one gill of cold svater for an hour, then pour over it the same of boiling water, and stir occasionally till nearly cold. Switch up one gill and a half of good cream till light and spongy, adding one tablespoonfin of lemon syrup and two ounces of icing sugar, then add the gelatine, after it the preparation of almonds, mixing carefully and gently, thll it begins to set, then pour it into a mould previously dipped in cold water.

Strawberry Cream.-Cut in small pieces half an ounce of leaf gelatine, let it soak in one gill of milk for half an hour, then stir it over the fire till quite melted, taking care not to let it get very hot. Whip half a pint of cream till thick, and add a few drops of carmine and an ounce of sugar. Add the melted gelatine to the cream, and let it stand till it is just begiming to set. Pick over lialf a pound of ripe strawberries, wet a mould with cold water, and put one or two strawberries in the bottom of it, outlining the pattern of the mould. Pour the cream in, putting strawberries bere and there till the mould is fill.

Italian Cream. - Beat the yolks of two eggs with two ounces of ground sugar, add one gill of lilik and two ounces of ratafia, put all on together in a small brass pan, stir till it begins to thicken, then pass through a wire sieve: set aside till cold, and add one glass of curaça. Proceed with the preparation of gelatine, and the switching of the crean, both in method and quantities exactly as in Cream à la Romaine. When the cream and custard have been mixed, add two ounces of preserved ginger, with the same of preserved cherries, both cut into small pieces ; mix well, and pour into a mould previously dipped in cold water.

Italian Cheose。-Switch one pint of cream with the juice of three lemons, two glasses of sherry wine, and six ounces of ground sugar, until the cream curdles, which takes about half an hour, pour into a perforated mould made for the purpose, and put it on an ashet to let the whey drain from it. Let it stand till firm, turn on a crystal dish, and drave off the mould. This cream In turning ont does not require the usual process of dipping in water.

Apple Cheese. - Soak three-quarters of an ounce of gelatine in half a pint of cold water for an hour. Pcel, core, and slice one pound and a half of baking apples, put them on in a brass pan with the gelatine, lialf a pound of ground white sugar, and a few pieces of rough gluger. Stir, and let to boil till
the apples are quite soft, then pass through a hair sieve, stir occasionally till nearly cold, after whalel add one fill of switched cream, and pour Into a round casserole mould. When quite set, turn it out onl a glass dlsh, and fill the centre with swltcheci cream, on whicli sprinkle a little plnk sugar.

Pine Apple Oheese.-Put on a pound of tinned plne apple in lits own julce, and slmuer slowly till tender, adeing a little water should it reduce too much, then ponnd it in a mortar, after which force it througli a halr sieve, and sweeten with three ounces of sugar. Soak one ounce of gelatine in one gill and a half of cold water for an hour, then pour over it the same quantity of boillng water, stirring till nearly cold. Mix the prepared pine apple and gelatine together, both being cold, with one gill of switched cream; this nust be carefully done lest the gelatine should separate from the fruit and get into a lump. Pour it into a plain round casserole mould; when quite firm, turn out, and serve with switched cream in the centre. Apricot Clieese is made in the same way, substituting the timned apricots for the pine apple.
Burnt Almond Charlotte Russe.Blancli and chop four ounces of good sweet almonds. Melt in a brass or copper pan two ounces of sugar, let it boil till quite brown, then add the almonds, and stir carefully for a few minutes. Pour it out on a flat dish, let it get quite cold, then pound in a mortar, and set aside for use. Llne a plain mould with finger biscuits. Soak three-quarters of an ounce of gelatine in one gill of cold water, then pour over lt the same of boiling water, and stir occasionally till almost cold, not allowing it to set. Switcl up in a basin half a pint of good cream till quite light and stiff, adding at the same time four ounces of the finest ground sugar and two tablespoonfuls of lemon syrup. When swltched enough, add the gelatine, mixing it very carefully with the creain, then the burnt almonds, pour into the mould, and when jellied, turn ont and serve.
Coffee Charlotte Russe.-Proceed exactly as in the foregoing recipe, substituting the following preparation of coffee for the almond and sugar mixture. Heat in the oven, or in a pan over the fire, two ounces of roasted coffee beans, then put them into a quarter of a pint of boiling mllk, cover closely, let them stand for an hour in a warm place, and strain through a picce of nuslin. Let it stand till cold before mixing with the cream.

Pine Apple Charlotte Russe:-Put on in a brass pan about eight or ten ounces of tinned pine apple along with the juice and one ounce of loaf sugar. Let it simmer slowly till tender, adding a little water should it reduce too much, then pass through a wire sieve, and put aside for use. When wanted, proceed as in the recipe for Burnt Almond Charlottiz RUSSE, using the purée of pine apple instead of the burnt almonds.
A purde of apricots may be made as above for Apricot Charlotte rijsse.

Plain Shape of Cream.-Soak three-quar. ters of an ounce of gelatine in one gill of cold water for two hours, then pour over it the same of boiling water, and stir occasionally till nearly cold, taking care that it does not set or get lumpy. Switch up in a basin half a pint of good thick cream till very light and spongy, adding while doing so ibbout two tablespoon. fuls of lemont syrup (see LEMON SYRUP), and four ounces of icing sugar. When light enough, add the prepared gelatine by degrees, mixing it with the cream very carefully and thorouglaly, and pour into a mould previously dipped in cold water.

A great variety of creams may be made according to this recipe, simply by adding the flavour or fruit when the gelatine and cream are being mixed, this addition, whatever it may be, giving the wame to the cream. It will therefore save much unnecessary repetition if, in the following recipes, the various preparations for creams are given.

Ginger Cream.-Soak half an ounce of gelatine In a gill of milk, then stir it over the fire till melted. It must not be allowed to get too hot or it will curdle. Whip one pint of cream, add to it one ounce of sugar, the nelted gelatine, and two tablespoonfuls of ginger syrup. keep stirring it now and then till it is just
beginning to set. Cut two ounces of preserved glnger In smalf pieces and stir carefully through the cream. Wet a mould with cold water and pour the cream $\ln$.
Chocolate for Creams.-For one shape, put on in a small sauce-pan two ounces of grated chocolate with one glll of millk, and the yolks of two eggs beaten a little, stlr over a slow fire till it begins to thicken, wlthout allowing it to boil, and set aslde to cool.
Strawberry or Raspberry for Creams. - For one shape, pass througli a gravy strainer about a third of a pound pot of cither preserve, along witl half a gill of good milk. For elther a strawberry or a raspberry crean, a very little coclineal must be added to give a decided colour, as the preserve fails to do it.

Vanilla for Creams.- Found till very fone in a nortar one pod of vanilla will a llttle sugar, then pass it througli a fine sieve, after which put it on in a sauce-pan with a gill of milk, and the beaten yolks of two eggs, stir over a slow fire till it begins to thicken, then take it off, and let it stand till cold. Sufficient for one sliape.
Coffee lor Creams.-Heat in the oven, or in a pan over the fire, two ounces of roasted coffee beans, then put them into a gill of boiling milk, cover closely, let them stand for an hour in a warm place, and strain through a piece of muslin, then set aside till cold. Sufficient for one shape.
Pine Apple for Creams.-For one shape, put on in a brass pan, about eight ounces of timned pine apple with its own juice, and one ounce of sugar, let it simmer slowly till tender, then pass through a wire sieve, and set aside till cold. Tinned apricots may be prepared in the same way for apricot cream, by using more sugar, say double the quantity, or more if liked.
Burnt Almonds for Creams.-Blanch ancl chop four ounces of sweet almonds, melt in a brass pan two ounces of sugar, let it boil till quite brown, then add the almonds, and stir carefully for a few minutes. Pour out on a flat dish, let it get quite cold, and pound in a mortar.

Gimger tor Creams.-Cut in small pieces about two ounces of preserved ginger, add to the cream, with a little of its own syrup and a few drops of the essence of ginger.
Ratafia for Creams,-For one shape, pound in a mortar two ounces of ratafia biscuits, put them on in a small sauce-pan with a gill of milk; let it boil, then pass through a fine gravy strainer, and, when cold, add to the cream, with a few drops of the essence of ratafia.
Lemon for Creams.-Rasp the rinds of two lemons on a piece of loaf sugar, pound in a mortar, and add to the cream, with the juice of the lemons. Sufficient for one shape. Oranges may be done in the same way.
Hazel Nuts for Cream.-Take the dry hazel nuts and shell them, put them in the ovell till they become a deep yellow colour, after which take them out, and rub them against each other in a dry cloth, to take the skins off. When quite cold, chop them finely, then put them in a mortar, and pound with a little thin crean to a thick pulp. For one shape of cream, four ounces of nuts, after the shells are taken off, will be required.
Arrowroot Cream.-Have three ounces of arrowroot, and pour a tea-cupful of milk over it. Boil two pints of sweet milk with a stick of cimnamon, the rind of a lemon, and three ounces of lump sugar, for a few minutes, then pick out the cinnamon and lemon, and pour it boiling upon the arrowroot. Serve with stewed apples or preserved fruit of any kind.

Cream Custards in Cups. - To fill a dozen glasses, beat four eggs with three ounces of ground white sugar $\ln$ a brass pan on a stove near the fire till white and light, then add three gills of good milk, put it on the fire, stir till it begins to thicken, without allowing it to boil, pour into a basin, and stir occasionally till quite cold. Flavour the custard with rum, sherry wine, or brandy, then mix with half a pint of cream swltched with two tablespoonfuls of lemon syrup; fill the cups, and strew pink sugar on the top of each.

Any flavour may be used instead of tho wime or brandy, such as vanilla, cinuamon, or any essence that may be prepared.
Shape of Corn Flour. - Take four ounces of corn stuur and two pints on milk, rlissoive the corn four in a clean stew-pan with a litale of the milk, then pour in the whole, add two ounces of sugar, and stir very carefully over a slow fire until it has boiled for tell minutes. Whell ready; remove to the side of the hire, stir in the yolks of two eggs, put it on the fire again, and stir till the eges set, without boiling. Add flavour to taste, and pour into a, mould previously dipped in cold water. When wanted, dip the mould in warm water, turn out, and serve with creain and preserved fruit.
A shape of ground rice may be made exactly in the same way.
Lemon Water Ice. - To inake one quart shape, boil one pound of loaf sugar with a pint of water for ten minutes, thell add the juice of six lemuns and two oranges, lalf a pint of cold water, one teaspoonful uf the infusion of hay-salfron, or the rind of an orange rasped on a piece of loaf sugar, to colour the mixture: mix all together and pour through a gravy strainer into a freezer or ice machine. Break into small pieces about fourteen pounds of rough ice. unix it with four pounds of coarse salt, put some of it into a pail, then place in the freezer, surround it with ice and salt, and turn with the forefinger and thumb. When it begins to adhere to the side of the freezer, scrape it with an ice-spoon, and go on turning till nearly stiff. If wanted for dinner, put it into an ice shape, and put a piece of white paper between the cover and the shape, to prevent it from sticking; let it stand about two hours, pour the water off should it rise above the mould, and add a little more ice and salt. When wanted, take the mould out of the ice, wash it well in cold water, take of the cover and paper, turn up and shake it till you feel it loosening, then put it on a crystal dish, and draw of the mould.
Orange Wator Ice.-To make a quart shape. rasp three oranges on a piece of loaf sugar, and scrape it in anong the juice of six and two lenoons, half a pint of cold water, and one pound of loaf sugar boiled for ten minutes in one pint of water, mix a!! together and pour shrough a gravy strainer. Freeze, and turn out as directed for Eemon Water Ice
Ginger Water Ice.-To make a quart shape, boil three-quarters of a pound of loaf sugar and threefourths of a pint of water for eight minutes, pound four ounces of preserved ginger in a mortar with half a piut of cold water, mix all together, add the juice of two lemons, and two ounces of preserved ginger cut in thin slices; colour with a little cochineal. Freeze, and turn out as directed for Lemon Water Ice.
Pine Apple Water Ice.-To make a quart shape, boil one pound of loaf sugar in a pint of water for ten minutes, pound in a nortar three-quarters of a pound of pine apple till very fine, add the juice of one lemon and the sugar, mix well, and strain. Freeze, and turn out as directed for Lemon Water Ice.
Strawberry Water Ice.-To make a quart shape, boil one pound of loaf sugar in one pint of water for ten minutes, mix it either with the juice of one pound of fresh strawberries, or one pound of strawberryrjam pressed through a sieve, mix and add the juice of two lemons, half a pint of cold water, and a little cochineal. Freeze, and turn out as directed for Lemon Water Ice.
Raspberry Water Ice is made the same as above, by substitutinz raspberries for strawberries.
Red-currant Water Ice is inade the same as strawberry, by substituting one pound and a half of red" currants, and a few raspberries, to heighten the colour.
Apricot Water Ice. - To make a quart shape, boil one pound of loaf sugar in a pint of water for ten minutes, rub through a fine sieve six very ripe apricots, pound the kernels, mix, and add the juice of two lemons. Freeze, and turn out as directed for Lemon Water Ice.

Grape Water Ice,-To make a quart shape, boil one pouncl of loaf sugar in a pint of water for ten minutes, then add the juice of three lemons, the rind
of one orange rasped, half a pint of cold water, two glasses of grape syrup, one glass of sherry wine, one of the extract of elderberry blossom, and straln. Freeze, and turn out as directed fur Lemon Water Ice.

Strawberry Ice Cream.-To make a quart shape, bruise three-quarters of a pound of fresh scarlet strawberries and half a pound of strawberry fan through a sieve among six ounces of ground loaf sugar, half a pint of sweet rilk, the juice of two lemons, and onte pint of cream, inix all together, and add a little cochineal. Frecze, and turi out as directed for Lemon Water Ice. If fresh strawberries cannot bo procured, use strawberry jam.

Raspberry Ice Cream is made the same as above, by substituting raspberries for strawberries.

Lemon Ice Cream.-To make a quart shape, rasp the rind of two lemuns on a piece of loaf sugar, scrape it in amongst one pint of crean, a litsle unilk, lialf a poulld of ground lonf sugar, and the juice of two lemons, mix all together. Freeze, and finish as directed for Lemon Water Ice.

ANOTHER WAY.-Cut the rind of two lemons very thin amongst one pint of nilk, half a pound of sugar, and a small piece of stick cinnamon, put it on in a sauce-pan, and boil slowly for ten minutes; then strain into a basin, let it stand till cold, add the juice of two lemons, and one pint of cream. Freeze, and turn out as directed for Lemon Water Ice.

Ginger Ice Cream. - To make a quart shape, bruise six ounces of preserved ginger in a mortar with half a pint of milk, strain through among half a pound of gi ound loaf sugar, add the juice of two small letnons, and mix all together with one pint of creain. When half frozen, add two ounces of preserved ginger, cut in small pieces, and turn out as directed for Lemon Water Ice.

Pine Apple Ice Cream. - To make a quart shape, bruise in a mortar half a pound of pine apple with half a pound of ground loaf sugar, add the juice of a large lemon, rub them well together, and pass througl a sieve amongst one pint of cream and a little milk. When nearly frozen, add a few thin slices of pine apple, and turn out as directed for Lemon Water

Ratafia Ice Cream. - Tomake quart shape, beat the yolks of two eggs with four ounces of ground sugar, put them in a clean sauce-pan witl one pint of cream, half a pint of milk, four ounces of sugar, and two ounces of ratafia biscuits; stir over a slow fire till it boils, then strain through a sieve, and add the juice of a small lemon. When frozen, add two ounces of ratafia biscuits pounded and sifted, one glass of maraschino or sherry wine, and turn out as directed for Lemon water Ice. If wanted pink, add a little cochineal.
Brown Bread Ice Cream.-To make a quart shape, toast three slices of bread in the oven till brown, put one of thein in a sauce-pan with half a pound of loaf sugar, half a pint of milk, two penny sponge cakes, and one pint of cream ; stir over a slow fire till it boils, then strain through a sieve, let it stand till cold, and freeze as Lemon Water Ice, When stiff, add the other two slices of bread pounded and sifted, along with one glass of maraschino or sherry wine, and turn out as directed for Lemon Water Ice.
Uanilla Ice Cream.-To make a quart shape, pound in a mortar two pods of vanilla, with half a pound of ground sugar, till very fine, and sift it through a fine sieve, beat up the yolks of two eggs with a little of the sugar, put all in a sauce-pan with half a pint of milk, stir over a slow fire till it boils, then take it off, let it stand till cold, add the juice of one lemon and one pint of cream, mix, freeze, and turn out as directed for Lemon Water Ice.

ANOTHER WAY.-Boil two pods of vanilla in one pint of milk until the milk is reduced to the half, then strain througlt amongst half a pound of sugar. When cold, add one pint of cream, the juice of a lemon, and finish the same as above.

Hazel-Nut Ice Cream,-Prepare the same nixture as described in recipe for IIAZEL NUTS FOR CrFAM, only, six ounces of nuts after shelling are re?puired insfead of fout. Add this to the vanilla
cream described in the foregoing recipe, after it is cold, and frecze in the usual way.
Iced Soumf.- Beat up the yolks of eight cgas with six ounces of ground white sugar in a copper or brass pan, over the stove, till yery light, then draw it asicho and allow it to cool. Switcli up one pint of gond cream with two ounces of ground sugar ancl three tablespoonfuls of lemon syrup till quite thick innd spongy, switch up four of the whites of the eggs to a stiff froth; have half a pound of any dried preserved fruit, such'ns ginger, pine apple, or apricots, clopped up into small pieces. The nixing nust now be very carefully and lightyly done, adding a spoonful of the yolks and sugar mixture to the cream alternately with 50 much of the frothed whites and half the fruit at a time. When thoroughly mixed, pour it into the souffé dish with a paper band round it, place it among the ice and salt for a few hours, or till quite frozen to the centre, then take off the band of paper, and serve on a silver dish with vanilla and pink sugar sprinkled on the top.
Iced Apple Soutié,-Peel, core, and stew to a pulp six apples with three ounces of ground white sugar, as quickly as possible, stirring constantly, add the juice of a lemon, pour on to a dish and stir till cold. Separate the yolks from the whites of four eggs, mix the yolks in a bowl with four ounces of icing sugar, then beat them on the stove till white and light, after which remove them and beat till cold. Switclaup three gills of good cream till very stiff, adding two tablespoonfuls of lemon syrup and one ounce of icing sugar. The whites of the eggs must also be switched up to a stiff froth, then proceed to the mixing, which must be very carefully and lightly done, as follows:With a spoon add a little of the yolk mixture to the cream, thien a little of the puree of apples, then a little of the switcled whites, and repeat until all has been put in, mixing well after the addition of each ingredient, then pour into the souffé mould, strew lemon sugar on the top, place it in a cave, and freeze in the usual way.
A great variety of Iced souffés may be made by working according to the foregoing recipes, and simply altering the fruit or flavour, which gives the name to the souffé.

## CAKES, BISCUITS, \& BREAD.

Plain Shortbread. - Take one pound of butter (half-fresh half-salt is a great improvement), and cream it with the hand on a board or table, then add one pound and a lialf of flour, four ounces of rice flour, half a pound of fine ground sugar, and work all together into a smooth dough. Divide into the number of cakes required, pinch round the edge with the forefinger and thumb, and prickle on the top. Ornament with a few caraways and orange peel; paper a tin, put the cakes on it, and bake in a moderate oven.
Shortbread, No. 2-Beat to a cream half a pound of butter and five ounces of castor sugar; add the yolk of an egg and one pound of flour, and work with the hand to a smooth paste. Put it on a piece of clean paper, press it out with the hand, and then roll it a little to make the surface quite smooth. The cake may be either round, square, or oval, and should be about one-third of an inch thick. Pincl it round the edge with the finger and thumb, and prick it all over with a fork. Bake in a very steady, moderate oven for thirty or forty minutes.
Pitcaithly Bannock.-Take four ounces of fresli butter, the same of salt, and crean it with the hand on a board or table, then add twelve ounces of flour, two ounces of rice flour, two ounces of minced almonds (previously blanched), two ounces of minced orange peel, and four ounces of ground sugar. Rub all together into a smooth dough form into a round cake, at least an inch thick, prickle on the top, and pincli round the edge with the fore finger and thumb: ornament very tastefully with larke-sized caraways and orange peel; pin a band of paper round it. so as to keep it in its proper form ; paper a tin. put it on, and bake in a moderat? oven for ạbout half an hour.

Ginger Cake. - Rub together with the fingers hrilf a pound of flour, quarter of a pound of butter. and an equal weight of sugar. Rub untul it looks like lread crumbs, but do not press it into a paste as for sliortbread. Add half a teaspoonful of ground gnger. and half a teaspoonful of baking powder. Deat till likit one small egg, add it and rub the mixture again, till it is moist lut still loose like bread crumbs. Butter a flat tin, sprinkle in the mixture, making it quite level, aunl about half an inch thick. Bake in a steady, moderate oven for half an hour. When it is baked mark it into small cakes with a knife, but do not take It out of the tin till cool and firm.
Scotch Petticoat Tails.-Rub six ounces of butter into a pound of flour, and six ounces of sugar : ild a little water, and work into a smootlh dough. Divide in two ; roll into round cakes about the sjize of a dinner-plate. Cut a round cake from the ceutre of each with a cutter four incles in diameter, then divide the outside of each into eight, prickle on the top, dust over with fine ground sugar, and bake in a moderate oven about twenty minutes.
Diet Loaves or Sponge Cake:Take nine eggs, separate yolks from whites, dropping the yolks into a basin amongst four ounces of finest ground sugar, and the whites into a brass or copper pan. Switch up the whites till very light and stiff, and beat up the yolks with the sugar. Have six ounces of flour sifted, mix gently together, adding a little flour and a little of the whites to the $y^{\circ} \mathrm{lks}$ alternately. Line three square tin moulds with cartridge paper, pour in the mixture in equal quantities, put two thin slices of citron peel on the top of each, and bake in a slow oven for half an hour.

Sponge Cake, No. 2.-Beat three eggs with one tea-cupful of castor sugar for twenty' minutes. Add half a teaspoonful or vanilla, and stir in quickly and lightly one teacupful of flour. Pour into a buttered cake-tin, and bake for half an hour.
Small Sponge Cakes.-Break eight eggs into a pan amongst cight ounces of fine ground sugar, beat up over a stove till very stiff and light, then take them off and keep beating till cold, and add a few drops of the essence of lemon. Mix in gently nine ounces of flour ; drop into greased and sugared pans, and bake in a slow oven about ten minutes.

Savoy Cake.-Beat up twelve eggs with one pound of fine ground sugar, over a stove, till light and white, then take it off and beat till cold, add a few drops of the essence of lemon, and nix in gently one pound of four. Grease a tall mould with melted lard, then dust over with fine ground sugar ; put in the cake, and bake in a slow oven for nearly half an hour.

Pound Cake.-Take twelve ounces of butter and beat in a basin to a cream; add twelve ounces of ground sugar, and beat ten mlnutes longer ; then drop in two eggs, and beat five minutes; again two eggs, and so oll till you have put in twelve. Add a few drops of the essence of lemon, mix in gently one pound and a quarter of sifted four, and one ounce of caraway seeds. Pour the cake into papered tin hoops, and bake from an hour to an hour and a half in a moderate oven.
Rice Cake. - Beat six ounces of butter in a basin to a cream, add six ounces of ground sugar, and beat a little longer. Drop in an egg, beat a few minutes, then another, and so on till you lave put in sir, Add n few drops of the essence of lemon or ratafia, mix in gently'six ounces of sifted flour, two of rice flour, two of ground rice, and a little volatile. Put the cake in a papered tin hoop, and bake in a slow oven about three-quarters of an hour.
Rice Cake, No. 2.-Beat together six eggs. half a pound of sugar, and half a pound of rice flour in a basin, with a spoon, till very light. Add a few drops of the essence of lemon, pour into a prepared tin honp, and hake ahout an haur in a moderate oven.
Plain Rice Cake.-Beat to a creami a quarter of a pound of butter with six ounces of castor sugar. thern add a little flour and one egg, and beat again for a few minutes. Add in this way three eggs and six ounces of nour, dropping in one egg at a time, and beating a little of the four in with each egg. Mix onethird of a reaspoonful of carbonate of soda with six
ounces of rice flour, and stir it in thoroughly with enough butter-milk to make a smooth thick batter. lilavour with half a teaspoonful of vanilla, or a few drops of essence of lemoti. Turn into a cake-tin that has been buttered and lined with buttered paper, and bake in a noderate ovell for an hour or a little longer.
Snow Cake.-Beat to a cream half a pound of butter. add half a pound of ground sugar, and beat a little longer, drop in an egg, beat for a few minutes, then another epg, and so on, till you have added six. Mix in gently six ounces of flour, the same of potato flour, both sifted, and a little volatile. Paper a tin hoop, pour in the cake, and bake from an hour to an hour autd a half in a moderate oven.
Small Snow Cakes.-Beat half a pound of fresh butter to a cream, add half a pound of ground white sugar, and beat a little longer, then mix in one pound of potano flour. Beat up till very stiff and light the whites of six eggs, mix these very gently and lightly with the cake, and flayour according to taste. Line with paper an oven tin, about twelve iuches square, and iurned up at the sides, pour the cake into it, and bake in a moderate oven from twenty mlnutes to half an hour. When ready, take it out, turn over the pan, take of the paper, and cut into small squares while hot.
Bachelor's Cake. - Beat one pound of soft sugar with half a pound of butter for fifteen minutes: mix three teacuptuls of buttermilk with two teaspoonfuls of carbonate of soda, and one of tartaric acid ; add to the sugar and butter. Mix in one pound of raisins with one pound and a half of flour, one ounce of mixed spice, and two ounces of minced orange peel ; mix all together, and bake in a moderate oven two hours.
Hailes Cake.-Cream together quarter of a pound of butter with six ounces of castor sugar. Drop in two eggs, add quarter of a pound of flour, and beat hard for five minutes, then add another quarter of a pound of four and enough buttermilk to mix all to a smooth batier. Cut quarter of a pound of figs in snalll pieces and chop two ounces of almonds. Add these to the mixture, also one teaspoonful of lemon juice or a few drops of essence of lemon. Mix half a teaspoonful of carbonate of soda through quarter of a pound of ground rice, and stir it in thoroughly. Put into a well-buttered cake tin, lined with buttered paper, and bake in a moderate oven for an hour or longer.
Lunch Cake.-Beat to a cream six ounces of butter, add eight ounces of ground sugar, and beat for a short time, drop in an egg, beat a few minutes, then another egg, and so on, till you have put in four. Mix one gill and 'a half of sweet milk with half a teaspoonful of carbonate of soda, and two tablespoonfuls of vinegar. Mix together one pound of flour and half a pound of currants, add the half of this to the butter, sugar, and ezgs, then mix the whole ingredients together: put it in a prepared tin hoop, and bake in a moderate oven from an hour to an hour and a half.
Madeira Cake. - Beat twelve ounces of butter to a cream, add twelve ounces of ground sugar, and beat for some time, drop in two eggs, beat for a few minutes, again drop in two eggs, and so on, till you have added twelve. Mix in gently one pound and a quarter of flour, a little volatile, and ten drops of the essence of lemon. Pour into a papered hoop, dust a little fine ground sugar on the top, then three thin slices of citron peel, and hake from an hour and a half to two hours in a moderate oven.
Seed Cake.-Beat one pouud of butter to a cream, add one pound of sugar, and beat both together until they become white ; then add two eggs, and beat for some time, and so on until you have added twelve. Have one pound and three-guarters of hour sifted, mix in amongst it half a pound of orange peel and one pound of citron peel, cut small, half a pound of sweet almonds blanched, and cut small; then mix all together, but stir as little as possible. Have a hoop prepared, put in the cake, smooth with a knife, and scatter a few caraways on the top. Bake two hours and a half in a moderate oven.
Plum Cake.-Take one pound of soft sugar, and beat it with one pound nf butter (previously beat to a cream) for twenty minutes; add two eggs, and
beat for some time, and so on until yos have added twelve ; then addl a pound and a half of sifted flour mixed with one pound and a half of cleaned currants, and half a pound of orange peel cut surall. Bake three hours in a slow oven.
Rich Plum Cake.-Beat to a cream half a pound of salt butter and lialf a pound of freslit in a basint, over a stove or hot-plate, then addl one pound of ground sugar, and beat together till white; add two eggs. beat for five minutes, then another two, and so out till you have put in slx. Have ono pound and a haif of flour sified, from which take a handful and shake into the mixture, then two egys, and beat for five minutes, ngain a liandful of four, and so on, till you liave added in all twelve egrs. Have one pound and a half of currants cleaned, half a pound of sweet almonds, blanclied and cant smail, one pound of orange peel, and half a pound of citron, also cut down, and lsalf' a pound of sultana raisins. Mix all the frult with the remainder of the flour, then all together, taking care not to beat the cake after you have added the fruit and flour. Pour is into a papered hoop, and bake in a moderate oven for nearly three hours.
Sultana Cake. - Take one pound of soft sugar, beat with one pound of butter (previously beat to a cream) for twenty minutes; add two eggs, and beat for some time, and so on until you have added twelve : then mix in gently one pound and a half of sifted flour. along with two pounds of sultana raisins. Bake in a slow oven for two hours.
Kentish Cake.-Beat to a cream quarter of a pound of butter and quarter of a pound of castor sugar. Add gradually quarter of a pound of flour and three eggs, beating the mixture for several minutes after each egg is added. Stir in one ounce of grated chocolate, and the same of ground almonds and desiccated cocoa-nut, and Havour with quarter of a teaspoonful of vanilla. Butter a flat rouud cake-tin, line it with buttered paper, and put the cake mixture into it, spreading it evenly over the tin. Bake for thirty or forty minutes. When the cake is cold, cover it with the following icing :-Put in a sauce-pan quarter of a pound of clocolate powder and a tablespoonful of water, and stir until the chocolate is melted, Add quickly quarter of a pound of icing sugar, and spread the icing over the cake with a knife dipped in hot water.
Vienna Cake,-Beat half a pound of butterto a cream, add half a pound of ground sugar, and beat a little longer. Drop in two eggs, beat a few minutes. again drop in two eggs, and so on till eight are in. Mix in gently one pound of flour and a little volatile. Have six pieces of paper seven inches long and four broad, brush with lard, drop the cake in equal quantities on each of them, smooth with a knife on the top. and bake ten minutes in a quick oven. When you take them out, turn over on clean paper, and spread with various preserves. Lay the one above the other, pare the edges, and ice all over (see ICING FOR Cakes). Ornament with icing, angelica, and variously coloured jellies. This makes a very nice dish for a sweet course.
Cherry Cake, - Beat half a pound of fresh butter to a cream, add lalf a pound of castor sugar. and beat well again. Drop in one egg from the slycll. add a little flour, and beat for five minutes. Continue until five eggs and ten ounces of four have been added, and then stir in half a teaspoonful of vanilla, and six ounces of glace cherries. Butter a cake-tin. line it with buttered paper, pour the cake mixture in, and bake for an hour or longer. The oven should be rather hotter than ordinarily at first, as the cherries, l,eing heavy, are apt to sink to the bottom of the cake if it is slowly baked. Cover the cake with almond icing when cold.

French Cake, - Take six"eggs, separate yolks from whites, beat the yolks with half a pound of soft sugar and two ounces of butter: blanch and pound with two ounces of sugar, two ounces of sweet and half an ounce of bitter almonds; beat up the whites to a snow, mix in half a pound of common four, a quarter of rice flour, and a little volatile, pat all together, and season with tho grate and juice of one lenon, Bake one hour in a moderate oven,

Old Maid's Cake.-Bent up half a pound of fresly butter with half a pound of sugar for fifteen minutes; add one egg occasionally till you have added five. Have half a pound of currants, mixed with threco quarters of a pound of flour, mix all together by stirring as little as possible, Bake in a moderate oven for two hours.

Jenny Inind Cake. - Beat up one pound of ground loaf sugar with one poind of buiter for fifteen minutes; add two eggs occasionally entil you have added eight: then add half a pint of sweet milk. Have one pound and a half of flour mixed with a quarter of a pound of orange peel minced small; grate the half of a mutineg, half an ounce of ground cinnamon, half an ounce of ground caraway seeds, quarter of an ounce of ground cloves, and a quarter of an ounce of carbonate of soda. Then mix all together, line a hoop with paper, and bake two hours in a slow oven.
Ginger Bread.-Take two pounds of treacle, and set it near the fire so as to beconse hot; mix three pounds of flour with half ant ounce of ground ginger, half an ounce of ground cinnamon, quarter of an ounce of ground cloves, one ounce of caraway seeds, three ounces of sugar, two ounces of orange peel, cut small, and half an ounce of carbonate of soda. Then melt three ounces of butter, pound a quarter of an ounce of alum with half an ounce of pearl ashes, and add to the melted butter; shake them up till quite dissolved; then inix with the treacle and pour in among it the flour and other ingredients : mix well and roll out ; put it into a buttered tin about twelve inches square; smooth with a knife, and cut diamonds on the top. Bake in a moderate oven for three-quarters of an hour, then turn it out, and cut in square pieces, according to the size you wish. Ginger bread is improved by sponging a night or two.
Ginger Bread (Superior):-Pound well three ounces of carbonate of soda, and mix it thoroughly with seven pounds of sifted flour, on a board or table, then. rub in one pound and a half of butter, and mix well. Make a large space in the middle, into which pour four and a half pounds of treacle, heated sufficiently to make it pour easily, one pound and a half of orange peel cut into small pieces, one pound of sweet almonds without blanching, four to five ounces of mixed spice, one pound and a half of sugar, four eggs, and one ounce and a half of American pearl ashes, previously dissolved in a little hot water. Mix all these ingredients well in the centre, then gradually draw in the flour and work into a dough, put it into a large earthen jar, cover with a towel, and let it stand twenty-four hours. Form into cakes according to the size wanted, and bake in a very moderate oven.
Plain Ginger Bread.-Mix together in a basin one pound of flour, two teaspoonfuls of ground ginger, and two teaspoonfuls of carbonate of soda. Put three-quarters of a teacupful of treacle in a saucepan with quarter of a pound of butter and six ounces of sugar, and stir it till it boils. Beat two eggs till light and frothy; pour the boiling sugar and treacle over them, stirring all the time, then pour all into the flour, mixing quickly. Add enough buttermilk to make a smooth, thick batter, put it in a buttered tin, and bake from an hour to an hour and a half in a very moderate oven. Open the oven door as seldom as possible, and move the cake as little as possible while it is baking. If it gets tuo brown on the top, as it does very readily, it should be covered with several folds of paper. When it is baked, leave it in the tin for quarter of an hour before turning it out.
Very Plain Ginger Bread.-Heat one pound of treacle with two ounces of butter. Mix with one pound and three-quarters of flour, two teaspoonfuls of carbonate of soda, one of ground ginger, the same of allspice, and two ounces of ground sugar. Mix all together. Butter a flagon sufficiently large, put in the cake, and keep off the cover. Put it on in a pan of boiting water, cover the pan closely, and let it steam for two hours.
Scotch Bun.-To make a bun of twelve pounds weight, lave four pounds of dough ; stone four pounds of raisins, clean four pounds of currants, cut small half a pound of orange peel, half a pound of sweet almonds
blanclied, and cut In four, one ounce of allspice, an ounce of ground pinger, two nutmegs grated, and nilix the spices well with the fruit. Take two pounds and a half of the dough, add to the fruit, lay it on the baking table and work well until thoroughly mixed. Take the ponnd and a half of dough, mix it with four ounces of melted butter, knead it well wath a little flour till smooth and stiff, then roll it out large enongli to hold the bun, lay the bun on it, gather it up round the sides, and fold it nicely to cover all the fruit. Have the hoop buttered, turn the bun upside down on a sheet of greased paper, make it smooth on the top, and prickle it witl a fork or prickle, glaze on the top with water, put it into a quick oven; if a n.ttal oven, it will require four hours; if in a baking olw, three hours

## Sill do it.

Scotch Bun, No. 2.-Line a round cake-pin with a little plain short crust which has been rolled out very thin. Mix in a basin half a pound of flour, one ponnd of raisins, one pound of currants, quarter of a pound of sugar, two ounces of almonds, two ounces of orange peel, one teaspoonful of ginger, half a teaspoonful of cinnamon, one teaspoonful of Jamaica pepper, quarter of a teaspoonful of black pepper, and half a teaspoonful each of carbonate of soda and cream of tartar. Mix all these ingredients together with one teacupful of milk, mixing with the hand. Put the mixture into the lined tin, wet the pastry round the top, and roll out any scraps to form a cover. Put it on and press the edges together. Brush the top over with a little milk, and prick it with a fork. Bake in a moderate oven from two to three hours.

Rice Cheese Cakes.-For two dozen of cheese cakes, take a quarter pound of ground sugar, and a quarter pound of rice flour. Break three eggs, yolks and whites, in amongst the sugar and four into a basin, beat them up with a spoon till very light and white; add a few drops of the essence of almonds or lemon, and a little volatile, line the pâté pans with a piece of puff paste, fill them three-fourths full, put on the oven sheet, and bake twenty minutes in a quick oven.
Cheese Cakes.-Beat half a pound of butter to a cream, then add lialf a pound of soft sugar, and beat together until white: add one egg at a tine until you have added cight, beating all the time. Wher you find it beginning to oil, which it will do about the time you add the sixth egg, have three-quarters of a pound of flour sifted, and shake in a little. When all the eggs are $\ln$, and it sufficiently beaten, mix in gently all the flour, along with a quarter of an ounce of volatile, and season with a few drops of the essence of lemon. Line the pans witl puff paste, fill them about half full; with a paste-cutter cut some strips of paste, ornament on the top, and bake in a quick oven for ten minutes.

Macaroon Cheese Cakes. - Beat four ounces of ground sweet almonds and six ounces of ground sugar with the whites of four eggs for ten minutes, then add one tablespoonful of rice flour, and a little volatile. Have eighteen paté pans lined with puff paste, divide the mixture in equal quantities into them, lightly touch the clieese cakes on the top with a brush dipped in water, and bake in a moderate oven ten minutes.

Lemon Cheese Cakes,-Melt in a small brass pan four ounces of butter, then add one pound of loaf sugar, the juice of three lemons, and the grated rinds of two. Stir very carefully and constantly over a stove or 'slow fire until it has boiled for about eight minutes. With a spoon beat up six eggs in a bowl, pour in the mixture by degrees, stirring constantly to prevent curdling. When well mixed return to the pan, put it again over a slow heat, and stir very carefully until it becomes thick like a custard, without allowing it to boil, then set aside till cold. Line the paté pans with puff paste, put in the mixture, and bake in a quick oven. The mixture in the above recipe is sufficient for a large number of cheese cakes, but as it keeps good for a considerable time it may be set aside in a jar and used as occasion requires.

Rose Cakes.-Beat together to a cream three ounces of butter and three ounces of castor sugar. Add gradually three eggs and three ounces of flour,
beating for several milutes after ench egg is added. Stir the three ounces of corn flon and half a teaspoonful of vanilla, and lastly sufficient carmine to make tho mixture a pretty sliade of pink. Butter a dozen small fancy tins, fill thent laalf full, and baku int a uoderato oven for quarter of an hour.
Queen Cakes.-Buat four ounces of butter in a bamu to a creanin, add four ounces of ground sugar, beat together till white, then put in one egg and beat for a few minutes, then another, and so on till you have added four. If the nixture should oil before all the eggs are in, tike a liztle llour from the six ounces previously weighed and siffed, aud slake in anongst it; add a little volatile, a few drops of the essence of lemon, and nix four and all gently togetler. Have eighteen queen-cake pans greased, andl a few cleaned currants scattered in the bottom of each, pour in the mixture in equal quantities, aud bake them itt a mode. rate oven for about ten minutes.
Raspberry or Jelly Sandwiches. - Beat hall a pound oi butter to a creanh, then athl half a pound of ground loaf sugar, and beat together untii white; ald one egg at a tine until you have added eight, beating all the time. When you find it beginning to oil, which it will do by the time you have added the sixth egg, have one pound of four sifted, and slake in a little. When all the eggs are in, and it sufficiently beaten, mix in gently all the flour, along with a çuntrer of an ounce of volatile. Divide this qualtity into eight, with a spoon, on buttered papers, spread round with a knife, and bake in a quick oven, after which lay three together, the one on the top of the other, with jelly between, and cut to taste.
Victoria Sandwiches,-Beat six ounces of fresh butter to a cream, add the same quantity of fine ground sugar, and beat together till light and white, then add one egg, and beat for a few minutes, again one egg, and so on till you have put in six, then mix in gently nine ounces of sifted tlour. Have three half sheers of paper cut into six squares, butter them, divide the mixture into equal proportions on the squares of paper, and bake in a quick oven about five minutes, then turn them up; let then stand till cold; spread over three of them red-currant jelly or marmalade, and put them together. Ice them on the top with lemon icing (see Lemon Icing), pare the edges with a sharp knife, and cut into slices sinilar to finger biscuits.
Coronation Cakes.-With a switch beat up stx eggs ant eight ounces of sugar over a stove, till light and white, take them of the stove and beat till cold, then add a few drops of the essence of lemon, and mix in gently eight ounces of sifted flour. Have the pans greased and dusted with sugar, put in the mixture, and bake in a moderate oven for about ten minutes. When done, turn them out of the pans, and let the under sides remain up. Have some stiff icing prepared (see ICING FOR CAKES), put it into the ornamenting bag, with it form small rings round the top of each cake, and into each of these rings put a very little jelly of various colours.
Chocolate Cakes.-Beat together till crearny quarter of a pound of sugar and quarter of a pound of butter. Add by degrees quarter of a pound of four, and three eggs, beating the mixture for five minutes afterteach egg is added. Mix quarter of a teaspoonful of baking powder through three ounces of chocolate powder. Stir it in with one tahlespoonful of milk antl half a teaspoonful of vanilla. Butter small fancy tins, and fill them half full with the mixture. Bake for fifteen or twenty minutes in a moderate oven.
Orange Cakes.-Rub together till quite smootlı six ounces of hour, three ounces of butter, and four ounces of sugar. Grate in the rindl of one sinall orange ; add also quarter of a teaspoonful of carbonate of soda, and mix all well together. Beat one exg till light, and stir it in gradually with the juice of the orange and sufficient butter-milk to make a smooth thick batter. Half fill small buttered tins with this mixture, and bake for fifteen ininutes in a moderate oven.
Swiss Tartlets.-Make twelve tartlet cases, and fill them with jam of any klnd. Beat up the whites of four eggs till very stiff, mix in gently six ounces of
fine sifted sugar, then put it into the ornameutiug bag, and press out a small quantity on the top of each tartlet, to resemble as nearly as possible the shape of an egg, then slust them over with pink sugar; put them in a slow oven for five minates, and with the sanue mixture in tho bag form a ring on the top of eiteh tartlet, inso which put at very little jelly of various colours.
Albert Cakes. - Beat up twelve eggs witl fourteenl ounces of ground sugar ba it pall or basin, over a stove, with a swiech, till light and spougy, thea take it off and beat till cold ; add lialf a pounel of clean sultana raisins mixed with one pound of sifted hlour, mix all geutly together, and pour into a firt pan about fourteen liches square, previously lined with greased paper. Bake in a moderate oven twenty minutes, then take it out and cut into sinall square pieces.
Spanish Cakes.-l'ut on haif a pint of milk in a sutull sauce-pan with two ounces oi sugar, three ounces of butter, and a pinch of salt, let it come to the boil, then take it off the fire, and add five ounces of flour; put it on again, and stir well witl a woorlen spoon for three minutes. Remove to the side of the fire ; add three eggs, one at a time, mixing well after each; if too stiff, add the yolk of another, and flavour to taste. Blanch and chop two ounces of sweet almonds, and mix them with one ounce of ground white sugar and the white of an egg ; with a teaspoon lay the paste out on a baking sheet, in pieces about Jhe size of a walnut, brush over lightly with beaten egg, spread the almond mixture over them, then dust white sugar on them, and bake in a moderate oven to a pale brown. When cold, open them, fill with switched cream, flavoured to taste, and put them together again.
Cocoa-nut Cakes. - Cream together four ounces of butter und an equal weight of sugar, then beat in two eggs, one at a time. Add gradually six ounces of four and enough milk to make a thick smooth batter. Mix half a teaspoonful of baking powder ;with three ounces of desiccated cocoa-nut; add it with half a teaspoonful of vanilla, mixing very thoroughly. Half fill small buttered tins-with this mixture, and bake for fifteen minutes; or put all into one large tin, which has been buttered and lined with buttered paper, and bake for forty or fifty minutes. A little desiccated cocoa-nut shoulcl be sprinkled over the cakes before they are put in the oven.
Almond Cakes.-Bent to a cream four ounces of butter and four ounces of castor sugar. Add gradually quarter of a pound of flour which has been passed through a fine wire sieve, and three eggs, beating the mixture for five minutes after each egg is added. Mix quarter of a teaspoonful of baking powder through three ounces of ground almonds; add it and a few clrops of almond or ratafia essence. Bake in a mode. rate oven, in little fancy tins which have been well buttered.
Shrewrsbury Eiscuits.-Rub four ounces of butter into elght nunces of flour: add six ounces of sugar ; wash and dry sir ounces of currants. Beat up three eggs, yolks and whites, and mix them all together with a little carbouate of soda: roll them out into small biscuits, half an tnch thick, adding a little more flour if necessary, and cut them with a paste-cutter, Lay them upon a clean buttered tin, and bake in a noderate oven until they are a fine light brown.
Almond Biscuits.- Blanch and mince small a quarter pound of alinonds. Take half a pound of flour. half a pound of sugar grated, four ounces of inelted butter, and the half of an egg; mix all together witts a spoon; put them out into small thin cakes, cut them with a cutter, or drop upon a clean tin, and bake them in a slow oven from ten to fifteen minutes.
Wafer Eiscuits.-Rub in three ounces of butter and three ounces of sugar into half a pound of hour, add a little cold water, work it up with the hand. and roll out tnto very thin biscuits. Cut them with a cutter about five inches wide, prickle then on the top with a fork, and put them in a slow oven for ten minutes.
German Wafers.-Beat up for ten minutes eight eggs with one pound of ground loaf sugar, and actd a few drops of the essence of temon. Mix in half
a pound of flour, drop on greased tins, and bake in a moderate oven till a very light brown, then take them out and turn into the form of a cone
Sugar Biscuits.-Separate five eggs, the yolks from the whtes; beat up the yolks with half a pound of loaf sugar for half an hour; beat the whites to a froth. Sift in four ounces of uried tlour with the yolks ; beat them for five minutes, then add the whites, and a little essence of cimamon; drop them in a round form upon a slieet of white paper, and sift sugar over them. Bake them in a quick oven about ten minutes.

Macaroons.-Take fourteen ounces of sweet alntonds and two ounces of bitter, blanched and dried, pound them in a niortar with two pounds of sugar. Beat up the whites of twelve eggs with a switcl till very light, mix with the almonds in a basin, and squirt them through a pipe on wafer paper. Bake in a moderate oven.
Ornamented Macaroons:-Take one pound of sweet almonds, blanch, dry, and pound them in a mortar, with two pounds of finest ground sugar, then put them in a basin, and beat with the whites of twelve eggs, and three ounces of rice flour, till they become pretty stiff. Drop the biscuits on wafer paper through a bag and pipe; ornament on the top with small strips of angelica and coloured slices of almonds. Have the oven tins covered with common grey paper, on which lay the sheets of wafer with the biscuits, and bake in a slow oven about twenty minutes.

Dough Nuts--Rub one ounce of butter into six ounces of flour. Add two ounces of sugar, a third of a teaspoonful of carbonate of soda, and mix well. Beat an egg till light; add to it gradually with enough buttermilk to make a soft dough. Put it on the baking board, knead it lightly together, and roll it out about quarter of an incli thick. Cut it in small rounds, and nake a hole in the centre of each. Fry in hot fat, turning the cakes so that each side may be equally brown. There should be enough fat in the pan to completely cover the cakes, and it will be hot enough when a very faint blue smoke is seen rising from it Put them on kitchen paper as theyare fried, and when all are ready sprinkle them well with sifted sugar.
Spice Nuts.-.Heat half a pound of treacle, and mix it with four ounces of raw sugar, the same of melted butter, half an ounce of Jamaica pepper, an ounce and a half of ground ginger, half an ounce of caraway seeds, half an ounce of carbonate of soda, and three ounces of minced orange peel. Have about a pound and a half of flour on the baking-table, pour amongst it the above ingredients, and make into a dough. Roll out, and cut the nuts with a round cutter, lay them on greased tins, and on the top of each put a small slice of sweet almond. Bake in a slow oven about ten minutes.

Yorkshire Perkins.-Mix with half a pound of flour four ounces of coarse oatineal, one ounce of mixed spice, six ounces of brown sugar, and a full quarter of an ounce of carbonate of soda. Rub in four ounces of butter or lard, add four ounces of treacle, previously heated, and buttermilk sufficient to make a nice soft dough. Divide the dough into pieces weighing one ounce and a half each, form them into round flat cakes, put them on greased tins, and bake in a cool oven. When done, glaze them on the top with butternilk.
Squirt Biscuits.-Rub in six ounces of butter among three-quarters of a pound of flour, six ounces of sugar, a little volatile, moisten all with three eggs; make into a dough; put through the squirt; form the biscuits to taste; and bake in a sluw oven.
Jumble or Squirt Biscuits.—Beat to a cream half a pound of the finest butter, add twelve ounces of ground loaf sugar, beat a little longer, then put in one egg, and go on beating till you have added four, then add a few drops of the essence of lenion, and one teacupful of sweet milk. Spread on the table two pounds of flour, four ounces of rice flour, and alnost a quarter of an ounce of volatile; make a space in the centre, into which pour the mixture, mix all up lightly with the hands, press through the biscuit squirt, form into various shapes, and bake in a slow oren about tell minutes, If liked, a few caraway seeds may be added.

Ratafla Biscuits. - Blancl four ounces of sweet almonds, dry then, and pound in a mortar with? half a pound of ground sugar till very small, mix up with the whites of five eghs and one ounce of rice flour till smooth and pretty stiff. Have the oven tins lined with paper, put the mixture into a bag and pipe, made for the purpose, and drop the biscuits on the paper about the size of a sixpence. Bake in a slow oven about ten ininutes.
Brandy Waiers. - Heat half a pound of treacle: rub four ounces of butter into six ounces of flour, and half a pound of sugar, one ounce of allspice, and the grate and juice of one lemon; pour in the treacle amongst the ingredients, suixing them well together: butter a broad tin, and pour in the nixture, spreading it all over with a knife. Put it in a slow oven for about fifteen minutes, then take it out, and cut in square pieces, and roll on a wooden pin, to form the wafer.
Rice Biscuits.-Beat five eggs with four ounces of ground sugar in a pan or basin, over a stove or hot plate, till light and spongy ; take it off and beat till cold, then mix in gently two ounces of common four, and the same of rice flour. Drop the mixture from the point of a tablespoon on a greased tin, making each biscuit the size you wish, and bake in a quick oven for about five minutes.
Finger or Savoy Biscuits. - Break eight eggs into a brass or copper pan amongst ten ounces of ground sugar, and beat up over a stove till very light and white, then take it off and beat till cold. Add a few drops of the essence of lemon, mix in gently ten ounces of flour, and drop through a pipe and bag on clean paper. Have a sheet of paper on the table with some ground sugar on it; turn the sheet with the biscuits over on it, then take then off, and bake about five minutes in a quick oven.

German Biscuits.-Rub in four ounces of butter amongst half a pound of flour and four ounces of sugar, a little carbonate of soda; moisten with one egg, and season with a few drops of the essence of bitter almonds. Lay it in small pieces on a buttered tin as roughly as possible, and bake in a slow oven.

Victoria Biscuits.-Rub one pound of butter into three pounds of flour, and break in six eggs, add one pound of ground loaf sugar, half an ounce of volatile, a few drops of the essence of bitter almonds; mix them together into a stiff dough, and roll it our about a quarter of an inch thick. Cut the biscuits out with a small round cutter. Have one pound of loaf sugar broken into small bits, and spread on a sheet of paper. Wet the biscuits on the top witl egg, then lay the wet side amongst the sugar, turn them over, and lay them on greased tins a little distance from each other. Bake in a moderate oven till a light brown.

Cinnamon Biscuits.-Rub four ounces of butter into one pound of flour, add half a pound of ground loaf sugar, one ounce of ground cinnamon, and half an ounce of volatile. Moisten with water into a solt dough; roll out pretty thin, and cut to taste with fancy cutters. Glaze on the top with coarse melted sugar.

Lemon Biscuits.-Rub three ounces of butter into half a pound of flour, add half a pound of sugar and a very little volatile; moisten with two eggs, and a little essence of lemon. . Roll out, cut small, and bake in a noderate oven.

Abernethy Biscrits.-Rub in three ounces of butter amongst one pound of flour, two ounces of sugar, and lialf an ounce of caraway seeds; moistell with a little water; roll out to half an inch thick, cut with a small cutter, stamp them, and bake in a quick oven.

Wine Biscuits.-Rub in three ounces of butter amongst one pound of flour and one ounce of sugar ; moisten with a little water or sweet milk ; roll out to half an inch thick, cut to the size wanted, stamp them, and bake in a quick oven.
Ginger Biscuits.- Rub half a pound of butter into one pound and a half of flour, mix it with three eggs, half an ounce of ground ginger, one teaspoonful of the essence of ginger, half a pound of ground sugar, and a quarter of au ounce of volatile. Work all together into a smooth dough: roll out till about the thickness of a quarter of an incl. Brusli with an egg,
and strew over with mincel alnonds. Cut ont with an oval or star cutter, lay them on kreased tlus, and bake in a moderate oven from ten to fifteen minutes.
Ginger Biscuits, No. 2.-Rub ten ounces of butter mito one pound and three quarters of tlour. Mix with it four egys, one pound of ground sugar, one ounce and a half of ground ginger, half an ounce of volatile, and one teacupful of water. Knend all together into a smooth dongh; then roll it out thin, and cut them out with a ronnd cutter. Brush them on the top with eyg, put a suall strip of orange peel ou the top of each, put them on greased tins, and bake in a quick oven from ten to fificen minutes.
Fancy Rock Almond Biscuits.- Beat up the whites of three eggs with a teaspoonful of vinegar and one pound of the finest ground sugar till very stiff and lighe. Blanch, dry, and mince half a pound of sweet almonds, and add to the above. Drop from the points of two teaspoous on slightly greased tins, mud ornament on the top with small strips of angelica and coloured almonds. Bake in a very slow oven till they become hard, but not in the least brown. The half of the quantity may be made pink by adding a little cochineal.
Meringues. - Separate the whites from eighteen eggs; put twelve of the whites $\ln$ a brass or copper pan, and beat then with a switcla till very light, adding a spoonful of vinegar. Them take the other six whites, and beat them in a basin with two pounds of icing sugar, and a tablespoonful of vinegar, till it becones light and stiff. Mix all gently togetlier in the pan; bave three or four sheets of tbin cartridge paper greased; cut the paper in strips, and lay it on boards two inches thick, then. with a tablespoon, drop the meringues in rows on the paper as near to the shape of an egg as possible. Sprimkle a little coloured suyar on the top of each, and put them in a cool oven, the door of whicli unust be left open, for one hour. Take them out and separate them from the paper with a slarp-pointed knife dipped in warm water, then place two of them together, which forms the meringue.
Meringues, No. 2.-Drop the whites of six fresh exgs into a brass or copper pan ; switch up till yery stifl, adding a little white wine vinegar, then stir in gently eight ounces of the finest ground sugar ; put this mixture into the bag and pipe, drop the meringues through it on greased oven tins in the form of twisted shells. Bake in a very slow oven till they become hard and a light brown; then take them out, aud with a teaspoon scoop out the insides, so as to make space for some switched cream or preserves, with which they are filled when cold. Put the shells in some dry place all night, so as to dry them thoroughly before using.
Icing for Cakes.- Beat up the whites of three eggs with three-quarters of a pound of the finest ground sugar and a little vinegar. Beat it up till very stiff, pour the icing over the cake, and stmooth on the top and sides with a knife: Set the cake in a warm place until the sugar gets hard.

Lemon Icing.-Squeeze the juice of two lemons into a basin amongst half a pound of gromid white sugar, and beat it for a short time. If wanted piuk, add a little cochineal.
Lemon Icing, No. 2.-Pour half a gill of boiling water over the grated rind of a lemon, and let it stand for twenty minutes, then add the juice of half of the lemon, and strain it into a small sauce-pan. Allow it to get as hot as possible without boiling, then stir it gradually into half a pound of icing sugar. It should be poured over the cake, and smoothed with a knife dipped in hot water.
Raspberry Icing.-Mix two tablespoonfuls of raspberry jam with at half gill of hot water. Strain it Into a small pan, and let it get as hot as possible without bolling. Pour it gradually, mixing well, into half a pound of icing sugar, and add a few drops of cochineal or carmine. If rather thin for coating cakes and pastry, add a little more sugar.

Water Icing.-M1x half a pound of icing sugar with water near boiling point, making it sufficiently thick to spread on the cake without letting it run over the sides, flavour with pounderl mace.
Almond Xcing.-1put on in a brass or copper
pau four pounds of soft sugar with one pint of water, and let it boil from six to eight minutes, then draw off the fire, and mix with it two pounds of ground sweet alnonds, stirring till it begins to get thick, then pour equally over the cake.
Amond Icing, No. 2.- Mix together two pounds of ground sugar and one pound of ground sweet ilmonels, put this out on a clean bnard or table, make a space in the centre into which drop the yolks of six eggs, add a few drops of the essence of ratafia, and work with the linuds into a stiff paste.
Chocolate Icing.-Grate two ounces of best chocolite, put it on in a small enamelled sauce pan with half a gill of hot water, and stir till quite dissolved, then adel hailf a pound of icing sugar, and stir again till quite smooth.
Cofree Icing.-1teat in the oven, or on the stove, two ounces of roasted coffec beans, put them into a small enaumelled pan wish one gill of boiling watcr, cover closely and leave them to infuse for an hour, then strain and return to the pan. Stir in half a pound of icing sumar, or more if required, to bring it to the proper consistency for coating cakes, pastry, etc.
Butter Icing.-Beat over a stove till smooth half a pound of white fresh butter ; then add three ounces of fine sifted flour, and heat together till very smooth. This is used for omamenting cold fowls, turkeys, tongnes, hams, and other cold meats.
Butter Icing, No. 2.- Beat quarter of a pound of fresla buther to a cream, and aitd gradually half a pound of icing sugar which has been passed througli a fine wire sieve. Add lemon juice or vanilla to flavour, and beat till soft enough to pass through an icing tube.
Vienna Icing:-Put one pound of icing sugar through a fine wire sieve. Make a hole in the centre of it, and drop in two whites of eggs, and beat for twenty minutes or half an loour, until the icing is soft and very white. A few drops of lemon juice should be added now and then while beating. A layer of this icing should be spread on the cake with a knife dipped in cold water, and when it is dry it can be ornmmented with the icing that remains, using for the purpose an icing tube and bag.
Currant Loaf. - To make a good-sized one, take four pounds of loaf-bread dough, and work into it half a pound of melted butter, one pound of stoned raisins, three-quarters of a pound of cleaned currants, four ounces of orange peel cut small, and one ounce of mixed spices. Kneatl it till the frnit and spice are thoroughly mixed with the dough. Have an oven tin and a cake hoop greased, place the hoop on the till, into it put the loaf, cover up, and let it stand in a warn place for an hour to prove. Bake in a hot oven from an hour to an hour and a half, and glaze on the top with sugar and water.
Loaf Bread.-To make six loaves of bread, have three potatoes boiled and pared, rub them through a drainer with a wooden spoon into a large jar, adding a little warn water, to make them go through more easily, then add five quarts of lukewarm water, along with a pint of baking yeast and three ounces of salt, mix in flour enongl to make it a thin batter, cover it up, put it in a warm place, and let it stand for ten hours. Add another quart of water, a little hotter than the first, aud another three ounces of salt, beat it up a good deal with the hand, adding flour till pretty stiff, and let it stand two hours longer. Pour it out on a baklng table, and knead as much four into it as will make it a nice smooth dough. If you wish to make cottage loaves without a pan, take two pounds of dough, divide it in two, roll them up round and smooth, put the one above the other, press them down in the centre with the back of the hand, to give the loaves a shape; put them on the oven tin, then put them in a warm place to prove, for nearly an hour. and bake in a quick oven one hour more. When you take then out, brush with a little cold water on the top.
Bread with German Yeast.-Dissolye one ounce of fresh Gernan yeast in half a gill of tepid water. Mix in anl carthen jar two pounds and a half of four with nearly a quart of warm water, or niilk, or milk and water together $;$ add a good dessert-spoonful
of salt, then the dissolved ycast, after whicl work the batter well with the loand, cover it, and set it on the stove, or near the fire, ior two hours, to rise. When sufficiently risen, pour it out on the table or baking. board anongst flour, and knead flour into it suflicient to make a uice soft dough. Forin it into loaves welghing about two and a half pounds each, put thein on baking shcets, set these on the stove, cover thenl up, and let them stand from twenty to thirty minutes to prove. Bake in a quick oven fur about threcequarters of an lour. The above quantity will make two loaves of the above weight.

London Buns.-Rub twelye ounces of butter into three pounds of flour : put it into a basin, break nine eggs anong half a pint of sweet milk or water, add a small teacupful of good yeast ; mix all in amongst the flour and butter, stirring it a little, cover up with a cloth, and let it sponge all night in a warm place. Mix it up in the norning with three-quarters of a pound of sultana raisins, the same of sugar and citron peel, weigh it in two ounce pieces, and form with your hand as rough-looking as possible. Break some loaf sugar into sinall bits, and stick on the top. Place them on buttered tins, a little distance from eacli other; put them for an hour, either into a steam press or some warm place, to prove, and bake in a quick oven five minutes. Take them out, and brush them on the top with sugar and water.

Coolkies.-Rub six ounces of salt butter into one pound and a half of flour; put it in a basin, and break in four eggs; add one pint of lukewarm water with a smail teacupful of yeast, mixing them together ; cover it up, and let it sponge all night in a warn place. Mix it up in the morning with six ounces of ground sugar ; stiffen it with flour so that it will not adhere to the table. Divide into two-ounce pieces, make them round, and lay them onl greased tins, a little distance from each other. Put them for one hour into a steam press or some other warm place, to prove them; then bake for about five minutes in a quick oven, and brush on the top with sugar and water.

Cocoannut Buns.--Put in a bowl together half a pound of flour, quarter of a pound of sugar, and three ounces of butter, and rub lightly together till sinooth. Then add three ounces of desiccated cocoanut and a large half teaspoonful of baking powder, and mix well. Beat one egg till very light, add it gradually, with sufficient milk to make all to a stiff paste. Butter a flat baking-tin, and put spoonfuls of the mixture on it, not too close together. Bake in a quick oven for ten or fifteen minutes. A little cocoa-nut should be sprinkled over each bun, before they are put in the oven.

Fiot Cross Buns.-Rub six ounces of salt butter into two pounds of flour, put it in a basin, break in amongst it three eggs, add one breakfastcupful of yeast, and mix all together with a little tepid water, to make it the consistency of a thin batter, cover it up, and let it stand all night. Mix it up next noorning with half a pound of sugar, a little grated nutmeg, half an ounce of ground cinnamon, half an ounce of ground ginger, and a very little ground cloves. Mix all well together with as much four as will keep it from sticking either to the table or hands. Allow two ounces of the dough to each bun; make them round, make a cross mark on the top of each, and prove them for an hour in a steam press; then bake in a quick oven for a few minutes, and glaze on the top with sugar and water.
$B r e a k f a s t$ Rolls.-Put four pounds of flour into an earthen jar; melt four ounces of butter in a pint and a half of sweet milk, make a space in the centre of the flour and pour In the milk; add one tea. cupful of good fresh yeast, mix and stir it well; then a dessert-spoonful of salt, beat up two eggs well, stir them into the sponge, cover it up, then set it before the fire, and let it stand for six hours. Beat it up one way with your hands fifteen minutes, and form the rolls with as little flour as possible. You may bake this dough in small pans, or round rolls, formed the same as cottage loaves; bake them in a quick oven for twenty minutes, and when you take them out brush them on the top with a little water.

Brealstast Rolls, No. 2.-Mix two pounds
of flour with half an ounce of carbonate of sodia, and one of tartaric acid pounded; moisten with butter. milk till pretty soft, make up into small pieces like French rolls, put them on the tin, and place the rollpans above them. Bakc twenty minutes in a quick ovell.
Milk or Soda Rolls.-To make two dozen, rub three ounces of butter mito two pounds of flour, then add half an ounce of carbonate of soda, and one ounce of cream of tartar, mix, and inake a space in the middle, into which put half a tcaspoonful of salt, make into a soft dugh with butter-milk, and divide into twenty-four pieces, each weighing about two ounces and a half. Have twenty-four roll-pans and an oven sheet greased, turn the rolls round and smooth with the hauds, place them on the oven shert, then put a pan on the top of each, and bake in a hot oven from ten to twelve minutes.
To Make Yeast. - Put on the fire, in a large pan, one ounce and a half of hops, with eight quarts of water, and boil it for three hours; then pour it over two pounds of malt, let it stand till lukewarm, add a pint of old yeast, one ounce of coarse salt, and one handful of four; stir all together, then strain and bottle it. It should be kept in a dry place. Allow one teacupful of the above to one quart of milk or water for making loaf bread or break fast rolls.
To Keep Yeast.-Baking yeast is the best for bread. Run it through a hair-sieve, pour a gallon of cold water over it, and let it stand for a night, then pour the water off and mix it with a tablespoonful of brown sugar. If you require to keep it for some time, put it in a bottle, cork it tightly, and set it in a cool place.
Sweet Currant Scones.-Rub fine three ounces of salt butter into two pounds of flour, then add half an uunce of carbonate of soda, one ounce of cream of tartar, three ounces of ground sugar, and two ounces of cleaned currants, mix all together, then make a space in the centre of the flour, into which put half a teaspoonful of salt and about a pint of buttermilk, or as much as will make a nice soft dough. Mix carefully with the hands, and divide into eight, knead round and smooth, roll out about half an inch thich, prickle, and glaze on the top with a little milk and egg, and bake in a hot oven from eight to ten minutes. These scones may be baked on a hot-plate or girdle, in whicli case you neither prickle nor glaze then on the top.
Soda Scones.-Rub six ounces of butter into four pounds of flour, add one ounce of soda, half an ounce of tartaric acid, and make all into a soft dough with buttermilk, divide into twelve scones, roll out, prickle them on the top, glaze with buttermilk, and bake in a quick oven for ten minutes.
Girdle Soda Scones.-Mix well three pounds of flour with two teaspoonfuls of carbonate of soda and three teaspoonfuls of cream of tartar, both well pounded, add two teaspoonfuls of salt, and mix thoroughly, lay this on the table or board, make a space in the centre, into which pour about a quart of sour buttermilk, inix and knead with the hands into a soft dough, using a little flour to prevent it from stick. ing to the table or hands. Roll out to half an iuch thick, stamp out with a cutter according to the size wanted, and bake on a girdle over a clear but not very strong fire.

Whole Meal Scones. - Mix well half an ounce of soda and ten drachms of cream of tartar, with a pound and a half of whole meal. and half a pound of flour. Put it out on a table or baking.board, make a space in the centre, and into it put a good tea. spoonful of salt; dissolve by pouring over it rather more than a pint of good butternilk ; then mix all together into a smooth soft dough; divide into eight equal parts, roll them out to an equal thickness, and bake on the hot plate or girdle, turning them occasionally till ready, or in a hot oven.

Victoria Scones.-Pound well a quarter of an ounce of soda, mix with one pound of flour and five drachms of cream of tartar, pass together through a sieve on to a baking table, make a bay in the centre, in which cream three ounces of hutter, add two ounces of sugar, quarter of an ounce of salt, and half of an
eqie. Mix well, then add gradually half a pint of sweet milk, and make all into a dongh, kneadme it lightely for a litule; roll out in two large scones, divide each with a knfe into eight, and lake on the girclle.
Barley Scones. - liake one quart of good sweet mulk and put it on in a clean pan with a little salt. Wiien it boils, stir iul barley flour until It is as thick as porrilge, pour out on the baking-board, and let it stand till cold. Knead up with barley flour to a nice soft dough, roll out, cut to the size wanted, and bake on the sirdle. Flour scones may be made in the snme way.
Barley Scones, No. 2.-Mix twelve ounces of bartey hour with twelve ounces of wheaten flom, quarter of an ounce of bicarbonate of soda, and onethird of an ounce of cream of tartar. Pass this through a sieve, and add one teaspoonful of salt. Mix to a soft dongll with fresh hutter milk, roll it out, stamp witll a round cutter the size wanted, and bake on the girclle.
Dropped Scones.-Rub half an ounce of butter Into twelve tiblespoonfuls of four. Add two tablespoonfinls of sugar, half a teaspoonful of carbonate of soda, and half a teaspoonful of cremm of tartar, and mix well. Beat an egg till light, add it and sufficient butter milk to make a smooth batter. Butter a hot girdle and drop the batter on it in spoonfuls. Brown well on both sides, liy them on a clean towel, and keep them covered with it till cool.
Wafer Scones.--Take one pound of the finest flour, and inoisten with gooll sweet cream into a nice soft dough, or, if cream cannot be got conveniently, rub in three ounces of fresh butter and moisten with milk. Roll out as thin as a wafer, cut into small cakes, and bake the onc side on the girdle, and the other before the fire until crisp.

Lemon Pufis :-Put on in a small sance-pan one gill of sweet milk, with one ounce of ground sugar, one ounce of butter, the grated rind of a lemon, and a very little salt, let it come to the boil, being careful to see that the butter is all melted, then with a wooden spoon stir in two ounces of four, and go on stirring till very smooth. Beat it over the fire for a minute, then take It off, and beat into it two eggs. adding one at a time : pour out on a dish, and set aside to cool. From puff paste trimmings, rolled out to an eighth of an inch in thickness, cut out from twenty-four to thirty rounds with a two-inch cutter. put these on an oven tin, a little apart from each other, brush them lightly with beaten egg, put a teaspoonful of the prepared mixture on each round, then turn up the sides so as to form them into the shape of a three-cornered hat, brush them lightly with egg. bake in the oven to a nice light brown, and serve hot on is folded napkin.

## PRESERVED FRUITS.

To Boil or Clarify Sugar, -Take the quantity of sugar that you wish. pue it in a clean brass or copper pan, and to each pound allow half a pint of cold water; if wanted very pure, the whites of eggs slightly beaten may be added, allowing one to eacli four pounds of sugar ; put it on a stove or quick clear fire, and stir it with in spoon, so as to make it dissolve, which it should do before it comes to boil; when it boils, draw it to the side and skim it clean : then return to the fire, and boil till candy high, when it will be ready for the fruit you wish to preserve. To know when sugar is boiled to what is called "candy high," dip a spoon in it, then in cold water. and if it adhere to the spoon and feel soft and tough when you draw it. lt is ready. If wanted for barley-sugar or rock, boil it a little longer till it is quite crisp and breaks freely on the spnon when you try it as above. Spun sugar, or sugar for ornamenting trifles, is boiled to the same height as barley sugar.
Ginger Nablet.- Put on In a brass or copper pan three pounds of coarse sugar with a pint of colcl water, stir till it comes to the boil, boil till cancly hlgh (see CLARIFIED SUGAR), then take it off thefire, and stir Into it one ounce and a half of the finest ground ginger, and keep stirring till you see it beginning to
get thick. Have a sheet of paper greased and laid upon it stone slab, on it place lour ron ruds, so as to forll a syuare, into whicli pour the tablet, let it stand until it set, then turn uver and draw off the paper, and cut into small square pieces. Cimamon, rose, aud lemon tablets are made in the same way, by substituting loaf sugar for coarse, and the essence for the ground seasoning. The rose and cinnilloon are coloured with cochineal.

Cocoa-nut Tablet. - Put on the fire ln a brass or copper pan four pounds of brown sugar with one pint of cold witter, stir till it cones to the boil, and boil till cindy high (sce Clarified SuGar), then take it off the fire. llave a large cocon-nut pared ind grated, add it to the sugar along with the nulk of the cocoarnut, and stir it altogether until you see it begin. ning to stick to the side of the pan. Have a large sheet of paper greased, lay it on an oven tin or large flat dish, pour the tabler on it, and let it stand till it set, then turn it over, draw off the paper, and cut it with a saw or knife into squares, or break it into small pleces.
Cocoa-nut Ice Tablet.-Put on in a brass or copper pan four pounds of toal sugar with two pints of cold water, stir till it comes to the boil, by which time the singar should be quite dissolved, let it boil till candy high, and draw it to the side. Have a large cocoarnut pared and grated, mix logether with the milk, add three-fourths of it to the sugar, and stir till it begins to candy. Have a sheet of paper greased and laid upon a stome slab, on it place four iron rods, so as to form a square, into which pour the tablet. Repeat the above process with two pounds of sugar and one pint of cold water, adding a little cochinenl to colour $i$, and the remaisder of the grated cocoa-nut : when rendy, pour it over the first sheet of tablet, which will be set by the time you have done the second. When quite cold, turn it over, draw off the paper, and cut in strips about three or four inches
Everton x'offee.-Take six pounds of coarse stgar, put it on the fire in a brass pall with two pints of cold water, and let it boil briskly for twenty minutes; then add half a pound of fresh butter, and the same of salt butter, and let it boil ten minutes longer, by which time it should be brittle, which you will know by trying a little on a spoon in cold water; then butter a stone or flat dish, and pour it out. When half colel, mark on the top like diamonds; and when quite cold break it up.
To Preserve Angelica.-Cut the angelica in pieces about lour inclies long, and steep in salt and water for twelve hours. Have a quantity of cabbage or caulifiower leaves, put a layer of then into a clean brass pan, then the saıne of the pieces of angelica, again the leaves, and so on, till all is put in, having a layer of leaves on the top; cover with water and vinegar, and boil slowly till the angelica becomes quite green; then strain and weigh it, and to each pound allow one pound of loaf sugar. Put the sugar on in a dean pan with is much water as will cover it ; boil for ten pinutes, and pour it over the angelica. Leet this stand for twelve hours, pour the syrup off, and boil for five minutes, and again pour it over the angelica: repeat this process once more, and after it has stoorl twelve hours. put all on in a brass pan, and boil till tender: take out the pieces of angelica, put them in a jar. and pour the syrup over them.

Scotch Marmalade. - Take the weighe of bltter oranges required, and an equal weight of loaf sugar: rub the oranges with a clean rough towel, put them in a brass pan witi cold water, and let them boil till the skins are tender, and easily pierced with a pin, changing the water twice at lenst during the process of boiling. When ready, take out the oranges, and keep the water; divide the oranges in quarters, then with a kulfe scrape out all the white from the inner part of the skins, making them as thin as possible, then cut the skins into very thin strips, and lay them aside ou a dish. Put what remnins of the oranges lito the pan contalning the water inf which they were boiled, let lt boil slowly till reduced a little, and press through a sieve. Put all on together now, in a brass pan-that Is the chips, sugar, and what has been pressed thraluglt
the sieve, and let it boil quickly for a few minutes, or till it jellics.

HIashed Marmalade.-Take the weight of oranges recuired, ant wipe them with a clean rongla towel, cut them in four over a sieve, to preserve the juice, take out the pulp and put the skins on with colel water. Cover then closely, and boil until a pin-head will go througl thell easily, then take them out, scrape off the white, and mash thent in a mortar. Take as many pounds of sugar as you have of fruit, boil and clarify it; put in the mashed skins, press through all the juice with a woodell spoon, add the juice of two lemons, put all into a pan, boil, and Guish as in the foregoing recipe.

Grated Marmalade.-Tale the quantity of bitter orauges reguired, wipe them with a cloth, grate all the rinds off, and put it on the fire in a brass pan with a little boiling water, and let it boil for twenty minutes. To each pound of oranges take one pound of loaf sugar, put it in a large basin, break and squeeze all the oranges through a sieve over it ; then put all the pulp into a brass pan, just cover it with water, put it on the fire, and let it boil for ten minutes, then run througll the sieve among the sugar. Put it all on the fire in a brass pan; add the pratings after being drained through a piece of muslin or hair sieve, and let it boil till it jellies, which you will find out by trying a little in a saucer. Lemon mamalade may be made in the same way.
Orange Marmalade (Economical):Take twelve oranges and two lemous, and rub them with a rough towel, then divide then longwise into quarters, remove the seeds, and cut them into very thin slices. Weigh the fruit and put it into a basin with cold water, allowing three pints to each pound, and let it stand twenty-four hours, after which put it on in a clean brass pan, let it boil till tender, and set it aside again in a basin for twenty-four hours. Weigh it again, then put it on, allowing one pound and a half of loaf sugar to the pound, and let it boil briskly for a few minutes, or till it jellies. Lemon Marmalade nay be made in the same way.

Orange Jelly.-Take the quantity of oranges reçuired, half of sweet and the other half of bitter. cut them up, and squeeze through a fine sieve. To a pint of juice allow one pound and a quarter of finest loaf sugar, clarify it (see CLARIFIED SUGAR), pour in the juice, and let it boil about ten minutes; then try a little in a saucer, in order to ascertain whether it is jellied.
Apple Jelly,-Take green juicy apples, peel and cut them into quarters, throwing them in cold water as you peel them, to prevent discolouring, then put them on with the water in a brass pan, let them boil to a pulp, after which pour through a jelly bag. When all the juice has run through, neasure it, and to each pint allow one pouud of loaf sugar, put sugar and juice on in a brass pan, and let it boil for about ten minutes, or till it jellies. removing the scum as it rises to the surface. While the juice is running through the bag it must not be touched with the hands.

Black-Currant Jam. - Gather the black currants when dry. allow to each pound of fruit a pound of loaf sugar and to four pounds allow a pint of raspberry juice, adding a pound of sugar for each pint Put all on in a brass pan, stir slowly till it boils, and hoil for five minutes.

Black Currants for Farts,-Gather the currants on a dry day, and to every pound of fruit allow half a pint of rasp and red-currant juice Allow a pound and a half of sugar to each pound of currants and half pint of juice. Put them all into a brass pan together, and shake it frequently till it boils. Skim it clean, and let it boil constantly for eight minutes; then take it from the fire, put a piece of muslin over the jars. and with a divider take some of the thiunest of the jelly out of the pan. run it through the muslin, fill the jars, and go on filling until the jam comes to a proper thickness. This makes beautiful jelly, and the jam answers better for rills, tarts, etc.

Red-Currant Jelly.-Pick the fruit from the stalks, put it on in a brass pan, allowing four pints of cold water to the gallon of fruit, let it boil moderately till the currants get quite soft and broken, then pour
througha a clean laair sieve; when the jnice has quite run through, retnrn it to the pan, allowing one pound of loaf sugar to the plut, and stir witlo a clean wooden spoon till the sugar melts. When it has boiled rapidly for about eight minutes take it off the fire, remove the scum, and fill into pots
Red-Currant Jelly, No, 2.-Take the quantity of fruit required, squeeze it, and put the juice on in a brass pan. When it comes to the boil, take it off and runthrough a jelly bak. To a pint of juice allow one pound of loaf sugar, add the juice, and boil for three minutes; then try a little in a saucer, to ascertaill whether it is jellied. Be careful not to hoil it too nuch. as it will then be more like treacle tlian jelly. White-currant jelly may be made in the same way.
Fed-Currant Jelly, No. 3.-To six pints of red currants alluw two of white and two of raspluerries. squeeze all together; then measure the juice, and allow one pound of loaf sugar to the pint. Put sugar and juice on in a brass pan, let it come to the boil, and boil for about three ininutes, removing the scum as it rises to the surface.
White-Currant Jellys-Gather the fruit on a dry day, pick it from the stalks, and bruise it with a saucer in a basin, along with some white rasps, and to eacli pint of juice allow a pound of sugar, clarify, and boil candy high. Add the juice, and boil it quickly for six minutes, or you may squeeze and boil as in the foregoing recipe.
Green Gooseberry Jelly.-Take the quantity of green gooseberries required, put them on in a brass pan with cold water sufficient to cover them, let them boil to a pulp, being careful to stir them occasionally, to prevent burning. and pour through a jelly bag. Wheu the juice has all run through, measure it, and allow one pound of loaf sugar to the pint. Put sugar and juice on together in a brass pan, and let it boil for about ten minutes, or till it jellies, removing the scum as it rises to the surface. It is better in making thus or apple jelly to let the juice run through the bag all night, and finish next day.
To Preserve Raspberries.-Gather the raspberries when they are dry, allow to each pound of fruit a pound of sugar, boiled candy high, add the raspberries, and boil thein for twenty minutes.

Raspberry Jam.-To each pound of fruit allow one pound of ground loaf sugar, pick the rasps carefully, put then in a preserving, pan along with the sugar, put the pan on a clear brisk fire, and with a wooden spoon stir carefully from the bottom, as it is very apt to burn. When it comes to the boil, let it boil quickly from five to eight minutes, stirring all the time $;$ draw the pan to the side of the fire, skim it carefully, and pot it.

Raspberry Jam and Jelly.-Have equal weights of raspberries and red currants, pick the currants from the stalks, allow a pound of sugar to each pound of fruit, put all in the pan together, and stir with a wooden spoon until it boils. Skim it carefully when boiling; boil it for tell minutes: when done, run a few pots of the jelly through a bit of muslin, and return the berries that are in the muslin into the pan, and pot it up.
Strawberry Jam.-To each pound of fruit allow one pound of ground sugar. Pick carefully from the strawberries any leaves or stalks that may be among them, put them in a preserving pan along with the sugar, put it on a clear brisk fire, and with a wooden spoon stir very carefully from the bottom, as it has a strong tendency to burn. When it comes to the boil, let it boil quickly from eight to ten minutes: then dravr the pan to the side of the fire, skim care. fully, and pot it.
The frove-end scarlet strawberry is the best for making jam, and should be gathered when dry.
Strawberry Jam (ANOTHER WAY),-Take the quantity of strawberries you wish, pick any stalks or leaves from them, weigh them and put them in a preserving pan, put it on a hot-plate or very slow fire, let them slowly come to the boil, shaking the pan occasionally, to keep the fruit from adhering to the bottonn, and let them hoil fifteen minutes. To each pound of fruit allow one pound of gromid loaf sugar;
adk the sugar to the fruit, and let it boil quickly from ten to fifteen aninutes, when it should be reidy. This is a very good way of making strawberry jum when the fruit is gathered wet.
To Preserve Strawberrios.-Have the fruit gathered very dry and ripe. To six pounds of fruit allow two pints of the juice of red currants, and to each pound of strawberries allow one pound of loaf sugar, and the same toeacli pint of Julce. Clarify and boil the sngar candy high, put in the fruit with the juice, boil it for twenty minutes, take out a little on a saucer, and let it stand till cold. If it jellies it is done; if it runs, boil it a few minutes longer.

Gooseberry Jam.-Take as many red goosebersies as you renuire, allow an equal weiglat of sugar for fruit. To six pounds of gouseberries allow two pints of the juice of raspberries, and one pound of sugar for each pint. Put them all in the pan together, slake then oecasionally, skint well when they are boiling. and let is boil from ten to fifteen nimutes. The Niumeg or Warrender is the best gooseberry for janl.

Apricot Jam. - Weigh equal quantities of pounded loaf sagur and of apricots; slit thens up, take out the stones, and lay then on a flat dish. When they are all done, strew the half of the sugar over them. The following day boil the remainder of the sugar candy high, thell add the apricots, and boil it fifteen minutes, removing the scun as it rlses. Have the kernels blanched, add as many of them to the jan as you wish, and boil five minutes longer.

To Preserve Apricots Whole. - Weigh equal quantities of fine apricots and of loaf sugar ; cut a slice at the stems, and push out the stones; put them on a flat dish, and strew some sugar over them. Boil the remainder of the sugar candy liigh, put in the apricots, let then boil for three minutes, take off the pan, cover it closely, and let them stand for two hours, after which return it on the fire, let them come to boil for three minutes, take off the pan, cover it, and let it stand for two hours. Put it on the fire again, let them boil slowly for fifteen minutes, blanch the kernels, and adil them; carefully remove the scun, take it from the fire, and let it stand ten minutes before you pot it.
Damson Jam.-Pick the danisons carefully, and to each pound allow one pound of ground loaf sugar ; put sugar and fruit together into a preserving pan, put it on a clear brisk fire, stir with a wooden spoon till it comes to the boil, after which let it boil from ten to fifteen! minutes, stirring all the time ; then draw is to the side of the fire, skim carefully, and pot it.
It is a great improvement to the above jam to allow to each six pounds of damsons one pint of apple juice and one pound of ground sugar.
Damson Jam, No. 2.-To each pound of clamsons allow one pound of ground sugar. With a sharp pointed knife cut a slit in the side of each. When all done, put some damsons in a preserving pan, then some sugar, then some damsons, and so on, till you have them all in the pan. Let it stand for an hour or two, then put it on a clear slow fire; stir occasionally with a wooden spoon, and let it boil slowly for twellty minutes. Take a small drop In a saucer to cool; if it is thick, and jellies, it is done; if thin, and runs in the saucer, boil it a few minutes longer. When you take it from the fire, let it stand for ten minutes before potting it up.

## To Preserve Damsons Wholo.-Take an

 equal weight of damsons and pounded lump sugar ; prickle then with a needle, and have the sugar boiled. Put in the damsons, and let them boil a minute or two, then take them off the fire, cover them up, and let them stand two hours. Put them again on the fire, and let then boil up; put them in an earthen dish, and let them stand till next day; strain the syrup into the preserving pan, put it on a clear fire, and when it has boiled ten minutes put the damsons in it. Boil all together slowly for fifteen minutes, then take it off the firc. skin, and pot it.Apple Jam.-Take the Paradise or Ribston pippin, as many as you wish, pare neatly, and cut into cight, the long way of the apple, taking out the core at tho stine time; then cut across into stnall pieces,
and throw them into cold water as you do thent, in order to keep the colour. To every pount of apples take onc pound of loaf sugar, and put it on in a brass pans allowing a pint of water to six pounds of sugar, and boil It candy lighl. Drain the apples front the water, put then into the boiling sugar, and boil gently till soft, but by no means allow thenin to break, then put it up in jars as other preserves.
Rhubarb Jam.-Take as much Vistoria rhubarb as required, when it is tender and full grown; cut on both ends, do not peel it, but rub with a cloth, and eut in pieces about an incli long. To each pound of rhubarb allow one pound of sugar, and put then alternately in a deep dislı. Let it stand twenty-four hours, by which time the sugar should be in a liguid state. Pour the liquid into a brass pan, and boil briskly for half an hour; then add the rhubarb, and boil lialf an hour longer; take it off, and let it stand near the fire another half hour before you pot it.
To Preserve Cherries, -Allow an equal quantity of cherries and ground loaf sugar. With a pin pick out the stones and stalks, put the sugar in the preserving pan, and put in! the clierries as you stone them. When all done, set them on a slow clear fire, shaking them occasionally, and let thein boil for fifteen minutes, then take the pan off the fire, cover it close, and let it stand till cold. Put them on the fire again, let them boil, remove the scum carefully, and boil for fifteen minutes. When you take them from the fire, let thein stand fifteen minutes before you pot them.

Greengage Jam.-Pick and extract the stones from as inany greengages as required, and to eack pound of fruit allow one pound of ground loaf sugar. To six pounds of sugar allow one pint of water, put all together into a preserving pan, put it on a clear, brisk fire, and with a wooden spoon stir carefully. When it comes to the boil, let it boil quickly for fifteen minutes. It is a great improvement to the favour to extract the kernels-blanch, and have them added to the jam, just as it comes to the boil. When it has boiled the specified time, draw to the side of the fire, skim carefully, and pot it.
To Preserve Greengages: - Gather the large greengage pluns, put shem in a pickle of salt and water, and let them lie for twenty-four hours; put in some vine or cabbage leaves in the bottom of a pan, lay in the fruit, cover witli leaves, and fill it up with cold water. Put them on the fire, and let them just come to the boil; add a little vinegar, and keep them in that heat till they change their colour, and become green; take them out and drain them on a sieve. Take of sugar the weight of the plums, clarify it, put In the plums, and let them boil gently for fifteen minutes; then take them out carefully, and put them into jars. When the syrup is cold, pour it over them, and in three days pour off the syrup again; boil it up for ten minutes, and when cold pour it over the fruit.

To Preserve Apples:-Pare and core six pounds of good baking apples, put them into a stone jar, with half a pound of the best white ginger, and four pounds of ground loaf sugar, cover them up, and let them remain forty-eight hours. Boil two ounces of white ginger with a pint of water; strain it into a brass pan, and put in the apples with the syrup and ginger; pat them on a slow fire, take off the scum as it rises, and let them boil for three-quarters of an hour ; then take out the apples with a spoon, and place them in a jar; pour the syrup over them; and when cold tic them up. Take out the ginger when you send then to table.

To Preserve Cucumbers.-Have as many large green cucumbers as required; split then down the middle, and take out the seeds; put them in an earthen dish that will allow them to lie at their leng:h; cover them with cold water, add a handful of salt, cover them up, let them stand by the side of the fire for three days; take them out, and lay them in cold water for four hours, clanging the water twice: put them on a sieve to drain ; put a stick of cinnamon, a blade of mace, and a little white pepper in the inside of each, and tie them up with tape. Have of sugar the weight of the cucumber, and boil it with as much water as will dissolve it: trke off the scum when it rises, put in tho eucumbers, sibumer then for fifteen
minutes, then take them off again, let them stand till quite cold, put them on the fire algail, boil them slowly till clear and green, put the cucumbers in jars, cover them completely with the syrup; when they are cold, tie them up with bladder or starcled paper. Look at them in two weeks; if the syrup is wasted, boil more, and when cold pour it into the jar and tie it up.

To Preserve Jargonelle Pears:-Gather the pears with stalks before they are quite ripe; pare the pears as thin as possible, heeping on the stalks; cut out the black top, and as you peel them put them in cold water; put some cabbage leaves in the bottom of a prescrving pan, lay in the pears, cover them with cold water, and put a few leaves on the top; put thern on the fire, and boil them for half an hour ; thrust the head of a large pin lnto one, and, if soft, take them off and lay them in cold water a little. Have the same weight of sugar as of pears, hoil it with a little water, remove the scum as it rises, and add one ounce of whole ginger. Lay the pears on a sieve to drain, and when the syrup has boiled ten minutes, put in the pears, and let them boil for half an hour ; then take them out with a spoon, put them in a deep dish, and when the syrup is cold pour it over the pears. Cover them up, and in four days pour off the syrup, and boil it for ten minutes. When cold, pour it over the pears, and in four days repeat this process, and do it a third time; thell stick a clove into each pear, where the black top was cut out, and put the pears into jars. Divide the ginger, and pour on the syrup when cold.
To Preserve Pears Red.-Take as many pounds of pears as required; parboil them in water, and peel them. Have clarified the same weight of loaf sugar that there is of pears, add a pint of port wine, the juice and rind of one lemon, with a little cochineal, a few cloves, and a stick of cinnamon. Boil the pears in this till they become clear and red; take them out, and put them in a jar. Boil up the syrup, strain it, and pour it over the pears.

To Preserve Oranges. - Take as many large ligh-coloured and smootl-skimed bitter oranges as required, and with a sharp penknife cut a hole in the top, to admit the end of a teaspoon, with which scoop out the inside, and put the rinds into cold water, with two liandfuls of salt. Let thein stand two days and nights; change them into fresh water frequently, and boil them in a brass pan, with plenty of water, and a close cover, till the head of a pin will easily pierce them. Allow a pound of sugar to each orange; clarify and boil it candy high, place the orange skins in a flat vessel, and pour the syrup into and over thein. The following day pour off the syrup, repeat this four times, and at the last add the strained juice of four bitter oranges and the prepared rind, and boil them about eight minutes, carefully taking them out one by one, and put them into jars, and pour over the syrup, so as entirely to cover them.

To Preserve Green Gooseberries:Gather the gooseberries where they are a full size ; green, hard, and perfectly dry ; top and tail them; put them into wide-mouthed bottles, cork and seal them; put a little straw in the bottom of a large pot, place the bottles standing in the pot, up to the necks in water, watch them until the water boils; take ont the bottles instantly, take out the corks and fill with boiling water, then put in the corks again. When quite cold, seal them, lay the bottles on their sides, in a cold, dry place; and turn them twice a week for a month.
To Preserve Lettuce in imitation of Preserved Ginger.-Take abont three dozen of tender shot lettuces, peel, cut in pieces about three incles long, and throw into a basin of cold water as you do it. When all done, put it on the fire in a brass pan, shake in half a pound of ground ginger, let it boil two minutes, take it off, pour it carefully into a jar, and let it stand for two days; give it another boil for two minutes, and return it to the jar another day. Put on six pounds of sugar in a brass pan, with a quart of cold water; let it boil for ten minutes, take the lettuce out of the ginger water, and wash in cold water; then put it into the boiling syrup, let it boil briskly for five minutes, take it off and pour carefully into the jar. Repeat the boiling until it is clear, allowing a day or
two between each time; but before boiling the third tilne, put on six pounds of loaf sugar with a pint of cold water in a lirass pan ; let it boil briskly for $t_{1} \cdot 11$ minutes, then pour all together. In the last Loilin: put in an ounce of the essence of ginger, soume slired ginger, and two dozen of cayenne pods, tied in a mustin cloth. When you pot it up, you must let the shred ginger and the cayenne pods lie on the top. This is a good imitation of foreign ginger.

To Keep Peas Green,- llave full.grown green peas. Fill wrde-mouthed bottles up to slie neck with the peas; place them on the fire in a pan of cold water, and, when it boils, take them out and seal thent, and keep the 11 in a cool place.

## PICKLES, SYRUPS, AND SUGARS.

To Pickle Onions. - Have as many small pickling onions as you wisl. Take off the outside skin, throw them into salt and water as they are done. Let thent stand for four days, clanging the pickle once or twice, then put them into a jar, and pour over them boiling water and salt. Cover them closely, and when quite cold, pour oft the pickle and pack thein in wide-mouthed bottles. Have some strong vinegar boiled, and some sliced ginger and nustard seeds. Fill up the bottles, and, while hot, cork and seal them.
Mised Pickles.-Take some small cucumbers, French beans, sprigs of cauliflower, and some white onions. Make a pickle of salt and water that will carry an egg; pour it over them, let them lie for two or three days; then put some cabbage leaves in tre bottom of a brass pan, put in the pickles and the salt and water, put it on the fire, let them get hot, but not to boil. Keep them by the side of the fire, or on a slow hot-plate, until they get quite yellow; take them out, and clean out the pan; put some fresh cabbage leaves in the bottom; lay int the pickles, put in an equal quantity of vinegar and water to cover them; shake a handful of salt over them, and cover them with a few cabbage leaves. Set them upon the fire, put on a cover when they become hot, draw them aside, and keep them hot, until they are all green over. Then put them in a sieve to drain; have some vinegar boiled with sliced ginger, a few blades of mace, mustard seeds, and pepper-corn. Put the pickles into bottles or a jar, pour the boiling vinegar over them until they are completely covered, cork and seal them imniediately.
To Pickcle Eeetroot.-Take as many heads of beetroot as you intend to pickle, wash them well, but do not cut or break the points. Put them in a pan of boiling water, add a handful of salt to them; let them boil about three-quarters of an hour, take them off, and skin and trim neatly. Cut them in slices about laalf an inch thick, put them in a jar; have some spices with vinegar boiled, pour it over the beetroot, and when cold tie it up with a piece of bladder.
To Pickle Fed Cabbage.-Take as many hard stocks of red cabbage as required ; trim them, cut off the top points, slice them as thin as possibleyon cannot slice them too thin: put them on a large flat dish: shake two or three handfuls of salt over them, cover them up; next day shake them about and add a little more fresh salt. Let them stand two days, then take a coarse cloth and wring them, put them in bottles or a jar, and pour over them vinegar previously boiled with spices, as in mixed pickles, then cork and seal them.

To Piclele Cauliflower, - Take as many heads of white cauliflower as you intend to pickle. Break them down in small sprigs, put them in a dish with salt and water, making the pickle strong enough to carry an egg. Let thein lie four days, put them on in the pickle; let them get hot, but do not boil thern; drain them on a sieve, have vinegar witl spices boiled, put the cauliflower into a jar, put a piece of muslin on the top, pour the boiling vinegar over them, and cover immediately.

Broccoli is done exactly in the same way.

To Pickle Mushrooms.-llave as many button mushroms as you mend so pickle gathered in the morning before the sun is on hem, cut ofit the stalks, peel, and put them in cold water. When all done, have a stew.pan with boiling water and salt; let them boil five minutes; then put then iu a sieve to drain for in hour. Boil for ten minutes some vinegar with pepper-corns, four blades of mace, and mustard seed, put the mushrooms in a jar; put a piece of muslin over the jar. pour in the vinegar; let it stand till cold, then tie it up with a piece of bladder ur double paper.
Mushroom Ketchup.-Have the mushrooms gathered in the morning betore the sun is on them. Break them, in small pieces, put them in a large dish, and sprinkle a good deal of salt on thens; let them lic: for four days, turning them daily, then lay them on a sieve, or put them in a thin bag, and let then run all night until the liquor is all run from then. Take the mushroons out of lise bag, put then on in a little cold water, let them boil slowly tor about half an hour, then drain, and add this second liquor to the first. Put the liquor in a stew.pan, with plenty of mixed spices, let it boil for five minutes, run it through a piece of muslin into a basin, and, when cold, bottle up, cork, seal, and keep it in a dry vlace.
Black-Currant Vinogar,-Take the quantity of black currants required; put thein into a jar, break them with the hand, and cover with vinegar, let them stand for forty-eight hours; put them into the hair sieve, and let it stand till all the juice has run from them. Put the fruit into a brass pan, and nearly cover it with cold water, let it come to the boil, then take it off, and press as much as possible through a hair sieve. Mix this second juice with the first; measure it, and to each pint allow half a pound of brown sugar; pour back into the brass pan, let it boil for five minutes, run through a piece of muslin. and when cold bottle it up.

Gunner's Delight. - One quart best white wine vinegar, half an ounce of mace, half a teaspoonful of cayenne pepper, four tablespoonfuls of India soy, six cloves of garlic, one pennyworth of cochineal, let it stand for some time, shaking it every day; then put intn small bottles.

Black-Currant Syrup,-Have two or three quarts of black currants, put then in a jar, and set them in a dry place. Let them stand a few days, take a kitchen cloth, and wring them, and to every pint allow three-quarters of a pound of brown sugar, put it on the fire in a brass pan, and let it boil five minutes; run it through a piece of muslin, and bottle it up when cold.

Ginger Beer.-Pour a gallon of boiling water over three-quarters of a pound of loaf sugar, one ounce and a quarter of sliced ginger, and the peel of one lemon. When lukewarm, the juice of the lemon and a spoonful of yeast are added. It should be made in the evening, and bottled next morning in half-pint stone bottles, and the corks fastened down.

Ginger Beer, No. 2.-For a ten-gallon cask, eleven gallons of water, fourteen pounds of sugar, the juice of eighteen lemons, and one pound of ginger are allowed; the sugar and water are boiled with the whites of eight eggs, antl well skimmed just before coming to the boiling point. The ginger, which must be bruised. is then added, and boiled for twenty minutes. When cold, the clear part is put into the cask, together with the lemon juice and two spoonfuls of yeast ; when it has fermented for three or four days, it is fined, bunged up, and in a fortnight bottled. It may be made without the fruit.

Ginger Wine.-Take sixteen pounds of brown sugar, and the whites of six eggs well beaten, stir it in six gallons of water, and put it on to boil. The scum, having well rizen, should be taken clean off, and six ounces of the oest white ginger cut small added, and boiled for three-quarters of an hour. When it has become lukewarm, put it Into a wooden vessel, together with a teacupful of fresh yeast. the juice of six lemons, and the same of Seville oranges, made in a syrup. When it has fermented for three days, put it into the cask, with two hottles of brandy, or four of whisky. The fermentatlon should be bunged up, but not very tight at first ; it may be fined in eight or ten
weeks, and bottled, or allowed to stand in the cask uine or tell weeks.

Wine for Kitchen use.-Take all sorts of ripe frutt, bluse it in a large jar, and cover with cold water; let it stand for two or three days, then run thruugh a fine sieve into a clean tub. To every quart allow one pound of raw sugar, stir until it is quite dissolved, when you must fill up your cask or casks quite full, in order to increase the fermentation, which may coutinue for six days, stirring and filling up often, daily. When the fermentation ceases, bung np closely, set it in a dry place, and let it stand for six months. When you are to bottle it, run it through an old flanacl bag.
Raspberry Vinegar.-To four pints of rips raspberries allow a put and a half of vinegar, bruise the fruit in a large basin, pour the vinegar over it, cover it, and let it stand for three days. l'ut a sieve over a large basin, break the fruit, put it into the sieve, and let it run for a night, but do not press it. Allow to each pint of juice three-quarters of a pound of brown sugar: put it all on the fire in a brass pan, stir occasiunally till it boils; let it boil three minutes, and run it througln a piece of muslin; when cold, bottle it up.
Gooseberry Vinegar.-To each pint of ripe gooseberries allow three pluts of cold water previously boiled, bruising the fruit well first. Let it stand forty. eight hours, then strain through a jelly bag, letting it run until all the juice has run through, to each pint of which add half a pound of raw sugar, stirring it till the sugar is dissolved. Then put it into a barrel, and let it remain ten months.
Mushroom Powder,-Pick, skin, and clean half a peck of mushrooms, throw them in cold water, drain and put them into a sauce-pan with two spoonfuls of white pepper, a quarter of an ounce of nace, and five cloves pounded. Sinmer and shake them till dry, but be careful that they do not burn. Lay them on dislles, put them into a cool oven to dry, then beat them to a powder: put it into wide-mouthed bottles, tie leather over the corks, and keep them in a dry place.
Inemon Pickle.-Cut into quarters and pick out all the seeds of six medium-sized lemons, put them into a jar, strew over them two ounces of well-beaten bay salt ; cover the jar with a cloth and plate, and let it stand three days; then put' a few cloves in, and a quarter of an ounce of mace beaten fine, one ounce of garlic or shallot, two of mustard seeds, and one nutmeg sliced. Make a quart of vinegar boiling hot, and pour it over the ingredients; cover the jar, and in three or four days close it with a bung, and tie leather overit. It will befitfor use in a week, and is an improvement to most sauces, and particularly to fish sauce.
Currant Wine. - To forty pints of currants allow ten pints of water ; bruise the fruit and lay it on a sieve, pour the water on gradually, and squeeze out the stalks and seeds with your hand. To every pint of liquor add a pound and a lialf of sugar. The best way to melt the sugar is to reserve a little of the water. which you can warm and pour over it, stirring all the time, otherwise it is apt to gather into knots. Before you bung it up add a pint of whisky, work it in a tub, and take off the scum.

## Sweet Wine from Ripe Currants -

 The fruit is gathered when quite ripe, and the stalks being carefully picked out, it is bruised in the lands, and then strained through a canvas bag into a tengallon cask. Forty pounds of fruit, thirty of sugar, and a quarter of good tartar are allowed; the materials luving remained some hours in the tub in which it was nixed, it is removed to the cask, the bung-hole covered with a tile, and the cask is stirred every other day for ten days, and filled up every day as the fluid wastes. The fermentation may continue from three to six weeks. When it has subsided, the wine is racked into a cask, in which matches dipped in sulphur lave been burned, or in whicli a little of the sulphate of potash, or of oxymuriate of potash has been put. It should be again racked and fined in March, when the wine is completed, and may he bottled, or allowed to remain in the cask.Ripe Gooseberry Wine may be made by the same rule, excluding carefully from it all the lusks.

BlackeCurrant Wine.-The same varieties of proportions are allowed an this as in the otlicrs alreacly uentioned. The fruit being picked, it is brought to the boiling point in as much water as in avoid any rlsk of burning. It may then be strained, and put into the cask, or the lifuicl and skins may, with the other ingredicuts, be first fermented in the vit or tub, by which the wine will acquire a higler colour and favour.

Strawberry and Raspberry Wine.lirom either of these fruits agreeable wine may be obtained by following the rules given for making currant wine; but it. will be found a cheaper and Detter methnd to add a litle syrup or juice of the fruit to any flavourless currant wine when the fermentation begins to decline. Currant wine may also be flavoured with odoriferous flowers, such as cowslip, elder, mignonette; the quality of roughness is connmunicated by catech and kenochips of oak, and of beech, and also the sole, a small quantity of these or of the flowers being put iuto the cask when the first fermentation is over, and as soon as the wine has acquired the desired flavour it is racked and fined. The flavouring articles, such as orisroot, cloves, ginger, sweet and bitter almonds, are put into a muslm bag. and hung $\ln$ the cask for a few days, cluring the stage of insensible fermentation-tliat is, after the first fermentation has ceased; care being taken to taste the liquor frequently, so that the flavouring matter may be withdrawn as soon as it has produced the desired effect.
Milk Punch-Put two pounds and a quarter of loaf sugar into a good-sized jar, pour over it two quarts and a half of boiling water and cover it up; when nearly cold, add the juice of twelve lemons, cover up again, and let it stand till morning; then add one bottle of whisky, one of pale Jamaica rum, and stir it a little. Boil one quart of new milk and pour it in, iund while doing so, be sure you do not stir it. Cover upagain, and let it stand till mid-day ; then run through a jelly bag, and return till it comes is pure as water, and bottle it.
Lemon Syrupa-Squeeze about three dozens of lemons, put the juice into a jar, and add to it one quart of cold water previously acidulated with two ounces and a half of tartaric acid; add three pounds of loaf sugar, and stir occasionally till quite dissolved; pour it through a jelly bag, let it run all niglıt, then bottle it up. Orange syrup is made in the same way, by substituting oranges for lemons.
Wine from Mised Fruits-The three varietics of currants may be used in the largest proportions, and being nicely picked from the stalks, they are allowed just to boil in as much water as to prevent their burning. Of raspberries, strawberries, and cherries (black-heart is the best), equal quantities may be allowed; they are infused with a little water. Gooseberries may lee used to advantnge, but must be prepared separately; more powerful bruising in an equal quantity of water, and siraining through a canvas bag, the other fruits being also strained. To each gallon of julce thus obtained four pounds of loaf sugar and half an otnce of crude tartar are allowed. When the material has stood some hours in the tub in which it was mixed, it is removed to the cask, and managed as currant wine.

Strawberry Syrup.-Put twenty-four pounds of strawberries into a jar, nud pour over them four quarts of spring water previously acidulated with ten ounces of tartaric acid. Let them remain twenty-four hours, then strain them, taking care not to bruise the fruit. To each pint of clear liquor allow one pound of loaf sugar ; stir it occasionally. When quite dissolved, pour into a well-cleaned cask that will just contain it. except about a quart, which must be left out for the purpose of filling up during the process of fermentation. When it ceases, bung up, and let it stand for two inonths, when it will be ready for bottling.

Faspberry Syrup.-Put twenty-four pounds of raspberries into a jar, and pour over them four quarts of spring water previously acidulated with ten ounces of tartaric acid. Iset them remain twenty-four hours, then strain them, taking care not to bruise the fruit, To each pint of clear liquor allow one pound of
loaf sugar'; stir lt occasionally. When quite dissolved, pour it into a well-cleaned cask that will just contain it, except about a quart, which must be kept out for the phrpose of filling up during the process of fermenta. tion. When it ceases, bung up, and let it stand for two months, when it will he ready for bottling.

Baking Powder.-Two teaspoonfuls of car bonate of suda, three teaspoonfuls of creani of tartar, one teaspoonful of rice four. Yound tlie soda in a ninortar, then add the rice flour and pound together then the crean of tartar, and repeat the pounding till thoroughly mixed. Put it into a wide-miouthed bottle, cork, and put aside for use.

Cochineal.-Dissolve one ounce of sub.carbonate of potash in eight ounces of cold water, add to it one ounce of the best cochineal, previously bruised in a mortar, stir over the fire with a switch until it las boiled for five minutes. Mix lightly one ounce of potash alum with half an ounce of citric acid, add these gradually to the boiling liquid, let it boil, stirring constantly, until it ceases frothing up, then pour through a linen bag on to four ounces of sugar in a basin. When it has nearly run through, pour in about cight ounces of hot water to wash all through the bag, and bring it up to the measure required from the ingredients given. When quite cold, pour into a bottle, cork up, and put aside for use.

Pink Sugar.-Spread one pound of grated or ground loaf sugar on a sheet of paper; bruise a piece of carmine the size of a lean in a mortar with about two tablespoonfuls of liquid cochineal, sprinkle it over the sugar and rub between the hands until it becomes equally coloured, let it stand till dry, rubbing it occasionally to prevent it from getting into knots, put it into a bottle with a wide mouth, and keep in a dry place,

Vanilla Sugar.-Open two vanilla pods, take out the seeds, and pound them in a mortar with a little ground white sugar; then put it into a bottle with a glass stopper, and put aside for use. The empty pods may be used for creams or ices.

Orange or Lemon Sugar -Take a piece of loal sugar, rub the rind of the orange or lemon on it, till quite full; then grate it off, and repeat till the sugar is done. Put the sugar on a plate, set it on the stove to dry, then pound it, after which put it into a bottle with a glass stopper, and set aside for use.

Lemon Squash.-Pare very thinly the outside rinds from three lemons into a bowl, remove the inner white skin, and put it away, then slice the lemons crosswise as thinly as possible on a plate, putting away the seeds; add slices and juice to the rinds, along with two and a half ounces of sugar and three pints of boiling water; cover, and let stand all day or all night according to convenience, then strain off into a jug and serve.

Scouring Soap.-Put one pound of caustic soda into one pint and a half of cold water, stir occasionally till quite cooled down, by which time the soda will be quite dissolved. Have four pounds of fat melted and poured into a vessel large enough to allow the stirring. which must be constant, to be done freely, pour into this the soda and water, being careful to do so very slowly, and let it stand for twenty-four bours, when it will be ready for use. A pair of old gloves should be worn during the making of this soap. It is very cleansing, makes kitchen tables white, and a very good way to use up waste fat which has becone useless for frying.

Claret Cup.-Pour two quart bottles of claret into a four-quart jug, add to it three bottles of soda water, two glasses of sherry, lialf a glass of brandy, curaçoa, or marasclino, two lemons sliced, loaf sugar to taste. and about a pound of pure spring-water ice. Set it aside for a little to dissolve the ice and sugar, and serve. If liked, a sinall bunch of borage may be put into it.
Champagne Cup.-Pour two quart bottles of cliampagne into a four-quart jug, add to it two oranges sliced, three bottles of soda water, two glasses of sherry, and about a pound of pure spring water ice. Let it stand a little to dissolve the ice, and serve.

Coffee.-Have a muslin bag, with a wire round the mouth or opening, to fit the top of the coffec-pot. When the coffee is wanted, put this bag into the cofleepot, fitting the wire round the edge, pour boiling water throngh the muslin into the pot, in order to heat both. then pour it out, and put the newly ground cotfee intc
the bag, nllowing a tablespoonful to a break fist-cupfut of water. Pour the water boiling over the coffee, letting it run, and add more till the measure of water required has been added. Let it stand near the fire for a minute or two, and seave very hot, with boiled milk in a separate juy, or with switched crean.
Coffee, No. 2.-To make two breakfast-cups, heat one ounce of roasted coffec beans in the oven, then put them in the coffec-pot, pour over them half a pint of boiling water, cover closely, and let it stand for an hour, then add half a pint of boiling milk, and serve as liot as possible.
Apple Paste for Decoration.- l'ut on in a brass pan some apples cut in slices along with any parings or cores left from other dishes of apples, add rind of lemon sulficient to give llavour to the quantity, also a few pieces of whole ginger: barely cover with cold water, boil to a pulp, stirring cluickly and constantly. and pass through a wire sieve. To each pint of pulp allow twelve ounces of loaf sugar, return to the pan, add some lemon juice, let it boil from twenty to thirty
minutes, or till it becomes very stiff, stirring carofilly and guickly to prevent burning, then pour into :a pudding dish and set aside for use. It may le coloured wariously with li rench vegetable colouring, to be stirres in inmediately after taking it off the fire.

Victoria Punch.-Take the jnice of six lemons and the grated rinds of two, one pint of clarified sugar, and half a pint of water, mix together, then strain into the freezer, and frecze in the usual way. Add one flass of brandy, the saine of ruin, and go on freezing a little longer, as the spirit brings it down. Beat up the whites of three egess till quite stiff, then mix gently with four ounces of ground sugar, and stir slowly into the ice. Serve in glasses.
Barley Water. - Wash two ounces of parl barley in cold water, then put it into a clean enamellect pan with a litte water, let it boil five minutes and pour off the water. P'ut it on again with two quarts of Iresh water and the peeted rind of one lemon, let it boil gently till reduced to a quart, then strain, and when cold add the fuice of the lemon.

## (ilients.

## ; NOTE

This Dictionary has been compiled to give, as briefly as possible in simple language, an account of the Nature and Treatment of Common Diseases, and of what is to be done in emergencies or till the Doctor comes.

## MEDICAL DICTIONARY

Abrasion is applied to the removal of the outer skits or cuticle by riolent friction; for example, coming in contact with a hard surface, or by falling, by which the skin is eroded. The treatment consists in removing all dirt that nay have embedded itself in the injured surface of the skin, and then applying an antiseptic, the best of which is carbolic acid mixed with wide of zinc ointment in the proportion of one to sixteen or tiventy.
Abscess is an accumulation of matter either of a purulent or serous nature. If this consists of pus or natter, it is generally accompanied by severe pain a:d swelling. If, on the other hand, it contains fluid which is not undergoing decomposition, it may only nccasion incosvenience. In either case it is desirable that the fluid be given exit to as speedily as possible. This can be done without risk if antiseptic precautions are rigorously adhered to. To soothe the pain hot applications in the form of poultices or bot fomentations are very useful.

Acarus is a parasitic insect affecting the skin. It burrows between the cuticle and true skin, where it lays its egss and gives rise to the disease commonly called Itch. Tbe ireatment consists in destroying both the insects and the eggs as they mature by means of storax ointment well rubbed into the surface of the skin night and morning for two days in succession, then taking a warm bath, using carbolie soap freely as a cleansing agent, and repeating the application of the ointment during other two days, and again having recourse to the bath and carbolic soap. To be certain of a cure it is well to err on the safe side and apply the storax ointment for a further period of two days, when, as a rule, the parasite will be completely destroyed. Of course, all the clothing which has been worn during the process should be thoroughly cleansed and disinfected.

Acne is a disease of those glands of the skin which secrete the sebaceous or oily matter. It is characterized by pimples occupying the sites of these glands. One form of Acne is that which goes under the populir name of Comedones or Black-heads. On squeezing these, the retained secretion comes out on the skin like a little maggot. Acne very frequently occurs upon the face, shoulders, back, and chest. It is most common from the ages of 15 to 21 . To prevent the disease. frequent washing with a good soap (Years) and warm water is most efficacious, but when the disease has obtained a footing the following Iotion will be found useful: Flowers of sulphur, onedrachm; rectified spirits of wine, one ounce; glycerine, ono ounce; elderfower water to make eight ounces. Shake the bottle and apply every nigbt, at bed time, to the eruntion.

Aconite, Monkshood or Wolfsbane, is an Alpine plant, and has been introduced into almost every garden. It is a deadly poison, and as its root some. what resembles that of the Horse Radish many acci-
dents have occurred from mistaking the one for the other. The taste of the two are, however, quire different-the Horse Radish being pungent and sweet, and causing the eyes to water very freely. When Aconlte is partaken of, however, it produces. severe pain at the pit of the stomach, followed by nausea and vomiting, also a tingling sensation of the lips, feebleness of the pulse, and a cold, clammy sweat. In the majority of cases death occurs within a very short period after its ingestion. The treatment of poisoning by Aconite consists in inducing free vomiting by the adininistration of inustard and water or sulphate of zinc. This should always be followed by a full doze of castor oil. Stimulants, such as brandy and strong coffee, should be given. Aconite is, however, a most useful medicine, and when given in proper doses has a wonderful power in controlling fever, sore throat, inflammation of the lungs, and neuralgia. For these purposes an adult may take five drops to begin with, and then two drops repeated every half hour until the pulse is reduced to its normal standard.

Actaea Racemosa, or Black Snake Root, is a useful remedy in lunbago and the other forms of muscular rheumatism. It also goes under the name of Cimicifuga Racemosa, because of the repugnance borne to it by bugs. It is usually administered in the form of tincture, of which to drops may be taken every two hours in water.

Acute is a term applied to inflammatory disease which develops very rapidly and runs a short course; for example, inflammation of the lungs or pneumonia.

Adder Bites should be treated either by excision of the tissue immediately surrounding the bite, or by the free application of ammonia, caustic, or carbolic acid.

Addison's Disease is associated with atrophy of the capsules of fat surmounting the kidneys. Its symptoms are bronzing of the skin and anaemia. It is alvays associated with great debility, sickness, loss of appetite, and a peculiar pearly condition of the whites of the eyes. These?symptoms are followed by a characteristic bronzing of the skin, most frequently found on the face, neck, armpits, and lower part of the abdomen, and in the midst of these spots frequently are found areas completely devoid of pigment. The treatment consists in improving the general health and in the free administration of iron and arsenic.

Adipose is applied to the fatty matter of the body which sometimes becomes so superabundant as to assume the form of disease. To reduce this tendency it is necessary that those articles of diet which are known to produce fat be altogether avoided or used in very small quantities. The diet, therefore, ought to be so regulated that neither fat of any kind, starch y food, nor articles containing sugar be partaken of. Another safeguard against obesity is to imbibe as little fluid as possible. Liquids should not, for instance, be taken duritig eating, but only after the food has
been thoroughly mixed with the saliva and gastric Juice : in other words, no fluid shoukl be partaken of during a meal, but ouly after the meal is finished.
Aothers are those volatlle liquids which are employed in medicine as stimulants and antispasmodics. Annongst thoso most comnonly in use arenitric acther, or sweet spirits of nitre, sulphuric aether, and clıloric acther.

## Aftor-pains. Sec

Sickness.
Ague, or Intermittent Fever, or Malarial Fever, Is peculiar to marshy districts where decomposition of vegetable matter is coustantly in process. This evidently gives rise to the development of microscopic organisms which find an entrance into the body and produce the symptoms characteristic of the disease. The symptoms commence with a feeling of general lassitude, a sensation of weight in the region of the stomach, and a chilly sensation which rapidly develops into actual shivering and chattering of the teeth. When the disease appears to be at its height the colour of the skin becomes livid, and the body presents a shrivelled appearance. The circulation is feeble and the mucous surfaces become pallid, and sometimes actual stupor or convulsions may supervene. There are shooting pains throughout the bead and limbs. This cold stage will ill a short time be followed by intense heat and llushing of the whole body, when the pulse becomes quick and bounding accompanied by a throbbing headacle, hot skin, intense thirst. thickly coated tongue, and dark-coloured urine. This second stage is again followed by a third or sweating stage, when copious perspiration gives rapid relief. All these symptoms may again develop in twenty-four, forty-eight, or seventy-two hours, or at longer periods as the case inay be. This periodicity, as it is termed, is one of the chief features of the disease, and according to the time which is occupied by it in recurring it is called quotidian, tertian, or quartan. Quinine is not only the best preventative but also the best curative agent which at present we are acquainted with. Other remedies, such as arsenic and sulphate of zinc, are also of service. I should, however, be very much inclined to recommend the employment of phenacetin in this disease, as it has a marvellous power in controlling high temperatures when due to fevers. Quinine may be given in five-grain doses every two hours, or plenacetin may be adninistered in ten-grain doses every four hours, but in every instance before employing these antipyretics it is essential that the bowels be thoroughly cleared out, either by means of a full dose of castor oil or carbonate of soda and rhubarb. Within the last few years malarial districts which have been freely planted with the eucalyptus tree have been rendered healthy, and from these areas the disease has been completely eradicated. This seems to be due to its power of rapidly absorbing moisture and also to the abundant exudations of its essential oil given off by the leaves especially, and to a lesser degree by the whole plant.

Albumon is one of the chief constituents of the animal body. The white of egg is albumen in nearly a pure form. This substance exists in the watery portion of the blood in a very large proportion. From the white of the egg the chick in its development receives its nourishment, and from it is constructed its muscles, bones, and nerves. It can easily be seen then what a nourishing agent this substance naturally is. In its pure state it possesses a very important property of being an antidote to various mineral poisons, such as sulphate of copper, or blue vitriol, bichloride of mercury or corrosive sublimate, and chlorine.

Albuminuria is a term applied to the urine when it contains albumen in solution. This may arise either from organic disease of the kidneys or from a weakened action of the heart, which interferes with the functional activity of these organs. It can be detected in the urine by boiling a small quantity or by the addition of nitric acid to the suspected fluid, when coagulation of the albumen will immediately take place.

Alimentary Canal consists of the mouth, oesophagus, stomach, duodenum, sinall intestines and
largo Intestines. The two latter are suill further subdivided, but these subdivisions are only of interest to the anatomist.
Aloes is one of the most useful and extensively used purgatives. It is, however, seldom given alone, but gentrally in combination with some carminative which has the effect of preventing the spasmodic pain which this substance is liable to give rise to. The principal effect of aloes is upon the colon or large bowel, whose action it appears to excite without increasing the amount of the evacuation. In consequence of its cheapness and purgative properties it enters largely into the composition of quack medicines.

Alopecia is applied to baldness which occurs in patches, thus it is generally known by the term of Alopecia Areata. This disease is as a rule due, not so much to actual disease of hair bulbs as to nervous debility which affects their nutrition. This knowledse would lead us on this account to treat the disease not so much as a local affection but as an indication of general nervous debility. Our efforts, therefore, should be directed towards the restoration of the nervous tone of the system at large.

Alum is a conpound salt of potash and alumina in combination with sulphuric acid. It is one of the cheapest as well as one of the most efficacious astringents that are known, and has the power of controlling haemorrhage and catarrhal discharges when applied locally and in solution. It is useful also as an astringent in sore throat, being then used dissolved in water, and employed as a gargle.

Alvine is applied to the evacuation of the bowels; for example, alvine discharges, etc.
Amaurosis is total or partial blindness depending upon disease of the optic nerve or the brain. In this disease the eye-ball appears to be in no way altered, with the exception of dilatation of the pupil, which gives the eye an unmeaning expression. This disease may be induced by overworking the eye in an intense light, smoking to excess, rupture of a bloodvessel in the neighbourhood of the optic nerve or in the eye-ball itself, gout, indigestion, or excesses of any kind. In any case it is desirable that competent medical skill be immediately called in.

Amemonia is a diffusible stimulant and also an expectorant and counter-irritant. It is very useful in fainting, bronchitis, congestion of the lungs, and general weakness, when admlnistered internally. As an external application it is frequently employed where there is any inflammation of an internal organ or tissue.
Ammoniac Gum is an antispasmodic and expectorant, and is of considerable service in chronic bronchitis.
Amyl Nitrite is a powerful antispasmodic when employed either by inhalation or when taken by the mouth. It is especially useful in that formidable disease known as Angina Pectoris.
Anaersia is applied to that condition of the blood whose characteristic is a deficiency of the red corpuscles. It is most prevalent in females, and, as a rule, takes its origin in a prolonged period of constipation. The absorption of the foetid matter from the colon in these circumstances, by contaminating the vital fluid, appears to have a destructive effect upon these red corpuscles, the blood loses its colour, and consequently its carrying power of oxygen is interfered with. The symptoms are: A pallid complexion, with a blanched appearance of the lips and gums and all mucous surfaces; there is general languor and debility and breathlessness on the slightest exercise, coldness of the feet and hands, and a feeling of general malaise; there are also frequent attacks of palpitation. The remedy consists in a careful attention to dier, the daily evacuation of the bowels, and the administration of iron in large doses, the most efficacious preparation of which is that known as Blaud's Capsules. The effect of these, however, is very much enhanced by the combination of small doses of aloes, which tend to keep the bowels in a healthy condition; indeed, iron slould never be administered unless precautions are taken to ensure a free alvine evacuation every day.
Anaesthetics, or agents which produce insensibility to pain, whether applied locally or to the system
generally by inhalation. These should never be given but by a duly qualfied pluysician or surgeon, and on 110 account should a person attempt to artminister any one of these to himself. It need hardly be said that many operations, which at one time could not possibly have been performed, are now quite easily undertaken by the surgeon because of the passive co-operation which is given by the patient. The nost notable of these are the operatlons which are now so frequently and successfully performed upon the organs of the female pelvis and abdomen.
Anasarca is the term applled to a dropslcat condition of the limbs and tissues which retain tho impression called pitting, produced by pressure of the finger. Ir is usually due either to disease of the heart or kidneys. It may, however, be consequent upon obstruction of the veins beyond the scat of the allection.
Aneurism is a dilated condition of a portion of an artery. It may either be due to disease of the artery itself or to an injury inflicted upon it. The most dangerous seat of aneurisun is in the norta, or main artery coming from the lieart ; but the most frequent seat of the disease is probably in the artery situated belind the knee joint, called the popliteal. In a popular work of this kind it is quite superfluous to indicate any line of treatment, as this must necessarily come under the supervision of a competent medical man.
Angina Pectoris is one ot the most painful and agonizing diseases that the human frame can possibly sulter from. lis symptoms are a terrible struggle for lreath combined with pain of a most acute type situated over the region of the heart. It is always due to heart disease, but as a rule is brought about by some gastric disturbance in persons suffering from affections of the heart. The symptoms are attended by a feeling of impending death from suffocation. The treatment consists in the administration of nitrite of amyl, either by inhalation or by the mouth. When taken internally it is generally combined with nitro-glycerine in minute doses, and this combination has a marvellous effect upon the disease. As an adjunct to this treatment mustard poultices over the region of the heart will be found of considerable service. The precautions necessary to ward of the disease are entirely those which promote digestion, viz., the ayoidance of food which is known to disagree with the individual, and the administration of diges. tives such as pepsine, ingluvin, combined with aromatics and alkalies. The following will prove of service where the stomach is at fault : Pepsine, compound aromatic powder, of each three drachms; bicarbonate of soda, one ounce ; calcined magnesia, half an ounce. Mix. Half a teaspoonful in water three times a day immediately after food.
Animation, Suspended, is that condition of the body where life is threatened in consequence of some impediment to the breathing. The principal canses of this condition are-drowning, hanging, or inspiring gases which are not conducive to the maintenance of life, such as fire-damp, the inhalation of carbonic acid gas, and coal gas. For the remedies in such cases see special articles upon these subjects.

Aniseed is a most useful carminative, and is especially applicable to the treatment of flatulence in children. It is administered either as sugar of anise, which is simply sugar of milk mixed with aniseed oil, or aniseed water, which coutains the oil of aniseed in suspensi,n.
Ankle is the joint connecting the foot with the leg. Its connection is maintained by strong ligamentous hands. These sometimes become strained or stretched by a false movemeIt of the foot, at other times slight rupture may occur from the same accident. When such is the case we find the condition which we term a sprained ankle. The proper treatment of this accident is at once to apply leeches to the part, or a soothing and at the sarme time stimulating liniment. while rest must be enjoined for some dlays. During this perind it is most conducive to the comfort of the patient that a handare, preferahly of flannel, be applied to the joint so as to afford it support and at the same time restrain novement, Not unfreguently the
severe traction upon these ligaments may result in a fracture of the lower portion of the tibia or main bono of the leg, which is called the malleolus. If this compllcation shoukl be prescut it will he necessary to put the legr up either in is splint or a starch bandages but this proceeding call only be carried out by a nedical man.
Anodynes are those substances whicle have a soothing etlect upon the human bocly. The principal anodynes are - opium, chloral, hyoscyamus, hop, canalis indica, clitoralaniul, and sulphonal: while those which act locally are-menthol, cocaine, bella. donna, and linitnents containing opium, chloroform, chloral, etc.
Ant-Acids are those substances which correct an acid condition of the stomach, such as soda, potash, lithin, bismuth, anel waguesia. These are generally called into requisition in indigestion.
Antimony is a mineral medicine useful in cases of bigh fever, but this remedy has been lately superseded by much safer and less poisonous agents. It is very useful in certain forms of chest complaint, such as bronclitis, pneumonia, and pleurisy. It. has a powerful depressing effect upon the heart's action, and is one of the substances that have frequently been employed by criminals as a poison. Its presence. however, Is very readily detected in the blood and secretions" of its victims.
Antipyrin, as its name indicates, Is a medicine which was first employed as an anti.febrile agent. It
afterwards cane into great repute in the treatment of neuralyia. It is a drug, however, which requires to be taken with the greatest caution, as it is liable to produce very depressing effects upon the heart's action.
Antiseptics are those substances which have a destructive etfect upon the micro-organisins which give rise to disease. The most notable of these substances are-carholic acid, cllorine, oil of eucalyptus, aristol, thymol, dermatol, permanganate of potash, iodoform, boracic acid, perchloride of mercury, salicylic acid, etc. Antiseptics are invaluable in the dressing of wounds, and in consequence of their power of destroying the organisms which promote decomposition tend very much to promote rapid healing.
Anus is the exit of the bowel. It is controlled by a muscle called the sphincter ani. The anus is frequently the seat of disease, such as piles, or haemorrhoids, fistula, fissure, and prolapsus of the mucous inembrane of the bowel.
Aorta is the large artery which takes its origin in the left ventricle of the heart and distributes the blood to the various arteries of the body. This portion of the arterial system is liable to aneurism, which consists in a dilatatlon of the vessel. proceediny in some ln stances to such an extent as to exceed in dimensions the circumference of a large orange. If this be the case treatment is of little avail, and death ultimately ensues.
Aperient is the term applied to medicines which act as purgatives, e.g. castor oil, rhubarb, scammony. jalap, crotonl oil, colocynth, senna, Epsom, salts, etc.
Aphasia is a disease affecting the third convolution of the left hemisphere of the brain, and is generally produced hy a rupture of a blood-vessel in that region. Its characteristic symptoms are inability to associate objects with their particular name, and it is generally made apparent to the physician by the fact that the patient sulfering from this disease calls familiar objects by names disassociated from them. The treatment consists in absolute rest for the time being, together with attention to the general liealth.
Aphonia literally means loss of voice, and is always due to an inflammatory affection of the larynx or paralysis of the vocal cords. This may be caused, either by cold or specific dlsease, stich as sypliilis, tuberculosis, or cancer. The general treatment of such cases consists in the alleviation of the inflammatory action by poultices, hot fomentations, the inhalation of steam, etc. ; also by the employnent of expectorants, the most yaluable of which are ipecac and antimony comhinerl with soothing agents such as paregoric or chlorodyne. When paralysis is present. electricity is of considerable servicc when employed
in conjunction with the internal administration of stryclinine.
Aphtha is a disease due to the development of a fungus growth upon the mucons nsembrane of the mouth or throat. It is generally associated with a disordered condition of the digestion. The best local application is borax or boracic acid, or both combined, with a solution of glycerine, while at the same time the condition of the stomach is rectified by means of alkalies in conjunction with a tonic, such as the infusion of calumba, gentian, or quassia.
Apnoea literally means a loss of breath, and cventually terminates in the death of the patient, It niay be procluced by external causes or by disease of the lieart or lungs.
Apoplexy is invariably due to cither a congestion of a portion of the brain substance, when it is called congestive apoplexy, or to a rupture of a blood-vessel within the brain substance, which is invariably followed by paralysis of the side of the body whicle that portion of the brain supplies with nerve power. It is a frequent cause of sudden death, and invariably, when death does not immediately supervene, it is followed by paralysis. The great point to attend to in such cases is to keep the person affected at absolute rest ; and where the blood-vessel appears to be overloaded, blood letting is invariably indicated; free evacuation of the bowels is also an essential line of treatment to be pursued, while a light and nutritious diet is to be given.
Appetite consists in a physiological congestion of the stomach which produces a feeling of craving for food. This we designate A ppetite, As soon as food enters the stomacl this temporary congestion disappears and the gastric glands come into play, secreting gastric juice, which promotes the digestion of the food. It must, however, be noted that frequently what is called a false appetite exists. This, however, is invariably indicative of a diseased condition of the stomach, and consists in a congested state of the blood-vessels ; thus a false appetite is due to disease rather than to the desire of the individual for food. When this condition is present it is essential that the aid of a medical man be called in, as it, in many cases, is the precursor of a much more serious pathological condition.
Arcus Senilis is that condition of the cornea, or colouring matter of the eye, the circumference of whiclı appears to be surrounded by a pearly-looking ring. It invariably indicates a fatty degeneration of the heart and arteries, and is associated with advancing years. Its indications are always attended by serious import to the individual affected.
Areola is the term applied to the deepening of the colouring matter surrounding the nipple of the female breast, and is, as a rule, indicative of pregnancy being co-existent ; in fact, it is one of the chief signs of pregnancy. It is due to a deposit of pigment in the area where the colouration exists.
Axistol is one of the most useful and least irritating of all antiseptics. It resembles very much in its effects those of iodoform, but it does not possess the disagrecable odour of that substance, and therefore is to be preferred to it in every instance where antisepsis is desired in the treatment of wounds. It possesses a salmon colour, and it is necessary that it be kept in the dark, as exposure to light is liable to produce its decomposition, and thereby interfere with its nonirritating properties.
Arm-Pit, or Axilla, is that portion of the body which is bounded internally by the chest wall ant externally by the arm. It contains several inportant structures such as the axillaryglands, the axillary artery, the axillary vein, and the nerves going to supply the upper extremities. The external portion of it is covered with hair, and is supplied with sweat glands. It is frequently the seat of abscess.
Aromatics are those medicinal substances which are employed as carminatives and antispasmodics. Amongst these may be classed cloves, cardamoms, nutmegs. peppers, cinnamon, etc.
Arsenic pure and simple is a metal, but in medicine the term is applied to a combination of this with oxygen, and this article is teclnically known as
arsenjous acid. As is well known it is a deadly poison, and when swallowed acts as a powerful irritant to the nucous membranes, with which it comes in contact. Poisoning by arsenic produces faintness, nausea, and frequent vomiting, with intense burnins pain at the pit of the stomacli. When the stomach has enotied itself of its contents, it throws off a coffee-ground-like substance mixed with mucus, which is frequently streaked with blood. There is also intense heat in the gullet and throat accompanied by intense thirst. After a little time diarrhoea accompanied by cold sweats and convulsions sets in, and is shortly followed by deatl. In slow poisoning by arsenic the eyes become inflamed, and frequently this condition is accompanied by ant eruption on the skin. It should not be overlooked, however, that British clolera resembles very mucla in its symptoms arsenical poisoning. The promptest treatment is necessary, and the stomach should be emptied as quickly as possible, either by the administration of a tablespoonful of mustard in a teacupfol of warm water or 30 grains of sulphate of zinc dissolved in half a teacupful of warm water. Voniting may also be induced by pushing some object down the throat and thus sickening the patient, after this the stomach should be well washed out by means of the stomacll purnp. Milk mixed with magnesia or lime water should be given, as the arsenic tends to mix with this and form a coagulum. Olive oil is also useful in the circumstances. The fresh precipitated oxide of iron has been recommended as an antidote to a certaln extent. It should be borne in mind that arsenic is a volatile metal, and may produce its injurious effects if it is exposed, in any form, to the atmosphere, and the fumes inhaled. Hence, when entering into the green colouring matter of Scheel's green, which is frequently used on wall papers, the innlates of the dwelling where this paper is used are liable to suffer. On this account such colouring matter should be condemned and never employed on the walls of apartments. On the other hand, arsenic is a most useful medicine, and is extensively employed in the treatment of skin diseases, ague, and neuralgia, and, strange as it may appear, it has also a most bencficial cffect upon irritability of the mucous membranes. Its usual method of employment is in solution, viz., Fowler's solution of arsenic-from three to five drops in a little water thrice a day after meals is the usual dose. It is also employed in combination with soda, viz., the arseniate of soda, the dose of which is one-twelfth of a grain thrice a day.

Artery and Arterial llaemorrhage. Artery is the blood-vessel which convers the blood from the heart to the capillaries, from whence it is returned by the veins. The arterial blood is a bright red and flows in waves or pulsations. An injury to an artery may be recognized by the fact that the blood is ejected in spurts which correspond to the beats of the heart. while blood coning from an injured vein flows in a constant stream. Compression applied above the seat of the injury as well as over the bleeding aperture will modify the flow of blood till medical assistance is procured, while compression will completely arrest that from a vein. It need hardly be said that unless the haemorrhage from an artery is speedily checked very dangerous symptorns will arise, and if the artery is of any size soon prove fatal.

Articulation. (See JOINT.)
Ascites is the term applied to a dropsical condition of the abdomen. It may arise from various causes, such as disease of the liver, peritonitis, disease of the heart and kidneys, etc.

Asphyxia is due to the blood not coming in contact with atmospheric air, thus all the organs of the body suffer by the blood becoming, poisoned with carbonic acid. In consequence of this the heart becomes less and less excited until at last it ceases to beat, and death ensues. Asphyxia is produced by hanging, drowning, and suffocation.

Assimilation is the process succeeding digestion by which the food is rendered fit for absorption into the circulation.

Asthma is a spasmodic affection of the smaller bronclial tubes. The symptoms are paroxysmal, and may be recognized by intense breathlessuess, so that the patient is obliged to sit up in bed in consequence
of the difficulty of breathing. It differs from bronchitis by the fact that the air is more difficult to expel from the chest than to inhale, the wheeze therefore is heard only on expiration; but if it happens to be combined with bronchitis, the bronchitic wheeze will be heard on unspiration as well. As a rule asthuna depends entirely upon some derangentent of the digestive organs. It is, however, very pecullar in this respect, that certain atmospheres appear to induce it, whereas other atmospheric influences would appear to keep it in abeyance. The treatment of asthma should in every instance comuence by clearing the bowels, regulating the diet, and improving the digestion, while the spasm nlay be relieved by the inhalation of the fumes of blutting paper which lias beels saturated with a solution of nitre and afterwards dried, so that It will consume rapidly away, evolving at the same time thick volumes of smoke. Smoking stramonium and datura tatula through a clean pipe is also of great service. Frequently the inhalation of a few drops of chloroform on a handkerchief will give relief to tho spasm, while rubbing the chest with a liniment containing equal proportions of belladonna liniment, compound camphor liniment, and soap and opium liniment, will be found as a rule to relieve the patient.
Astigmatism is the term applied to a peculiar condition of the eye which causes an imperfect refraction of light. It may invariably be remedied by the use of suitable spectacles.
Astringents are those substances which cause contraction of the tissues when they are applied locally to thern. The best known of these are the vegetable astringents whicb contain tannin, e.g. oakbark, galls, matico, catechu, kino; and the mineral astringents are, sulphuric acid (and to a lesser degree the other aciels), alum, the salts of iron, particularly the muriate and perchloride, sulphates of copper and zinc, the acetate of lead, and nitrate of silver.
Atrophy, or Wasting, may be either generalwhen it is due to disease such as consumption or cancer-or it may be local, when, as a rule, it is due to some deficiency of the nerve supplying the part affected. These will be treated under their respective heads.
Auricle is the name of the external ear as well as that of the two upper cavities of the heart, the left receiving the oxygenated blood from the lungs, and the right the venous blood from the general circulation. These communicate by valvular orifices with the ventricles of the heart.
Auscultation is the term applied to the detec. tlon of disease in the chest by means of the ear applied either to the chest wall directly, or by means of the stethoscope. It is also a useful assistant in detecting disease of the abdomen and fractures of bones.
Axilla. (Sec Arm-PIT.)
Bacillus is the term applied to a microscopic organism which has the power of multiplying to an enormous extent and with great rapidity within the human frame, and thereby producing disease.
Bacteria are microorganisms which, when they find an entrance into the circulation, produce disease. There are various species of this class of fungus, such as those which produce diphtheria, typhoid fever. charbon. and the various specific fevers.
Baldness as a rule is due to atrophy of the hair follicles. This may be due to some constitutional or hereditary tendency, while it also is not unfrequently due to the secondary effects of syphilis. It may to a certain extent be remedied by the application of a stimulating lotion to the scalp, e.g. tincture of cantharides 2 drachms, splrit of rosemary $x$ ounce, acetic acid I ounce, rose water to make 8 ounces: apply a little night and morning to the scalp, and afterwards the hair should be kept soft by rubbing in a little pomatle.
Bandages are strips of ganze, linen, calico, flannel, or elastic web, and are applied to the body or limbs sequiring artificial support. A bandlage, to be of any service, should be thoroughly applied, as otherwise It will slip and become useless. Bandages for the abclomen and chest should be supplied by a professed bandage maker, by whom they will be made to fit the several parts. When the limbs require support tho
bandage should be about three inches broad, and to enalhe it to apply itsclf accurately to the irregularitics of the limb will require to be turned at every revolintion, or nearly so. A little practice will soon emable anyone to apply a bandage scientifically.

Math. The application of water, vapour, or hot air comes under thre compreleusive term of bath. The daily use of water to the surface of the body, either by means of the sponge, spray, shower, or plunge bath, is one of the best and most easily applied hygienic rules. The bath may be cold, tepid, hot, simple, or medicated. A cold bath should always he followed by reaction, but if there is difficulty in obtaining this, great assistance will be afforded by the individual standing ill a foot bath containing warm water during the process of crying the body. Sea bathing is one of the most popular as well as one of the most invigorating hygienic measures that can be enployed. The temperature of the various baths may be stated as follows :-Tepid bath varies from $85^{\circ}$ to $95^{\circ}$; warın bath ranges froul $95^{\circ}$ to ro2 ${ }^{\circ}$; liot bath from ro6 to $10^{\circ}$. Baths may be either general or local; for example, the sitz or hip bath, and foot bath, are local; a bath is general when the whole body with the exception of the head is inmersed. The vapour bath may be applied by a suitable apparatus when the patient is in bed, or by sitting in an enclosed space into which steann is freely admitted. Medicated baths are those into which chemical substances are introduced, such as carbonate of soda, salt, vinegar, or extract of pumuline. Mineral baths are usually employed in conjunction with the drinking of the various waters, such as chalybeate or iron water, sulphurous, gaseous, and saline. The best known in England are those of Bath, Harrogate, Cheltenhan, Buxton, and Strathpeffer in Scotland, and on the Continent Aix-le-Bains, Kreuznach, IIomburg, Schwalbach, Wiesbaden, Baden-Baden, etc. The Turkish? bath is not only one of the most invigorating, but also one of the most enjoyable which we possess. After a day's fatigue it is wonderful how refreshing a Turkish bath is. It is, however, very necessary to use every precaution in the way of having the body cooled thorouglaly before going again into the open air. Moreover, the Turkish bath possesses curative properties of no mean order, e.g. in many diseases such as neuralgin, rheumatism, dropsical swellings, chronic diseases of the lungs, and affections of the digestive organs. If disease, however, is present in any shape it would be as well to take niedical advice on the subject.
Bed Sores arise in lingering illnesses, and are due to continued pressure upon one particular part. They chiefly occus on the buttocks, and give rise to serious complications in the course of diseases in which they occur. The greatest safeguard against such sores is the employment of a water-bed, whereby the pressure is equalized over the whole body. When a bed sore threatens, the part presents a red and congested appearance. In such circunstances the surface so affected should be bathed frequently with warm water, and after drying with a soft towel eau de Cologne or whisky should be applied. If a bed sore has really formed, then it is desirable to keep it clean by neeans of frequert applications of antiseptics, such as charcoal poultices or carbolized oil, which will promote healing. One part of carbolic acid in sixteen parts of oxide of zinc ointment is also a valuable dressing in such circumstances. The daily application of aristol by dusting it over the raw surface is an excel. lent healing agent.
Bee Stings.-If possible, the first thing to do is to extract the sting and then apply an alkahi, such as ammonta, bicarbonate of soda, bicarbonate of potash, or lime, which substances have an affinity for the formic, which is the essential constituent of the sting, and thus its virulence is destroyed.
Bile is the secretion of the liver, and aids in the assimilation of the fatty portions of the food. If the liver becones defective in its actlon, then the biliary products are liable to accumulate in the system, and give rise to what is popularly terned billousness, and not unfrequently jaundice is the direct result. If this condition obtains the urine will frequently bo observed
to contaln bile, whllo the alvine secretlons are deficient in the biliary colouring matter. A frequent cause of what is popularly termed biliousuess is constipation. The effects of this, however, are not entirely due to the accumnlation of bile in the system, but to a great extent to the fact that faecal absorption by the fower bowel takes place from the rolalned matter in the canal, thus contaminating the blood and giving rise to the dusky and sallow complexion which is directly consequent upon this process; hence a free purgative will often have the effect of relieving the symptons which are present, If, however, the unhealthy condition is due to a sluggish action of the liver, then it will be necessary to add to the purgative one of the medicines which we know act directly upon the liver itself, such as calomel, grey powder. blue pill, podophyllin, or taraxacum. Nitric acid has also a nost beneficial effect when combined with a tonic when the liver is sluggish. All attempts, however, to correct biliary derangements should be combined with careful attention to dier.
Biliary Calculi, or Gall Stones, are not really calculif in the same sense as those which constitute stone in the bladder, but are what might popularly be termed congealed nasses of bile which render them Incapable of passing through the bile duct as the substance would normally do if in a fluid state; they therefore have to be forced through by spasmodic contraction of the canal, hence the severe pain which Is produced and obstruction which they cause to the free exit of the biliary sccretion. The consequence of this Impediment is that the gall bladder becomes distended and the bile is absorbed by the bloodvessels, giving rise to the yellow colouring of the whites of the eyes and skin which is characteristic of jaundice. Jaundice, however, is not 'uvariably due to the presence of gall stones, but may arise from organic disease of the liver and to thickening of the walls of the gall duct, which thus reduces its calibre, and hence its capability of permitting a free passage of the bile into the duodenum. The treatment of gall stones which has been recently recommended, and which has proved of immense service, consists of large and repeated doses of olive oil. As much as a tablespoonful has been given every two hours with marked beneficial results. It is certainly a simple remedy, and has proved very efficacious in the hands of many men who have studied the question.
Biliary Disorder is due to a diseased or unhealthy condition of the liver, gall bladder, or biliary ducts. It is a frequent accompaniment of indigestion, especially when this is co-incident with a catarrhal condition of the stomach and bowels. Its symptoms are, general lowness of spirits, sickness, and deficiency of bile in the alvine excretions, and an excess of bile in the urine, accompanied by an unhealthy appearance of the skin. It is a very frequent disorder in civilized life, and is intimately connected with over-indulgence in alcoholic liquors and food. It is not unfrequently due, however, to cold. If the liver is out of order, then the health is rapidly affected, as its secretion is essential to the assimilation of food, and therefore the nutrition of the body is rapidly affected. It also tells, upon the circulation, and by the fact that the blood is contaminated the nervous apparatus becomes deteriorated and rendered unduly sensitive to cold. Attacks of biliousness are generally accompanied by sick head. aches, howel complaints, which may either result in constipation or diarrhoea. A low and morbid condition with irritability of temper is a frequent concomitant of this disease. The remedy consists in clearing the bowels and, at the same time, acting upon the liver by means of calomel, blue pill, grey powder, or some other remedy which stimulates the liver to a healthier state of action; at the same time it is essential that the diet should be carefully studied so as to promote digestion and assist the bowels in their daily evacuations.

Bismuth is a most popular remedy in certain forms of dyspepsia. It is generally prescribed in the form of subnitrate or carbonate, both of which substances are a white and zather heavy powder. It is very useful in heart-burn and water-brash, the dose beiug 10 grains three times a day about half an hour
before food. It may also be administered in the form of lozenges and tablets.
Bites of doys should, in every instance, be first of all thoroughly cleansed by means of warm water, the bleeding at the same time being encouraged, and afterwards the raw surface should be cauterized, either by means of lunar caustic or carbolic acid, and then dressed with carbolized oil or carbolized zinc ointment.
Bladder. The urinary bladder is the receptacle of the urine after it has been secreted by the kidneys. It is situated at the lowernost point of the abdomen, just belind the pubic bones. It is subject to many affections which are due to various causes, such as carelessumess and neylect, to cold and disordered digestion. If the bladder is pernitted to become distended it may rupture, when the consequences are very serious and 'frequently fatal. Irritability of the bladder is due, as a rule, to an inflamed condition of lts mucous membrane, which may be produced by cold or an irritating condition of the urine, and not unfrequently to the action of cantharides, either given internally or absorbed into the blood from a blistered surface; hence it is a frequent sequel to the application of a blister. Stone in the bladder is not an uncommon cause of great pain in the organ. When this is present the urine is liable to become bloody after exercise, and the urinary stream is frequently impeded or completely stopped by the obstruction caused by blocking up of the water passage. The general treatment for disorders of the bladder is the hot sitz-bath, accompanied by the administration of bicarbonate of potasli in conibination with tincture of henbane and the infusion of uva ursi, buchu or triticum repens. The following mixture will often be of service when the bladder is in an irritable condition:-Bicarbonate of potash six drachms, tincture of henbane six drachms, infusion of uva ursi to make eight ounces. A tablespoonful three times a day in water half an honr before food. Weakness of the bladder, indicated by inability to retain its contents, is a frequent disorder of old age. It is not uncommon in children also, and may be remedied by giving tonics which we know act upon the involuntary muscular tissue, such as ergot of rye, belladonna, and nux vomica.
Bleeding. (See HAEMORRHAGE.)
Blindness, or Loss of Sight. may arise from accident to the cornea or lens, or from disorganization of the eye-ball by accident or disease. It is also not unfrequently due to disease arising independent of accident to the cornea, lens, vitreous humour, and retina. Blindness may also arise from disease of the optic nerve or brain. As a rule, when this affection is due to disease the symptoms cone on gradually, but when accident is the cause, as might be expected, they come on suddenly. When blindness is due to opacity of the lens itself, or cataract, it may be remedied by operation; when due to the retina it is called Amaurosis, which see. Colour blinduess is a peculiar condition of the optic nerve which prevents it from being able to identify various colours ; hence this affection precludes many individuals from engaging in occupations which render it necessary that colours presented to their vision be correctly identifed, c.g. railway signalmen. In blindness arising from ally cause whatever it is essential that a competent medical practitioner be consulted, and that without loss of time.
Blister, Blistering, or Counter Irritation, by the application of cantharides plaster, although not so much in vogue at the present day as it was some years ago, is still a most useful remedy in certain inflamnaa. tory disorders of the internal organs and joints. As a rule, blisters are applied to too great a surface at once. A small blister will act quite as efficaciously as a larger one in many instances. The proper method is to allow the blister to remain on fron eight to ten hours, then if it has not risen sufficiently to apply a piece of cotton wool, when, as a rule, a large vesicle filled with serum will appear, this should then be cut with a pair of scissors and all the dead cuticle removed so as to expose a raw surface. This raw surface should be dressed night and morning with prepared lard on a piece of lint, until it is healed.

Blood. The blood, or vital fluid, has been clesignated by some "The Life." This, lowever, is not the case, any more than food is life, or oxygen is life, but certainly it is the nedium of life. Its composition is a liquid in which float innumerable corpuscles, or globules. These are designated the red and white corpuscles, the red particles being the carriers of earbonie acid gas from the system towards the limgs atd of oxygen from the lungs to the capilary vessuls. The white corpuscles, or leucocytes, are the minute bodies which protect the animal economy against disease and wage constant warfare against the numerous hacilli, inicrobes, bacteria, etc., which are the essential elements of zymotic disease. The chemical composition of blood is 79 parts water, 4 albumen, ry globulin, together with certain salts in solution. When blood escapes from the body it separates into two portions, coagulum, which is generally known as blood clot, and serum. It is the serum of the blood wisich fills the vesicle or bleb of a blister. Blood letting was at one time a much more popular remedy than it is at present. Fifty years ago it was carried to an absurd extent, and people were under the delusion that it was necessary to have a vein cut and a certain anount of blood abstracted from it at least twice a year. The process consisted in tying a bandage above the seat where the puncture in the vein was to be made, the vein was then cut by a sharp lancet and a certinin amount of blood abstracted. The bandage which had been used to constrict the limb above the point of incision was generally utilized to stop the bleeding, which was readily staunched by pressure. Blood lewing still retains a certain amount of Importance in the treatment of disease, especially where there is a plethoric condition of the system, or where a rupture has taken place of a blood-vessel within the brain. Other means besides the lancet were employed in abstracting blood, such as cupping, leecbing, and scarifying, for description of which see their respective articles.
Blows may be either of a very innocent nature or of very serious import. For example, a blow on a fleshy part of the body will ouly result in a rupture of minute vessels at the seat of the injury; discolouration will result from the effusion of blood which oozes from the ruptured vesseis, but this will disappear within a few days, and all traces of the injury be eradicated. A blow on the chest or abdomen, however, may have very serious consequences, as the shock to the nervous system in such sircumstances may be followed by alarming symptoms, and possibly death. Blows on the head are also of great importance, and should never be treated with indiference. Not unfrequently, dangerous symptoms may supervene months or even years after the blow has been inflicted in this region. It is hardly necessary to suggest that in severe blows on the chest. abdomen, spine, or head, medical aid should be called in without delay.
Blue Disease, or Cyanosis, is due to a defect or malformation of the heart which prevents the full volume of blood passing from the lieart into the lungs for oxygenation; thus the venous blood never becomes completely converted into arterial, but always enters, in a greater or less degree, into the general circulation.
Elue Pill is composed of mercury in a very fine state of subdivision. It is a useful agent combined with some other purgative in disorders of the liver. (See Biliary Disorders.)
Boil, or Furuncle, is a localized affection of the skin, produced by a microscopic organism which locates itself in the hair follicle and there propagates its species, giving rise in the process to suppuration in its immediate neighbourhood. This affection, as a rule, can only develop when the system is below par. If the little pustule which at first appears is touched with pure carholic acid, as a rule the boil will be aborted, in consequence of the destructive effeet of the acid upon the microbes which tend to produce it. At the same time great diligence should be observed in endeavouring to improve the general health. As a rule, the less a boil is meddled with the better. Permit it to come to a head if it has gone beyond the stage when it can he aborted. Boils frequently nppear
about the neck, as they are encouraged by the irititating effect of the collar rufling the pustules, whith otherwise would lave died away without developing hato the more painful affectlon. Oranges are to a certain extent beneficial where there is a tendency to boils. They slould, however, be eaten in fairly large quautities, say six or cight a day. A carbuncle, asa rule, develops from a boil which has been undnly Irritated.
Boras is a compound of boracic acid and soda, ancl is a most convenient aud useful antiseptic. It is allso employed as a preserving agent for uilk, soup, or other perishable food. It is used largely in combination with glycerine for the treatment of thrush, or aplatha, on children's mouthis, and in sore throat.
Bowels, or Intestines, are frequently the seat of disease, such as inflammation, colic, catarrl, tuberculosis, etc., which see.

Brain is the liorge mass of soft tissue occupying the craniun or skull case. It is arranged in convolutions or coils, which are subdivided into the riglet and left hemispheres, while the brain itself is made up of cerebrum and cerebellum, the latter portion is in connection with the spinal cord. From the brain itself arise the most important nerves whicli govern the economy, such as the auditory, optic, pneumogastric, and phreatic. Brain concussion is the term applied to the condition which results from in severe blow when unconsciousness is produced without any organic nischief having been inficted upon the brain itself. Brain compression is applied to an injury whicl dis. places a portion of the skull or ruptures a blood-vesse! within the brain substance, thereby causing compression of the organ. In either of the foregoing affec. tions it is highly desirable that competent medical aid be called in without delay.
Erandy, when pure, is derived from distillation of grape wines. Of late years, however, it las been manufactured artificially from ordinary spirit. It is a most useful stimulant when this is required for medical purposes, and has often proved invaluable in the treatment of debilitating diseases, and lias often been the means of carrying patients over critical periods.
Breast. (See "Woman in Health and Sickness.")
Breath. By the breath many important diseases may be recognized, or at least suspicion of their presence aroused. If the breathing is rapich and excited we would imer that there is some impediment to the proper aeration of the blood. It then remains for us to ascertain whether this be due to disease of the lung tissue, to some affection of the heart, or to a distended condition of the abdomen, which prevents the proper innation of the lung at each inspiration. If, on the other liand, the breath is offensive we may from this derive many indicatons of a variety of diseases, such as disease of the mucous membrane of the air passage, caries of the bones over which a portion of this mucous membrane is stretched, a disordered state of digestion, or of the several conditions of the blood which arise from inipurities being present. Bad tecth and uiceration of the gums will also give rise to an offensive breath. The greatest stench that can possibly impregnate the breath is that which is derived from gangrene of the lung. Whenever the breath is disagreeable to those in the nelghbourhood, it is desirable that medical aid be called in and the exact cause ascertained and remedied.
Bright's Disease is the term applied to In . flanmatory affections of the kidneys, and is readily recognized by the presence of allumen in the urime when it is boiled or when a snall portion of nitric acid Is added to it, eacli process giving a copious deposit of albumen. The disease is so serious and the treatment of it so important, that in every iustance where it is suspected medical aid sloould be called in without ${ }^{-}$ delay.

## British Cholera. (See DIARRHOEA.) <br> Broken Bones. (See FRACTURES.)

Eronchitis is due to an inflamed condition of the linitg membrane of the bronchial tubes. It is, as a rule, induced by cold, but may occur in the eourse of some acute diseases, such as typhoid fever. In the first stages of acute bronchitis the mucous membrane of the tubes is frequently so inflatned as to give rise to intense spasin and pain in breafling. When the in-
flammation somewhat subsides and the membrane is permitted to secrete mucus, it does so in such exces. sive guantitles as to camse agreat amount of expectoration, which of course is always accompanied by an inveterate congl. Sometimes the infarumatory state of the tubes spreads downwards towards the minute capillary branches and even to the lung sulastance itself, when of course very serious symptoms may supervene. The proper treatment of bronchitis is the freqnent application of mustard and linseed poultices to the back and front of the chest, each of which should be pernitted to reunain on for at least half an honr, to be followed by a fresh application in three or four hours. The patient should be confined to bed and well nourished. When there is difficulty in bringing up the expectoration, this may be assisted very materially by remedies such as ipecacuanha wine, antimonial wine, paregoric, squills, etc.
Bronchitis Mettles are very useful in conveylng a warn and moist atmosphere into the apartment of those suffering from affections of the windpipe and chest. They are usually made by attaching a long tube to the lid of a tin kettle. When this is put upon the fire and allowed to boil, the steam escapes through the tube and diffuses a warm, moist atmos. pliere throughout the apartment in which the patient is confined.
Bronchocele is strictly speaking a cyst of the thyroid gland. It may, and frequently does, attain to enormous dimensions; as a rule, however, it is not a disease accompanied by danger to life, although it invariably causes immense inconvenience. The proper and most ad visable course to pursue when bronchocele is present is to draw off the fluid by means of an aspirator, while syrup of iodide of iron should be given regularly for a considerable period.
Broom. The new shoots of the common broom, when infused in boiling water, yield a liquid which is very popular in the treatment of dropsical effusions, as it possesses a powerful influence in stimulating the excretory powers of the kidneys.
Bruises and contusions are produced by direct violence to the part affected. It is generally followed by considerable effusion of blood due to rupture of the minute vessels at the seat of injury. This effused blood or ecchymosis, as it is termed, may become diffused over a considerably greater area than one would naturally suppose. Gravitation plays a considerable part in inducing this. The proper treatment of a bruise is to apply cold at once, so as to prevent as much effusion of blood as possible. The swelling which invariably results from a bruise is due to effusion of blood and serum into the injured part. This, liow ever, will as a rule disappear after a few days if the skin has not been broken.
Bubo is the swelling of a gland which usually tends to suppurate. The inflammation whicli causes the bubo is, however, due to some sore in its immediate neighbourhood, and which has a connection with the gland through the lymphatic vessels. If the bubo suppurates it will be necessary to treat it as an ordinary abscess. Suppuration, however, may frequently be averted by applying a blister over the swelling, or painting the part with liniment of iodine once or twice a day.
Bunion is a swelling over a joint, usually that of the great toc. It is due to inflammation of the capsule of the joint, and is, as a rule, induced by continued pressure, possibly by wearing too tight boots. When a bunion threatens, the part should be leeched and well fomented at frequent intervals, and a proper fitting boot procured.
Burns and scalds are inflicted by heat, the one -from a dry substance, and the other from boiling water or oil. According to the length of application of the super-heated substance so will the relative severity of the burn or scald be. If the burn or scald be extensive and severe, it may have very serious consequences, and in any case will produce a severe shock to the nervous system. The proper treatment is to apply an antiseptic in solution as quickly as possible, and cover the part with sheets of cotton wool. If the pain is very severe the application of cold to the part affords great relief. Cold water, having in solution permanganate
of potash, is a very useful application In the circumstances. Condy's fluicl, being a solution of permanganate of potash, may he employed in the proportion of a tablespoonful to a breakfast-cupful of water. Cotton or linen rags wrung out of this and applied to the surface at frequent intervals will prove veryserviceable, not only in relieving the pain, but in promoting healing. Afterwards, when the pain has clisappeared and the dead skin has been removed, carbolized zinc ointment (one part of carbolic acid to sixteen or tweuty parts of oxide of zinc ointment) spread upon lint and applied to the sore will assist materially in the healing process.

Cachexia is used to express an unlecalthy appearance whicl is duc to some interference with the nourishment of the body, caused by disease. It is always a term siguificant of serious disease within the human body.

Caddis, or Lint, is employed in the dressing of wounds, and is composed of linen loosely woven, one of the surfaces having a soft and fossy appearance. It is this surface which is applied next the wound.

Caloric; or the heat generated by the living economy, is dependent upon vital actions which are present within the body. These are due to the chemical changes constantly going on within the animal frame, and which depend for their existence upon the changes due to digestion, assimilation, and respiration.

Cancer is a malignant disease which may attack any portion of the human body. By some it is snid to be hereditary, but it would appear to be essentially due to the presence of minute organisms, which attack a tissue reduced in its vitality by some distinct cause. There are several varieties of cancer, such as epithelial, scirrlus, and colloid. It is essentially a disease of mature years, rarely occurring under thirty years of age, and being of such a nature that, if left to itself, it is always fatal. This disorder is naturally dreaded by all. Its early recognition is of the utmost importance, as it is only in the first stages of its progress that it can be eradicated, and that for the most part only by a surgical operation. It usually commences as a hard, painless tumour of very small dimensions. It is more frequent in females than in males, and oftener attacks the breast than any other organ. Some trades are more liable to this disease than others. For example, chimney sweeps and those working among paraffin oil are particularly liable to it, and in these individuals it generally attacks the scrotuni. The skin, particularly that of the lip, is liable to it. Of the intemal organs, the womb, the stomach, and the liver are frequently the seat of it. If it attacks any one part, the adjacent glands are almost certain to be affected sooner or later, hence the necessity of diagnosing the disease in its early stages, and removing the affected part before the surrounding tissues have become involved. Local applications, as a rule, are of little service, yet it is gratifying to know that recent experiments have proved that the disease may sometimes be arrested, if not completely cured, by the frequent application of ichthyol, and recently inoculation with the virus of erysipelas has been said to be an antidote

Cancrum Oris is peculiarly a disease of a low state of the vitality. It is a mortification or gangrenous inflammation affecting the lips, cheeks, and gums of ill-nourished children. It is a most loathsome complaint, the first symptom of which is a red, hard, inflamed-looking spot on the cheek or lip, which rapidly develops into an angry foetid ulcer giving off a most offensive odour. The great point in the treatment is to sustain the vitality of the patient by an abundance of good nourishment conjoined with stimulants, and in keeping the sore aseptic by frequent applications of antiseptic lotions, such as Condy's fuid, carbolic lotion. aristol, or solution of chlorinated lime or soda. A medical man should be called in as soon as possible, who will endeavour to destroy the diseased tissue and establish a healthy condition of that immediately surrounding it.

Canine, or Eye Teeth, are four in number, and are situated imnediately below and in a direct line with the eye, hence the term Eye Teeth iso frequently applied to them.
Cantharides, or Spanish Fly, is an insect with
long whegs and having a bright green colowr. They are chicfly brought from Hungary, where they are taken from the trees in great nunnters and afterwards dried and reduced to powder. When applied to the skin they cause a blister to rise on the surface with which they have heen in cont.tct, and are of immense service in many infanmatory conclitions of the internal organs and joints, (See BLISTER.) Cantharides, or Spanish fly, are also employed internally, but the symptoms produced by their administration are too serious to permit of this drus being prescribed except under medical advice. They are sometiules given by malicious persons and criminals on account of the peculiarly distressing irritation they give rise to in the urinary organs. The remedies employed to allay the Irritation profluced by this suhstance must be of the most soothing character. Milk lins a peculiarly beneficial effect in poisoning by Spanish Ay, so also has the white of egg, arrowroot, and linseed tea. The parts sulfering froin the irritation should be soothed by hot fomertations over which laudanum has been freely sprinkled, and the internal administration of tincture of henbane will be found to allay the irritation if given in frequent doses of, say 15 to 30 drops every two or three hours in water.
Capillary is the term applied to the minutest blood-vessels in the body, and compose the uniting link bet:veen the arterial and venous circulation.

Carbolic Acid is obtained by the destructive distillation of coal. It is in its crude state an oilylooking liquid, and resembles very much in taste a similar product derived from the destructive distillation of wood which is called creasote. Carbolic acid and creasote resemble each other very much, both chemically and in their various properties. It is a potent antiseptic. They both have a destructíve effect upon the life of minute organisms. Carbolic acid is a powerful sedative, and is applied internally to allay vomiting and sickness. As an external application it is largely employed as a lotioo, the strength of which may vary from two to five per cent. When purified it forms long needle-shaped crystals, which dissolve very rapidly. It is frequently combined with soaps on account of its antiseptic properties. The fumes of carbolic acid In stem are employed in the treatment of honping cough. and are frequently used as a disinfectant where contaginus diseases are or have beell present.

Carbon is an essential constituent of all living bodies. Its most familiar forms are plumbago, or black lead, which is pure carbon; the diamond, which is crystallized carbon; and charcoal, which is carton produced by combustion of vegetable or animal substances. It is a powerful antiseptic. It is sometimes taken in the form of biscuits or in powder by those suffering from indigestion accompanied by flatulence and eruptions of a foetid nature. In combination with oxygen it is exhaled from the body at each expiration, carbonic acid being the result of a chemical change which takes place in the blood during its transition from arterial to venous. As carbonic acid it is a deadly poison when inhaled by the lungs, yet in solution it is quite harmless when taken into the stomach. It is this gas which gives the effervescing character to sparkling drinks, such as champagne, sparkling hock, bottled beer, soda, potash, and lithia waters, ginger becr and lemonade. It is this gas which is called choke damp. It is much heavier in its specific gravity than atmospheric air, and thus falls by virtue of its weizht forming a deadly stratum in ill-ventilated and overcrowded buildings, old wells, brewers' vats, the holds of ships, and certain valleys, such as the Death $V$ alley of Java, so called becanse of its being entirely filled up to a certain level by this noxious gas. It is generated by a combustion of charcoal, hence the danger of employing charcoal fires without due precautions being taken as to ventilation.
Carbuncle, although resembling a boil to the extent that it is due to the developinent of a microorganism in the substance of the skin, is a much more vlrulent affection. It may indeed develop from a simple pustule or boil, and is invariably an indication of a low state of the general liealth. Irritation aggra. vates it very much, and permits it to assume in some instances enormous dimensions. A carbuncie is essen-
tially a destruction of the vitality of the skin, which results in grangrenc or mortification of the part affected, and it is not until this mortified portion, or slougla, comes away that healing can take place. It froes withont saying that a carbuncle is a most painful and depressing disease, and not unfrequently it has proved fatal. The treatment couslsts in the indurated part being laid open by a crucial incision. This should be done early in the progress of the disease, and will $\ln$ variably shorten its course; at the same tine the bodily lealth must be well maintained by suitable nourishment assisted by stimulants, the best of which is port wine.

Cardiac, that which pertalns to the lieart.
Carditis is infammation of the lheart tissue, but cardiac inflammation is generally confined to the lining membrane of the sack in which the heart lyeats and to the outer covering of the heart, when it is called pericarditis. The lining membrane of the lieart may also be affected, when the disease is termed endocarditis. Pericardit is is accompanied by acute pain in the region of the heart, and frequently is followed by effusion of fluid into the sack, which naturally Incommodes tho heart's action to a very serious degree. Both pericarditis and endocarditis are intimately associated with a rheumatic condition of the system, and they are a frequent sequelae of rheumatic fever. Such cases must necessarily come under the care of a medical practitioner.

Caries is a kind of ulceration of the bone, producing death of the part affected. It is usually due to a tubercular condition of the system. The muriate of calcium will be found an invaluable remedy in cases of caries, if the remedy is persevered with for a prolonged period and a nourishing diet at the same time administered; but not unfrequently it will be necessary to have recourse to surgical measures to get rid of the disease.

Carminatives are those medicines which are of service in flatulence, distension of the bowels accont. panied by spasm, or in other words colic. The princh. pal carminatives are peppermint, pennyroyal, cinnamon, ginger, nutmegs, ether, sal volatile, and even very lot water will often prove of service.

Carotids are the two large arteries whicl lie on each side of the wincl-pipe and supply the head and neck with blood.

Carron Oil is made by mixing olive or linseed oil with lime water in equal proportions. It is useful as an application to burns and scalds, but it has been very much superseded of late by carbolized oil, one part of carbolic acid to sixteen or twenty of olive oil being the strength usually employed as an application in these circumstances.

Cartilage is a pearly-looking substance which covers the extremities of the bones and joints. It there forms an elastic cushion, and the novenent of one cartilage over another is rendered easy by the syonovial fuid which is secreted within the joint itself.

Cascara Sagrada is an American plant which possesses very valuable laxative and tonic properties. It is one of the safest laxatives that can possibly be prescribed, because it not only induces a healthy action of the bowels, but at the same time acts as a tonic to the muscular fibre of the gut, whereby it enables it to act of its own accord. Then, again, by relieving the lower bowel of its congested condition, it reacts upon the circulation of the liver, thereby giving it considerable help and enabling it to become restored to a healthier condition. The dose of the liquid extract of cascara is from 15 to 30 drops every night at bedtime. It is also prescribed in tabellae, or tablets, which are manufactured by Allen \& Hanbury, each of which contains two grains of the solid extract of the drug, the dose being from two to three tabellae at bedtime. Anyone who has been long troubled with ohstinate constipation should never desist from routino and regular treatment until cascara has had a very fair and prolonged trial.

Castor Oil is one of the most popular as well as one of the most useful purgatives we possess: it acts quickly and thoroughly, and does not require the cose to he increased when it is necessary to administer it at frecfuent intervals. It is higlly useful in infancy and
old age. When combined with iaudanum it Is invaluable in diarrhoea and clysentery, The great objection to castor oil is its museous taste, but this has lreen overcome to a great extent by Messis. Allen \& Hanbury, who lave introduced an ahmost tasteless oil luto the market. It can also be administered in gelatine capsules, when of course there is no taste whatever. Castor oil is also frequently employed as an in-jection-lwo wine-glassfuls should be made into an emulsion with the yolk of one egg and afterwards well mixed with a pint of thin gruel which has been previously stramed; the whole of this should be injected by means of the enema syringe and retained as long as possible. The inunction of castor oil over the abdomen has often proved of great servlce in habitual constipation. For an infant a teaspoonful should be well rubbed in over the abdomen night and morning, the quantity being increased in proportion to the age of older people.

Catalepsy, or Trance, Is a very rare affection, and seems to be entirely nervous in its origin. Fre. quently when catalepsy exists the signs of life are so apparently absent that the individual may be looked upon as being dead, and doubtless burials have frequently taken place when the patient has been in this condition. If catalepsy is supposed to exist, ammonia should be applied to the nostrils, and aether or brandy injected under the skin, while friction should be applied to the surface of the body. Electricity is also a useful agent in these circumstances.

Cataract is the term applied to that affection of the eye which, as a rule, does not come on till life is well advanced. It is due to an opacity of the crystalline lens, and is a disease which is usually gradual in its development. An oculist should be consulted in such cases, which, as a rule, are amenable to operative measures.

Catarrh literally means "'a running through." It is characterized by an excessive secretion of mucus, and is, as a rule, a consequence of exposure to cold. It may attack any mucous surface, such as the air passages, the ear, the stomach and alimentary canal, the bladder, urimary passages, vagina, etc. What is commonly designated a cold in the head is a most characteristic example of catarrl. Some constitutions, principally those with a rheumatic tendency, are very liable to this disease, and in many instances we meetwith people who are aflicted with the disorder in a chronic form, it being never allogetlier absent in their case. The treatment consists in endeavouring to soothe the irritation of the canals of the mucous membrane affected and the administration of remedies which act upon the affected surfaces. For catarrh of the several organs see special articles. Catarrh of the nasal mucous membrane is a premonitory symptom of several dis. eases, such as measles and influenza. In these circumstances it is usually accompanied by an irritable cough, which indicates that the irritation is not confined to the nasal tract alone. Catarrh of the air passages may frequently be aborted by the inlialation of steam impregnated with creasote, menthol, eucalyptus oil, pumuline essence, and benzole.

Cathartics, or Purgatives, are medicines which promote an evacuation of the bowels, and are largely employed as domestic merlicines. The most popular cathartics are castor oil, Epsom salts, semna, aloes, and cascara sagrada.

Catheter is an instrument made cither of silver, gum elastic, or india-rubber, and is employed to draw swater from the bladder when the natural efforts fail. It is always essential that great care be taken in using this instrument, as injury to the urinary canal may easily follow its careless use. It should always be rendered aseptic before being used.

Caustics aresubstances which have a destructive effect upon the animal tissues. The principal caustic: in use are nitric acid, nitrate of silver, chloride of zinc, caustic lime, caustic potash, or soda, and acetic acid. Chromic acid and salicylic acid are frequently emplyyed for the purpose of destroying warts and corns.

Cellular Tissue is that peculiar memhraneous web or network which connects the various tissues of the borly, filling up the interstlces between them. It is made up of thunterless row's of ce!ls crossing cach
other like a complete network and containing in the neshes of the network small intercellular spices which communicate with each other throughout the body.

Cerebellum is that portion of the brain which occupies the posterior portion of the skull cavity.

Corumen is that waxy-looking matter which the membrane of the external ear secretes. In catarrh of the ear it frequently accumulates to an abuormal extent, and thus is a frequent cause of deafness. When this has occurred the liardened mass should be softened by the introduction of a drop or two of warm glycerine, and then the ear syringed with warm water in which a little soap has been dissolved.

Chalk Stone is that concretion which is liable to be deposited in the joints of those who suffer from gout. It is composed mainly of urate of soda. Therefore soda should be avoided by all who have a tendency to gout, Potash or lithia are the most useful antacids to be employed whit there is gout or rheumatism in the system.

Chancres are ulcers which result from the specific poison of venereal disease. Theygenerally commence as small pustules, which break down and form an ulcer of a yellowish grey appearance, round whicls the skin is indurated. Whenever these appear the surface should be freely cauterized so as to destroy all the unhealthy tissue, but in every case the patient should apply for medical aid.
Chapped Fiands are the result of carelessness in drying the parts after washing when the weather is frosty. The employment of a soap containing an excess of alkali also tends to give rise to this affection. Where the tendency to this complaint is very pronounced the application of vinolia cream or lanoline will prove helpful in warding of the affection. The greatest beneft, however, will be obtained by using, for toilet purposes, the soap known as paraftin soap, which has a most emollient effect upon the skin.

Charcoal. (See CARDON.)
Chest, technically termed the Thorax, is the cavity of the body containing the lungs, heart, and large blood-vessels. The gullet and windpipe also pass through this cavity in a portion of their course. It is separated from the abdomen by the diaphragm, and its upper portion is bounded by the neck. The developinent of the chest may be cultivated to a large extent by judicious gymnastic exercise.

Chest, Water in the, or Hydro Thorax, is the result of pleurisy and where eflusion into the pleural cavity has taken place.

Chicker-Poz is a zymotic disease, and is highly infectious. It occurs principally amongst children, and only once during life. It may be preceded by slight feverishness, afterwards the eruption, composed of pimples with white heads, appears on the breast, shoulders, face, scalp, and body generally, It may also affect, and very frequently does, the tonsils and roof of the mouth. On the third or fourth day the white vesicle dries up, forming a crust which soon drops off. If the vesicles are not irritated they will pass away without leaving any mark, but as they are apt to be very itchy the little patient by rubbing them may so irritate the part as to create a slight ulcer, which will result in a little indentation or pit. To obviate this irritability it is usual to apply a little car. bolized oil to the itchy part, which will speedily allay the irritation. The great point in the treatment of chicken-pox is to keep the patient indoors and to attend to the daily evacuation of the bowels.

Chilblain is a very modified frost bite, whereby the skin becomes inflamed, irritable, and disagreeably itchy. It is more liable to occur in persons who ane weakened by disease and in those who nre of a rheumatic constitution. The best application for chilblains is carbolized zinc ointnent in the proportion of one part of carbolic acid to siateen or twenty of the oint. ment. The application of tincture of iodiue has also been recommended.

Childhood is always an anxious period to parents, in consequence of the inability of the infant to indicate the symptoms from which it inay be suffering. Ore thing may be accepted as an axiom, that if a cliild is fretful and cross there is some cause at the root of this. As a rule, this will be found to exist in the digestive
organs, and is frequently caused by pains due to Altulence. These may bo freguently ailayed by a close of castor oil or the adminilstration of a little carminative combinell wleh a small close of bicar bouate of soda. The child should be bathed regularly uight ind quorning, and alwdys sponged after an evacuation of the bowets or passing of urine, the parts in the immecliate neighbourhood after being thoroughly drici shoukd be dusted with oxide of zinc powder, so as to prevent scalding' at the folls of the joints. It is always better that ant intant should sleep in a cot, and not with the mother or nurse. If this advice is carried out it will be found that the sleep will not only be more prolonged, but nuch less disturbed than it would otherwise be. The nursery slould always be well aired, lut free from draughts. The moat hatural food of the infant is certainly the mother's milk, and if possible every mother should suckle her own infant. but if she ls unable to do this, then a wet nurse should be procired. Should it be preferred by the mother to resort to artificial food for the infant, great care shoukl be exercised in selecting this, as there aro so many dilferent kinds of infants' food in the market which might constitute a difficulty in making a proper selection. Mellin's food is so well kuown and so popular in nurseries that it may be recommended with the greatest confilence.
Chin Cough. (See Hooping CouGh.)
Chloral is a soporific which at one time was most popular, but in consequence of its popularity came to be too freely employed as a means of procuring sleep. The consequence is that it has fallen into considerable discredit, and this arises from the fact that individuals indulged in it too freely, and thereby acquired the habit of depending upon it, this habit resembling to a large extent the craving for alcoholic stimulants. The dose of chloral, when legitimately used for procuring sleep, is from 15 to 30 grains given at bedtime.

Chloralamid is another soporific which may be given with considerable benefit in sleeplessness, and does not seem to produce any injurious effects when taken occasionally as a hypnotic.
Chloroborom is a substance whicl has been prescribed in sea-sickness. The dose is one ounce repeated every two or three hours if necessary.
Chloroform is, as a rule, administered to children without much danger, and should always be employed if an operation, however slight, is requisite. The inhalation of this anaesthetic will also be found most useful when convulsions occur during childhood, as thereby the convulsive movements will be immediately checked, and frequently a fatal issue avoided. In the administration of chloroform there is practically no clanger if the anaesthetist is a careful man and directs his whole attention to his duty. Accidents are almost invariably the result of carelessness.
Chiorosis is an aggravated form of anaemia, and is invariably the result of prolonged constipation in young women, when it is usually accompanied by cessation of the menstrual periods. It is always accompanied by languor, palpitation of the heart, and disturbed sleep. The deterioration of the blood accounts for the peculiar greenish tint which is characteristic of the disease. The treatment consists in procuring a daily evacuation of the bowels and the administration of iron, together with plenty of fresli air.

## Choke-damp. (See CARBONIC ACID.)

Cholera, properly so called, is of Asiatic origin. Fortunately the advance in sanitary science has practically stamped this disease out of existence in our country. It is, like every epidemic disease, due to the development of a microscopic organism within the body. This has been identified by bacteriologists, and has the form of a comma, hence it is called the comma bacillus. It takes possession of the alimentary ranal, where it produces its virulent symptoms. These are very violent in their nature and develop very rapidly. The symptoms commence with diarrhoea, a sinking sensation in the stomach: the diarrlioea rapidly develops in virulence and the stools become very frequent, and accompanied by severe cramps of the limbs and abdomen. The character of the stools is very distinctive of the disease, and resemble thin gruel
or rice water. As the clisease advances the surface hecomes cold, livid, and hathed in profuse perspira. tion ; this is called the collapse stage, and frequently terminates fatally. The treatment consists in keeping up tho animal heat and endeavouring to arrest the great drain that takes place of the vital fluids. Opinm hirs always held a prominent position in the treatment of this nallignant disorder, but probably the most efficacious means is the frequent administration of antiseptic remedies, tho most useful lut this clisorder being nophthaline. Cholera, although epidenic in its nature, is not necessarily infactions, but is generally duc to the imbibing of fluids containing the gerns of the disease.
Cholera, British, is characterized by coplous diarrloea, accompaned by spasmodic pains in the region of the abdomen and limbs. It is generally cinused by eating unwholesome fruit. The proper course to pursue in sucli circumstances is to clear out the bowels by a dose of castor oil and laudanum, 20 or 25 drops of the latter beligg given to an adult, and less according to the age of the patient, after which chalk mixture containing an astringent and laudanmm niay be given at regular intervals.

Chorea, or St. Vitus's Dance, is essentially a disease of a rleumatic origin. It is characterized by involuntary movements of the voluntary muscles, and is practically a disease of childhood. It is generally consequent upon a constipated condition of the bowels occurring in patients vith a rheumatic constitution. During the progress of the disease the patient cloes not appear to have any control over the move. ments of his limbs and face. It is frequently followed by disease of the valves of the heart, resembling in this peculiarity the sequelae of rheumatism. The treatment consists in procuriug a daily evacuation of the bowels and giving nerve tonics, the best of which probably is the valerianate of zinc and arsenic combined with the extract of conium, which tends to soothe the irritable condition of, and give tone to, the nervous system. Bromide of potassium has also been employed as a remedy, but this only acts temporarily, and, moreover, it las to a certain extent a depressing effect which is not desirable when chorea is present.

Chromic Acid, so far as medicine is concerned, is only employed in the destruction of growths such as warts and carunculae. Its effects are very marked in the treatment of warts on the face, liand, or any other part of the body, when these growths are not pedunculated. Great care, however, should be taken in not permitting the acid to attack the healthy structure of the skin in the immediate neighbourhood of the wart.

Chronic is the term applied to diseases of long duration and which run no definite course. It is used in contra-distinction to the term acute in medical language.

Chyle is the milk y looking fluid which is separated from the cliyme after it has passed from the stomacli and been acted upon by the bile and pancreatic fluid in the duodenum, by which it is emulsionized and rendered easy of absorption by the lacteal vessels. These vessels convey this substance to the chyle or thoracic duct, from which it is conveyed to the venous circulation.

Cicatrix is the substance which takes the place of skin in the covering of a wound either of the integument or mucous membrane. Cicatricis arise when a portion of the true skin has been destroyed, as in burns, sloughs, or ulcers. It has not the appearance of skin, nor does it possess a like vitality, and is therefore more easily injured, and not unfrequently it becomes the seat of clironic sores and cancer. Cica. tricis, and especially those of some extent, are very liable to contract and thus produce deformilies.

Clavicle, or Collar Boue, is that long bone whicl stretches from the stermum, or breast bone, to the shoulder blade at the top of the chest on each side. It is frequently the seat of fracture, and causes, in many instances, no Ilttle clifficulty to the surgeon In his endeavours to set and retain the fragments in position,

Clorgyman's Sore Throat is 凤 peculiar condition of the throat and larynx, the effect of prolonged use of the volce and straining of the vocal chords. It is characterized by hoarseness and catarrh
of the mucons membratue, the volec loses its normal tone, and not unfrequently disappears adtogether. It is generally associated winh a rheumatic constitution. The proper treatment is rest, and repeated mhalatoms of creasote, cucalyptus, or punmine in the vapour of steam. The general system should at the same time receive tonic treathtent. The application of electricity to the throat lans anso proved of manense service, The best internal remedy is the glycerite of tar, combined with munnte doses of arsenic.

Club Foot is a deformity of the foot due to a contracted conclition of one or other of the tendons which are in conjunction with the muscles regulatng its movements. When attended to in early lite it can, as a rule, le easily remedied by a simple operation.

Clyster. (See ENEMA.)
Coagulation is a term applied to the clotling of blood when it is ciriwn from the body and comes in contact with a foreign substance by the action of two constituents of the blood named globulin and licpor sanguinis upon each other, the effect being the production of fibrin, which is the composition of the coagulum.
Coal Gas. (See CARburetted llydrogen.)
Cobra. di Capello is the name of one of the most deadly snakes of India. The bite of the reptile should be immediately cauterized by a hot iron, or excised with the knife. The application of strong ammonia to the wound, however, frequently has a most beneficial effect, and recently the injection of strychnine in large doses and also the subcutaneous injection of a solution of chloride of gold have proved most efficacious.

Cobweb has been employed as a popular applica. tion to bleeding surfaces with a view of stopping haemorrhage, but a piece of cotton wool or lint applied to the part, along with a certain amount of pressure; is much more cleanly and quite as efficacious.

Cocaine is a crystalline substance obtained from the coca leaf. It has the power of producing local anaesthesia, and is useful in the treatment of diseases of the eye, toothache, a hypersensitive condition of the nipples, haemorrhoids, etc. Many operations have been performed under the local amaesthetic effects of cocaine, such as the extraction of foreigu bodies from the eye, the removal of cataract, and the operation for squinting. It has also been employed to deaden the pain in the extraction of teeth; and small operations on various parts of the body have been undertaken, when the subcutaneous injection of cocaine has been the only means of destroying the pain of the operation, and in many instances this has been lighly beneficial, Cocaine, however, should never be injected subcutaneously in close proximity to the head, its beneficial and non-injurions effects being more apparent when it is introduced by this means in regions requiring operative measures when these regions are at a considerable distance from the brain.

Cod Kiver Oil holds a high place as a curative remedy in many diseases, such as scrofula, consumption, and rheumatism. Its efficacy is very much increased by its being combined with malt, which has the additional advantage of rendering the oil less nauseous, and therefore more acceptable to children. When combined with malt it is not so liable to be rejected by the stomach, and is, at the same time, more readily assimilated.
Colchicum is a popular remedy for gout. It, however, requires to be administered with great care, as its effect upon the heart is depressing, The preparations of colchicum which are usually employed are the tincture, wine, and extract-the dose of the two former being from to to 30 drops, and of the latter from half a grain to one and a half grains, three times a day after meals. Colchicum lias a slightly laxative effect upon the bowels, and this may possibly be the reason why it is so efficacious in gouty affections.

Cold may be said to be simply the absence of heat, The extraction of heat from the body by exposure to cold often leads to most disastrous results, causing a depression of the vitality and susceptibility to disease. Many diseases which are directly attributed to cold are only due to this agent in a secondary degree: just as the inhalation of impure gases renders the systeru
susceptille to typhoid fever, so does exposure to cold aCt in indncing diseases such as ricumatism, pneumonin, catarrl, and congestion of the various organsthat is to saty, the organisms which are int rinsically the cause of these diseases are enabled to gam a footing within the systenf in consequence of the lowered condition of the vitality resulting from exposure, when, if this had not occurred, the system would lave been able to withstand and conquer the discase-producing entities.

Cold in the Head, or Catarrl, is due to congestion ol the mucous membrane, and liyper-secretion is the result. It is an infectious disease, lout does not in every instance necessirily arise from exposure to infection; it is frequently the result of a clitll, or of sitting or standing for an unduly long period in a drauglit of cold air. Those of a rleumatic temperament are more susceptible to this affection than those who are free from this tendency. When a cold in the head is threatening, the best method of cutting it short is to inhale such substances as creasote or menthol along with the vapour of steam. The steam so impreguated acts as an antiseptic, and therefore is a clestructive agent to the minute organisms which keep up the irritation of the mucous surfaces. Frequently cold in the head, especially in young children, spreads by continuity of tissue into the bronchial tubes and even into the minute capillary tubes which ramify in the lung substance, giviug rise to what is popularly termed capillary bronchitis and pneumonia.

Colic is a painful spasmodic contraction of the muscular coat of the bowels, particularly that of the large bowel or colon. It may be caused either by a large accumulation of wind or the presence of some irritating matter, such as undigested food or hardened faeces, too powerful purgatives or poison, as well as by exposure to cold. The claracteristic symptoms of colic is pain conling on in paroxysms which last for a shorter or longer period, and then gradually pass away, only, however, to recur within a short time. The pain is frequently relieved by firm pressure over the part, and in this it differs from infammation, which, on the other hand, is aggravated by pressure. The seat of the pain is usually in the region of the navel. If the pain is due to flatulent distension this will frequently be relieved by raising the buttocks considerably above the level of the head and by the injection of hot water. If this is not practicable, then the application of hot fomentations, freely sprinkled with laudanum, over the abdomen, will prove of great service. Internally, the combination of nepenthe, essence of ginger, chloric aether, and tincture of cardamoms will act most efficaciously as an anodyne.
Colic, Lead, is a disease of a much more serious nature than the above, and is due to the absorption of lead, either from constant contact with the skin, or from being taken in small quantities into the stomach in solution. It is accompanied by obstinate constipation, and is recognized by a blue line appearing on the gums at the junction of the teeth and gums. Paralysis of the wrist, or drop wrist, is also a palpable symptom.
Collapse is the term applied to that extreme condition of prostration which arises in the course of many diseases, and is always indicative of imminent danger. It is characterized by lividity of the countenance and a clammy coldness over the whole surface of the body, aud is due to failure of the vital functions.
Collar Bone. (See Clavicle.)
Collyrium is a lotion given for the relief of diseases of the eye. (See EyE.)
Colocynth, or Bitter Apple, comes principally from the shores of the Mediterranean. It is a powerful purgative, and should always be combined with some aromatic or soothing medicine, as otherwise its purgative effects are accompanied by severe pain.
Colon, or Large Bowel, is that portion of the bowel which receives the faeces after the nutritive properties have been extracted from the ingesta.
Coma is a state of insensibility resulting from some pernicious infuences acting upon the brain, and may be due either to direct injury, to the absorption or retention of poisonous matter within the economy itself, or to the effects of narcotics or intoxication of one kind or another. It is a frequent precursor of
death in dlseases such as apoplexy and other affections of the brain, and also where the functions of tho kldneys are $\ln$ abeyance.
Complexion may be divided into fair and dark, but it nay vary between these two points. Agaill we may have the pallid and Horid complexion, the latter being due to an excess of blood, and the other to a desciency of it, or an absence of the colouring matter of the blood. If, however, the Indlvidual is in bad health, the couplexion frequently gives indication of the catse- 0.8 . in constipation and billousness the complexion becones sallow, or dusk $y$, this being due to the ract that the blood is contanmated by the absorp. tion of some foctid or excrementitious matter absorberl fror the bowel. If the complexion is yellow and conjoined with the yellow colouration of the whites of the eye, then we may conclude that there is some deficient excretion of bile, or in other words, that the individual is suticring from jaundice. Frequently there Is a lark rim round the cyes, combined with a dusky colcuration of the skin ; thls is generally associated wit' coustipation. In other instances the face lasa a wary appearance, when it is suggestive of kidney disease. If the skin is pallid and this pallor is conoined with a loss of colour in the mucous membrane of the eyelids, nostrils, lips, and gunns, the cause is ssually anaenia. In short, from the complexion a considerable annount of information may frequently be gathered which will guide the physician very much in his endeavours to come to a correct diagnosis. A choice of soanp is also of great inportance in maintaining a healthy complexion, as, if the soap contains an excess of alkali, it acts as an irritant to the skin, and conveys to it a rough and unhealthy appearance. Careful ablution and the use of Pears' Soap, with its emollient properties, tend greatly to clear and brighten the complexion. This soap is generally recommended both on account of its cleansing properties and its innocuous effects upon the skin.
Concretion means an unusual aggregation of any of the secretions within the body, such as the gall and urinary bladders, kidneys, joints, and also in the intestines, the latter arising from taking some substance in excessive quantities into the stomach. In many instances hair in large balls has been found in the stomach, also pieces of thread. Magnesia, when partaken of too freely, is liable to accumulate within the intestinal canal.

Concussion is the effect of a severe blow upon the head ur spine. In concussion of the brain the consequences are alarming at first, but usually they are of a transient nature and soon pass off. The inmediate effects of concussion are insensibility, frequently followed by vomiting. The treatnent of such cases consists in endeavouring to remove the shock which is the immediate cause of the attack. This is best done by the administration of stimulants, such as ammonia, brandy, or whisky, and the application of ammonia to the nostrils and cold to the head and face; immediately following these, the application of mustard and hot water to the feet and over :he stomach.
Congestion means an overloaded condition of the blood.vessels in any one part. This may lead to effusion of the liquid portion of the blood into the tissues immediately surrounding the seat of disease. Int the popular mind it is usually synonymous with inflammation, and is marked by a sensation of heat, pain, and swelling of the part-e.g. congestion of the throat, of the lungs, or the kidneys are all due to inflammatory action in these organs. The proper treatment in such circumstances is to endeavour to counteract the morbid process by means of poultices, blisters, or sometimes even cold applications, and, at the same time reduce the temperature of the body by suitable antipyretics.

Conjunctiva is the membrane whlch covers the eyeballs and eyelids. It is of a white pearly colour, and over the cornea and iris is a perfectly transparent membrane. It is liable to inflammation, which is termed conjunctivitis. This may arise either from direct contagion or exposure to cold. Until a medical man is called in great relief may ve obtained by bathing the eyeball with a strong infusion of tea to which a few drops of laudanum have been added,

While one or two grains of quinine may be given every three hours. The introduction of a drop or two of a five per cent. Solution of cocaine gives linmedlate relief to pain, and frequently cures the disease.
Constipation, or Costiveness, is one of the most frecpuent predisposing causes of diseases. This can be readily understood when it is pointed out thas if the frecal matter is permitted to remain for a lengthened period within the colon, or lower bowel, absorption of the thuld constituents of the faeces rapidly tikes place, and las the effect of contaninating the blood and producing a forni of blood poisoning. In consequence of this, the functions of the body at large become more or less prostrated, while, at the same time, the quality of the blood hecomes deteriorated. The consegucuces of constipation are very varied-c.q. it reuders the indiviclual more susceptible to infectious disease ; secondly, it interferes with digestion; thirdly, it iuterrupts the excreting power of different organs, such as the llver and kidneys; and lastly, it has a most pernicious effect upon the nervous apparatus, causing depression of spirits, irritalilility of temper, disturbed and unrefreshing sleep, and an undue sensibility to cold.

Consumption is a discase which is due to the development within the tissues of the tubercle bacillus. It is probably the greatest scourge that ever visited mankind, and is responsible for more suffering and deaths than almost any other disease; in fact, its ravages produce about one- ifith of the death rate of the adult population, and in children it is equally fatal. It is considered a hereditary disease, so far as the facts and deductions at our command seem to indicate. At the same time it must be looked upon as a specific disease, and due, in its essence, to the presence of a partlcular micro-organism which has the power of attacking and invading tissues such as the lungs, glands, and bones, in which it develops its virulence. Consumption is usually the term applied to pulmonary disease where tubercle is the power at work. It is manifested by a cough accompanied by copious expectoration, which comes away cliefly in the morning. Unlike the usual expectoration of bronchitis or catarrh, which, as a rule, is frothy, the expectoration of tubercular disease is cliaracterized by its purulent nature, which may sometimes be streaked with blood, or even accompanied by spitting of blood. Technically, the expectoration is termed nummular, in consequence of its resembling somewhat in shape and form a coin. Its consistence is denser than that of any other form of expectoration. Another symptom of consumptive or tubercular disease $1 \mathrm{~s}-$ wasting of the body, the enaclation proceeding in some instances to an extreme degree. It is frequently accompanied by profuse perspiration, especially at night. The extremities of the fingers become clubbed, the face palfid with a hectic fush on each cheek, and in many instances there is profuse diarrhoca, and if the mucous membrane of the larynx is also attacked there is hoarseness, in some cases proceeding to actual loss of voice. Consumption, to be curable, must be detected in its very earliest stages, when a clange to a dry, bracing, and cold clinate., such as is founct in some parts of the Engadine, will have a most beneficial effect ; a long sea voyage is also a popular remedy which has proved of great service; conjoined with these a good nourishing diet must be prescribed. Cod liver oil, syrup of hypophosphites, muriate of calcium, creasote, and other remedies of a like nature have proved most efficaclous in enabling the constitution to overcome the disease and expel it from the system. As is well known, Kocl has recommended the subcutaneous injection of a substance which he calls tuberculin, while others have advised the employment of a compound of cantharidin with some mineral salt ; others, again, have recommended the subcutaneous injection of chloride of zine: but all these local applications can in reality have little effect upon the disease, which is essentially a constitutional affection. The grand point in treating consumption is to strengthen the organism attacked, so that each individual cell composing that organism will be rendered capable of exerting its powers to the full, and so resist the multiplication of the eutitles which constitute the real essence of the
disease, and thus prevent them getting a footing and a loold upon the individual. Mmriate of calciun would nppear to hiave the most powerful effect in accompllshing this ent, and it seens to ne beyond eloubt to be the great remedy whicli in future we will depend upon ln the treatment of this discase which has hitherto proved to be amost fatal aflection. Of course no treatment of a disorder of this nature can of itself cure or arrest it. Medical treatment must therefore be accompanied by strict attention to the laws of health. A good and nourishing diet must be partaken of, whllst the body should be well and comfortably clothed, flamel in every instance being worn next the skin. The apartment whicla the patient sleeps in should be airy and well ventilated. It is a curious circumstance comected with this disease, that patients suffering from it never seen to realize its danger, but invariably are buoyed up by inost optimistic views. It should always be borne in mind that consumption is to a considerable extent an infectious disorder, and therefore it is desirable that those who are in a healthy condition should avoid occupying the same bed, or even the sane apartment, with a patient suffering from this affection.

Contagion means literally the contracting of disease by touch. The term is applied, however, to all infection contracted either by breathing the air exlialed from a patient, or by drinking out of the same vessels, or using the same clothing as that which has been utilized by patients suffering from infectious disorders. This power of propagating disease is due to the fact, that the organisms which are the disease-producing entities are transferred from one individual to another, and it is then called epidemic disease. Endemic, on the other hand, is applied to those diseases which come and are spread independently of infection -e.g. influenza, which appears to come in a wave and attacks whole conimunities without any evidence to indicate that it is spread by infection or contagion, There are certain furms of contagion which, if antiseptic precautions are not thoroughly and efficiently employed, may linger about a piece of furniture or clothing, or a bedroom, for months after the disease lias apparently disappeared, thus showing the great necessity of employing disinfectants, not only to the individual, but to all his surroundings, immediately that convalescence has been established. The most virulent form of dlseases, such as scarlet fever and small-pox, have been known to develop months after all fear of infection had been apparently removed. No precautlon, when the disinfecting process is being carried out, should be overlooked, and the most minute details with regard to this sanitary measure should be rigidly enforced. The best antiseptics to employ in the circumstances are-carbolic acid, chlorine, sulphur, eucalyptus, etc., and one or other of these ought to be freely employed, not only when the house is being disinfected, but during the progress of the disease. A good plan is to have a slieet over the doorway of the apartment where the infected patient is lying, and to keep this freely sprinkled with a saturated solution of carbolic acid in water. By this means the air that passes out of that apartinent will be disinfected before it gains access to the other parts of the loouse. The ventilation of the room should also be made certain by kecping a fire constantly burning.

Contusion is applied to injuries arising from bruises, and is gencrally followed very rapidly by swelling of the part which has suffered from the blow. This swelling arises partly from rupture of the minute vessels which permit the exudation of blood into the tissues of the parts, and by the effusion of lymph which also takes place. The treatment which is most useful in these circumstances is, to apply cold to the part, in the form of cloths wrung out of cold water, as rapidly as possible after the injury has been inficted, thercly keeping in clieck the effision of blood, and thus permitting the ruptured vessels to become closed by the formation of clots within their orifices.

Convalescence is that period which intervenes between the cessation of disease and restoration to health. It commences at the point where the discase process has completely ceased to act, and is as a rule characterized by a fecling at its commencement of
great prostration, which very slowly or rapidly, as the case may le, gives place to the re-establisliment of health and strength. In convalescence it is of the utinost inmportance to cudeavour to restore the vital energles by the judicious yet frequent administration of suitable nourishment and stimulants, where the latter are thought to be advisable. A change of air in these circumstances is frequently of considerable service, lut the grand joint is to insist on the patient taking food, and that of the most nutritious and easily digested character, at frequent iutervals, which should be continued even during the niglit, that is if dio patient is not asleep, It must be obscrved, howger, that sleep is one of the best restorers, or is the best restorer, that a convalescent can command, therefore this should never be disturbed oll any pretext. Sometimes it will be found that, where there is restlessiess and wakefulness during the night, if an egg fipor a cup of strong nutritious soup be taken. steep will speedily ensue, and that of a nost refreshing natare. In convalescence from acute disease whicli has neeessarily prostrated lie vital energies to a considerajle extent, it will be found that taking food frequently asd liberally will aid very much in shortening the period of restoration to health. The management of convalescence is sometimes even more important than the treatment of diseases, for these as a rule run a certaln course, and if the vitality of the patient be well main. tained, will do so without causing much anxiety ; yet, in some diseases, such as scarlet fever, measles, smallpox, pneumonia, influenza, etc., so many complications may arise in the course of convalescence that the greatest care must be exercised, and the most extreme vigilance employed to counteract the tendency to inflammatory affections which so frequently prevail during this period. The excretions must be rigidly watched; for example, the bowels should be acted upon at least once a day, and the condition of the urine carefully observed. If constlpation exists, it acts in a most pernicious manner, while an unhealthy condition of the kidneys may proceed to disease which may eventually prove fatal. During convalescence the bedroom should be well veltilated, the clothing be sufficlent, and the diet and cooking most carefully attended to.
Convulsions are those distressing symptoms characterized by unconsciousness and Involuntary movements of the muscles of the body at large. They are always of an alarming nature, and give rise to great anxiety to those interested in the patient. They are characterized by twitching of the muscles of the face, contortions of the body, lividity of countenance, foaming at the mouth, and frequently biting of the tongue. They may arise from some reflex irritation, sucli as teething, constipation, or worms. On the other liand, they frequently are due to some organic mischief within the brain itself, such as epilepsy or congestion of the lining membrane of the brain, of vessels within the brain substance, or rupture of vessels within the cranium. An attack may come on without the least warning, but, as a rule, there are generally premonitory syimptoms. If in children (and they are probably more liable to this nervous disorder than older people), the convulsion will generally be preceded by moaning in the sleep, grinding of the teeth, starting in a fright, irritability of temper, squinting or rolling of the eyeballs in sleep, a startled look about the face, and a constipated condition of the bowels. In an adult they are sometimes preceded by restlessuess at night, noises in the ears, giddiness, depression of spirits, irritability of temper, confusion of the mind, and want of power of concentrating the thoughts, loss of memory, and headache. The digestive organs are very frequently involved, and vomiting without any obvious cause is also a frequent concomitaut. There may be hiccough, cramp of the limbs, and as a rule there is present a peculiar sensation which is called the "Aura," which will be immediately followed by the attack. Convulsions are rarely fatal when due to a cause outside the nervous apparatus, that is to say, when they are not due to some organic disease within the brain or spinal cord. Convulsions of children should be treated by inmmediately emptying the bowels, either by medicine or by

PEARS' CYCLOPAEDIA.
an enema; a mustard poultice should then be applied to the nape of the reck and to the calves of the legs. If the convulsion persists, the adninistration of chlorofornt sliould be munceliately resorted to, when the spasm will be found to pass away is the patient comes wader the influence of the anaesthetic. Ten grains of bromide of potassium combined with an equal guantity of chloral dissolved in water will generally prove very efficacious in keeping the attacks in abeyance, In some instances it may be necessary to bance the gums. After the-attack has been successfully conbated, its recurrence sloould be guarded against by strict attention to diet aud to the daily evacuation of the bovels. The warmth of the body should also be thoroughlymaintained by judicious clothing. In every instance, however, where a convulsion occurs no tine should be lost in having recourse to medical advler, ats the treatunent of such cases requires the best professional skill that can possibly be obtained.

Cookery for invalids is of the greatest importance. Unless this is property conducted the stomach of tho patient will be sorely tried. Nothitg aids recovery so much as judicious cooking-c.g. in dyspepsia food should not be stewed or bolled, as by this process the digestive salts are abstracted from the meat and the food thereby rendered more difficult of digestion. Roasted and grilled food, well, but not overcooked, sloould be given in such cases. In convalescence from fevers and other acute diseases the cooking is of no less importance, as the patient's apetite is, during that period, often very fickle and very difficult to please. Wilk puddings properly made should always enter into the dietary of invalids, while articles containing a large amount of gelatine should invariably be avoided. It is quite needless in a work of this kind to enter into details with regard to the cooking of the various articles of diet that might be enumerated-these can always be obtained in a book devoted to the subjectbut at the same time it may be suggested that soups contain little nourishment, whereas milk puddings with the addition of eggs are highly nutritious, and animal foods are much preferable in their cooked condition thin broth and soup made frons them, which are erroneously supposed to contain the nutritive properties.
Cora is an excrescence generally situated upon one or other of the toe joints. It is a liypertrophied condition of the cuticle or epidermis of the part, and is as a rule due to friction or pressure arising from wearing tight boots. This, however, is not always the cause, the tendency to coms being generally hereditary. They therefore do not disappear when the apparent cause is renoved, but may persist in spite of this. Sometimes what are called soft corns appear between the toes, and these as a rule are due to an excessive secretion of the skin, causing irritation. They are generally productive of considerable uneasiness and pain. When corns are situated in this particular lncality, they generally contain underneath the hardened surface of the skin an accumulation of fluid resembling in some respects the contents of an abscess. The treatment which gives the most speedy relief consists in rentoving the indurated surface. and afterwards applying a solution of salicylic acid in collodion along with the extract of Cannabis Indica, the latter soothing the pain which the former is apt to give rise to. The salicylic acid has a destructive effect upon the cuticle, and in process of time is quite effective in eradicating the affection. Chromic acid has also a powerful destructive effect upon this thickened condition of the epidermis. The application of caustic at frequent intervals has also been advocated in these circumstances, but nothing seems to lave the curative effect that salicylic acid combined with collodion exerts.

Cornea is the transparent portion of the eyeball through which light is transmitted to the retina.

Corrosive Sublimate. Of late years this has come much more into use, on account of its antiseptic properties, than formerly. It is, however, given internally in certain diseases where the action of mercury is desired. Its chemical nane is bi-chloride of nercury. Its administration requires great caution, and should never be employed except under medical supervision.

Cough is a violent expectoration which expels alr and mucus from the air bassages. It is invarlalaly the symptom of disease, and not so much a disease of itself. It is abways influced by the cold air impinging upon an irritated surface of the resplratory tract. When arising from discase confined to the harymx it is generally associated with a tickling sensation at the $10 p$ of the windpipe, and is liable to assmme in such circunstances a spasmodic character with little expectoration. When, however, the bronchial tubes or lums tissue are affected, the cough terminates in the expectoration of a mucous, or muco-purulent, or mucosanguineous discharge. Cough in many instances, on the other liand, may be reflex in its character and arise from derangement of the stomach, the lrritation of worms, or some uterine disorder. In everyinstance where cough of a troublesome nature exists it is wise to call in medical aid so as to ascertain its proper source and the treatnent to be applied. In tho majority of instances cough usuatly arises from the effects of exposure to cold, and great relief, if suclt bo the case, will be obtained by the judtcious administration of an expectorant nixture, such as the following : -Chlorodyne, chloric aether, and ipecacuanha winc, of each three drachms, syrup of squills to make three ounces-a teaspoonful to be taken at intervals of two or three hours to sootlie the irritable membrane and at the same thme pronote expectoration.

Counter-Irritation consists in applying an irritaut to the surface, which, acting through the nervous system, relieves inflammatory action in the deeper structure-c.g. if congestion of the nucous membrane of any of the organs of the body exists, then a counter-irritant applied on the surface over this will frequently give considerable relief. Counter-irritation may be either produced by mustard poultices, the application of croton oil liniment, acetic acid, fy blisters, or the actual cautery, the latter being considered the most severe counter-irritant which we can employ. If mustard poultices are employed, these require to be repeated at intervals of three or four hours, whereas if acetic acid or croton oil is the counterirritant preferred, then the application may not require to be renewed except at intervals of twelve or even twenty-four hours; but if the fly blister or the actual cautery is decided upon, then a longer time will necessarity require to elapse before they are renewed. The two latter are generally employed where the disease is deeper seated or of a chronic nature. There is perhaps no more popular remedy in inflammatory affections than counter-irritation, and this claim to popularity is based upon its great utility, as there can be no doubt that this method of treating inflammatory affec* tions is one of the inost efficacious that has ever beell adopted.

Countenance. (See COMPLEXION.)
Coup de. Soleil, Sunstroke, or Sun $\Lambda$ poplexy, is the direct effect of the sun playing for a considerable time upon the naked or insufficiently protected head, which produces congestion of the brain or its membranes. The symptoms are, throbbing of the head, accompanied by sickness, and frequently followed by insensibility, and even death. The treatment should be in every instance very prompt. and consists in the application of cold to the scalp, either int the form of cold water cloths or ice bags, while the bowels should be thoroughly emptied by a purgative, and mustard poultices applied in the abdomen and extremities. The patient sloould at the same time be kept perfectly quiet and free from any form of excitement, and the food should be of the simplest kind.

Coverpor is the disease affecting cattle which has all the characteristics of small-pox in the human being. It, however, is not of such a virulent nature, and therefore vaccination, which is simply the inoculation of a human being with the vlrus of the cow-pox, or vaccinia, is universally resorted to to render the individual innocuous to small-pox, which effect it inhdoubtedly has; and, being a disease of suclt a mild type, renders the operation free from danger, while at the same time it protects the vaccinated person from the more loathsome disease.

Crab-Louse is the vilgar name given to the iusect which tocates itself in the hair round the pubes
of dirty people, and which gives rise to intolerable itclang and sometimes to sores in the parts. It is easily destroyed by the application of mercurial ointnuent or carbolic oin, while afterwards the parts must be kept clean by means of carlsolic soap and water.

Cramp is a spasmodic affection of one or other of the muscular tissues. It ntay affect the voluntary muscles, such as those of the leg or thigh, also the lnvoluntary muscles, sucli as those of the intestines or stomach. When cramp occurs, the part affected contracts to such in extent as to produce a hard lump at the point of seizure. When it occurs in the bowels it is generally due to some indigestible food in the stomach, or which has escaped from the stomach into the intestines. When it occurs in the limbs it is gener. ally due to some reflex irritation conveyed from the stomach or bowels. It is a symptom of British and A siatic cholera. It is also frequently due to disease of the heart or the large blood-vessels of the cliest. Exposure to prolonged cold frequently produces cramp, and this is particularly noticeable in the cramp which seizes those who have been too long inmersed in cold water, and is in many instances the cause of death to bathers. The best remedy when cramp occurs is to use friction very energetically to the part affected. Bromide of potassium given internally is also a nseful remedy, not only in relieving the spasm, but preventing its occurrence. When the bowels are affected by this painful disorder, opiates, in one form or another, are exceedingly useful. In every instance, where a person is liable to cramp, particular attention should be invariably paid to the free evacuation of the bowels.
Cranium, or Skull, is the bony cavity containing the brain.
Cream of Tartax, or Bi-tartrate of Potasl, is a popular remedy employed in conjunction with sulphur as a laxative. It also possesses useful diuretic properties when given in solution with water and lemon juice.

Creasote is a substance very much resembling carbolic acid in its properties and oclonr. It is obtained from the destructive distillation of wood, and possesses powerful antiseptic properties. It is employed both externally and internally as a medicine. Externally, it is frequently added to ointments, both on account of its antiseptic properties and its sedative effect upon the skin. Internally, it is applied to decayed teeth for the relief of toothache. It frequently enters also into the composition of inhalations, a few drops being added to a jug of boiling water and inhaled for the reiief of bronchial affections and also in common catarrh of the liead. In the form of pill (one grain mixed with a little bread crumb), it has a sedative effect on the stomach, and thus is useful in vomiting. Creasote is not unfrequently employed in the curing of certain kinds of fish, they being dipped into a weak solution and then hung up to dry.

Creatine is a crystallizable substance which exists in the flesh of all animals.

Crisis is the term applied to a sudden change which takes place in the course of disease either for the better or worse. The crisis is generally associated with some well-marked symptom, such as copious perspiration, eruption on the skin, or some deposit in the urine. When tlie crisis for the better is established it is followed by refreshing sleep, but on the otler hand, if death is impending, the crisis is denoted by sudden loss of the vital powers.

Croton Oil is obtained from the seeds of the small plant called croton-tiglium, which is a natire of India and Ceylon. The oil should be of a very pale amber colour and nearly as thick as castor oil. It is a very acrid oil, and as a purgative it is very rapid in its effects, a single drop being sufficient to produce copious evacuation of the bowels. Externally it is applied in the form of liniment, the oil being diluted for this purpose with cajuput, or some other bland oil. It has proved to be a most useful liniment in bron. chitis. Its application is followed by a copious papillary eruption. Great care should be taken by those who apply the liniment that they do not bring it In contact witli the face, as it will thereby produce

Intense irritation and swelling, especially if it is rubbed in near the eyes.

Croup. There are two forms of croup, that of the most frequent occurrence being of a spasmodic nature. and due, as a rule, to rellex irritation produced by indigestion or constipation combined with slight cold. It most frequently occurs in early childhood, and is always a source of great anxiety to parents. The treatment should be commenced by giving a good dose of castor oil, and if this causes sickness benefit will be derived, but in any case by clearing the stomach and bowels the cause of the spasm will be speedily removed. The chest, back, and front should at the same time be well rubbed with the following liniments:-Equal parts of the compound camplior liniment, belladonna liniment, and soap and opium liniment-a little to be well rulbed in over the back and chest at intervals of two or three hours. Sometimes it may be necessary to supplement a dose of castor oil with to drops of ipecacuanha wine every few ninutes until voniting is produced. This gnedicise has the additional effect of promoting a flow of mucus in the winclpipe and bronchial tubes. This form of croup goes under the name of spuriouscroupin contra-distinction to membraneous or true croup. The latter, however, appears to be more allied to diphtheria, and therefore is always a most dangerous disfase. (See DIPHTHERIA.)

Cupping is a process of drawing blood by means of a series of lancets arranged with a trigger connection by which a spring is let loose, this carrying the knives rapidly through the skin at the required depth. Before the lancets are applied congestion of the skin is produced by means of cupping glasses in which the air has been rarefied by the insertion of a lighted wick. The glasses are again applied after the incisions have been made, so as to draw off the required amount of blood. Cupping is not nearly so much in vogue as it was some years ago ; it is still employed, however, to a certain extent, and is useful in certain inflammatory affections of the internal organs. In cases of poisoned wounds the application of a cupping glass is a good precaution, as thereby the poison together with the blood of the part may be withdrawn and thus prevent absorption of the virus.

Curry is animal food prepared witl the well-known aromatic curry powder, which is made up of turneric, cumin, cayenne pepper, mustard, ginger, and other spices. From its composition it will be seen that it is not an article of diet that can be indulged in by persons of an irritable or weak stomach. It is much better adapted to give a slight stimulating property to rice and other vegetable foods of hot climates than to animal food.

## Cuts. (See Wounds.)

Cut Throat. T wo great dangers which threaten life immediately. in this horrible condition are, bleeding from the large vessels of the neck, and the liability of the blood to enter the windpipe, thus producing suffocation. If a non-medical person has sufficient presence of mind to act energetically on the instant, he nuay render considerable assistance by restraining the bleeding. If an artery is wounded the danger of course is much more imminent, and pressure would not be of much service. The proper course to adopt would be to endeavour to seize the bleeding vessels by forceps and tie them with a silk or cotton ligature until medical assistance arrives. If, on the other hand, a vein is wounded gentle pressure with a handkerchief made into a pad and dipped in cold water would be effectual in arresting the bleeding. If the windpipe is wounded the patient should be laid on his side or front, so as to endeavour to keep the blood from gaining access to the wounded tube. Or course it goes without saying that medical assistance should be immediately sent for.

Cutaneous; or belonging to the skin, such as cutaneous eruptions, etc.
Cuticle, the external layer of the skin.
Cyanosis, or Blue Disease, is essentially venous blood circulating in the arteries. It is due to a congenital malformation of the valves of the heart, and is therefore an incurable affection.
Cynanche is applied to affections of the throat
which tend to produce loss of voice and difficulty of breatling, such as cynanche clericorun, or clergyman's sore throat. (See CATARRH.)
Cyst is a nembraneuls bag containing fluid or other morbid substances which may be either semifluid or solid. Cysis frequently form just underncath the skin and especially under the scalp. Those found on the head are usually of hereditary origin and contain a substance very much rescmbling porridge in appearance. These are called atheromitous cysts, ant are easily removable. The cysts which attain the largest size are those of the ovary, but these are also removable with wonderful freedom from danger.

Cystitis, or Inflammation of the Bladeler, may be due to exposure to cold, adinlssion of air by faulty application of the catheter, direct injury, as in the case of instrmmental interference in cases of labour, the presence of stonc, or the introduction of poisonous master from without. The symptoms are, great pain and frequent desire to make water, which, in consequence of the irriability of the organ, comes away in sumall quantities, or positive retention of urine may take placo accompanicd by a strong desire to void it. Chronic cystitis, or catarrh of the bladder, is a serious malady, and frequently continues for a very long period. When the clisease is acute the urine shoulit be cliluted by the patient partaking of fuids in large quantinies, hot sitz-batlos, and medicine containing an alkali combined with an anodyne, such as the fol-lowing:-Bi-carbonate of potash six drachms, tincture of henbaue six drachms, the infusion of uva ursi to make eight ounces-a tablespoonful of which may be taken three times a day. If the disease is chronic and the urine loaded with pus, boracic acid in ten-grain doses repeated three times a day is a most useful remedy, while the bladder should be washed out with a solution of the same acid night and morning.
Dandelion, or Leontodon Taraxacum, is a plant well known in almost every country in Europe. It is a medicinal ageut of considerable value, especially in affections of the liver and kidneys. It is usually prescribed as an extract of the root, which may be taken either in a semi-solid form or as a liquid. Sometimes the root is made into a kind of coffee and is taken to breakfast instead of ordinary coffee or tea. The dose of the liquid extract of taraxacun is from one to two teaspoonfuls three times a day.
Dandriff is an affection of the cuticle wherein the complete development of the outer layer is interfered with, and is therefore cast off in scales. It is positively a disease of the epidermis, and is closely allied to that form of skin disease which is termed Pityriasis. Hard brushes and small tooth combs should not be employed in this affection, but it is desirable that the scalp be washed two or three times a week with a solution of borax, and afterwards a pomade containing the red oxide of mercury applied. This application will have a curative effect upon the diseased condition of the cuticle and eventually cure the disease. Half an ounce of the red oxide of mercury may be added to two and a half ounces of ordinary pomade, and this will prove of considerable service in this affection. It frequently occurs in infants, but as a rule it will speedily disappear if soap Is not used in cleansing the scalp, but instead, a solution of borax to which a little spirits of camphor has been added. and the oxide of mercury pomade may afterwards be applied with considerable advantage.

Deadly Nightshade, or Belladonna, is largely employed in medicine. In large doses, however, it is a powerful poison, and should only be taken under medical supervision. It has a powerfully tonic effect upon the involuntary muscular fibres, and is therefore entployed to a considerable extent in ophthalnic practice, and It is also given in constipation and incontinence of urine.

Deafness may be either partial or complete. If It is congenital, the individual is also a mute, from the fact that he has never been able to hear sound, and therefore is unable to learn how to employ his vocal cords. The causes of deafness may be temporary or permanent. It may also be due to an affection of the brain, or only to the mechanism of the ear ltself. Temporary deafness is frequontly the result of catarrh
of the exterual car, of tho internal ear, or of the Eustachlin tube. Sone clugs also have a curious effect upon the auditory apparatus, such as quinine when given in too large doses. If deafness is due to obstruction in the external ear, this may readily be rennoved by the judicious employnent of the syringe, with warm water. If, however, congestion of the throat or Eustachian tube exists, by which the calibre of the tube ls reduced, or even temporarily obliterated, then of course it becomes necessary to treat tho local affection and remove the thickened condition of the mucous memhrane whlch obtains. In any case it would be injudicious for the patient himself to attempt to cure his own deafness; his proper plan would there. fore be to consult a competent nedical authority on the subject.

Debility, or Weakness, is that failing of the vital powers of an individual which prevents him from performing his usual duties or enjoying pleasure as might naturally be expected if he were in liealth. Debility is invariably a concomitant of illness, and in many instances persists for a longer or shorter period after the illness has entircly disappeared; it therefore becomes necessary in all illnesses to endeavour to sustain the vital powers, not only with a view to counteract this debility, but at the same time to enable the pationt to throw off the disease. The feeling of debility often arises from indigestion and constipation. If due to dyspepsia alone it is always more pronounced after a meal, but if due to constipation it gives rise to what is often erroneously designated as a bilious condition, aud in these circunstances a free purge will often relieve the distressing symptoms. The great point in counteracting this state of the health is to endeavour to live regularly, both in the matter of diet and taking of sufficient exercise. The cold noorning bath will also be found of great service in bracing up the system, a healthy condition of the skin being thus ensured and a conic influence imparted to the body generally in consequence. Debility in childhood is very frequently congenital, but it is astonishing how this congenital deficiency may be remedied by judicious ineasures being adopted, both in the way of nourishment and by remedies which ensure the proper assinulation of food. Muriate of calcium given after meals has proved itself a inost potent remedy in promoting assimilation, and thus removing a great cause of debility in early childhood. The syrup of lypopliosphites are also most useful medicines in this condition. When debility depends upon disease, then of course the cause must be attacked and renmoved before it is possible to get quit of this syinptom: for, of course, in these circumstances, it can only be classed as a symptom and not as a disorder per se. Debility raturally is a consequence of old age and general decay of the vital powers, yet even in such circumstances, by assisting digestion and attending carefully to the bowels together with endeavouring to sustain the external heat by judicious clothing, a great deal may be accomplished in alleviating the symptom and in prolonging life.
Decline is synonymous with consumption or tuberculosis. Decline of the bowels is that diseased condition of the peritoneal cavity which is due to the deposit of tubercle. (See CONSUMPTION.)
Decomposition is that change which takes place in dead bodies which results in their being decomposed into their elementary atoms. Fernentation and putrefaction are two forms of decomposition. The process of decomposition in organic matter is due to the development of microorganisms, which feed upon the substance undergoing cluange and liberate the various elements of which it is composed. This can be averted by agents which we call antiseptics, in consequence of their power of destroying the vitality of these minute bodies.
Deformity is any and every deviation from tha normal proportions and symmetry of the human frame, but it is most usually applied to those irregularities of form which consist in local deviations from the correct anatomical condition of the parts. These may be either congenital or acquired after birth. The causes of congenital deformities are not properly understood, although they are frequently attributed to mental lmpressions made upon the mother cluring gestation.

In those which are acquired, irritation of the nervous system produced by some canse, such as worns, teething, constipation, etc., is the usual factor at work. Organic chanke in some portion of the nervous system, such as the brain or spinal cord produciner paralysis, not unfrequently resnlts in malformation of the parts affected. Certain occupations also, such as leanins over a desk, carrying heavy loads, etc., may produco curvature of the spine, but prodably the most irequent canse of inalformations affecting the bones of the body and resulting in deformity is malnutrition of the parts, which produces the deformities affecting the spine and the bones of the lower limbs. Deforminty is frequently due to tubercular affections of the joints, in which caso the limb is shortened. Shortening of the limb also arises from fractures whicli lave been improperly set. Probably the most frequent form of distortion is club-foot, which is due to a spasmodic condition of one or other of the muscles controlling the movements of the foot. This can, as a rule, be easily remedied by a simple surgical operation ; incleed, most of the defornities which we meet with are annenable to surgical and medical treatment. Ry-neck is also due to a spasinodic condition of the sterno-mastoid muscle. Severe scalds or burns, where the skln has been completely destroyed and a cicatrix has been established in its place, are naturally a cause of distortion, in consequence of the tendency of the cicatrix to contract and draw the parts in its neighbourhood out of their normal position. (For special Information on the various forms of defornity refer to articles upon RY-NECK, RICKETS, SPINE, and Club-Foot.
Delirium is a temporary aberration or disturbance of the mental functions, occurring cluring ilness either of a febrile or exhausting nature, or due to prolonged indulgence in alcoholic drinks. It is generally a symptom of considerable importance, but not always so, slight causes frequently in clitdren and even in adults producing delirium. When delirium arises from an exhausting disease it is always of serions import, and may gradually merge into a low muttering form and terminate in coma. Again, deliriun may be due to some disorder of the brain, either of an inflammatory nature or resulting from injury. Of course, in the treatment of delirium the first thing to ascertain is its cause ; e.g. if a person of full habit becomes delirious, and along with the delirium there is a high temperature, a quick pulse, blood-shot eyes, and a flushed face, the proper course to adopt would be to abstract blood either from the arm, or by leeching the temples, or cupping the nape of the neck. A free purgative should also be administered, while to the calves of the legs and abdomen mustard poultices should be applied, and the head shaved and kept cool by the application of ice. If the delirium is accompanied by violent contortions or movements of the limbs, these should be restrained as much as possible. Sleep should also be promoted by the administration of medicines which are known to have a soothing effect upon the nervous system without producing any degree of narcosis. The vital energy should also be maintained by the judicious administration of nourishment, either by the mouth or rectum. In every case of delirium patients should be strictly watched, so that they may not do themselves any injury, as fequently if constant surveillance has not been observed, the patient has been known to rush out of the house by any mode of egress he could find, and not unfrequently this has been through the window; it therefore becomes essential that unceasing care be exercised till intelligence returns. Delirium is so frequently combined with violent muscular exertion that the disease is aggravated and the chances of recovery very much interfered with ln consequence of the exhaustion which naturally arlses from such an amount of fatigue that thereby is induced. It would therefore be madness to abstract blood, yet it is essential that the bowels be kept morierately open, the extremities kept warn, the head cool, and in every instance the patient should be placed in an airy and well ventilated roon. Among'st the best medicines to induce sleep when delirinm is present are-bromide of potassium in $30^{-}$ grain doses administered every two or three hours, the
hydrate of chloral in 15 to $20-g r a i n$ closes repeated at intervals of two hours till sleep is induccel, sulphonal in from 20 to 30 grain doses at intervals of four hours, or chloranicl in 20 -grain doses repeated at intervals of two or three hours. There is hardly any disease of an acute nature which may not develop delirium in its course, and in all these instances it is usually dependent upon the vitiated condition of the blood due to the poison upon the presence of which the disease is dependent. Delitium must always be differentiated from insanity, its treathent being so entirely opposite
Delirium Tremens is essentially an exhausted and poisoned condition of the nervous system due to the indulgence for a prolonged period in alcoholic drink. The clisorder of the nind, which is the chief symptom of this disease, is of a peculiar kind. It is always accompanied by sleeplessness, restlessness, and peculiar hallucinations, which latter seem to excite terror in its most acute form. The entire hodily frame is in a state of tremor, even the closed eyelids and the tougue are tremulous, the hand is unable to perform any action with exactitnde in consequence oft the incessant shaking of the limb. Great prostration speedily follows an attack, yet the patient is unable to sleep, the nervous excitement becouning so intense that the patient cannot be kept in bed, and eventually the strength becomes so exhausted that stupor supervenes, followed by death. Delirium tremens is frequently the sequel of an injury of one kind or another which overtakes a man who has been a habitual drunkard. The great point in the treatment of this disorder is to endeavour to restore the animal strength by means of the frequent administration of nourishing diet of an easily digestible nature, such as egg flips, beef peptinoids, and strong soups, while at the same time sleep may be induced by the administration of sulphonal, chloralamid, or any of the other soporifics which are mentioned in the article upon Delirium. It is needless to say that alcoholic stimulants should beentirely suspended and that the patient be constantly watched so as to prevent hiin doing himself an injury or escaping from the house.
Demulcents are those remedies employed in medicine which have a soothing influence upon the mucous membranes and skin when these are in a state of irritation. These substances may be applied either locally or by the stomach and bowels. When the demulcent is intended to act upon the urinary organs or air passages, they are administered by the mouth, and it is always desirable that they should be given in considerable quantitics. Demulcents are exceedingly useful when the urine is irritating, in consequence of their power of diluting the fluid. In the same way they act on the mucous membrane of the bronchial tubes by promoting a free flow of mucus. Amongst the demulcents may be mentioned almond emulsion, gruels made of arrowroot, sago, tapioca, and oatmeal, egg flips, barley water, rice water, gum arabic in solution, linseed tea, linsced oil, spermaceti, lard, wax, etc.
Dengue is an epidemic fever which prevails in the East and West Indies and also in North America. It is accompanied by great pain and swelling of the joints, resembling very much the symptoms which occur in acute rheumatism. It presents nany of the characteristics of eruptive fever, and is fiable to frequent recurrence or relapses. There is a strong evidence to show that influenza, especially when it occurs in those severe epidemics which have overwhelmed the cominunity during the past year or two, is closely allied to dengue.
Dentifrice is composed of an alkaline substance such as chalk or magnesia, as a base, and some colouring and odoriferous matter to make its use in cleansing the teeth pleasant. The most popular dentifrice is precipitated chalk mixed with a small portion of camphor, which not only acts as an antiseptic, but makes the dentifrice more pleasant to use.
Dentition is the period during which the teeth impel their way through the gums in infancy. It is always a more or less anxious time, as disturbances of the nervous system and the digestive organs are liable to take place during its progress. It is always desirable to keep the child as much in the fresh air as possible, and to observe that the bowels are kept rather loose
than otherwise. If dentition is creating amy disturbance, as a rule the matter may be safely left to nature.

Derbyshire Neck, or Coitre, is a clisease of the thyroid gland producing an enlarged condition of this organ, which not unfrequently develops into n largu cystic tumour. This disease is peculiar to certan localities where an undue proportion oflime is contained In the drinking water. It is benefited by the internal adrtinistration of iodine and iron.
Desquamation takes place after diseases which are accomp:utied by acute lntlammation of the skin, such as erysipelas, scarlet fever, measles, and erythemat. Desiguamation is the separation in flakes of the epidermis, or outer skin. Strictly speaking, this process is constantly going on over the whole surface of the body, the epithelial cells which are thrown ott being rapidly replaced by others. Desquamation also occurs after the application of an irritant, such as mustard plasters, blisters, croton oil, acetic acid, etc. See articles on these several diseases.
Diabetes is that wasting disease in which there is an musually large secretion of urine and in which is suspended a considerable antount of saccharine matter. This discase should only be treated under nutedical supervision. Many remedies have been proposed for Its relief, but the sheet anchor of the patient consists in strict attention to diet and the avoidance of everything containing sugar or farinaceons matter. Skim milk has been advocated by some as an article of diet in the treatment of this disease, but the great point consists in attention to the strict avoidance of all articles containing starchy or sugary matter. Amongst the medicines which have been recommended in this disease arecodeia, morphia, and salicylate of soda. In this affection, although the quantity of the urine is enomously increased, its specific gravity is always unduly high in consequence of the sugar contained in it. It must be remembered, however, that a copious flow of urine does not always indicate diabetes, as frequently in certain nervous disorders the secreting power of the kidneys is very much increased. This is specially the case in hysterical affections.
Diachylon Plaster is the plaster commonly sold by the druggists as adhesive plaster. At one time it was supposed to have healing properties, but this itlea is long since exploded. It is now principally employed in long, strips for supporting the stitches which have been inserted for the purpose of bringing raw surfaces together. It is also employed in exerting pressure upon chronic ulcers, so as to promote absorption of the hardened tissue surrounding the edge of the ulcer and enable the granulations to cicatrize and the ulcer to heal.

Diagnosis is the word which is applied to the art of discovering the nature of any disease and clistinguishing it from others. It is a term which is largely employed in medical literature. To diagnose a case is of course the first step taken by every medical man when called into the sick room. If he is able to come to a correct conclusion as to the nature of the disease, the greatest difficulty has been overcome and the treatment is thereby rendered comparatively easy. If, on the other hand, his diagnosis is incorrect, then the greatest mischief to the parient may follow. Hence the necessity in many cases of calling in other help to clear up a point which may be hazy. A great many instruments have heen called into requisition for the purpose of assisting in diagnosis, the most important of which perhaps are-the stethoscope, the thermometer, and the microscope, in medicine; in surgery, the probe, sound, and exploring needle; in diseases of the throat and air passages, the laryngoscope and the rhinoscope; for the ear, the anriscope ; for the female genital organs. the speculum and uterine sound ; for disease of the kidneys, in addition to the microscope and urinometer, chemical tests are employed in examining the constituents of the urine.
Diaphoretics are those medicines which have the effect of promoting a free action of the sweat glands of the skin. These are employed in cases of fever, where it is always desirable to bring the skin into a state of action. This can be accomplished by various means, such as baths of various kinds, viz., the hot bath, vapour bath, Turkish bath, and the hydropathic
back, Various medicines also lave this property, tho most important of which is phenacetin, which not only reduces the temperature of the borly, but promotes copions perspiration. Amongst the older diaphoretics may be included acctate of ammonia, commonly catled when in solution the spirits of mindererus, ipecacnanhin, nntimoly, opitm, etc. The great point, however, In treating fevers is to encleavour to get the temperaturo reduced as rapidly as possible, and in certain cases it is ndvisable to apply a cold spray or sponge bath to the whold surface of the body, and not unfrequently lifo has beell saved when the temperature has been very light by the application of bags filled with ice over the region of the heart and abdomen. As a medicine, however, nothing seems to equal phenacetin in attaining this object, though scveral preparations of like nature, sucls as antipyrine and antifebrine, etc., havo been largely used, but their employment is always more or less attended with danger, whereas phenacetin is uniformly safe.

Diarrhoea consists, as its nature implies, of a copions discharge from the bowels of liquid or semiliquid matter, this generally being of a ntost offensive odour. It is frequently accompanied by severe griping pain, which invariably indicates that the diarroca is due to the presence of some irritating matter within the intestinal canal. The proper method of treatment to be adopted when these painful symptoms accompany the disorder is, to commence by clearing out the alimentary canal by means of castor oil and laudanum, or a mixture of rhubarb, soda, and ginger-the first, however, as a rule, is to be preferred. A form of diarrhoea, or pseudo-diarrhoea, frequently occurs in the lower portion of the colon, and this is clue to the presence of hardened faeces within the canal which set up the irritation, exciting the bowel to undue action in its efforts to get quit of the matter, This cliarrhoea is accompanied by very great depression of spirits and irritability of temper, and nay be recognized by the fact that when the patient goes to stool he invariably has the feeling as if he could not get himself properly relieved, and feels inclined to sit and strain long after the bowel has apparently been emptied, It is also characterized by the fact that when the desire to go to stool comes on, the call is inperative and will admit of no delay. It has also the additional characteristic that diarrhoea frequently supervenes immediately on rising to the erect position or after partaking of a meal. It may continue for a day or two, and then there is a period of constipation, when the bowels do not act at all ; this, however, againgives place to looseness of the bowels, and it is dificult to convince one ignorant of the cause of this form of diarrhoea that it is in reality due to constipation. The treatment consists in the employment of enemata, so as to wash out the bowel and clear it of its irritating contents, and this should be repeated at regular intervals of at least fortyeight hours. Diarrhoen again is an urgent symptom in certain diseases, such as typhoid fever and cholera, It may also arise from a catarrhal state of the mucous membrane of the intèstinal canal ; in such diseases, however, it is essential that medical aid be called in to indicate the proper line of treatment. The most popular remedies for diarrhoea after the bowel has been cleared of any irritating matter are-opinm, chalk mixture, bismuth, and gum arabic, combined with a light diet.

Diet is a subject which is of the greatest inportance for consideration in this age of luxuries. Nine cases out of ten of indigestion are due to over-indnlgence in eating and drinking. Again, attention to diet is most important when there is a tendency to plethora and obesity, and it is equally inportant when there is a tendency to constipation, and certainly no case of dyspepsia can be treated without the strictest attention being paid to the food, both as to its cooking and its nature. If there is undue distension after meals, such articles as broth, soups, stewed and boiled meats, pastry, badly cooked potatoes, and uncooked vegetables should be carefully avoided, and liquids must not be partaken of ln any quantityd during a meal, but should only be drunk after the meal is finished. Cont fections of all kinds are also pernicious where there is dyspepsia, and long-infused tea is also to be avoided,

It is hardly necessary to add that where indigestion is present it is essential that the food be thoroughly masticated and mixed with the salivary secretion before being swallowed.
Digestion is the process commencing in the mouth and terminating in the duodenun by which food is rendered fit for nonrishing the body, The first stirge in the process is mastication, which should in every instance be thoroughly accomplished, as by this means its fine division is secured, which renclers it capable of coming in contict thoroughly with the juices which are mecessary to act upon it in the process of digestion, By mastication a thorough mixing of the food with the salivary secretion is obtained. This secretion is most important where farinaceous articles are concerned, therefore bread, potatoes, and food containing starchy matter should come thoroughly in contact with the saliva before being swallowed. When the food is swallowed it comes in contact with the gastric juice, and by a peculiar worm-like movernent of the stomach called the peristaltic action, it is kept constantly moving to and fro until all the albuminous portions have been cligested and the contents of the stomach converted into chyme. The chyme then passes into the duodenum, where it comes in contact with the bile and pancreatic juices, the fatty matters there becoming emulsionized. The digested food is thus transformed into chyle, after which it is taken up by the lacteal vessels and conveyed to the blood as nourishment. The unassimilated portion of the ingesta then passes into the large intestine or colon, where it becomes acid and mixed with the feculent excretion from the glands of that bowel, and is thereafter discharged as excrement. Digestion will thus be seen to be very much facilitated by thorough mastication, while the organs of digestion are kept in healthy vigour by the nervous apparatus controlling their secretions being supplied by a pure blood; hence the necessity of a daily evacuation of the bowels. If this is not regularly accomplished absorption of the foetid liquid takes place, and the blood thereby becomes contaminated. This vitiated blood circulates through the nervousi system, and naturally has a prejudical effect upon their activity; thus not only are general symptoms of nervous depression persistent if the bowels are not acted upon daily, but likewise the nerves stimulating the gastric and other glands are deprived of their normal power, and hence the secretions become reduced in quantity as well as in quality. The salivary glauds are stimulated and becone active when the process of mastication is going on, the saliva being poured out in sufficient quantities to completely saturate the food which is undergoing mastication. It is therefore quite unnecessary to imbibe any fluids during eating, as this only dilutes the natural gastric juices, and renders them less efficient in consequence. The salivary secretion, as before stated, acts in a chemical manner upon the starchy components of the food, converting them into sugar, by which transition they become fitted for absorption. Starch, on the other hand, cannot pass into the blood as nourishment. The gastric juice, as already noted, acts principally upon the albuminous portions of the food; its action is highly acid, and, in consequence of this, any starchy matter that has escaped from the mouth without being acted upon by the salivary secretion remains unaltered until it comes in contact with the pancreatic and biliary secretions in the duodenum. These juices neutralize the acidity of the chyme, and, by emulsionizing the fats and transforming the reinaining starchy constituents into sugar, transform the chyme into chyle. This substance, as before stated, is absorbed by the lacteal vessels, which ramify over the sinall intestines and have communication with the intestinal canal by small glandular elevations called villi. These vessels take up the nutritious portions of the chyle and convey them through the mesenteric glands, thus filtering it from all matter which is not capable of being vitalized. After this purification it acquires the power of coagulating, and assumes a slightly reddish tinge when exposed to atmospheric air. The chyle from the smaller vessels is emptied into the larger trunks, which unite and form one main clannel. This conveys the blood to the vein formed by the junction of the large veins of the head and neck
with those of the arm. This large lacteal vessel is culled the thoracic duct. At the junction of the thoracic duct witl the venons circulation the process of digestion and issinilation ternimates, (For INDIGESTION see article.)

Digitalis, or Fox-Glove, is a well-known plant, and one which yields the nost graceful pendulous flowers that aclorn the hedgerows and wilds of our native land. It is a most powerful medicine, which. when in skilled liands, is one of the most important remedies we possess, It should never be enmployed as a clonestic remedy, but only when prescribed by a skilled physician. It acts as a powerful tonic on the heart, but, like all other tonics, when given in excessive doses is lizble to produce very serious symptoins. The dose of the tincture of digitalis is from ten to twenty drops every four or five hours, whereas that of the infusion (which probably is the most reliable preparation) is a dessert-spoonful every four hours. By its effect upon the heart's action it stimulates the circulation throughout the whole body, and has a special effect on the kidneys, enabling then to secrete in nuch larger quantities than they would other wise do if the heart's action was unaided by a valuable drug like digitalis.

Diphtheria is essentially a disease due to bad sanitation, and is therefore preventible in every instance. The casus morbi is a fungoid growth, whose spores are deposited upon the tonsils or fauces, These spores do not reach their seat of attack by the atmosphere, but must be conveyed to the spot either by the saliva, food, or drinking water. This disease never occurs' in a person who is of robust health, but is generally associated with a vitiated atmosphere confined within the dwelling, and which is as a rule due to the escape of sewage gas into the apartment or apartments inhabited by the individual. The inhalation of such gases for a prolonged period has the natural effect of debilitating the human frame and rendering it susceptible to disease, while these gases, when absorbed into water, convey to that fluid the power of sustaining and nourishing the disease-producing germs. Thus, when this contaminated fluid is partaken of, the germs are conveyed along with it into the system of their victim, and produce the dire consequences of this dreadful disorder. The first indications of diphtheria are lethargy combined with a slow and weak pulse, which is followed in a day or two by sore throat and feverish symptons. When the throat is examined a small ulcer of a yellowish white colour may be detected upon some part of it ; this rapidly spreads in area until not only the throat but the pharynx and larynx may likewise be covered with the deposit. When the disease is confined to the throat it is readily destroyed by the application of strong antiseptics, such as carbolic acid, boracic acid, per-chloride of iron, sulphurous acid, chloral, and other germicides. While the throat is being attended to, however, it is essential that the genernl health be also carefully looked after, and copious supplies of nourishment should be administered at frequent intervals; stimulants, too, should be freely administered, so as to enable the system to resist and overcome the disease. When diphtheria has located itself on the throat, it is at first only a local affection, but in process of time the filaments of the fungus which constitute the disease penetrate the mucous surface and insinuate thenselves into the blood-vessels, and it is then that the dreadful characteristics of the disease so rapidly develop. When once the disease germs have been permitted to enter the blood, the most dangerous stage of the disease may be said to have been arrived at. Our object then should always be to prevent this catastrophe by energetic, persistent, and repeated attacks being made upon the disease before it has become constitutional; in other words, we should endeavour in every instance to attack the disease and destroy it in its initial stage, and prevent its invading the circulation. This can only be accomplished by the energetic application of antiseptics to the primary ulcers. As a rule, if these injunctions are strictly followed out, diphtheria will be found most amenable to treatment, whereas, if time is allowed to elapse without the local remedies being actively enmployed, the disease becomes one of the most malignant and fatal that flesh is heir to. The following application will be found to be most cfficacious

In destroying the micro-organism when it has deposited itself on the thront, viz:- lispuad portions of the strong. liquid of the per-chloride of iron, sulphurous acid. glycerine of carbolic acid, and pure glycerine; this should be applied to the utcers cvery two hours by means of a camelthair pencil, while a mixture containing five drachus of sulphurous acid, five drachmis of the tincture of the muriate of iron, two and a half drachms of chlorate of potash, two and a half drachus of salicine, and water to make eight ounces should be given In tablespoonful does every two hours, so that the application ank the medicine are given at alternate hours, thus bringing the remedy in contact with the diseased surface every hour. Of course, sinultancously, the patient should be well nourished ly frequently partaking of strong soups, egg fip, and port wine. biphtheria, however, is a discase involving so much danger that it is absolutely necessary that every individual case be placed in the hands of a competent medical man, While diphtheria is most commonly a throat diseaso in its first stages, it may be conveyed to other mucous surfaces, such as the eyc, nose, varina, and bowel, in which instances, of course, suitable local measures will require to be employed, all of which must necessarily be antiseptic. A useful adjunct to local and general treatnent will be found in keeping the air of the apartment in which the patient is confined saturated with the fumes of eucalyptus, which may be conveyed to the patient by means of steam impregnated with the oil issuing from a bronchitis kettle.
Dipsomania is evidently a form of insanity or mononannia, in which the patient has an inveterate craving for drink, occurring at intervals of long or short duration. The individual seems quite unable to control this unnatural desire, and if not constrained by physical force, he at any cost, will procure drink, and indulge in it until his morbid craving is satisfied. The term dipsomania is necessary, because it is well known that numbers of people are alive whose desire for intoxicants is so strong, and their ability to resist them so feeble, that they are obliged to give way to it; reason has no effect upon them, and thus they are classed amongst maniacs. Several remedies have been advocated for the treatment of this painful disorder, but it would appear that few, if any, have proved of much avail. If the patient is lacking in that moral courage which will enable him to abstain entirely from alcoholic stimulants in any form whatever, medicines are of very little service. Doubtiess, however, some few of the many remedies suggested have proved helpful in the treatment of this mental affection. The extract of red chinchona bark at one time had some little reputation in the treatment of dipsomania. Latterly, however, it has been suggested that a solution of the per-chloride of gold should be injected under the skin, and many practitioners have spoken highly of this therapeutic agent. Isolation in a retreat for three or six months has in many instances proved remarkably beneficial, as it is a well-known fact that the longer the patient denies himself the use of stimulants, the less difficulty does he encounter in his attempts to resist them. It goes without saying, that the more a man indulges, the less able will he be to withstand temptation, because a long continuance in the excessive use of stimulants without doubt produces degeneration of the nervous tissue, and, therefore, enfeeblement of the moral sense results. Dipsomania, although probably more frequently met with in the lower and middle classes, is also prevalent to a considerable extent among those occupying a high social position, and possessing large fortunes and estates. (Refer to Alcohol, Delikium Tremens, Drunkenness, Stimulants.)
Discharge is a term applied to fluids which are expelled from the system either by the natural passages or from abscesses. As a rule it is applied more frequently to fluids which are of a purulent nature.
Disinfectants, or Antiseptics, are preparations which have the effect of destroying the germs of dis. ease. There are several natural disinfectants, such as pure air, sunshine, and goocl ventilation. Disinfectants must always be distinguished from aseptics; e.f. water, as a rule, contains germs which may be morbid in their action or not, but if this water is boiled, the vitality of
the germs is thereby clestroyed, and thus the water is rendered aseptic-that ls to say, it is deprived of the power of producing poisonous effects upon the indlvidual drinking it. Disinfectant, therefore, in reality neans the power of clestroying the potency of certain low forms of microscopic life. Among the must power. ful antiseptics are-bi-chloride of aucrcury, carbolic acit, creasote, thymol, aristol, chlorine, acetic acid, sulphurous acid, chlorail, chloroform, alcohol, and many others. The direct cffect of these asents is to destroy the vitality of the germs which give rise to disease. If we wish to isolate a patient who ls suffering from a contagious disorder, the ordinary plan would be to hamg a sheet over the door of the apartment in which the patient is confinecl, and keep this shect saturated with a solution of carbolic acid. lly this means all air passing from that room will naturally be deprived of its disease-producing constituents, in consequence of the destructive effect of the carbolic acid upon the germs. Disinfectants are also employed as local applications in certain diseases, such as aphtha, diphtheria, furunculus or boils, small-pox, and all the exanthemata during convalescence. In the latter circumstances disinfectants are applied to the skin, so as to disinfect the scales which are thrown off by the cuticle. In certain diseases of the bladder also, disinfectants, of which the most popular is boracic acid, are employed intermally, and also by injection into the bladder, with a view of destroying the tendency to the formation of pus which frequently exists in disease of this organ. They are also largely employed in the treatment of women who have recently given birth to children. In this instance they are used in solution, and injected into the vagina night and morning, with a view of keeping down putrefaction of the discharges which naturally are thrown off after child birth. So many diseases depend upon the effects of microorganisms that these are invariably treated by the application of disinfectant fluids; e.g. ophthalmia is most successfully combated by the introduction of antiscptic fluids within the eye, the most potent of which perhaps is a dilute solution of the bi-chloride of mercury. Again, offensive odours arising from putrescence of any kind may be destroyed by the free use of certain disinfectants, which in this instance are termed deodorants, simply from the power which these agents have of destroying the organisms which give rise to the foetid stench which is generated by decomposing substances.
Dislocation is purely a surgical term, which means the displacement of bones, or portions of bones, where they ought to be connected. Violence, as a rule, is the factor producing this deformity. When it takes place it is often very difficult to reduce, in consequence of the unnaturally strong action of the muscles surrounding the part and attached to the dislocated bone. It is, therefore, frequently necessary to put the patient under chloroform, with a view of overcoming the muscular traction upon the parts, so that by the muscles being rendered inactive, the dislocated bone may be replaced in its natural position. Chloroform, therefore, is a most useful agent in enabling the surgeon to reduce dislocations. It is quite needless in this book to go into details of the various dislocations that nay arise, as no one will make the attempt, or risk the result, if be is not thoroughly competent from his anatomical knowledge to ascertain when he has in reality brought the parts into their proper position. Surgical aid should in every instance of dislocation be called in, so that the dislocated bone may be accurately replaced. After reducing the dislocation, the parts should have complete rest ; and in no instance should they be brought into active use until sufficient time has elapsed for the tissucs to have become thoroughly consolidated.
Diuretics are those medicines which act upon the secreting power of the kidneys, and thereby increase the flow of urine. The most popular diuretics of the present day are-diuretin, digitalis, salts of potash, malt liquors, spirituous liquors, broom, dande. lion, juniper, squills, and the free administration of liquids, such as barley water, rice water, gruel, linsced tea, skim milk, and phain water. These arents are freely employed when it is desirable to dilute the
arine, either on acconnt of its irrltating properties or hecause it is necessary to flush the kidncys.
Douche is a colnmn of water so arranged that it will play 1 pon a certain portion of lee boty, It is a most usefnl remedy in certain conditions of the joints, where thickening has tisken place from lnfammatory exudation. It is also most efficacious in many rheunatic affectious, such as lumbago, stiffiness of the joints, and in affections of the womb. Where there is chronic inflammatory mischief it proves of great servlce, when combined with friction in the form of massage.
Dover's Powder is a compound of one grain of ipecacuanha, one grain of opium, and ciglit grains of sulphate of potash, mixed together in a mortar. It is largely used in the treatment of feverish complaints where it is desirable to produce free perspiration. In common catarrh of the head, or ordinary cold, it frequently succeeds in eutting sloort the disease; and in inflammatory affections of the lungs it is a most popular remedy when combined with calomel. In sucli cases five grains of Dover's Powder combined with half in grain of calomel, administered every four hours, will irequently liave a most beneficial effect.
Drainage, as applied in medicine, has special reference to the removal of fluids which are secreted in cavities, such as abscesses and after-operations. If free drainage is not induced, the fluids which are secreted, either in the cavity of an abscess which has been opened or in that which has been produced by the removal of unhealthy tissue, may decompose and produce constitutional effects which would otherwise be obviated. Drainage, of course, is a term more largely employed with reference to the hygienic conditions essential to the preservation of health, and in this [instance has special reference to the removal of superabundant fluids from the surface of the soil, and also to the removal of soil from dwelling-houses. In the drainage of houses it is essential that all fluids which do not contain decomposing matter should be emptied into the sewage pipes without being connected with them; e.g. all liquids emanating from baths, wash-hand basins, and sinks, should have no direct connection with the sewer pipes. On the other hand it is necessary that the drainage of water-closets should be conducted into the main sewer; but previous to their junction with this channel they should be so ventilated that any gases emanating from the main sewage system will be permitted to escape into the open atmosphere, and not by virtue of a continuity of pipe be permitted to enter the divelling-house. The complete severance of the drainage system of a house from that of the sewer is essential to the health of the individuals inhabiting the dwelling; and this, of course, can only be brought about by the introduction of traps which are thoroughly open to the outside air. The certainty of removing such a contingency as the admission of sewer gas into a house is so easily accomplished that it would simply amount to criminality in any builder to permit such a catastrople to occur. Of course, it goes without saying that the sewage pipes within the dwelling should be thoroughly impervious to the escape of gas; and to provide against the risk of this occurring, the drains should be periodically tested, so that it may be ascertained, at least once a year, whether they are in perfect working order. If this rule be adopted, serious consequences arising from sewage contamination may always be avoided, and thereby not only illness prevented, but valuable lives saved.
Drastic is a term applied to severe measures, and also to purgatives which act in an energetic manner, such as croton oil, scammony, jalap, etc.
Dressing, as applied to surgery, means the appli. cation of certain substances, either in a simple form or combined with some medicinal substance which renders their action more efficacious; c.g. dry dressings are applied to certain wounds where absorption of discharges is required. These dressings are always, or ought always, to be rendered antiseptic by previous inmersiou in some fluid which has a destructive effect upon micro-organisms. Until within the past few years wet dressings were largely employed in the treatment of wounds, whether these were surgical or due to injury. Now-a-days dry dressings are very much more in
vogue, and these are invarially associated with antlsepuic substances whiclı prevent decoupposition, while the clressings absorb thic clisclarges. The most important joint 20 be attended to in the dressing of wounds is to procure as rapid licaling of the raw surface as possible, and this can only be induced by Leepsing down decomposition of the fluids which naturally exude from a wounded surface. It is therefore customary to, first of all, niake the wound aseptic lyy the application of antiseptic flaids, such as bi-chloride of mercury, carbolic acid, iodoform, or aristol. When this has been effected the wound is dusted over with an antiseptic powder, sucl as boracic acid, aristol, or jodoform. The most efficacious, however is aristol, and when it is combined with cocaine, say in the proportion of 5 or 10 per cent., the pain of the wound entirely disappears in consequence of the anaesthetie effect of the cocaine upon the eut surface. When aristol is judiciously employed $\ln$ the dressing of wounds we frequently find that these heal without the slightest difficulty; indeed, if it is properly applied, we will invariably have union taking place without any appearance of suppuration. The best dressing for wounds is what is usually called blue gauze, because of its being saturated with a solution of bi-chloride of mercury, which is probably one of the most powerful antiseptics we possess. A wound dressed witl this substance and in the manner which has been indicated will frequently not require to be looked at for a week afterwards, when in all probability it will be found that complete union has taken place and that no further dressings will be required.

Drop Wrist, or Wrist Drop, is a characteristic affection of lead poisoning. It is due to paralysis of the muscles which extend the hand, and in consequence of this paralysis it is impossible to expand the fingers and lift up the wrist, hence the wrist drops. The treatment consists in electricity applied to the muscles twice a day, together with judicious inassage, and with a view to get rid of the cause of the mischief sulphur may be given at regular intervals; this combines with the poison which is the cause of the disease, and so the system gets quit of the castes morbi. Wrist drop is always associated with constipation, hence it is essential to attend carefully to the condition of the bowels.

Dropsy is the effusion of the watery constituents of the blood, and is invariably due to an imperfect circulation through the veins. When dropsy occurs in the limbs it may be detected by pressure applied to the swollen part, in which case the indentation produced by the fingers remains for a considerable time after the pressure has been removed. This is called pitting, and teclinically this form of dropsy is termed Anasarca. When dropsy occurs in the cavity of the abdomen it is generally due to the obstruction of the venouscirculation of the liver, or to some inflammatory condition of the peritoneum which interferes with the complete circulation of the blood in this membrane, and in consequence oozing takes place of the watery constituents of the blood into the peritoneal cavity. This form of dropsy, as well as that of the limbs, is frequently coincident with heart disease and with Bright's disease of the kidneys, but in every instance it depends upon an incommoded circulation of the veins. Dropsy in the chest, or hydro-thorax, is the direct outcome of pleurisy which has not been cured in its acute stage, or it may arise from pressure upon the large veins which pass through the thorax in their progress towards the heart. When dropsy of the limbs, or anasarca, occurs, it of course is necessary in every instance to ascertain the immediate cause, and this should be treated with remedies which will tend to remove the cause of obstruction; e.g. if the kidneys are at fault it will be necessary to employ diuretics with a view to increase the action of these organs, and also purgatives to relieve them as much as possible of the burden which naturally devolves upon them, while at the same time the circulation should be relieved by keeping the limbs in a horizontal position. If abdominal dropsy, or ascites, exists, the same remedies should be employed as in the case of dropsy of the limbs, but it will often be found that the most expeditious way of remoring the fluid is by tapping. The same applies to dropsy of the chest. This operation can now be performed with such safety.
and with so much freedom from inconvenlence, not to say pain, that it secms absuril to rely on mellicinal agents when such ant expeclitions method of getting quit of the fluid can be adopted. Dropsy is such aut important and serious ailneut that it would be wrony to endeavour to tresit it without tho aicl of nerdicil science ; therefore, in every case of dropsy meclical atid should be inmedtiately called in. Amongst the most useful diuretics used in the treatment of dropsy aredigitalis, diuretin, creall of tartar, acetate of potash, infusion of broom, etc., together with saline purgatives,
Drowning, as cycryone knows, is sulfocation due to impuersion in a dluid, which is generally water. The great point to olscrve in treating a person who las been inmersed in water for a considerable period is, to endeavour to produce artificial respiration, and thus re-establisls the action of the lungs, which, for the time being, has been kept in abcyance. If this can bo successfully accomplished tho possibility exists of anination being restored, and the indivilual brouglit back as it were from the gates of death. An important point in the restomtion of persons threatened with death from drowning is to retain and supplement the temperature of the body by the application of external liteat, while at the same time artificial respiration should be employed by expanding the chest and compressing It alternately. This is perhaps best accomplished by drawing the arms forcibly backwards, and then bringing them downwards and compressing them against the walls of the chest. This shoull be persisted in for some time and until all possibility of inducing natural breathing has ceased. If electrical appliances are at hand they should be used with a view to stimulating nervous action. Pure oxygen is also a powerful adjunct In restoring animation, if the apparatus can be commanded at the moment by which a pure gas can be introduced into the lungs. Drowning, however, generally occurs where such apparatus are out of reach, and it is therefore necessiary to depend upon more simple methods, the most inportant of these, as has been stated, are-retaining all the heat the hody possesses, and supplementing it by means of external heat; endeavouring to expand and compress the lungs so as to produce artificial breathing, when, possibly, the hlood contained in the pulmonary vessels, by coming in contact with the oxygen which is thus forcihly propelled tinto the leungs, may find its way to the heart and thus re-establish cardiac contractions, and in this way restore animation. No time should ever be lost in enteavouring to re-establish the action of the lungs; in shon, promptitude is the great point to attend to in every case of apparent suffocation from drowning. Never take for granted that the patient is beyond hope of recovery, as many instances are on record where this conclusion has been erroneously arrived at.
Drug is the term which is generally applied to agents-employed in medicine for the treatment of disease. It is, however, more commonly applied to those substances which were at one time much more in use than at present. The substances which are more commonly called drugs are those which have a prejudicial effect upon the system when employed too persistently, such as opium, mercury, digitalis, Indian hemp, etc.
Drum of the Ear, or Tympanum, is that membrane which separates the internal from the external ear, and which receives the impressions produced by the vibrations of the atmosphere. It is in contact with the minute hones or ossicles of the internal ear, which in their turn convey the impressions to the auditory nerve and in sequence to the brain.
Duct is the anatomical term applied to a canal which conveys fuids from a secreting body, such as the lachrymal cluct, conveying the tears from the lachrymal gland to the eyeball; the salivary duct, conveying saliva from the salivary glands to the mouth; the gall cluct, conveying bile from the blacder; tho thoracic duct, conveying the chyle to the circulation; and so on.
Dumbness is the result, in almost every instance, of denfness, and is directly cansed by the individual not hearing articulate sourds, and thercfore being unable to intitate them.

Duodenum is the first portion of the small intes. tines which receives the chyle from the stomach and in which this fluid is mixed with the pancreatic and biliary secretions, and thus transforneed into chyle. It derives lts matue from the fact that it extends to the extent of about twelve hinger lengths.
Dysentery is an affection of the mucous meurbrane of the lower reaclies of the large intestinc. Its characteristic symptoms are, liquirl stools composed principally of mucus mixed with blood, and a constant desire to go to stool, which is always accompanied by severe straluing and pain. Dysentery is frequenty accompanied by wever and slivering, and as a rule it arises from a congested state of the liver, which is invarially the result of sume indiscretion, either of eating or drinking. In the East it is a diseaso of nuch more consequence than it is in this comentry, because of the fact that it is generally due to the slinking of water contaminated by some deconiposing matter which contains the germs of the disease. The proper treatuent of dysentery is, first of all, to clear the bowel of the offending matter, either by a close of castor oil and laudanum or rhubarb in comhination with carbounte of soda and grey powder. In the East, however, where this disease is more of a specific character, the great remedy is lpecacuanha, which may be given in considerable doses, and as a rule this medicine has a marvellously good effect. A most useful adjunct to these remedies, in dysentery, is found in an enema containiug an antiseptic such as carbolic acid, combined with a seclative such as laudanum, mixed with a solution of starch and Injected into the lower bowel. For an adult 30 drops of haudanum, 4 grains of carbolic acid, mixed with two tablespoonfuls of starch about the consistence of creain, will be found of great service where the desire to go to stool is of frequent occurrence, and where pain and straining are prominent symptoms. Dysentery may be diagnosed from ordinary diarrhoea, by the fact that the stools in the former instance are generally slimy and mixed with blood, and small in quantity, whereas in the latter instance the stools are copious and of a brownish colour, and have a very foetid odour.
Dyspepsia, or Indigestion, is one of the most common illnesses that effect civilized races. It is generally brought on by indiscretions in eating and drinking, together with inattention to the daily evacuation of the bowels. Many remedies are advocated as curative agents in this disagreeable affection, but the grand point in every case of dyspepsia is to study the diet and attend to the condition of the bowels. The general rules for the treatment of dyspepsia may be summed up in the avoidance of such articles of cliet as tend to undergo fermentation when they enter the stomach, such as soups, stews, boiled meats, and food containing oatmeal; while other articles, such as longinfused tea, pastry, shell-fish, potatoes, uncooked fruit, uncooked vegetables, etc., are injurious, because of the difficulty which the stomach, even in a healthy condition, encounters in digesting them. If an individual suffers from dyspepsia the condition of the teeth should in the first place be attended to, so that proper mastication may be accomplished, this being the first and most important process involved. If the food is thoroughly masticated and mixed with the saliva before passing into the stomach it is in a condition ready to be acted upon by the gastric juices. Water, or any other liquid, should not be partaken of during a meal, but reserved until the meal is finished. Pepsine, ingluvin, and other cligestives of a like nature, will frequently assist a weak stomach if taken in conjunction with the meal. There are, however, so many forms of dyspepsia that it would be guite impossible in a work of this kind to go into the treatment of it in its various phases. Medical aid should therefore be called in, and the strictest attention be given to the instructions received from the physician who is consulted.
Dysphagia is a difficulty in swallowing, and may arise either from a nervous condition of the indivilual or from actual constriction of the oesophagus or gullet.
Dyspaoea is difficulty in breathing, and is associated with clisease of the heart, of the lungs, of the windpipe, and larynx. It may he, and frequently is, coincident with indigestion, when this results in a distended condition of the stomach and intestines from
accumulation of fatus. When this is generated to an undue extent the stomach int intestines become so inflated that they tencl to pusli the diaphragm upwards, and thus interfere with the free action of the heart and lungs. Dyspnoea also, and very frequently, results from the accumulation of tluld within the cavity of the chest, due to pleurisy. It miny also be the result of anenrism or dilatation of the large vessels coming from the heart. When there is dyspnoea the patient is unable to lie down, and is therefore obliged to sit up in bed to obtain the greatest amount of ease in breathing.

Ear, as is well known, is the organ of learing by whicl we are made sensible of the vibrations which take place in the atmosphere. These vibrations are communicated to the brain by means of the auditory nerve, which receives these impressions from the tyinpanic membrane, whicl membrane communicates with the auditory apparatus by a series of minute bones. The ear is divided into minute portions, called the external, middle, and internal portions. The external ear is made up of the auricle and the meatus. What is usually called the ear is intended to collect the vibrations from the atmosphere and convey them through the canal to the drum, which in its turn, as has been before stated, conveys them to the sensory nerves. It is necessary that the internal ear should be in free colnmunication witli the atmosphere, so as to prevent undue pressure being exerted upon the membrancous drun. This communication is established through the Eustachian tube, which has its exit in the pharynx, which aperture is situated just behind the tonsils. If this tube becomes congested, which frequently occurs in catarrhal affections of the mucous membrane of the nose and throat, then deafness results from the fact that the air becomes rarefied within the internal ear in consequence of this cavity being to a certain extent isolated from the external atmosphere. This form of deafness is popularly known as throat deafness. The sense of hearing may be, and frequently is, interfered with by an undue secretion of wax in the external ear, which acts as a barrier to the waves of sound travelling in the atmosphere. This as a rule can easily be remedied by the judicious use of the ear syringe. No case of deafness, however, should be treated by amateurs, but should invariably be confided to a competent medical man.
Early Rising has been extolled on all hands as conducive to health, yet we must always remember that the body requires a certain amount of rest in bed, so that early rising, without being accompanied by going to bed at a reasonable hour, is simply out of the question, "Early to bed and early to rise" is certainly a much better rule than late to bed and late to rise, and it will always be found that a good start in the morning aids one in many ways, There can be no doubt that sleep in the early hours of the night is much more refreshing than that which is obtained in the morning. Morning, too, is the best time of the day for taking exercise, and the healthiest man is he who takes advantage of this, the general tone of the body being invigorated and the digestive powers likewise improved.

Ecchymosis is that condition which supervenes upon a blow by a blunt instrument. The best example of ecchymosis is that whicl we find after a blow in the region of the eye, where the colouration lof the part becomes of a dark purple, due to the rupture of the minute vessels circulating in the injured tissues, the consequence being that the venous blood becomes extravasated and produces the swelling and discolouration.
Eiczema is intrinsically a disease of the epidermis, in consequence of which the outer layer of the skin does not mature, and therefore pernits the exudation of the watery portion of the blood. Eczema is characterized by what is technically called a "weeping surface," which on drying develops an incrustation or scab. This, on being removed, reveals a red, angry, and moist surface which is exceedingly irritable and gives rise to considerable pain and itching. Eczema may attack any portion of the skin, but its most frequent seats are belind the ear, the flexures of the joints, the hands, feet, and legs. Want of cleanliness in many instances, especially in the case of infants, gives rise to
this affection. It is frequently a concomitant of the rleeumatic diathesis, and in sucl circumstances is very intractable. p'colle suffering from eczema should therefore be carefully dieted so as to keep down any acid tendency of the blood, and at the sanne ture arsenic, in the fornin of Fowler's solution, מusy be given in 5 -clrop doses three times a day after food. The lest application which the author has ennployed inthe treatment of this disease is one containing the oleate of mercury and oleate of zinc ointments in equal proportions, with 5 per cent. of the following-carloolic acid. cocaine, and aristol added to it. This ointment should be applied niglat and morning on a picce of lint.

Efluvium is a gaseons enanation from bodies in a state of decomposition, always offensive in odour and noxious in its effects. Effluvium arising from decomposing animal and vegetable substances is most pernicious and liable to give rise to disease,
Effusion is the term applied to the disease process whicl? results in an excessive amount of fluid being generated in the cavities or tissues of the body; e.g. in pleurisy an undue anount of fluid accunsulates within the pleural cavity, and by virtue of its presence interferes witla the free action of the lungs-this is called pleuritic effusion. An inflammatory affection of the pericardium also may result in effusion into that cavity, in which case the heart's action is materially inconsmoded. In inflammation of the peritoneum, or lining membrane of the abdomen, fuid may accumulate in such large quantities as to distend the cavity to an enormous extent. This is popularly known as Dropsy, and is technically termed Ascites. Effusion may also take place into the cavity of the skull, when it is termed Water in the Head. When it takes place in the scrotum it is termed Hydrocele. Effusions also occur in the joints and tissues of the body, and also into the lung substance. In the latter instance it is usually associated with disease of the heart or kidneys,
Electricity and Galvanism are employed, not only in the investigation of disease, but also in the treatment of various affections of the nervous system. Electricity is also employed as a cautery, and is most useful in removing unhealthy growths, as, by its employment, the danger of bleeding from the cut vessels is very much reduced. The electric lamp is also frequently employed now in the investigation of disease, especially of various internal organs. The emplofment of electricity has recently been recommended in the treatment of fibroid tumours of the womb, but so far the results obtained have been far from satisfactory. This force, combined with massage, has been brought into considerable prominence of late, and doubtless great benefits have resulted from its judicious application.
Elophantiasis is applied to those diseases of the integument where it puts on an unhealthy growth and attains gigantic proportions, in consequence of the thickened condition of the skin and the tissues lying immediately beneath it. Leprosy is a form of elephantiasis, and is called Elephantiasis of the Greeks, It is characterized by a shining tubercular condition of the integument, which tends to ulcerate and slough. It is a disease of a most painful character, and is no doubt infectious. It reduces the patient to the most pitiable condition imaginable. There are other fonns of this disease which are more local in their effects, and which can be removed by simple operation.

Emaciation, or Wasting of the Tissues, may progress to such an extent that the individual may be literally described as being composed of only skin and bone. It is a symptom that may either indicate very dangerous or simple disease. It not unfrequently occurs in dyspepsia, but as a rule it depends not so much upon a deficient action of the stomach as upon the loss of power of assimilating the food after it has been digested. It is a constant symptom in pulmonary consumption and malignant disease of the liver and other organs. The great point in the treatment of emaciation is to endeavour to restore the glandular system, and this can frequently be accomplished by the judicious administration of the muriate of calcium together with careful dietetic measures.

Embrocation, or Liniment, is a fluid sometimes of a stimulating, at other times of a soothing, nature.

These fluids are rubbed into the skin over the parts which are affected, and are uscful in affections of tho chest, of the joints, and of the muscles.
Emorgencies is a term whicls may be applied to occasions where accidents occur, and whero one's own judgment requires to be prompely and jucliclously called into action during tho absence of medical assistance, such as in the case of iujury, sudden haenorrhages, fits, drowning, burns or scalds, poisoning, etc. It would, however, lee very injudicious for any one to interfere in such circumstances withont having some knowledge of how to act, as frequently more injury may be produced by ignorant nueddlesomeness than by leaving the patient alouc. In the event of an accident resulting in fracture of the limbs or skull, the great point to be observed is to keep the lnjured part as much at rest as possible, so as to pre. vent the fractured portions of bone injuring the soft tissues in their immediate neighbonrhood until proper medical assistance is procured. If a person receives a wound where the hatanormage is considerable, then the duiy of the indlividuals at hand is to endeavour to arrest the bleeding by the application of compresses wrung out of cold water and applied firmly over the bleeding parts; and if the situation of the wounch is in a limb, a tight band should be applied above the bleeding orifice, so as to constrict the arterics which are pouring blood into the injured limb. In the case of burns or scalds, the greatest relief may be obtained by repeated applications of mgs wrung out of Condy's Auid diluted with water. If the accident produces so much shock as to induce faintness or collapse, it is advisable to administer brandy and water from time to time, and at the same time keep up the heat of the body by the application of hot-water bottles to the extremities. In convulsions it is always desirable to lay the patient down, and undo anything that constricts the neck or chest, while a piece of wood or cork may be placed between the teeth to prevent the patient biting the tongue; and on no account should any attempt be made to make the patient swallow anything during the convulsion. In poisoning it is always desirable to induce vomiting. This may be attained by the simple method of mixing a tablespoonful of mustard in a cupful of warm water, and giving it to the patient; following this up by copious draughts of warm water until vomiting ensues. If there is violent vomiting after an injury, this, as a rule, will indicate that the brain has suffered to a considerable extent. In these circumstances it would be advisable to keep the head cool by the application of cold-water clotls or ice, while the extremities should be kept warm by hotwater bottles and mustard poultices applied to the calves of the legs and to the pit of the stomach.
Emetics are those substances which induce vomiting when taken into the stomach or injected into the skin. The most powerful substance for thls purpose is amorphine, which is always used subcutaneously, which operation is speedily followed by the emptying of the stomach. Those medicines which are used most frequently as internal remedies are-antimony, ipecacuanha, sulphate of zinc, and mustard and water. The most efficient method, however, of emptying the stomach in the event of poisoning is by means of the stomach pump, by which apparatus the organ can be not only emptied of its contents, but washed out at the same time, thus ensuring the complete removal of the foreign substance from this cavity. An emetic is often of very great service, especially in children where there is great accumulation of mucus in the chest. It is also a useful remedy in certain spasmodic affections, such as spasmodic croup, colic, asthma, etc. Great care should be always taken, however, in resorting to the employment of emetics, as considerable mischief may follow their use, e.f. in pregnancy and in persons of a plethoric habit. They are also dangerous in cases of falling of the womb and in rupture.
Emollients are those remedies which have a soothing and relaxing effect upon the parts to which they are applied. Amongst these may be mentioned the innnction of nily and fatty matters, the application of steam containing certain remedies when inhaled, and which have a soothing effect upon the mucous membrane of the throat and air passages,

Emulsion is a mixture of oil, water, and an alkali. New milk, for iustance, is an enulsion of cream and milk ; the fat, in this instance, scparates in the form of cream from the milk in consequence of the mixture not leing complete. Einulsions can be matle for inedical purposes by the admulxture of gun or the yolk of egr with fuids such as water, gruel, minik, soups, etc. Sweet almonds powdered and mixed with water are frequently used in emulslon as a velicle for giving medicines which tend to fall to the bottom of the lluld.
Endemic is that term which is applied to disenses affecting commanities, but due to the district or surronnclings of the individuals attacked. Ague, denguc, cretinism aro alt endemic. Typhoid fever, cloolcra, and rheumatism are also frequently endemic. It is a curious fict that the constitutions of individuals of certain localitics have, by some process or other, been rendered inpervions to endenic disease.

Enema is probably one of the most useful inedical measures that can be employed in the treatment of constipation and its banefil effects, It is easily applieed and gives immediate relief, and as it can do nopossible illjury, being simply a process of washing out the lower bowel by means of suitable fluids, it does not deserve the antipathy which so many have towards it. Irequently persons, and especially children, feel a degree of discomfort, weakness, irritability of temper. and depression of spirits, and when this is accompanied by cold feet, a shivering sensation over the body, bad taste in tho morning, and frontal headache, we may rest assured that these symptoms are all due to a loaded condition of the lower bowel. If an enema, composed of one pint of warm water to which a table spoonful of common salt has been added, be injected into the lower bowel and retained for a few minutes, the probability is that a copious stool will be obtained, and in a short time all these disagre eable symptoms will have disappeared. Many prefer soap and water as the component parts of an enema, but soap is nuch more irritating to the mucous membrane than salt, and therefore salt is to be preferred. Several forms of apparatus have been introduced for the administration of this remedy. When it is to be employed for cliidren the ball syringe is to be preferred, but the nost comsplete enenta apparatus which is also applicable for children, but more especially for adults, is what is generally known as Hagginson's or Davidson's enema syringe. The enema is not unfrequently !employed in the treatment of worms, dysentery, and diarrhoea. Where the discharges are, offensive, in the two latter cases the enema contains an antiseptic as well as an anodyne, with a view of soothing the irritated mucous membrane, and also to destroy any disease germs that may be present within the intestine.
Enteric Fever, frequently named Typhoid, or Gastric Fever, is due to the absorption through the alimentary canal of specific disease germs. It is a disease which runs an uncertain and always a long course, and is very liable to relapses, In the majority of instances it is due to bad sanitary arrangements. It cannot, however, be definitely stated that it is the result por se of the inhalation of sewer gas; on the other liand, it is very frequently the result of the contamination by sewage gas of water, which by virtue of this absorption is enabled to provide pabulum for the germs of the disease, and thus enable them to assume an active form. If water containing germs thus nourished is taken into the stomach of persons debilitated by other causes, these individuals are highly susceptible to typhoid fever. Now, as the inhalation of sewer gas has a most depressing effect upon the vitality, it thus plays a secondary part in the production of the disease by rendering the individual more susceptible to disease of any kind, and particularly so to typhoid fever. It is yet an open question whether this fever is contagious or not: for my part I do not think it is, and I have searched for evidence on this point for many years. The great dangers of typhoid are the high temperature which accompanies it and the tendency of the bowels to ulcerate, thus giving rise to hamorrhage, which not unfrequently proves fatal. The characteristic symptoms are, in the first place, great prostratlon of the hodily strength accompanied
which has the appearance of pen soup. The temperature nsually rises at night and lalls towards morning, nud not infrequently an ernption of purplish coloured spots may be observed on the surface of the abdomen and sometimes on the chest also. Whren the disease has ndvancel to any considerable extent the tongue becomes dry and coated, and sordes appear on the tectlo. All the secretions except those of the mucous mombrane of the bowel become deficient, and the urine especially, which is of the most consequence, is liable to becone very scanty, so that the secretion of the kidneys is seriously interfered with, uracinic poisoning takes place, resulting in coma. The ligh temperature, withont donbt, has altogether to do with this partina paralysis of the organs of secretion, and it is therefore most important in the treatment of this discase to endeavour to kecp the temperature down, while it is also necessary with a view of preventing waste of strength that the diarrhoea should be controlled as much as possible. The best antipyretic that can be employed in this instance is phenacetin, which not only possesses the advantage of rapidly reducing the temperature, but of being perfectly safe in every respect; if given in eight-grain doses every four hours to an adult it rapidly brings down the temperature and has a soothing effect on the patient, in many instances promoting sleep as well as copious perspiration. Of course it goes without saying that judicious nursing is most important in this terrible disease, while the diet must be carefully attended to and the room kept well ventilated. Not unfrequently the high temperature of typhoid fever has been treated by cold affusion, oreven the cold bath. The hydropathic pack has also in many instances proved highly efficacious; and where great prostration of the vital powers has taken place and death appeared to be imminent, the application of ice bags over the heart and abdomen have given immediate relief, and in not a few instances tided the patient over the crisis. These seem to be heroic measures, but they have been found in the author's experience of tho greatest service to the patient.

Enteritis is, literally, inflammation of the intestines, or, more accurately, of the intestinal mucous membrane. It is generally due to catarrh, and is indicated by excessive mucous discharges. Dysentery is in reality enteritis of a small portion of the colon, but the catarrial inflammation may, and frequently does, affect the whole mucous menibrane of the alimentary tract. The most useful treatment in such circumstances is the administration of tar in conjunction with small doses of arsenic given after food, while the diet should be of the simplest and most easily digested kind.

Entozoa are those parasitic animals which obtain a nidus within the body. The most common forms of entozoa in man are intestinal worms, but there are others of less frequent occurrence, such as cysticercus, trichinae, guinea worm, and possibly the itcl insect may come under this class.

Epidemic is a term applied to those diseases which spread from one individual to another by infection, such as influenza, scarlet fever, measles, looping cough, typhus fever, etc. Cholera, typhoid fever, and diphtlieria have often been classed in this form of disease, but the opinion of the author is that none of these last mentioned are infectious in the same sense as those previously mentioned. The great remedy against epidemic diseases is to observe strict cleanliness both of the person and of the domicile, to endeavour to sustain the vital functions, and to be assured of perfect ventilation. Of course isolation of the patient, together with the use of antiseptics in his apartment, would be absolutely necessary to ensure safety to the other members of the household, but the grand point to be enforced is the keeping up of the hygienic conditions of those who have not contracted the disorder.

Epidermis is the outer or scarf skin, or cuticle. It is this layer which rises in a blister after scalds or burns of a slight nature, and when a blister has been applied. It is also this portion of the skin which is diseased in certain skin affections, such as eczema, psoriasis, and which is thrown off in certain acute fevers, such as scarlet fever, measles, etc.

Spiglottis is a small valve of a licart shape which
covers the glottls or openher into the larynx, so as to protect it fronn the introduction of forcign bodies.
Epilepsy, or Fialling Sickuess, is a disease which is fencraliy accompanied by a premonitory sensation on the part of the patient called the "Aura," which sensation is succecded by a convulsive seizure, accompanied by foaning at the mouth, lividity of the countenance, and sevcre spasmodic contraction of the muscles of the body. As a rule, in consequence of the tongue falling between the tecth, it is lialble to be litten liy the spasmodic closure of the jaws, and therefore blood becomes mixed with the salivary secretion whals cxudes in considcrable quantities from the mouth during an attack. It is therefore desirable to take precautions against this accident by introducing a piece of wood or inclia rubber between the teetll. All articles of clothing which tend to constrict the breathing apparatus should be loosened, and the patient laid upon a sofa or bed, or even the floor, until the convulsions cease. These will be succeeded by a leavy, stupid look or a deep sleep which may continue for some hours. This sleep should not be disturbed, as, if the patient is forcibly wakened, his mental functions will be found to be temporarily suspended. Epilepsy varies very much in severity, some attacks being vers mild and others very severe in their nature. Epilepsy occurs very frequently during sleep, and is undoubtedly in such circunistances superinduced by a deranged condition of the digestive organs or the bowels; indeed, any disturbance of the nervous system may, in an epileptic subject, give rise to an attack. Epilepsy is frequently a hereditary disease, but it may le, and certainly is, in many instances induced by blows on the head, worms, dyspepsia, constipation, and overindulgence. In infancy the nervous system is highly sensitive, and readily acted upon by various irritating causes; thus a deranged digestion, or the irritation of dentition, or constipation, frequently give rise to attacks during the infantile period of life. It is rarely that epilepsy results in death, though, after repeated attacks, a fatal issue may result. When deatlo does occur, however, in this disease, it is not as a rule so much due to the attack as to the suffocation which arises from constriction of the muscles of the throat and chest. In the epilepsy of children, and adults also, the disease may be cut sliort by the adninistration of chloroform, but to prevent its recurrence is more important than the treatment of the attack when it has developed. However, in infants a fatal issue may frequently be averted by administering chloroform during the seizure, and it should always be ready on the least indication of an attack threatening, so that the chloroform vapour may be administered and thus cut the attack short. Amongst the various remedies which have been advocated in the treatment of epilepsy arethe bromide of potassium, belladonna, antipyrine, phenacetin, and chloral, but the great point is to attend strictly to the digestive and excretory organs, and the patient should be relieved of all unnecessary ankiety and worry.
Epistaxis is the technical term applied to bleed. ing from the nose. When this occurs great benefit will often be derived from the simple method of holding up the hands above the level of the head, also by the application of cold to the spine. When, however, the bleeding is persistent, it may be necessary to plug the nares. This is most efficiently accomplished by introducing an india rubber bag of a cylindrical shape, and filling it while within the nares either with water or air, and thus bringing pressure to bear upon the bleeding surface. Cotton wool is also used as a plug in these circumstances, and before its introduction the plugs may be saturated with an astringent solution, such as a solution of tannin or per-chloride of iron. Some people, in consequence of the pecinliar structure of the veins, are very liable to frequent bleeding from the nose. These patients should be treated for a lengtlacued period by the administration of remedies which are known to have a special effect upon the blood and the veins. The most useful of these are, tincture of iron and the extract of witch hazel or hamamelis.
Epsom Salts, or Sulphate of Magnesia, is one of the most popular saline purgatives which we possess.

In a dry state it entcrs into ncarly every cffervescing caline, and is sold under various names, such as Eno's fruit salt, effervescing saline, etc. It also enters largely into the bltte? waters which are so much advertised it the present time; amongst these may be enumerated Fredrichslall. Munyadi Janos, etc. Epsom salts should invariably be :aken when required for purgativc purwoses in a very dilute solution, and preferably before breakfast.

Ergot of figo is the diseased fungold condition of the cereal $y^{\prime} e$. It is black in colour, about balf an incb long, and about a quarter of an inch tbick. It has 3 powerful stimulatlng effect upon the involuntary nuscular tissues, especially upon tbose of the womb: bence it is largely used by accoucheurs for stimulating that organ during parturition, and also In Inducing a contractile condition if there is any tendency to lacmorrhage. It is also employed in producing con. raction of the arteries in internal bleedings from the lung, stomach, kicheys, and bladder.

Eructation is always the rcsult of indlgestion, in consequence of which large accumulations of gas are generated in the stomach, and are emitted through the suouth. Charcoal in powder is very useful as a palliative agent, but the great point to attend to where eructation is troublesome is the diet, and improving tbe digestive functions by suitable remedies, su cb as pepsine, ingluvin, and tonic medicines.

Eruption is a diseased condition of the skin, arising either from a vitiated condition of the blood, without this being due to a specific poison, or it may zrise in tbe course of certain febrile diseases, such as measles, scarlet fever, small-pox, etc.

Erysipolas is an inflamatory affection of tho skin, and sometimes also of the subcutaneous tissue, arising from a specific germ wbicb locates itself in these tissues, and develops its progeny there. It is always accompanied by considerable pain and hardness of the part affected, together with a highly febrile condition of the system at large. It may, and frequently docs, develop without any external injury having preceded it, in which case its usual seat is in the face, and when it affects this part of the organism there is always more or less tendency for it to spread to the covering mem. brane of the brain, when it may prove fatal. It not unfrequently, however, takes its origin in an injured surface, and when this is the case may occur in any part of tbe body. The most approved treatment of erysipelas is to cover the parts with a solution of ichtbyol and glycerine, and administer 10 drops of the tincture of the muriate of iron every two hours, while the boweis should be carefully attended to, and the dict be of a light and nutritions character.

Trythemn is a superficial congestion of the skin rcsembling often in its appearance erysipelas, but it is not attended by any of the dangerous symptoms of this affection. It is usually the result of some gastric disturbance. The congestion of erythema may be so severe as to result in the formation of the vesicles on the surface attacked. Tbere is a form of tbis disease termed Erytbema Nodosum, to wbich persons of a rbeumatic or syphilitic constitution are liable.. These paintul swellings usually are located over the shin bone or on the forehead. The simple form of erythema is best treated by the administration of medicines which improve the digestion and keep the boweis in a healthy state of action. Erythema nodosum, on the other hand. requires tbe administration of iodide of potassium. together with blisters over tbe inflamed area.

Eucalyptus, or the Blue Gum Tree of Australia, flas obtained a great reputation on account of its antiseptic powers. The tree itself is a most powerful destructive agent of the miasma, which gives rise to ague, while tbe essence obtained from tbe lcaf is tirgely used as an inhalation in many infectious cliseases, such as influenza, diphtheria, catarrh, etc. It is also frequently employed in chronic diseases of the chest, amongst which may be mentioned cbronic bronchitis, emphysema, and consumption.

Euonymin is a Tesinous principle which of late years has been largely employed in tlie treatment of bilious disorders. It is frequently given in combination witb the extract of casciril sagrada, in doscs of from one to three grains at bedtime.

Eustachlan Tubo is that canal which connects the internal ear witb the pliarynx, and thus permits a free passage of nir into tle tympanum. Catarrh spreading to thls tube is frequently the cause of deafness, In consequence of this channcl belng cither partially or totally occluded; this gocs under the name of Tbroat Deafness.

Exicrotion 15 that wbich is tlrown out from tbe buman body, belng either superfluous or noxious in character. Excretions are distinct from secretlons in so far that the former are of the nature of debris, while the latter are procluced by glandular structures, and are thereafter utilized in the digestion or assimilation of food. Amongst the excretions are-perspiration, urine, and the excretion of the bowel. If althy elimination of the cxcretion is as important to the hedlth of the individual as the sccretion of the various organs, because if excretion does not take place, absorption of foetid matter is liablo to occur and blood polsoning result.

Exercise is one of the most important factors in maintaining the healtb of the body. Every man and every wonman should undergo a certain amount of outdoor exercise every day. It is not sufficient that the daily requirements, as far as internal duties are conccrned, are undertaken; no one thing probably has such an effect upoil the health of an individual as a systematic amount of exercise in the open air, whether this be walking or horse exercise; hence out-door games, such as tennis, golf, cricket, and football, are to be higbly commendcd in consequence of the exercise whicb such games necessitate. Shooting and fishing are also health-giving exercises in consequence of the amount of walking and enjoyment which they give. It is wrong, however, to take exercise immediately after taling food; rest should always be enjoyed for a longer or shorter period after a meal.

Ssmalation is applied to the excretion of tbc lungs and skin when these occur in the form of vapour. In the nonnal state of the human body it is calculated that from thirty to forty ounces of water pass every day from the respiratory organs, and that from fifteen to twenty-five ounces of perspiration are exhaled by an adult. If the functions of the skin are interfered with in any way, considerable danger may arise in consequence of the interference of free perspiration. A healthy condition of the skin and kidneys is essential to health.

Exinaustion is in every instance the result of prolonged effort, whether tbis be on the part of the muscular system, the nervous system, or the organs of the body at large. It is wonderful, however, bow different organs and tissues can, by proper training, be fortified against exhtustion, so that fatigue which in ordinary circumstances could not bc borne without conscquent evil effects will under certain circumstances, where long training has been persisted in, be borne, and the individual be little the worse of what would otherwise produce great prostration. Amongst tbe restorers which are serviceablo where endurance is essential in consequence of prolonged fatigue are-strong tea, coffee, cocoa, and kola. Thesc do not act as nourishing agents, but scem to have power in preventing undue waste of the muscular tissuc.
Enspectoranes are a class of remedies wbicls enable the air tubcs to throw off an exccssive secretion from their mucous membranc. Amongst the most popular expectorants are-ipecac, antimony, paregoric, tolu, ammonia, pumuline, and terebine.

Sixpactoration literally means the putting out of the secretion of the chest. In ccrtain diseases, such as consumption, bronchitis, and catarrl, there is always secreted an undue amount of pernicious fluid within the pulnonary apparatus which requires to be cougbed up and ejected from the mouth. In certain circum. stances it is with considerable difficulty that tbis is effccted, when of course expectorants must be employed to help nature in her efforts. If the cxpectora, tion is frothy in its character it is usually due to bronchitis or catarrh of the air passages. If, on the other hand, it is more or less purulent and consolidated in character, it may be taken for granted that tbere is consumptive diseasc of the lung. If it is viscid and rusty in colour it is in all probability due to pneumonis or inflanumation of thulung.
zye is the organ of vision, and is one of the most beautiful structures of the human body. Not only is it beautiful, but it is perfect in every particular, and manifests in a small compass the great, the unspeakable, the incomprehensible power of our Creator. It is important to man, and its adaptation to its requirements is beyond the power of speech to describe, and in a work like this it is quite impossible to give anything but a nere outline of its structure. It is naturally divided into two sections, the globe of the eye and the appendages which control its movements. As is well known, it is situated in a bony case which protects it as perfectly as possible from external injury; this is called the socket, in which it revolves and moves in so many directions. The eyeball is protected from injury to a large extent by the eyelids, which automatically, so to speak, close on the approach of anything that is likely to injure the delicate membrane which covers the eyeball. The external covering of the eye, which is reflected upon the eyelids, is called the conjunctiva or white of the eye. In the centre is the pupil, which opens and closes by the action of a muscle called the iris, while that part composing the coloured portion, together with the pupil, is termed the cornea. The globe of the eye itself is barely one inch in diameter, and measures longest from before backwards. It is completely enveloped by the sclerotic, which is composed of a very firm membraneous structure. This membrane, howcver, does not continue beyond the margin of the cornea, and at the posterior surface it opens so as to permit the passage of the optic nerve. Within this membrane is the choroid coat, which is of a dark brownish colour, and within that is situated the retina or expansion of the optic nerve, which forms the layer called the sensitive coat, upon which objects are projected, the impressions of which are conveyed to the brain. The globe of the eye is filled with two remarkably transparent fluids contained in chambers, the anterior of which is called the aqueous humour, and the posterior the vitreous humour, between which two chambers is situated the lens. To produce the sense of vision, the rays of light emanating from the objects in front of the eye pass, first of all, through the cornea, then through the aqueous humour, the lens, and the vitreous humour; and in their passage undergo certain refractions which bring them into their proper focus on the retina, where the picture or the impression is conveyed to the brain through the channel of the optic nerve. The object of the dark-coloured or choroid coat is to absorb all the superfluous rays of light, which ethervise would confuse the vision. The eye is subject to many diseases, such as ophthalmia, or inflammation of the conjunctiva or external layer; this is called Conjunctivitis. Sclerotis, on the other hand, is usually of a rheumatic nature, and is distinguished from conjunctivitis, which produces a red colouration of the conjunctiva, by producing a more livid appearance. The cornea may likewise contract inflammation, when it is liable to become opaque, and therefore interfere with the transmission of the rays of light. The lens also may be affected, and in process of time become completely opaque, when the disease called Cataract is the result. The humours of the eye may be the seat of disease, and also the retina and choroid coat. These diseases, however, are of so great importance to the individual that it seems to be quite beyond the scope of this work to attempt to give any directions as to treatment, as this can only be successfully carried out by one well versed in ophthalmic disease.

Faceache. (See NEURaLgIA.)
Fraeces, the excrement from the bowel (See ALIMENTARY CANAL; DIGESTION.)

Fainting is a state of unconsciousness due to an abnormal contraction of the blood-vessels supplying the brain. Some people, especially those of a nervous femperament, are more liable to faint than others. Fainting is, as a rule, due to a shock received by the nervous system, which may be produced in various veays, such as witnessing an accident, or the sight of blood, and sometimes it has even been known to result from smelling a rose. It may also arise from some affection of the mind, such as grief, intense joy, or other emotions, and not unfrequently it results from weakness of the heart's action, loss of blood, or any cause which
acts injuriously upon the vital energies. When fainting occurs, the patient will naturally involuntarily assunie the recumbent posture, and thus injuries may be inflicted if the head comes in contact with any hard object in falling. The clothing about the throat should be inmediately loosened, while cold water may be dashed on the face and strong smelling salts applied. to the nostrils; and if the person is capable of swallow. ing, a little sal volatile, or brandy mixed with water, may be given by the mouth. Nitrate of amyl, which becomes volatile very readily, may be administered on a pocket handkerchief, five drops at a time. The inhalation of this substance causes relaxation of the blood-vessels, and therefore all the faint symptoms disappear. It may be necessary to apply strong friction, or a nustard poultice, over the region of the heart.

F'zlling Sickness. (See EPILEPSY.)
Farina, or Starch, enters largely into the composition of all cereals and certain tuberous plants, such as the potato. It therefore enters largely into articles of diet, and is utilized in the formation of fat and sustaining the animal heat.

Fear in nervous people is very liable to be seriously injurious, and may give rise to convulsions, faintness. and even complete cessation of the heart's action. Fear, therefore, should never be resorted to to terrorize children into good behaviour, and nurses especially should be warned against frightening the little ones placed under their care.

Febricula is the term applied to slight feverish attacks. These occur principally in children, and are usually due to some slight disorder of the alimentary tract. (See "Our Children.")

Febrifuge is an old term applied to those medicinal agents which have the power of reducing fever, the most popular of which, until within recent years, was quinine. Other substances, however, of much greater value have been introduced into medicine within the past decade, the most notable and useftil of which is phenacetin; while others, such asantipyrine, antifibrin, have also been employed, but these are attended by more danger, and therefore should be avoided. Salicin, salicylate of soda, salol, and other substances are also very useful as febrifuges, especially in rheumatic affections. By these medicines rheumatic fever has been shom of a great portion of its danger, and its duration has also been considerably shortened.

Femur, or Thigh Bone, is the longest bone of the human body. It is frequently the seat of fracture, and in such circumstances requires the greatest care possible on the part of the surgeon in placing the parts in apposition, and retaining them there by suitable splints.

Fetor is applied technically to offensive odours arising from decomposition of any kind. Foetid breath has usually some connection with disease in the air passages. The most offensive odour arising from this cause is due to an ulcerated condition of the mucou meinbrane and spongy bones of the nares. Fetor of the breath may also be caused by decayed teeth and certain affections of the stomach. Fetor arlsing from the feet is always due to the development of a microorganism which produces fermentation of the sweat. Antiseptics are the only useful remedy for fetor, whether it arises from the breath, or any other cause; those most applicable are-chlorine, charcoal carbolic acid, and hyposulphite of soda.
Fever is that condition of the body in which the temperature is elevated, the pulse quickened, and where there is persistent thirst and general functional disorder. Fever may arise from various causes, such as blood poisoning, chill, or specific infection, but it will invariably be found that the actual cause of ferer is some norbid material circulating within the blood.
Fevers comprise a large number of diseases, such as typhus, typhoid, relapsing fever, yellow fever, intermittent fever or ague, and all the zymotic diseases.
Fibula is the small bone of the les:
Figs are a most wholesome, nutritious fruit, and very useful where constipation exists. The pulp of the fig is the only part of the fruit which should be eaten it it has not been previously stewed. If properly cooked, however, the whole may be eaten with advantage.
Fingers, from their constant exposure and uses to which they are applied, are specially liable to acci-
dent and disease. They maty be fractured, dislocated, burnt, or bruised, and nay be attacked by cleep-sented suppuration, which is ternied Whitlow, or be chapped by the etfects of cold; all of which are treated under their special headings.

Fistula is an abnomual passage between some in ternat orsan and the skin. The term is most gener. ally applied to a canal which is formed between the bowel and the skin. It is usmally the result of an abscess which has formed in the neighbourhood of the anus, ancl which has burrowed its way into the gut as well as to the surface. It is invariably in indication of poor healeh, and gives considerable pain. Tle only remedy is to lay the false passape open in its entirety, and permit the womd to lical from the bottom. Fis. tulous openings may occur in the check, in the neigh. bourhood of the eyc, and these are due to false passages being formed from the salivary and lachrymat ducts.

Fits is the term applicel to any convulsion or spas. modir seizure, such as epilepsy, hysteria, and convul. sions generally. These miry occur at any period of life.
Flannel is a woollen fabric, withont which no one is perfectly clothed. Every man, woman, and child should wear fiumel next the skin, especially in a variable climate like ours. It not only gives warmeth, but pernits of free ventilation of the skin, and absorption and elimination of the perspimition. In this way the skin is kept in healthy action, and thereby the temperature of the body regulated: thus there is less linbility to cold when flannel is worn than there is when the body is only clothed with cotton or linen material.
Flatulence, popularly termed Wind in the Stomach, is a collection of gas generated in the stomach and bowels, and in every instance is the result of indigestion. The badly digested mass becomes deconposed by fermentation, giving rise to acidity and a gas which we call Flatulence. The most important measures to adopt in this disorder are to prevent its formation by attention to the diet, and promote a healthy condition of the stomach. The foods which conduce to the formation of flatulence are-over-infused tea, soups, butcher meat which is boiled or stewed, and other articles which are well known to be indigestible. Perhaps the best remedy for fatulence, as a general rule, is charcoal, which has the power not only of absorbing the gas, but which also acts as a slestructive agent upon the ferment. When flatulence proceeds to such an extent as to produce distension of the stomach and bowels, it may be the cause of very considerable inconvenience, by interfering with the free movements of the chest. Thus, breathlessness and palpitation are frequent concomitants of flatulent distension. If the fatulence accumalates in large quantities in the lower bowel, great relief may be obtained by an enema containing turpentine one ounce, castor oil two ounces, the yolk of one eggs and a pint of thin gruel, all switched together and injected iuto the bowel. This enema may be retained quite comfortably for four or five hours.
Flooding. ("See Woman in Health and Sick. ness.")
Eluor AIbus. (See LEUCORRHOEA.)
Fluse is a term which has quite gone out of use.
Footus is the term applied to the embryo after it reaches four and a half months, and has become viable.
Fomentation is the most useful, and at the same time simple, method of applying inoist heat to any part of the body. It is most efficaclous in relieving spasmodic affections of the abdomen, also in inflammatory affections in any part of the body. The proper method of making and applying a fomentation is to fold about six plies of flannel and place this on a towel laid over a wash-hand basin; the flannel shoukcl then be saturated with boiling water and enclosed in a towel, two people being employed in wringing out the redundant moisture. The fomentation slould then be spread outt, and, if it is to be applied to a part where there is considerable pain, it may be, with grent arlvantage, sprinkled over with laudanum. It should then be applied as hot as the patient can hear it, and covered over with several layers of dry flamnel so as to retain its heat. Another very convenient way of applying fomentations is to take a hot water india-rubber bag, half fill this with boiling water, and expel all the air from the bag before
screwing on the top, this enables the lage to apply itself thorouglity to the part to he acted itpon. Two or these pilies of Hamel shoukd then be wrung out of warm water, haid over the part, and covered by the hotwater batg. $\Lambda$ fontentation of this bature will retain its heat much longer than when composed simply of flamel.

Food, which is essential to the living body, ouglit to be partiaken of at regular intervals, and always with deliberation. A nual should never lie hurried over, but thoroughly masticated and mixed with the saliva before it passes into the stonsach. It is a mistake to partake of too much flukl during the process of mastication: in fact these slould always be left to be insbibed after the solid portion of the neal has been eaten. The more simple the diet is, the greater is the prospect of health to the individual, and it is a wellknown fact that we eat far more, as a rule, than the body requires for motrishment. Over-indmgence in cating is quite is pernicious as over-indulgence in alcohol, although its effects at the moment are not so apparent. Temperance in all things is the proper rule to follow, and my own observation teaches ine that those who are the strongest advocates of total abstinence, as applied to alcoholic dinks, are the very individuals who eat most inordinately, and in this way injure themselves much more than if they were temperate in both enting and drinking. Both animal food and vegetables should be eaten fresh if possible, as many dangers attend the preservation of edibles, and numerous instances are on record of poisoning which have been distinctly traced to the consumption of timed meats and vegetables. When artificial food, especially in childen, is called for, Mellin's Food can be higlrly recommended.
Forearm is that portion of the arm extending from the elbow to the wrist. It is composed of two bones, the radius and uha. The wrist is articulated with the forearm by the radius, which enables the hand to rotate.
Fractures of bones are not at all uncommon occurrences When the fractured ends of the bone do not protrude through the flesh and skin, it is termed a simple fracture; when the fracture has resulted in a shattering of the bone, so that it is made up of several broken pieces, it is said to be conminuted; when the fractured fends protrude through the skin, it is terned a compound fracture. The great point to attencl to in fractures is, to endeavour to prevent movement in the injured bone until surgical assistance arrives, so that the broken pieces may be put into position, or set, and kept in that position by means of suitable apparatus. If it is necessary to move the patient at all, the greatest precautions shothel be taken against altering the position of the limb. This can be doue by supporting it on any convenient apparatus, such as a shutter. Should the fracture be compound, and a considerable time likely to elapse before a surgeon can be obtained, it woutcl be a wise precaution to keep it covered hy cloths wrung out of a solution of carbohic acid in water, with a view to prevent the entrance of micro-organisms, and thus guard against suppuration. A fracture can always be distingutished from a sprain or other injury by the sensation which is produced when the two fragments are moved and rub against each other. This sensation is called crepitation. As a rule, fractures are accompanied by considerable swelling in the neighbourhood of the injury, in consequence of the laceration which is produced in the tissues surrounding them; and in fracture of the rib we may have swelling all over the body, in consequence of fragments of the rib having injured the lung, thus permitting air to penetrate from that organ into the cellular tissue of the body.
Ereckles, which are so common, especially on children of fair complexion, are due to an accumulation of pigment in the particular parts affected, and are induced by exposure to the sun. They are not amenable to treatment, but they usually disappear as maturity is attained. The following ointment is said to do much good in this disfigurement:-White precipitate ointment, half an ounce; subnitrate of bisulth, three and a half drachms; glycerine to make four ounces. Mix. To be applied every other night.
Friction, or kubbing a portion or the whole of the body, is conducive to health, especially so when
this is followed by bathing. Rubbing must le clistlngalshed from properly applied massinge, as frecjucutly nuch injury is done to this useful method of treating certain diseases by ignorantly supposing it to be neerely rubbing. Rubbing is uscful where there is stifiness of any muscle or joint, and mity be conjoincd with the inunction of oil over the affected tissues. Rubbing the chest with certain conuter-irritants is frequently cunployed in the treatment of bronchitis, spasmodic croup, asthma, etc, The method of treating bronchitis and spasurodic croup in children, by rubbing in a lininnent containing both slight counter-irritating and soothing properties, is especially to be commended. Ertell's is one of the best.
Fruits should enter into the clietary of every one as far as possible, and if eaten before breakfast are very beneficial where there is a tendency to constipation. Besides this, they are useful in purifying the blood.
Fumigation should be thoroughly carried out during the progress of contagious diseases, and for some time after convalescence has been established. The nost powerful antiseptics to employ in these circumstances are carbolic acid and sulphur.
Functional Disorder of any organ of the body is to be distinguished from organic disease, by the fact that it is simply due to a disordered condition which can be rectifiel; whereas, in organic disease an actual change has taken place in the tissues affected, and cannot be restored by nature's efforts; e.g. dyspepsia, or indigestion, is a functional disorder of the stomach, while an ulcer or a thickening of any portion of the walls of the stomach are organic diseases.
Funis is a term applied to the umbilical or navel cord.
Gall Bladder is the receptacle of the secretion of the liver which we call bile. It lies beneath the right lobe of the liver, and is pear-shaped. From the apex to this bladder there proceeds a short duct whicl! joins a similar duct from the liver, and then forms what is known as the common bile duct, which empties itself into the duodenum.

Gall Stones are composed of inspissated bile, and contain a considerable quantity of one of the crystalline ingredients of this fluid, called cholesterine. They vary very much in size, and according to their dimensions give rise to symptoms more or less severe. Sonnetimes they accumulate in very large numbers within the gall bladder, and at times produce considerable swelling of this organ, so much so that it not unfrequently is necessary to perform a surgical opera. tion for their removal. When they becone impacted within the gall duct, they give rise to most excruciating spasmodic pain, and, in consequence of the bile not getting free exit, jaundice is liable to result. When gall stones are present in the gall duct, the pain may be very much soothed by the frequent application of hot fomentations over which laudanum has been freely sprinkled. Opiates internally are also called for, and these may be repeated at intervals of two or three hours. If the pain continues, the hypodermic injection of morphia is perhaps the best means of giving relief. When there is a tendency to gall stomes, it is most imperative that a daily evacuation of the bowels be obtained and the diet strictly regulated, so as to facilitate the action of the liver as much as possible. The best purgative to administer in these circumstances is olive oil, in tablespoonful doses, frequently repeated.

Ganglion is an anatomical term applied to those minute nerve centres which abound througlout the body. The term is also applied in surgery to those elastie swellings which appear generally on the wrist, and sometimes on the top of the foot also. They are about the size of a hazel nut, and when the cyst walls become thin they can be easily ruptured by pressure, after which the fluid which was contained in them disappears by absorption.

Gangrene is a term applied to the death of the tissues, and is indicated by the fact that the parts become black in colour, void of sensation, and, in short, dead. It is always due to some interference with the circulation, and may arise from al direct obstruction in the main artery of the limb or by a thickening of the
walls of the artery, preventing a proper supply of blood being carried to the part. When galugrene occurs in young people it is generally the result of a blocking of the artery by a blood elot, or, very rarely however, it may be clue to a nervous contraction of an artery, when it is usnally symuetrical. When it occurs in old people it is the result of a discased condition of the coats of the artcries, which becone thickened in consequence. Senile fangrene commences at the toes, and may be set up by sone very trifing injury to the parts; hence it is important in the eutting of the toe nails or paring of corns in elderly people that the greatest care be taken not to injure the surrounding tissues. The disease spreads up the limb, and in some instances may reach the thigh, but before this occurs it is usually fatal. Sometimes what is temed the line of denarcation may form, that is to say, the disease process cerises at a certain point, in consequence of the blood current not being interfered with higher up. The only thing that can be done in this clisease is to amputate the limb beyond the discase. (See Mortification.)

Gargles are, practically, lotions applied to the throat; they may be astringent, antiseptic, or soothing. Astringent gargles, combined with an antiseptic, are useful in all inflammatory affections of the throat in their early stages. If there is much accumulation of mucus in the throat, then a gargle of hot water, in which is dissolved a small quantity of bi-earbonate of soda, acts as a very soothing agent. Chlorate of potash in solution is also a most useful gargle, and when there are uicerated patches upon the throat this solution of chlorate of potash combined with borax is very effica. cious in removing the unhealthy deposits. A good all-round gargle for throat affections is twenty-five to thirty drops of sulplurous acid mixed with a sherryglassiul of warm water and used frequently. Alum dissolved in water makes a good astringent gargle, but the most useful astringent to employ in such circumstances is the glycerine of tamnin mixed with water.

Gas is the term usually applied to those substances which exist in the form of an elastic fiuid, and which are permanently aeriform at ordinary temperatures. Gases must be distinguished from vapours, which are elastic and aeriform only at high temperatures. The gases alluded to in this book are-Ammonia, Carbonic Acid, Carburetted Hydrogen, Chlorine, Hydrogen, Sulphuretted Hydrogen, and Oxygen.
Gastric Juice is an acid secretion of the stomach, and is produced by the gastric glands, which are stimulated when food is taken into the stomach. Its special duty is the solution of albuminous compounds. It has no effect upon gelatine, as has been erroneously stated, and therefore there is no nutrition in this substance. The acid of gastric juice is abstracted from the salt which is taken with food. It contains also an albuminoid substance called peptone, which is also derived from the food.
Gathering. (See WhitLow.)
General Health is a term applied to the state of the body and its functional activity in contradistinction to the condition of individual organs or sets of organs. The gencral health, however, always suffers when one or more organs are involved.
Gentian Root is obtained froms an Alpine plant, and is employed as a tonic and stomachic. It is either taken in the form of extract, infusion, or tincture. The dose of the extract is two to four grains, three or four times a day; that of the tincture a teaspoonful in water; and of the infusion from a half to one ounce.
Germs of Disease: A great amount of infor: mation has been obtained with regard to these minute organisms during the past few years. It is now pretty well established that every disease which the human frame suffers from is due to the invasion of a specific germ or microbe. Some of these find entrance to the system througl the breathing apparatus, but in the majority of instances the cliannel is the mouth; in short, disease, as a rule, enters the system by being swallowed either in the saliva, or in the process of drinking or eating.
Gestation is that period which is required for development of the living child, from conception to the eud of pregnancy.

Giddiness-In medical languago 'Vertgo'-cul minates in a loss of balancing power with a sensation of reeling, and may terminate in the indivldual falling to the ground. It is frequently attributed to an abnormall supply of blood to the head, whereas it is most feesuently eaused by a deficiency of blood in the craniun, or anaemia of the brain. Of course, when duc to anaemia it is not dificinit to comprellend that the brain should lose its functional power, as it is temporarily deprived of its nourishment, and therefore acts inperfectly, As soon, however, as thu gialdiness results in the patient takiug a recumbent posture, the head ecases to be the highest point to which the blood Is propelled, and consequently the bloud is driven with greater facility to the brain, and thus the gidediness passes away. A weak action of the heart, in cousequenco of its lunperfectly propelling the bloud thruugh the cerebral vessels, is a frequent cause uf giddiness. Flatulent distention of the stomach, by incommuding the heart's action, is also a potent cause of this dis. agreeable sensation. Giddiness fregnently results when people suddeuly rise from the horizontal posture, and this is due entirely to the fact that the circulation in the brain is temporarily interfered with by tho sudden ehange of posture.
Ginger is the well-known spice proeured from the root of a certain tropical plant. It is a useful carminative, and has a sliphtly stimulating elfect upon the biliary secretion. It enters into the composition of various stomachics, anongst which may be mentioned Gregory's mixture and aromatic powder. In the form of the essence of ginger it is frequently administered where there is flatulent distention of the stomach and intestines, and is a useful adjunct to opiates when there is colic of the intestine.
Glanders is that malignant disease which attacks horses, and may be transmitted to man by inoculation through erosions of the skin, so that very gieat care should be exercised in handling horses which suffer from this disease. As glanders is always fatal when it attacks the horse, the ass, or the mule, the animals should be immediately destroyed when it is recognized, and buried immediately afterwards at a considerable depth.

Glands are those bodies which filter the fluids of the human body, and thus keep the blood pure. Their office is the secretion of various substances-e.g. the kidneys which secrete urine, the liver which secretes bile, the lachrymal gland which secretes tears, the salivary gland which secretes saliva, the gastric gland which secretes gastrie juice, etc., etc. These glands are all more or less subject to disease, which varies in its character just as the secretions wary in theirs. When the mesenteric glands are affected this is generally due to some tubercular deposit. This also, as a rule, is the cause of disease of the glands of the neck. In such circumstances it will be found that muriate of calcium given after food has a most beneficial effect: indeed, it seems to be the most potent remedy in glandular disease wherever this may be situated.

Glottis is the opening into the larynx. (See Laryix.)

Gluten is the nitrogenous principle which exists in every kind of grain, but more abundantly in oats and wheat than in Farley. It is elosely allied in its composition to the flesh of animals, and is therefore highly nutritious.

Glycerine is a substance which enters into composition with fats and oils, whether these belong to the verctable or animal kingdom. In combination with olece acid it would scem to be essential to the formation of soap. It has been extensively used both in the arts and in medicine. In the arts it enters into that wellknown and powerful explosive which we call nitroglycerine; In medicine it is principally used as an application, diluted either with water or fat, to the skin to produce an emollient effect. Internally, it has proved a useful adjunct to eod-liver oil in pulmonary consumption. It has also a slightly laxative eflect upon the bowels, and is frequently employed in catarrh both of the bronchial and alimentary canals. It has a powerful affinity for water, and is therefore employed on tampons to reduce congestion and affections of the womb. In combination with borax it is applied in
aplitha or thrush, which frequently develops on tho tougue and throat of children suffering from acldity of the stomach. It is also combined with tamin, and in that form is a popular renedy for relaxed sore thruat. when, if it is frequently applicd with a caunel hair pencll, it produces a most beneficial astringent effect. Glycerine is also a popular solvent of many substances, such is carbolic acit. Injected into the rectum-a teaspoonful at a time-it is useful in constipation.

Goitre is an affection of the thyroid ghand, which is hndheed by drinking curtain waters whach contain an excess of lime in solution. Its popular name is Derly shalru Neck. The ${ }^{11105 t}$ potent and hoost highly recommended remedy fur goitre is iodiue, both Interually and applied to the swelling as an externid application. Sometimes cysts form within the swollen glind and enlarge it to an enornuus extent, when it is termed Bronchocele.

Gout is not so much a disease of the blood as a disease in the blood. It is a hereditary disease also, or perhaps it would be more accurate to state that heredity inakes one nore liable to it if there is irdiscretion as to diet on the part of individuals whose forefathers have been the victins of this disease. Its foundation in every case is in the digestive apparatus. If the digestion is good, and the bowels in a healthy condition, no oue need be afraid of gout. The natural outlet of the poison of gout is the kidneys; but when uric acid exists to an undue extent within the blood, the kidneys fail to eliminate; it is then liable to deposit itself in some locality, usually in a joint, when pain, accompanied by active inflanmation, results. This is desiguated the explosion of gout. As this disease is one of such im. portance, it would be out of the question to go into its pathology aud treatment with sufficient elaboration to enable one to attempt its treatment without the aid of a medical man ; some general hints, however, may be useful, and amongst these the most important is, to abstain from all articles of diet which are difficult of digestion-in short, to confine one's self to a diet of the lightest kind, such as milk food, chicken, fish, oysters, etc., while as an application to the painful part a solution of three drachms of menthol in half an ounce of chloroform and one ounce and a half of belladonna liniment will prove most beneficial. As an internal remedy, probably the most useful is the benzoate of lithia in combination with small doses of tincture of colchicum given after food three times a day, while a course of treatment at Aix-les-Bains will prove of imnense service. There is no doubt that gout and rheunatism are very closely allied to each other, but gout would appear to be a more specific disease than rlecunatism, though possibly both are caused by poisons of a similar nature within the blood.
Granulations are those small red granular points which fill up and promote the healing of a sore. It is a well-known fact that if no granulations exist the sore can never heal ; the object therefore of the surgeon is invariably to promote granulation. Sometimes, however, the growth of the granulations proceeds too far, and this is termed proud flesh, when healing is thereby arrested. In such cireumstances the granulating 1 surface requires to be cauterized with a vlew to reducing their redundancy, when healing will succeed.
Gravel is the term applied to that condition of the urine when it is highly acid and crystals of uric acid or particles of urate of soda, lime, and ammonia become suspended within this fluid. Gravel is invariably the outcome of dyspepsia and a highly acid condition of the blood, and is frequently associated with rheumatism and gout. The best remedy for gravel is bi-carbonate of potash or lithia,
Green Sickness is technically called Chlorosis, and is a form of anaemia which frequently attacks young girls who have been long the victims of obstinate constipation. Its connection with puberty has frequently misled not only the general public but physiciaus them. selves, as it has been customary to associate it with the menstrual functions improperly performed. In every instance it will be found that chlorosis takes its origin In constipation. (Referito article on CONSTIPA. TION.)
Gregory's Powder is composed of one part ginger, two parts rhubarb, and four parts calcined
manemesla. It is one of the best stomacliles combined with a purgative actlon we possess. It also acts ns an antacid and tonic to the alimentary camal. It is probably as safe a medicine as can be taken when a gentle aperient action is deslred. If a few dropls of brandy, whisky, or enu de Cologne, are put in the water in which it is mixed, the disagreeable taste will be very much modified.

Griping is a paln which is produced by spasmodic contraction of the muscular coat of some portion of the intestine, and arises either from the effects of cold or from the presence of some forcign irritating matter within the alimentary canal. Undigested food, for instance, passing into the intestine frequently gives rise to colic, which is simply an aggravated form of griping. Certain medicines, sucl as aloes, colocynth, or scammony, when taken without the addition of some carminative or anodyne, produce severe griping; it is therefore highly desirable that purgative medicines possessing sucli irritating properties slould never be prescribed without being combined with some anodyne or carminative, or with both.
Grippe is the French name for Influenza, which has recently become anglicized.

Gullet, or Oesophagus, is the tube which leads from the mouth into the stomach. It is liable to be injured when caustic materials, such as carbolic acid, or vitrol, or any other caustic material, are swallowed. It is liable also to spasm, to stricture, and diseases of a more malignant type, such as cancer. When food is impacted in the oesophagus very considerable difficulty may often be experienced in either pushing it down or drawing it up into the mouth again. If the food actually passes into the oesophagus it does not produce choking, but naturally very unpleasant sensations are experienced until it finds its way into the stomach or is brought back again into the moutli.
Gums. The gums are composed of dense mucous membrane, which covers the alveoli, or the bony sockets, of the teeth. They are liable to be affected by such diseases as scurvy, lead poisoning, and want of cleanliness. Sometimes the gums bleed very frecly, but this, as a rule, is due to the effect of disease or to neglect of the teeth. The guins are also frequently affected in children, aphtha being the most comnon disease of this class, but not unfrequently this may develop into small ulcers which may prove difficult to heal. The best application for disease of the gums, from whatever cause it may arise, is a lotion containing carbolic acid, chlorate of potash, and tannin in solution with water.
Gum Boils are abscesses connected with teeth which are decaying at the roots. Their origin in reality is in the alveolar process, or tooth socket; hence they give rise to intense pain in consequence of the tension which they produce. When a gum boil has once occurred it will be very liable to develop again on little provocation if the tooth is not removed.
Gunshot Wounds do not always occur where medical assistance can be speedily obtained ; it is therefore advisable to endeavour to dlsinfect the wound as rapidly as possible, and this may be accomplished by mixing one part of carbolic acid with forty of water and injecting it into the wound, and afterwards covering the aperture with a pad soaked in this solution.
Gymnastics are exercises which should always be regularly practised with a view to the developing of the muscles of certain parts and the physical energies of these parts. It is wonderful what can be obtained by the judicious employment of gymnastics, both in developing the chest and limbs. Massage is a form of gymnastics which is practised by a second party. By its means, muscles which have been rendered almost useless by disease may frequently be restored to a fair amount of health, and general nourishment of the body can by this means be promoted to an extraordinary extent. Massage, moreover, produces a healthier action of the nervous system, and in certain diseases where exercise cannot be taken in consequence of the weakness and pain which it produces, massage is a most efficient agent in removing these conditions. Swimming is another very popular
form of gymnastics ; no other exerclse brings so many muscles mito play as swinuming does; therefore, beyond its utility as a life-saving means, it is an excellent method of carrying out a thorough system of gymnastics.
Haematemesis, or Voniting of Blood, is applied to that particular forto of beeding which takes place from the stomach in contra-distinction to laemoptysis, which is bleeding from the lungs. Fre. quently great alarm is experienced loy what would appear to lee voniting of blood, when in reality the blood has been swallowed, such as in bleeding of the posterior nares and bleeding from the gums. It is a curious fact that the stomach will not retain fresh blood, but immediately cjects it Sometinnes the blood becomes partly digested, in which circumstances its appearance is completely altered and resenbles coffee grounds; this in every instance may be taken as a diagnostic feature of the blood having come from the stomach.
Haematuria is blood passing along with the urine. It may procced from the kidneys or from the bladder. If from the former the urine assumes a smoky appearance, whereas if it comes from the bladder it is generally bright in colour.
Haemoptysis, as has been stated in the article on Haematemesis, is bleeding from the lungs, and is generally a symptom of great gravity, as in the majority of instances it is an indication of consumptive disease which has produced ulceration of the blood-vessels of the lungs.
Haemorrhage is an escape of blood from any vessel, and is caused either by direct injury or from the effects of disease. If the bleeding orifices are within reach, then the proper method to adopt with a view to check it is, to apply pressure until the arrival of the surgeon, who will be able to pick up the bloodvessels and tie them. If the haemorrhage is internal. then it may be arrested by the administration of astringent remedies, such as gallic acid, dilute sulphuric acid, acetate of lead, or those remedies which act directly upon the blood•vessels, as ergotine and hamamelis. The administration of ice is also usefully employed in such emergencies. If, however, as frequently happens, the haemorrhage is the result of a sluggish action of the heart, which interferes with the complete circulation in the veins, then cardiac tonics such as digitalis and strophanthus will be found of very great service. Bleeding from the nose is perhaps one of the most common of what we might designate internal haemorrhages; in such circumstances holding up the arms will be beneficial, and the application of cold to the spine is also a popular and useful means of arresting the bleeding. It may, however, be necessary to plug the nares, which can be done by pieces of cotton attached to thread and soaked in an astringent solution, which are pushed up the nostrils.
Hair in many ways resembles a plant, as it grows from a follicle within the skin, and continues to grow as long as this follicle is in a healthy condition. Its mode of growth is very similar to that of the hyacinth. It is composed of a horny tissue resembling in every particular of its composition that of the cuticle, or scarf skin. Baldness is always due to atrophy of the follicle which produces the hair. These follicles are supplied with a pair of miuute glands, which secrete the greasy matter supplying the hair. After many acute diseases the nutrition of the hair becomes so interfered with that it is liable to fall off. Debility also so interferes with the naturity of the hair that it is liable to splitjor become forked. The colour of the hair is due to a pigment contained within the minute tube which permeates its centre. The natural colour of the hair therefore is white, and it is due to the deficiency of this pigment that the hair becomes blanched as years progress. Severe inental emotion may so affect the colouring matter of the hair as to make it turn white in a very short space of time. Hair, as is well known, is liable to grow on places where it is very unsightly, such as on the faces of women. A popular and. I believe, a very efficient neans of removing superfluons hair is in the application of the brine which accumulates in herring barrels. This, although it produces a temporary rash on being applied, lias often the eflect of conipletely destroying the hair follicles. The application of arsenic lias also
been resorted to for the destruction of hair follicles, but this being a dangerous remedy is not to be advocated. Electriclty has illso been employed for this purpose, as has also the introduction of a hot wire into the cavity of the follicle.
Hand. This marellous agent of the human mind is, in consequence of exposure, necessarily liable to injury. If this should occur at a distance from medical aid, the first thing to be done is to endeavour to stop the bleeding, and at the same thine apply a 3 to 5 per cent. solution of carbolic acid on lint. It is highly desimble that as much of the hand be preserved as possible, even a single finger, ant certainly the thumb in conjunction with this, if it is at all within the ranse of possibility. (See ARTEKY: DISLOCATION. WUUNDS, CONTUSIONS, etc.)
Hanging, or suspension of the body by the neck, causes death in threo distinct ways. First, it may cause fracture of the cervical vertebra ; secondly, suffocation by contracting the wind-pipe ; thirdly, by pressuro upon the veins causing effusion within the brain. If the former has occurred, nothing can be done to resuscitate the inclividual, whereas if death has not supervened from the asphyxia produced by pressure, the patient may recover: but if rupture has taken place in any of the blood-vessels of the brain, the probability of restoring the individual will be very much lessened.

Hare-Lip, or Clef.Lip, is a congenital deformity due to conplete union not having been effected of the two halves of the body. It is frequently associnted with cleft palate, and may extend througlt the whole roof of the mouth. It can be remedied by surgical measures, whicb should be resorted to at as early a date as possible.

Hay Asthma, or Hay Fever, is a most troublesome disease in consequence of its intractable natnre. It is difficule to say what it is positively due to, but the popular belief is that it arises from the inhalation of the pollen of certain grasses. The irritation which is its direct cause may also be produced by the inlatation of certain powders, such as ipecacuanha, and I have known the odour of the rose positively give rise to this disorder. The symptoms are suffusion of the eyes, violent sneezing, and active discharge from the nostrils, with an irritating cough accompanied by severe headache. Sometimes severe spasm accompanies the disease, resembling in its character that of asthma. The treatment whicb is most efficacious is, to remove the individual from the cause of irritation; at the same time many remedial agents are of considerable valuc, such as the inlalation of carbolic acid vapour, the insuftation of snuff containing focaine or opium, and probably the best preventative is a long-continued course of arsenic with Archangel tar, which seems to have a beneficial effect upon the mucous membranc, which is the seat of the disease.
Hazeline is a clear fuid distlled from the fresh twigs of the hamamelis virginica, or witch hazel. It is a powerful astringent, and has in special action upon enlarged veins; hence it is valuable in the treatment of haemorrhoids, which are intrinsically a varicose condition of the veins of the rectum. It is also useful as an external application in varicose veins of the leg anll bruises and sprains. Given internally, it seems to act upon the venous system where haemorrhage or enlargement has taken place.

Headache is an affection which a great many people suffer from, and its causes are very various. Headache may be due to indigestion, nervous prostration, neuralgia, congestion of the blood-vessels, and constipation. It is frequently symptomatic of disease, and is a constant symptom in febrile affections. Of course the treatment depends entirely upon the cause, but it will be found that nervous and neuralgle head:aches can be very quickly removed by the administration of phenacetin in ro-grain doses, combined with two grains of caffein. Antipyrine has been frequently prescribed for the relief of headache, but this drug should be taken with the greatest caution, as its effect upon the heart is ofttimes very deletcrious. When headache is of frequent occurrence and persistent, particular attention should be paid to tho digestive apparatus and the condition of the bowels. Hardly any one suffers from headache whose bowels
nre in a healtly condition. (Sco CONSTIPATION.) If the headaches are of a neuralgic origh this is invarlably associated with a lowered condition of the vitality: tonle treatment nust therefore be persevered in for some thane, and possibly it naty be necessary to send the patient away for clange of alr and scene, together witl complete rest from his ordinary vocation. Neuralgic headaches ean generally be differentiated from those proceeding from anotler cause, from the fact that they are usually confined to onse side of the liead and are paroxysmal in their claracter, whereas a headathe arislng from general nervous causes is usually felt throughout tho entire head, nnd frequently gives the sensation as if the top of the liead were being lifted off. or of severe weight and pressing down upon the top of tho cranlum.
Heart, the central organ of clrculation, Is placed obliquely in the chest, with its aper situated belind the space between the fifth and sixith riles, from an inch and a half to two inches below the left nipple. The base of the organ is placed upwards, and to the right side of the apex. The heart may be computed to be about the size of the closed fist of the individual. It is contalned in its own proper membrancous bag, called the pericardium, which in health is lined by an extremely smooth membrane, lubricated very inuch in the same manner as the joints are lubricated by a serous fluid. The heart is divided into four cavities, viz., the right and left auricle, right and left ventricle, and is composed of a series of layers of muscles arranged in such a manner as to give the greatest power possible in contraction and expansion. The cavities communicate with each other by orifices which are provided with valves to maintain the circulation only in one dlrection. The aorta, or main artery, which conveys the blood from the left ventricle to the gencral circulation, is also provided with valves at its junction with the heart, as also are the apertures by which the venous blood reaches the heart and the orifices through which the blood is transmitted to and from the pulmonary circulaion.
Heart-Burn is a burning acrid sensation felt both in the stomach and at the top of the gutlet. It is usually accompanied by an undue flow of water into the mouth; called water-brash, and is a symptom of acid dyspepsia. It is a frequent concomitant of pregnancy, and minsucli circumstances often causes very considerable discomfort. It can be temporarily relieved by the administra. tion of carbonate of potash, soda, and lime, these acting as neutralizing agents to the acid. It is not, however, expedient to have constant recourse to these remedies, but in every instance the diet should be arranged so as to avoid those articles which are found to be prejudicial in the circumstances, and with a view to strengthening the stomach eight grains of bismuth combined with ten grains of ingluvin may be given three times a day just before meals.
Fieat, or Temperature of the Body, should be about $98^{\circ} \mathrm{F}$. in the normal state. The heat of the body invariably rises when there is febrile disturbance, and in consequence of this the muscular tissue under. goes disintegration. As is well known, heat is essential to vitality, and animals accustomed to one temperature are unable to retain their health in another. Excess of heat is almost more difficult to stand than excess of cold, and sudden transitions from heat to cold are wellknown factors in the production of disease. If a person is exposed to the heat of the sun for a prolonged period, sunstroke, which is simply congestion of the bloodvessels of the brain, is liable to occur, and may leave very disagreeable symptoms if it does not imntediately prove fatal. The skin of certain persons exposed to the strong rays of the sun is liable to an eruption called prickly hort. Heat is frequently employed in the treatment of disease, especially in the forn of hot poultices and hot fomentations. Again, it is used in the Turkish batlt as an invigorating agent, while as a hot bath it is employed in incipient febrile attacks with a view of promoting a healthy action of the skin. Were it not for the free perspiration which exposure to heat induces, the human frame would not be able to exist in certain climates, as by this means radiation takes place with great freedom and rapidity. The application of hot water 9 d dry licat is yery useful in causing çontraç:
tion of the blood-vessels in cares of hamombrafe. Ileat spots, as they are populurly called, are rurely the effects of heat, but gencrally of an impure condition of tho blood. (Refer to liomentations, poulticiss, ctc.)

Fiectic, or Ilectic Fever, is that febrile condition which occurs in wasting discase, sucl! as consunntion, It is indicated by a pright red burning spot upon tho wasted cheek of the patient, and always conveys the Idea of jmpending death. It is generally accompanied by a condition of the skin varylng from excessive dryness to profuse persjuiration.

Hemicrania is that form of neuralgia which affects one sille of the head. It may be relieved by phenacetin, quinine, guarana, galwanism, or other auti-ncuralgic agents, but the great point is to endenvour by judicious nourishment, and stimmation if necessary, to restore the vitality of the Individual. (See IIEADACHE,
Hemorrhage, (Refer to HAEMORRHAGE.)
Fenbane, or Hyoscyanus, is a Inative plant of Britain and Europe generally. In the form of tincture and extract it is an excellent sedative remedy where there is local irritation, such as in griping or colicky pains of the abdomen. It is frequently combined with purgatives in pills, with a view of rendering their action painless.

Hepatic is the term employed to denote circumstances connected with the liver or with the functions of that organ.

Hepatitis is inflammation of the liver.
Hernia is the term applied to that condition of the abdomen where the bowel protrudes through its walls, popularly known by the name of rupture. When hernia exists it is desirable to support the protruding portion of the bowel by means of a properly fitted truss. (See RUPTURE.)

Herpes is an inflammatory disease of the extremities of certain nerves which produces an eruption, first of all containing a clear fluid which gradually becomes more opaque, and finally comes off as a crust. It frequently appears on the lips and eleek. Shingles, which is a form of herpes known as herpes zoster, as a rule makes its appearance upon the body, and is generally In connection with an intercostal nerve.

Hiccup, or Hiccough, is an intermitting spasmodle nffection of the diaphragm, and is frequently due to indigestion. When, however, it occurs in the last stages of acute disease it is of great gravity, and frequently indicates a fatal terınination. When hiccup occurs in ordinary health it generally arises from some irritating matter which has been taken into the stomach, and will usually pass off of its ovn accord.

Hip Joint is a ball and socket joint which Is enclosed in a strong capsule. It is liable to dislocation and fracture within the capsule, and both these accidents require the immediate attention of surgeon.

İip-Joint Disease, or Morbus Coxarius, only affects children of a tuberculous habit. It is due to tubercular disease, either in the joint itself or in its immediate neighbourhood, and results in the formation of pus, which may burrow and find an outlet at a considerable distance from the joint. As a rule, the premonitory symptoms of hip-joint disease are felt In the knee, in consequence of the disease affecting the trunks of certain nerves which terminate behind the knce joint. This disease has a most pernicious effect upon the joint, and may culminate in its complete destruction, when, of course, stiffness of the part ensues, if the patient should be fortunate enough to recover from the disease. When disease of the hip is in an incipient stage complete rest should be enjoined, and the limb should be kept extended by means of a weight attached to a cord running over a pulley at the foot of the bed, while the general health of the patient should be carefully attended to, and inuriate of calcium given regularly for several weeks at a tinse. There is not the slightest doubt that this medicine has a most beneficial effect in diseases of this nature. If an abscess has formed, it must be evacuated, antiseptie precautions being taken so as to prevent the ingress of the germs of putrefaction. In some instances it may be necessary to eut down upon the disease and remove the dead bone; but if the disease has advanced further
than to render this necessary, the prospects of the bitient's recovery are very distimt.
RIome Sickness may le thought by some to le purcly an imaginary diseise, but in reality it may assunte dimensions which beconse in some instances quite alarming. Depression of spirits and a falling awisy of the general health frequently occur, so that disease actually is the outcome of a longing for liome and its burroundings. As a rule, this sickness passes away with the lapse of a little time, but in some cases nothing will give rclief to the syuptoms but removing the patient hone.
IIomoopatiny is a system of treating disease, first promuigated by Simuel Halncmanm of Leipzic in 1796. The "Organon of Medicine" which he published in 1810 contains a full exposition of his system. perfected after many years of careful observation and experiment. It is based upon the observation-as old as Hippocrates-that a drug which on the healthy will cause a certain array of symptoms will cure a disease presenting a similar array of symptoins. Thus, Hippocrates observed that Veratrum, which is capable of causing a series of symptoms resembling cholera, cured that disease. Again, amongst the well-known poisonous effects of Belladonna are sore throat and a red rash all cver the skin, and it is claimed that Belladonna is a specific for scarlatina, which is accompanied by a similar sore throat and red rash ; and Quinime, which produces on the healthy, febrile symptonis resembling ant attack of ague, will, as is well known, cure the ague. From these and numerous analogous observations, Halmemann inferred that the treatment of likes by likes was the long sought for true rule for medical treatnent of disease. Further it was found that the sensitiveness of the parts of the organism affected by disease was so much increased that the homœopathic medicine which acts on the same parts had to be given in doses much smaller than those generally employed, in order to avoid a primary aggravation of the original disease. Homoeopathy has had a powerful influence on the general practice of the medical profession during the present century, and in recent years the method of studying the action of drugs, originally suggested and carried out by Hahneniann, has been adopted to a very large extent. It claims to be a system of medicine that approaches the exactness of science, and Its advantages are-universal applicability, shorter duration of diseases, greater chance of cure, pleasantness to take, absolute freedom from danger of being poisoned, eheapness, and compactness. A homoopathic medicine chest can be of the smallest compass.
Frooping Cough is a curious disorder of a certain nerve, viz., the pneumogastric. This nerre supplies the stomach, lungs, and larynx. It is a questlon whether the disease is primarily a stomach disorder, a lung disorder, or an affection of the larynx, or whether it is due to some congested condition of the nerve centre itself. Be this as it may, the cough, which is paroxysmal in its character, affects all the three organs to which the nerve is distributed: we have the cough proceeding from the lungs, the hoop which is a spasmodic affection of the larynx, and the vomitirg which of course arises from the irritation of the stomach. Hooping cough commences apparently like an ordinary catarrh of the head, which seems to spread to the larynx and downward's towards the lungs. The cough at first is not paroxysmal, but speedily the paroxysms supervene after what is usually called a "fit " of eoughing. The difficulties experienced by those suffering from hooping cough are-an inability to inspire while the paroxysm prevails, as the cough is so very incessant, and when the cough is exhausted the prolonged draught of air passing through the spasmodically elosed larynx gives rise to the peculiar hoop which is characteristie of the disease. As a rule, however, the paroxysm does not actually cease until free vomiting has taken place, when it will be observed that the contents of the stomach are largely mixed with a glairy mucous expectoration. While the expulsive eough is going on it would seem as if the child were on the point of suffo-cation-the face becomes swollen and livid, and the veins of the neck and face turgid, and the eyes sometimes, in a severe paroxysm, have the appearance as If they would stakt out of their sockets; the child con-
vulslvely holds on to whatever object it can lay its hands upou, su as to ubtann suppport during the puroxysill. Not unfrequently the congestion of the Glood-vessels of the head is so great that rupture may take place from small twigs, wither in the nose or eye, or possibly, as I have observed, within the brain itself. Bleeding at the nose then is not unfrequently a con. cumitant of hooping cough, while etlusion of blourl in the white of the eye also occasionally occurs. The treatment of hoopine cough consists ln , first of all, careful attention to the bowels, especially keeping the lower bowel ennpty by enemata if nece.ssary, rubbing the chidd's chest and abdomen nlyht and morning with a liniment composed of equal parts of soap anid opium combined with compound camplor and belladouna liniments. Mauy internal remedies have been ad. vocated for this disorder. Amongst those which I have found most useful are-the iodide of silver given in $3 / 8$ of a grain doses three times a day; the bromide of sodiun in from 5 to 15 grain doses, according to the age of the child, three or four times a day ; but perlaps the mest energetic renedy is one which should only be prescribed under medical supervision, as it requires to be carefully watched during its administration, that is ouabain in r-roooth to $1-500$ th of a grain doses. The greatest danger of hooping cough consists in the complications which frequently arise in its course, viz., bronchitis and preumonia. Either of these diseases add very much to the gravity of this affection when they are present. The greatest care should therefore be taken to avoid exposure to cold. (See יOur Children. how to keep them well, etc.")
Hop, a well-known bitter agent, is chiefly used in the manufacture of bitter ale. It is, however, a useful tonic as well, and, as the tincture and extract, is frequently employed in medicine. The aroma from the hop has an agreeably soothing effect, and hop pillows have therefore been employed with a view to soothing invalids to sleep.
Horehound is a plant which grows freely in clis country, and its infusion is used largely by country people in the treatment of cough.
Horse Radish is a well-known garden plant, rnd is employed extensively as an aromatic. It may ulso be used as a stimulant, and as a counter-irritant when applied in the form of poultice. Great care should be taken to distinguish this root from that of the common monk's-hood, which also grows freely in our gardens, but which is a deadly poison.
Housemaid's Knee is, as a rule, the result of frequent and prolonged pressure upon the knee. It is therefore frequently met with in servants who have a considerable amount of scrubbing to do, which necessitates their kneeling upon hard floors, stairs, or stone passages. The disease is usually of a chronic character, but sometimes the symptoms may be of an acute nature. It is characterized by swelling over the knee cap. and is in fact due to an effusion having taken place within the capsule of the knee cap. If the affection is chronic, there is no inflamniatory blush apparent upon the skin. This, however, makes its appearance If the disease is of an acute nature. The best treatment which can be employed in such circumstances is rest, together with the application of Blisters, the one succeeding the other as soon as healing of the previous one has taken place. Absorption will thusibe induced. and the swelling will disappear in a short time.
Kumerus is the anatomical name given to the long bone of the arm. It reaches from the shoulder joint to the elbow, and is liable to fracture, when of course surgical aid will be necessary.
Hydatids are parasites which develop in the animal organism, but which are introduced into the stomach either by eating or drinking. These undergo the first stage of their development within the stomach. and become provided with a perforating apparatus by which they penetrate the coats of the stomach or in testine, and find their way into the circulation, afterwards locating themselves in some distant organ or tissue, such as the eye. Urain, liver, or muscular kissue. They there produce a cyst within which they reside until they are liberated by the substance in whicl they are contained being taken into the stomach of a second animal. There they complete the cyclo
of their development, and become transformed into a tape worm. When a hydatid cyst becomes located in an organ, such as the cye, brain, or liver, it may attain considerable proportions, and not unfrequently proves fatal to its host. The fluid of the cyst may be drained off, and the hydatid along with it, when of course a cure may naturally be oxpected. If it exists tn the eye. however, it will be necessary to have tho whole eys. ball removed.
Mydrocele is a dropstcal conditionof the scrotum. It is due to an inflanmaztory conditlon of the serous membrane lining this bag, and requires to bo treated by the;surgeon. Great confort, however, may be afforded by wearing a suspensory bandage, and in a few rare instances absorption may take place if thils treatment is adopted.
rydrocephalus is popularly known as ' Water In the Head,' and is cluo to an luflanmatory condition of the nembranes surrounding the brain. It is usuaily of tubercular origin, and is a frequent cause of death In delicate children.
IIydrocyanic Acid is the technical name of prussic acid. As is well known, it is a deadly poison. yet it is in many Instances a useful meticine when given in small doses. It acts as a direct sedative to the stomach, and is one of the component parts of clilorodyne,
Hydrogen Cas is the lightest known substance -it has neither colour, taste, nor smell when in a pure state. It burns with a pale yellow flame, and in its combustion it unites with oxygen, formilug water. Hydrogen gas enters largely into the composition of coal gas. When combined with sulplur it forms sulphuretted hydrogen gas, which is soluble to a considerable extent in water, but is a deadly poison. when inhaled.
Hydropathy is that system of treating dlsease by the external and internal application of water. The body and trunk pack, cold water compresses, hot and cold baths, and the douche bath, comprise to a large extent the external applications employed in hydropathy, while the administration of hot or cold water constitutes the internal medicaments employed In this method. There can be no doubt that hydropathy is a most useful adjunct to medical treatment. Inflanumations, either local or general, as well as febrile complaints due to specific causes, may be very much infuenced by the judicious application of hydropatly. The temperature of the body can be rapidly reduced when fever is present, either by the direct application of cold water to the whole surface of the body or by promoting perspiration by immersion of the whole or part of the body in warm water. Then again, the daily employment of the morning bath, if not actually a medical agent, is at all events of considerable value as a preserver of health, and a valuable hygienic measure.
Hydrophobia takes its origin from the fact that those suffering from it dread the very sight of water It is one of the most fearful diseases that an animal can be subjected to. As is well known, it is only conveyed by inoculation through the body of an animal suffering from rabies. If a person has been bitten by a mad dog. although the wound may heal in the ordinary manner, it does not follow that the person has escaped the disease, for after an uncertain interval the symptoms may appear-it may be months or even a year after the injury has been inficted. The first symptoms which show themselves are, an uneasy or painful sensation about the injured part, and if the wound has healed the scar tingles, or some peculiar sensation is experienced in its neighbourlood. This pain or uneasiness extends from the sore or scar towards the central parts of the body, and within a day or two of these symptoms appearing the patient commences to feel very il and uncomfortable, and tho specific constitutional symptoms commence, These are, great irritability of temper, with pain and a cloking sensation about the neck, and throat, and the patient is unable to swallow fluids, which, if he attempts to do, spasms, not only of the throat but of the body penerally, specdily supervene, and within a few days he dies of sheer exhaustion. It would appear that this disease is due to the poison Imbibed by the system
acting upon the spinal cord and producing changes there which culminate in the fearful and distressing symptoms of the disease. The precaution to be taker when a person is bitten by a mad clog is, of course, in the first Instance to endeavour to destroy the poison by the free application of caustics. Perhaps the nost useful appllcation to apply to the wound is pure carbolic acid: if this is not at hand, then lunar caustie may be applied vigorously and freely to the part. Within recent years a very great deal of information on this hitherto almost uniformly fatal disease has been obtained through the researches of M. Pasteur of Paris, and lie has been able by a process of attenuating the virus to render the system so far invulnerable as to enable it to overcome the potency of the poison. This is accomplished by injecting underneath the skin of persons bitten by mad animals this weakened virus; by doing so he acts upon the system very much in the same way as vaccination does with reference to smallpox. Pasteur's method of treating persons bitten by mad dogs, who are therefore liable to take the disease, has now become universally recognized as one of the greatest achievements of medical science.
Hygiene is that department of science which is devoted to the preservation of health.
Hypochondria is the term applied to that portion of the abdomen in which the stomacls and liver are contained. It is also applied to a disease which is characterized by lowness of spirits with a tendency to monomania. This disease is usually associated with a sluggish action of the liver and indigestion, and as a rule can be relieved by restoring the functions of these two important organs to a liealthy condition.
Mypochondriasis is the technical term employed for hypochondria; hence people suffering from this affection are said to be "hypped."
Hypodermic, or Underneath the Skin, is the term employed when medicines are administered by means of a perforated needle and a syringe, by which means the medicaments to be employed are injected underneath the surface. It is not only a reliable, but most efficacious and speedy way of obtaining the beneficlal effects of certain agents, such as morplia, atropine, digitaline, ergotine, cocaine, strychnine, and numerous other substances. It is eminently useful In cases of severe pain, whatever may be the cause of it; e.g. in neuralgia or spasmodic affections the subcutaneous injection of one-sixth of a grain of morphia will have an immediate effect in giving relief. Then, again, in great prostration the subcutaneous injection of ether produces a rapid stimulant effect upon the general system. Subcutaneous injections of digitaline will alsoact very rapidly as a tonic to the heart's action, and in this way a crisis may at times be tided over. Antiseptics have also been employed subcutaneously where microbes have located themselves and developed the disease peculiar to them in the skin, such as anthrax, , or, as it is popularly termed, malignant pustule. By this means the course of this deadly disease has been cut short, and the life of the patient saved by this simple measure. It has also been proposed to use the hypodermic syringe in the treatment of cancer, and, as is well known, its employment has been suggested by Professor Koch of Berlin in the treatment of tuberculosis. This, however, has resulted in complete failure. It would be dangerous for any but a properly qualified practitioner to employ hypo. dermic medication.
Hypogastrium is the lowermost portion of the abdonnen. It commences about two inches below the navel and extends to the pubes.
Hysteria, as its name implies, generally takes its origin in some affection of the womb: it is therefore entirely a disease of females. This is invariably dependent upon some congested or irritable condition of the sexual organs, and when it is not assumed is a disease requiring much sympathy, for, as a rule the patient suffers very much more than her appearance would suggest. It is a curious fact that a woman may have a very serious affection of the womb without her general condition suggesting the presence of disease, but as time goes on and the disease becomes more aggravaterl the general health speedily suffers, and this becomes apparent to the most casual observer,

If a woman becomes depressed In spirits, Irritable In temper, and easily fagged with the least exercise, we will find on luquiry that this is not all assumed. but that there is some irritation present internally which is exhnusting her nervous system and developing these symptoms. It therefore becomes important that when a female complains in this way that the condition of the womb sliould be immediately examined. It is strange indeed that such an important organ should lave been so systematically ignored when examining for the cause of disease. All sentimentality should be put aside when the health is at stake, and the conditiun of every organ of the body ascertained before arriving at a diagnosis, as, by ignoring this, a great many women while suffering intensely receive no sympatliy because of the ignorance inanifested by their medical attendants on this inportant subject. The syinptoms of the patient in these circunstances have frequently been said to be imaginary, when the patient herself knew full well that they were 800 well founded upon fact. Of course there are impressionable females who give way more readily than others, and who inake the most of their symptoms; it is necessary in sucl cases to act firmly, but this firmness should always be accounpanied by kindness-cruelty should never be resorted to. The general symptoms of hysteria may be summed up as follows:-Lowness of spirits accompanied by weeping at the slightest cause, sometimes alternating with fits of what is called hysterical laughter; it is seldom that a hysterical patient looks on the bright side of things, and there is always considerable irritability of temper. Another prominent symptom is what is termed the globus hystericus, which gives a sensation as if a ball were in the throat, and conjoined with these there is always more or less an excessive flow of urire, the urine being almost colourless. Neuralgia fre. quently accompanies this disorder, and there is always sleeplessness. If we dip further into the symptoms we will find that there is a bearing-down sensation at the bottom of the abdomen with weakness and pain in the back, also pain extending from the groin down the limbs; these of course are due to the direct cause of the hysterical symptoms. The treatment consists in, first of all, removing the local irritation, which will be materially assisted by enjoining rest in the horizontal posture; the bowels should also be very carefully watched; the tincture of valerian or the ammoniated tincture of valerian will be found very efficacious when a paroxysm threatens or is actually present-this may be given in teaspoonful doses in water every two or three hours, a pill containing a $\frac{1}{\frac{1}{2}}$ grains of valerianate of zinc, and 2 grains of extract of conium given forenoon and nfternoon will be found the best nerve tonic for a hysterical patient. These may be continued for ten or twelve days at a stretch. Women, and young women especially, are very much given to underclothe themselves, and especially to abjure the use of flannel next the skin. This, it need hardly be said, is a very pernicious habit; it is therefore essential that all suffering from nervous prostration, from whatever cause it may arise, should wear flannel next the skin. The digestive functions are liable to go out of order in hysterical patients; the diet, therefore, should be carefully regulated and adapted to the conditions of the stomach of the patient. From what has been said it is absurd to say that a nian can be affected by hysteria. doubtless he may suffer from nervous symptoms, but that these are hysterical carries absurdity on the face of it. (See "Woman in Health and Sickness.")
Ice is the crystallized condition of water, and may be said to be water from which the latent heat has been extracted. It is a most useful article in the ireatment of many diseases ; e.g. in congestion of the head the application of iced cloths or a bladder filled with ice is a most potent remedy. It also has a most powerful remedial effect in certain diseases where the temperature is unduly high. The author has scen it of the utmost value in typhoid fever, where death seemed imminent from the ligh temperature affecting the heart's action and causing it almost to cease ; in such circumstances the application of a bag of ice over the heart and upper portion of the abdomen has frequently tided the patient over what appeared to be a fatal crisis. By this means the temperature of the
body may be reduced $\operatorname{In}$ a very short tillo $4^{\circ}$ or $5^{\circ}$. and it is astonishing to find how the heart's action inhproves along with the subsidence of this abnornally high temperature. Ice is also frequently employed externally as a local anaesthetic, and is specially useful as such in severe cases of nemralyia. is an application tory affections. As an internal remedy, ice is highly bencficial in obstinate voniting-a good plan to give it in such circumstances is, to powder the ice and give it in teaspoonfnh closes, requesting the patient to swallow It before it is melted in the nouth. Iced drinks will also be retained when tho stomach is highly irritable, - when fluids at a warmer temperatare would not be retained for a moment. It is also very grateful in inflammatory affections of the throat, when taken internally.
Ichor is an unhealthy discharge emanating from an ulcer. Its properties are very acrid and irritating, and In every instanco retard healing, and are liable to make the original sore extend its area. When an ichorous discharye is present in a wound or micer, the raw surface should be thoroughly cleansed and rendered aseptic by the application of solue antiseptic substance or tluid, probably the best application in these circumstances is aristol, bat iodoform, dermatol, and other substances are also of service.
Ichthyosis is a disease of the skin which develops hard scales, making the surface somewhat resemble the skin of a fish. The disease is frequently hereditary and usually congenital. It is to a certain extent endemic to some districts, and is very difficult to treat successfully.
Idiocy and Imbecility may be described as the result of an innature or ill-developed brain. These diseases are invariably congenital, the one being only a milder type of the other. They are usually the result of frequent inter-marriages, but they also occur where the constitutions of the pareots have been tainted by syphilis or tubercle. If these diseases exist in the parent, and inter-marriage also exists, the offspring are thereby much more liable to be deficient In their intellectual powers. No doubt a great deal can be done for the amelioration of the subjects of these distressing mental conditions, but the idea of curing and elevating them to the platform of intellectual beings is beyond the scope of medicine. Both inabeciles and ldiots should invariably be placed in asylums or institutions devoted to their care.
Idiosyncrasy is that peculiar state of the mental or physical apparatus which reacts in such a manner as to render an individual peculiarly susceptible to certain diseases and influences which other people are not affected by; e.g. hay fever is an idiosyncrasy, so is asthrma, but the most peculiar form of susceptibility which I have known was in an individual who, on smelling the aroma of certain flowers, was immediately attacked by catarrh of the mucous membrane of the nose, or, as it is commonly called, cold in the head. It was not, however, as can be easily seen, duc to cold, but to irritation arising from the emanations of certain flowers. With regard to the administration of medicine many peculiar idiosyncrasies require to be stated and noted; e.g. the least quantity of mercury administered to some people will cause salivation, whereas others may be able to take it in considerable quantities without any apparent effect being produced. Ernptions on the skin occur in some people when certain articles of diet are parraken of or certain medicines given, while others, and the majority, are uninfluenced by these substances. Certain individuals are unable to take 'quinine from the physiological effect it produces upon the heariug, others apain are purged by taking iron, while as a rule it has an opposite effect. Then, again, it has been stated that Epsom salts have actually produced constipation in certain Individuals.
Imperial Drink is made by pouring upon half an ounce of crean of tartar and one lemon cut into slices a pint of boiling water and allowing it to cool, the fluid afterwards being poured off as required for the patlent. It has an excellent effect on certain slugrish conditions of the kidneys, and is also a mild laxative. It may be taken ad $\ddagger$ tbitum where there is
any slight feverish condition combined with a deficiency of urine.

Impetigo is a pustular cruption of the skin. It may be associated with ecrema, when it is called impetiginous eczenina. It should invaridoly be treated by a comperent medical man, but if this is beyond reach great benefit will be derived by the application of an ointurent containing a small proportion of nitrate of mercury, chrysarobin, and quinine.
Incontinence of Urine ariscs from a deficient action of the sphincter muscle of the bladder. It is not at all of unfrequent occurrence in boys up to a certain age, and sometimes even in girls, who, in consequence of this weakness, pass their urine during sleep. It again occurs in very aged persons, when it is usually a symptom of approaching death, as it is in these circumstances due to paralysis. When children suffer from incontinence of urine, tho important point to attend to is to keep the lower portion of the body at a higher elevation than the bladder, so that pressure does not occur upon thls sphincter muscle which sur. rounds the orifice of exit from the bladder. Certain medicines arc also useful in these circumstances, amongst ${ }_{3}$ which may be mentioned belladonna, nux vomica, and steel drops. As this condition is frequently aggravated by constipation or the presence of worms in the intestines, these causes should be removed. Douching the parts with cold water night and moruing and using considerable friction are also very beneficial adjuncts to other treatment.
Incubus, or Nightmare, is invariably the result of something disturbing the digestive tract, eithcr eating too much indigestible food shortly before going to bed or an accumulation of foetid matter within the large Intestine. It is a mistake to suppose that sleep is more refreshing and less disturbed by abstinence from food for some hours before retiring to rest. On the other hand, it is a greater mistake to eat too much before retiring, yet it must be conceded that a moderate quantity of easily digested food, an hour or so before retiring for the night, will not only facilitate sleep, but make it more lasting and refreshing.
Indigestion, or Dyspepsia, is probably the most common complaint that the human frame is liable to; this is largely due to the fact that people will not study their diet and attend to the daily evacuation of the bowels. Indigestion may arise from many causes, the chief of which are-the partaking of rich or unwholesome articles of diet: tbis of course can be easily remedied by abstaining from those particular substances which one by experience leanas is the cause of the trouble; nervous debility brought on either by mental fatigue and worry or from the enervating effects of certain diseases ; while febrile disturbances also have a direct effect upon the digestion. Dyspepsia also frequently arises from catarrh of the stomach, and this condition is in many instances hereditary, while in others it is the result of exposure to cold. When this exists an undue secretion of mucus takes place, and a deficiency of gastric juice results. When indigestion is purelystomachic in its origin it is indicated by a feeling of discomfort or pain immediately after taking food, with an inclination to vomit. In other forms the dyspepsia manifests itself by a sensation of distention of the stomach, accompanied by frequent eructations. This is generally acconpanied by fermentation of the food, the fact being that the temperature of the stomach favours this kind of decomposition, and the result is the generation of acid and gas, which is in consequence accompanied by the eructation of flatus, or wind, as it is popularly called. The acidity which accompanies it may be of such an acrid nature as to give rise to what is popularly known as heartburn, and this is also accompanied by pyrosis, or water-brash. This is an eructation of a watery fuid having a disagreeable taste. Along with indigestion there is frequently an undue inflation of the intestine as well as of the stomach, and when this is the case it is manifested by a feeling of fuloess low down in the abdomen, together with a griping scnsation. As a rule, this is due to undigested food finding its way into the intestinal canal. When indigestion is present it is essential that a proper dietary should be attended to, and it will be found that the following instructions, if carefully carried
out, will be of consideralle service, viz., the avoldanco of soups, stewed meat, and boiled meat, and if such nrticles as porridge aud vegctables produce acid, these should be abstained from also. Anotherpregnant cause of incligestion is the partaking of tea in too large quantlics, and especially of tea which las been long infused; it is therefore necessary that tea should not be infused for more than three or four minutes at the outside. Bread sliould not bo eaten before it is at least one day old, and brown bread, or that which is mado from whole wheaten meal, will be found mucl more easy of digestion than white bread. Then, it may be necessary to assist the digestion materially by adopting an exccedingly simple diet. It nay be necessary to nbstaln eutirely for a little while from butcher meat, and only such articles as chicken, fish, sweetbreads, revalenta, and milk diet generally will require to be fallen back upon. It is also a well-known fact that butcher meat underdone is much more easily digested than that whlch is overcooked. It need hardly be mentioned that in cases of dyspepsia it is essential that thorough mastication of the food should take place, but perhaps that which requires as much care as anything is the daily evacuation of the bowels, and where this requires assistance a sniall dose of Gregory's mixture will probably answer the purpose better than anything else. If catarrh of the stomach is present, or if dyspepsia from other causes exists, great service will be obtaned by washing the stomach thoroughly out before cating, and this can be done very easily by sipping a teacupful of very hot water about an hour or thiree quarters of an hour before meals. Regular and systematic exercise in the open air, and the employinent of a cold bath, either by means of the spray or sponge, with a good rub down in the morning, will also be found very advantageous. Then, again, it must be remembered that proper clothing is a most useful and beneficial means to adopt in persons who are of a dyspeptic habit; it is essential that the body be kept warmly, but not over. clothed, and with a view of accomplishing this, fannel sloould always be worn next the skin. If the feet are cold, and the sleep is disturbed by dreams, with a feeling of fatigue in the morning accompanied by bad taste and frontal headache, we may rest assured that the bowels are in an unsatisfactory condition. These symptoms are frequently ascribed to biliousness, but the liver is not altogether at fault, the condition being due to a very large extent to the fact that the lower bowel is in a torpid condition. When such symptoms are observed a saline purgative, very thoroughly diluted with water, taken before breakfast, will prove most beneficial. When it is necessary to assist the digestion, pepsine. ingluvin, papain, or zymine will be of considerable service if taken immediately after meals. Frequently, pepsine combined with aromatic powder, bi-carbonate of soda, and magnesia, or with helalin, will give great comfort and relieve the distressing symptoms. The following prescription may be taken with advantage if combined with the regulations as to diet which have just been given:-Pepsine and aromatic powder, of each three parts, bi-carbonate of soda, eight parts, and heavy magnesia, four parts; half a teaspoonful of this powder taken in water immediately after food will often prove to be of immense service. If, however, the indlgestion proceeds from an atonic condition of the stomach it may be necessary to combine this with 20 drops of tincture of nux vomica and a tablespoonful of a bitter infusion, such as that of quassi, calumba, or gentian. Nux vomica is an admirable stomachle where the stomach requires tone. It will, however, always be advisable when indigestion is present to consult a competent medical man, as it is quite impossible for any patient to treat himself, however well he may be advised in a work of this kind; indeed, medical men theniselves are quite unable to treat a disorder of this kind occurring in their own persons.

Infection is applied to the contraction of dlsease through the breath. It is contra-distinct from contagion, in so far that this is the contracting of disease by touch. Some diseases are both infectious and contagious. It is a question, howerer, if infection can be in every instance due to the inhalation of the poison. It is very probable, I think; that it is the result of the
disease germs finding access into the mouth and being hmprisoned there in the saliva and thereafect swallowed. So far as my own obscrvations liave gonc, I have been led to believe that if a person who is in the vicinity of a patient suffering from an infectious discase continually keeps his mouth shut and breathes through his nose and does not swallow his saliva, that he will escape infection. It is therefore important that inclividuals who are obliged to come in contact with cligeases of this nature should act up to these injunctions: Of course it goes without saying that disinfectants have a most powerful infuence in destroying infection, and as these substances can be employed without any detriment to the patient, they should invariably be diffused through the sick-room.

Inflammation is that unlealthy action which may arise in any part of the human body, and is claracterized by an engorgement of the blood-vessels of the part, producing redness, pain, and swelling. It may arise from the direct introduction of some poisonous matter or by the absorption of septic material from without; indeed, in every instance it would appear to be due to the latter infuence. It has recently been ascertained that the engorgement which takes place in the part which is inflamed is due to the developinent of microbes of an injurious nature within the part. These microbes have the power of developing very rapidly withln the blood stream, but there are sul)stances within the blood called white corpuscles or leucocytes, which, when a part is invaded by this poisonous matter, immediately congregate in the neighbourhood, and, by the power which they possess, attack the germs producing the mischief, and endeayour to destroy them by absorbing them with in their own cellular structure, thus devouring them so to speak. These bodies, in consequence of this peculiar power which they possess, have obtained the name of "phagocytes,' and the process of their action has been termed - phagocytosis. Whatever be the nature of the septic germs which develop inflammation in a part, these phagocytes lnvariably accumulate in the neighbourhood and endeavour to destroy them. That they are not always successful is a fact of which we are too well conscious, but it is astonishing what they can accomplish if they are assisted by the bodily health being well sustained by nutritious and stimulating nourishment. Medicines are also of considerable service in assisting them in their efforts, and amongst the most useful remedies which we can employ in these circumstances are those which reduce the temperature of the body, which is always high during the existence of inflammatory action, such as phenacetin, salicine, quinine, aconite, and those substances which act upon the skin, producing free perspiration-amongst these may be includecl ipecac, liquor of the acetate of ammonia, sweet spirits of nitre, hot gruels; and if the infanmation is extemal, the application of ichthyol, belladonna, dilute solution of carbolic acid, menthol in solution, ice, cold water compresses, and hot fomentations. If the disease has affected an internal organ, then the application of mustard poultices, fly blisters, dry cupping, and even blood-letting may be found to afford very beneficial results. In every instance, however, it is essential that the vital forces should be well maintained by judicious nourishment, and stimulation if necessary. There can be little doubt that when inflanumation is present it is not so much the local mischief that tends to produce a fatal result as the high temperature of the body which accompanies the attack, as when the temperature is running high the whole muscular system of the body, especially that of the heart; becomes lmpoverished, and tends to become falby; therefore it is the first duty of any one in charge of a patient whose temperature is above the normal to get this reduced as rapidly as possible. Phenacetin in ro-grain doses, repeated every four hours if necessary, will, in these circumstances, have $n$ most beneficial effect, and not only prevent this enervation of tho muscular system from proceeding too far, but also assist in maintaining the vital energies of the leucocytes, which have so much to do with the destruction of the disease yerms. It is also necessary that the lower bowel be kept ennpty, preferably by the enema, as thereby a most prostrating effect is avoided, this

PEARS' CYCLOPAEDIA. 081

MEDICAL:DICTIONARY.
prostration being due to the absorption of foetld natter from the large bowel, which of course has an acklitional prejudicial effect upon the blood current. A person surfering from luflamation will necessarily be very thirity; his thirst therefore shonkl le assuaged by allowing him to purtake freely of firtinaccons gruels; which tend to, as it were, supply fhe super-heated blool with fuel, and thus prevent it from preylug apon the tissues of the body. It $1 s$, however, needlcss to advise that wherever infammation, accompanicd by a temperature above ros ${ }^{\circ}$ exists, that the patient shouk be inmediately placed in the hands of a medical man.
Influenza iuay be described as the most typical example of epidemic disease. It literally comes apon the people, and does not appear to bc conveyed by Infection so much as it is produced by a peculiar atmospheric condition, duo evidently to the fact of the athospliere being loaded with tho gcrms of this disease at the time being. Influenza has been (in the popular mind) very much mixed up with orinary catarrh and cold, for the reason possibly that the premonitory symptoms of inlluenza very much rescmble those of cummon catarrh : they are, however, two vcry distinct diseascs. Influcnza is a feverish attack conning on quite suddenly, ancl producing invariably a sudden and considerable rise in the temperature of the body. It is always accompanied in the first stage with a catarrhal affection of the mucous membrane of the air passages, henco lt is probable that the disease germs, in the first instance, locate themselves upon the mucous membrane of these passages very much in the same way as the poison of mcasles does, and through these channels it enters the general circulation, Shortly after the onset of the disease there is great prostration, shivering, and pains through the whole body, especially in the loins and head. As a consequence of the fever there is loss of appetite, and in many instances vomiting, with intense heat of the surface and excessive thirst. As a result of the affection of the nucous membrane there is generally cough, and not unfrequently this congestion of the bronchial tubes may extend until it reaches the lung tissue, and tbus produce pneumonia, which so often is the direct cause of death in this disease. Death, however, may occur from the excessive debilitating effects that the disease has upon the vital powers, especially upon the heart. As is well known, influenza seems to come in waves over a very large extent of the world's surface, and attacks large numbers at once, and frequently simultaneously. This is a striking peculiarity of the diseasc. Another of its characteristics is the tedious convalescence which follows it, and the liability to relapse or to a fresh attack occurring. It is not a little remarkable how some people escape from its ravages. It would appear that only those whose health is at the time in an unsatisfactory condition are affected; especially are those liable to it whose blood is contaminated by faecal absorption from the lower bowel, due to that comtronest of all evils and predisposer of disease, constipation Of course, exposure to cold or any other influence which will depress the vitality for the time being will also lay the system open to an attack, In the treatment of this disorder we must always remember that death oscurs in every instance from the disease affecting the vital organs with such rapidity that they are unable to withstand the attack. Now this, to my mind, is entirely due to the fact that the febrile disturbance in the system is so great, and the high temperature which results has such a prostrating effect upon the heart's action, that congestion of all kinds are vcry easily set up, in consequence of the driving powver of this organ being so terribly reduced. The first point then, and the most important, to attend to in the treatment of influenza is, to reduce the temperature at once. On no consideration permit It to be retained at anything above $100^{\circ}$, and this can reaclily be accomplishocd hy the free and, if neccssary, frcquent adininistration of phenacetin. For a child up to slx years of age four grains may be given cvery four hours, up to ten years six gralns, from ten to fifteen ycars eight grains, and above that ten gralns may be safcly ardministered at intcryals of four hours if necessary. Phenacctln is not only a safe but a most efficacious remedy in diseases which give rise to a high tempera-
ture. At the same thme that this medicine is licing adnuinistered, the lower bowel sliould be kept clear by the datly use of the cnema, and the vital powers sustained by fudicious nourislment. When an attack of influenza is threatening, the frec Inhalation of eucalyptus onl or nenthol by a steam inhaler may cut short an attack, but the ,grand point to observe is the condition of the gencral hcalth, and espccially that of the bowels.
Infusion is tle extriction of the essential constituents of vegetable [substances by means of boiling water. A great many infusions are employed in medicinc, such as cinchona, senna, calumba, chamomile, broom, gentian, quassia, hop, scnega, uva ursi, bucchu, etc. The most commonly cmployed Infusion is tea, ind this article, in conscquenec of the mode of infusing it, frequently produces most prejudicial effects upon the stomach. All the time necussary for the inffuston of tea and the extraction of its Invigorating and aromatic properties is four minutes at the outside; if it is infused longer than this, the gummy extractive natter and the tannin enter into the liquid, and are preguant sources of dyspepsla, espccially among females, who drink large quantities of tea. It is therefore desirablo not to let the infusion go on longer than three or four minutes.
Inhalation is one of the most efficacious means of introducing medical substances into the respiratory organs and blood, if this is requlred. When it is desired to act locally upon any portion of the respiratory tract, the vapour is conveyed by means of steam issuing from any article which is employed as an inhaler. The common jug answers the purpose fairly well, but there are vessels to be had adapted for the purposc, which are manufacturcd and retailed at inost moderate prices, Amongst the more common vapours employed in inhalation are those of menthol, eucalyptus, terebinc, pumuline, camphor, and other volatile substances. The inhalation of chloride of ammonia, for which a special inhaler has bcen manufacturcd, has of late years becn largely employed in the treatment of catarrh of the nares and bronchial tubes. It is easy of application, and not at all unpleasant for the patient, and at the same time has considerable power in relieving the distressing symptoms which are invariably present in these cases. Sulphurous acid at one time was held in high esteein, as an inhalation in the treatment of catarrhal affections of the air passages, but, like many other things which have been boomed too much, it has fallen into an oblivion which it scarcely deserves, as doubtless it is a most uscful agent in the treatment of the first stage of catarrh, and this is evidently due to its antiseptic properties. When it is desired to act by inhalation upon the blood, as in the production of anaesthesia during operations, ether, chloroforn, laughing gas, and other like substanccs are inhaled without being diluted, except by atmospheric air. The inhalations used in these circumstances are quite distinct from those employed when medicinal effects alone are desired, and as the administration of these substances is always attended with more or less danger they should never be administered by unskilled hands. Oxygen gas in its pure state has of late come again into use in such diseases as pneumonia, etc. In its concentrated state it is administered to tide the patient over what may be considcred the crisis, and by this means the lividity indicating a deficient oxygenation of the blood speedily disappears, this being due to more completo oxygenation taking placc, In consequence of the gas bcing inhaled without dilution, Sinple steam may frequently be inhaled with advantage where there is sore throat or an irritable condition of the windpipe. It ls also a very useful soothing agent in bronchitis, cspecially in children, and the apartment occupied by the patient can be kept moist by means of what is popularly known as a bronchitis kettle, from which a constant current of stcam is kept flowing. This may be impregnated with cucalyptus oil, terebine, or pumuline. The inhalation of carbolic acid vapour is very uscful and beneficial in whooping congh, and is also of considerable service in other spasmodic couglis, and in the inveterate coughing of consumption. In diphthcria the inhalation of iodine vapour and that of eucalyptus oll has been strongly advocated, and doubtless not without good rcason. Inhalatlon, however, in
such diseases as these must not be relled upon solely as the means of treatment, as local measures require also to be adopted.

Inoculation is the introduction of a foreign substance into the system by means of a wound. The term is generally applied to the inoculation of smallpox, which was freguantly adopted prior to the discovery of vaccination by Jenner. It was found that the introduction of the disease artificially rendered the patient less liable to the full virulence of the disorder. Inocu. lation at the present day is much more largely employed than ever it luas been before, both among ammals and the human race. It has been ascertained, principally through the researches of Pasteur, that certain diseases of a most virulent type can be modified to a remarkable degree, and indeed, in many instances, the system may be rendered impervious to them when an attenuated virus is introduced by subcutaneous injection. Amongst these diseases may be mentioned tetanus or lock-jaw, hydrophobia, anthrax, pleuro-pncumonia, etc.

Insanity or Unsoundress of Mind are terms which are applied to aberrations of the inental faculties. Althougli these diseases may come on in the course of one's life, they are, as a rule, hereditary in their tendency. Many modified forms of insanity exist, such is monomania, peculiarities of the mental faculties, imbecility, dementia, idiocy, and complete lack of the mental faculties, called amentia. The main points to be observed in considering insanity are those which relate to the legal responsibilities of the Individual ; many people labour under delusions which in them. selves are harmless, and these people may be able to perform their social duties fairly well, but should the delusions referred to be so pronounced as to lead them to be dangerous from a legal point of view, then it becomes necessary to put them under restraint; indeed, whenever a mental affection has even a suspicion of rendering the individual irresponsible for his actions, it is not too soon to take the precautions which the law prescribes for the detention of such persons. When a patient, whose mind is supposed to be affected, becomes suspicious and indulges in conversations with himself, and looks upon his best friends as his enemies, it is time that particular note be taken of his actions, and if these go to prove that his mental capabilities are becoming undermined medical aid should be at once called in, and proper precautions taken either to prevent him injuring himself or others, or to put him under restraint entirely. This of course cannot be done without the sanction of his friends, the certificates of two unprejudiced medical men, and the warrant of a magistrate or sheriff. Whenever an individual whose mind is suspected of being unhinged makes either an attempt upon his own life or that of another, no time should be lost in resorting to the measures which the law enacts. When the nind becomes disordered it is generally preceded by restlessness, inability to attend to one's normal duties, peculiarities of conversation, these generally running in a special groove, suspicions regarding his best friends, sleeplessness, and general disorder of the bodily functions. With a view to ward off worse symptoms, and if possible bring about a cure, the first thing to attend to is, to endeavour to procure for the patient a refreshing sleep, and this may be attained by the judicious adnainistration of certain soporifics, the best of all being sulphonal. This can be given without danger, and generally with the very best results. Mania is a form of insanity which may be either acute or chronic, and is indicated at first by the patient slowing peculiar emotional proclivities, this being followed by disorder of the intellectual powers. The first symptoms which appear are generally those of despondency, irritability of temper, combined with sleeplessness. The digestive organs, together with the functions of the bowels, are generally very much disturbed, the skin becomes hot and irritable, and sometimes may even develop an eczematous disease. Such cases are generally associated with a rheumatic constitution; the despondency frequently attains such a pitch that the patient may make an attempt upon his life. or if his mania is directed in a particular channel he may develop homicidal tendencies. Another form of mania is called, rightly or wrongly, kleptomania, This, however, is often taken advantage of as a shield
for theving propensities which lave nothing but the criminal clement in their nature. Dipsomanla is said also to be a form of insanity, and doubtless it becones so whan the patient indulges in his proclivity for drinking. 1 certain form of mania not unfrequently attacks women shortly after confincusent, this being generally associated with a hereditary tendency to mental disorler, and is called pucrucral mania. As a rule, however, this disease will speedily subside if the patient receives a proper anount of sleep, either artificially or naturally. Epileptic mania results from continuous attacks of epilepsy, and is generally associated witlo some disordered condition of an organic character located at the base of the brain in close proximity to the spinal cord. At the change of life woinen are fre. quently attacked by a species of mania which, as a rule, is associated with some organic mischicf occurring in the womb or its appendages. These attacks not unfrequently develop into insanity, and can only be relieved by the removal of the diseased condition which is the origin of the malady. When any form of mania lias once attacked an individual, relapses are very liable to occur, but when such attacks occur in a person who has previously enjoyed good health they are gencrally due to some organic lesion, and the first duty of the physician is to attend to the removal of the disorder which lias in the first instance given rise to the disease. If this is done in an efficient manner, and the disease disappears, we may calculate that there will be no recurrence, providing the affected organ is completely restored to health. It is a curious fact that when insanity occurs in an individual who previously has enjoyed melltal health, the most extraordinary hallucinations possess him or her, and he or she may become possessed of the idea that they are transformed into personages occupying prominent positions eitluer in ancient or modern history; e.g. the author has met with individuals who have so far lost their own identity as to make them pose as emperors, kings, queens, generals, and even as Jesus Christ. It is needless to say how pitiable it is to behold men and women whom we have been acquainted with in their sane moments subject to such terrible delusions. There can be no doubt whatever, leaving out the more severe types of this painful disease, that many persons whom we consider rational in almost every respect are more or less insane upon certain topics, and that those who are socalled. eccentric have to a greater or less degree insanity in their constltutions; indeed, there seems to be a point at which high mental culture stands on the verge of a precipice dipping down deep into the abyss of insanity, and from which pinnacle a very slight mishap would precipitate them. With regard to the treatment of this painful disorder little can be done except by judiclous restraint and careful attention in an asylum devoted to the care of patients affected with this malady.
Inspiration is that act of the lung, combind with the movements of the chest and diaphragm, by which air is drawn through the air passages into the vesicles of the lung tissue. It is therefore opposed to the act ot expiration. In a healthy adult the number of inspirations per minute should average eighteen; these of course are naturally increased according to the amount of exertion that is being expended, but in the quiescent state of the body from sixteen to twenty inspirations may be considered normal. If, however, the lung has been affected by disease, and a portion of its tissue destroyed, then the number of inspirations will be thereby increased, so as to maintain a proper oxygenation of the blood. In all affections of the lung, such as bronchitis, asthma, pneumonia, and tuberculosis, the number of inspirations is necessarily increased, and frequently disease or these organs may be suspected from the fact that the breathing is more rapid than normal.

Intemperance may be said to comprise either the over-indulgence in alcohol, tobacco, or food. It is a strange coincidence that those who are intemperate in any of these articles live the shortest lives. I mean by this, that those who are intemperate drinkers die young, those who are excessive snokers also shorten their lives, while those who are inordinate eaters invariably die before they have attained the
normal epoch of life's duration. Tecetotallers are, as a rule, inordinate eaters, and therefore hurt themselves quite as much, if not more, than they would do were they to indulge moderately in stimulants. Smoking to n moderate extent invariably has the effect of quitting the nervous system, and at the sume time has a tendency to keep the appetite wislin proper bounds; and I feel eereain that if statistics be properly stated, that those who ent moderately, drink moderately, and, If they ehoose, smoke moderately, will in every ense be found the longest livers. There is quite as much intemperance practised by advocates of total abstinence by their madulgence in articles of diet, as well as by their speeeh, as there is by those who partake of stumuhnts to excess; and a great deal of nischief acerues by their vituperative remarks upon a subject which ought to be left to every man's good sense.
Intermittent is the term applied to diseases which, like ague and neuralgin, come on in paroxysmis and then subside, leaving the patient comparatively well for a short time, but only to disappoint his hopes, and return again with renewed vigour. The term is also applied to the pylse when It intermits or misses a beat every now and again. This is not necessarily a syinptom of heart disease, but may be due to sonse nervous disorder eonsequent upon some stomachie derangement, or possibly from the over-indulgence in the nise of tobacco and stimulants.

Intestines. The intestines, as is well known, eccupy the abdominal cavity, and consist of that portion of the alimentary canal which commences at the pyloric end of the stomach and terminates at the anus. The intestines are divided into the duodenum, jejunum, and ileum, which constitute the sinall intestines. The ileum terminates in the large intestine, or colun, In a kind of valve-like opening called the ileocaceal valve, beyond which is a cul-de-sac, or pouch, about three inches in length, called the caecum. Attached to this caecum is a worm-like appendage ahout the thickness of a goose quill. tubular in form, and from four to six inches in length, the use of which Is not understood; yet it is a very important structure, as it is liable to inflammatory disease, and the surrounding tissue may be the seat of abscesses from inflanmatory action taking place in it, or its immediate neighbourhood giving rise, as the case may be, to typhlitis or perityphitis. Generally speaking, the intestines are clivided into small and large. The former, though of smaller calibre, are more than three times the length of the eolon, or large intestine; and it is in the small intestine that the chyle is absorbed into the general circulation. The duodenum measures from eight to ten inches in length, and is continuous with the pyloric orifice of the stomach. It fomms a kind of horse-shoe groove between the liver and the pancreas, and above its middle receives the secretions of the pancreas and liver, which enter it by a common duct. It is to these juices that the transformation of the chyme into chyle, whieh the stomach discharges into the duodenum, owes its aceomplishment. The jejunum, which is continuous with the duodenum, receives its name from the fact of its usually being found empty after death; in other respects it presents little difference to duodenum In its structure. The ileum, which again is continuous with the jejunum, and which forms the last third part of the small intestines, has somewhat a narrower calibre, and its coils or convolutions are much more numerous. The entire length of the small intestines measures about twenty feet. The inner surface of the intestines, or mucous membrane, is supplied by innumerable glands, follicles, and villi, by means of which the food is absorbed and transmitted to the circulation through the ehyle duct. As has been before said, the jejunum terminates in the large intestine, and the junction of these two portions of the intestines takes place in the riygt side, low down in the abdomen. The colon then ascends upwards on the same side until it reaches the lower border of the liver, when it crosses horizontally to the left side, and thus forms what is termed in anatomy the transverse portion. It afterwards passes downwards on the left side of the abdomen, and when it reaches the upper portion of the sacrum it takes the form of the letter $S$, and is therefore termed the siginoid flexure; after which it tenninates in the recttun, which

Is a straight tube from which the faeces are discharged. At the extremity of the rectum there is a circulas muscle ealled the sphincter of the anns, which, whent elosed, retains the faceal discliarges, and, when open, pernits of their exit. The healthy condition of the lower intestines has so mueh to do wlth the preserva. tion of health, that too much stress cannot be hald upon keeping them in a healthy state, and emptying then at least once every twenty four hours. Nunserous disenses may atfect the intestines, such as catarrla, illceration, atony, rupture, stricture, and inflammation. When ulceration takes place, which it frequently does in the progress of typloid fever, haemorrhage is liable to occur, and this eomplication adds very nuch to the gravity of the disease. The rectum, on the other hand, is liable to stricture, eancer, haemorrhoids or piles, and fistula, while the anus many be the seat of fissure and intense irritation, causing most inveterate ltching, termed pruritis
Intoxication, although literally meaning a poisoning of the blood by alcolnol or any other toxic agent, is generally applied to that resulting from excessive use of alcoholic stimulants. The first symptom of alcoholic poisoning is the local irritation produced upon the stomach, which is indicated by a sense of warmth. When, however, the alcohol is absorbed into the blood, its next effect is upon the brain and spinal cord, and througl these upon the entire nervous systen. At first the imagination is excited, and brilliant and happy thoughts pass through the mind; as, however, the stimulant obtains a greater possession of the nervous system, the mental and physical power of the individual are, according to the amount imbibed and the susceptibility of the person, brought to a standstill, or they become unable to perform their functions properly. Whenever the partaking of alcohol produces flushing of the cheeks, it has then proceeded to a poisonous extent, this being due to the fact that the nerves which control the arteries are, for the time being, paralyzed, and unable to keep the blood-vessels in a state of contraction, It is therefore an important point in the administration of alcohol as a stimulant to observe this fact, and prevent the patient having inore, or even as much as produces this symptom of alcoholie poisoning. The next symptom which follows flushing, if alcohol still be imbibed, is pain in the forehead and inability to hold the head up, the eyes lose their expression and become half closed, so that the whole physiognomy is altered, and a vacant expression exists. Afterwards the voluntary muscles are lost control of, and the arms drop or their movements becomeirregular, and ithe legs arel unable to support the individual in his effort to walk. If the poison be still partaken of delirium is apt to follow, and sleep disappears. The condition then becomes very grave, and delirium tremens is apt to supervene. If a large quantity of alcohol has been taken in a short space of time into the stomach, and uncousciousness has resulted from this, the first proceeding to be adopted is to empty the stomach as rapidly as possible by means of the stomach pump, and aftervards wash the organ out with warm water, Free voniting may, however, be excited by the subcutaneous injection of apomorphine; for, as a rule, it will be impossible to get the patient to swallow an ordinary emetic, but not unfrequently nature takes the matter into her own hands, and the alcohol itself seems in many instances to act as an emetic. If the extremities have become cold by the effects of the poison, the external heat must be maintained artificially, and electricity may also be employed with at view to rouse the drunkard. If other methods fail, nustard plasters may be applied to the pit of the stomach and between the shoulders, but in every instance the first point to attend to is the complete emptying of the stomach, as these other measures may be pursued and yet absorption of the poison still be going on.
Inunction is the rubbing in of an ointment on the skin, so that it may become absorbed through this membrane. The only ointments which are thus employed are-mercurial, iodine, sulphur, and those containing a narcotic, such as atropine, morphia, cocaine, etc.
Iodine is consudered to be all elementary hody, and is obtancel from kelp, which is carbonized sea
woed. It ls there found in combination with potash nud sodia, from which the free iodine is liberated by suitable chemical methods. Jodine is formed in dark purple-coloured metallic scales; it has a powerful odour, and stains whatever it tonches with a deep yellowish-brown colour. It is volatile in its mature, and when heated in at llask it rises in a beantiful violetcoloured vapour, and then condenses on the side of the cold portion of the glass. lodine is a miost useful preparation, and is mucla cmployed in medicine. It is given internally, generally in combination with potash nud soda, in many diseases, and has been found specially useful in syphilis, goitre, enlarged glands, thickening of the bones, and in rheumatic affections. Externally, it is employed as an ointinent and as a lininent with a view both of producing counter-irritation and promoting absorption in the thickened tissues. It is a medicine, however, which should generally be employed under medical supervision.
Ipecacuanina is a most useful medicine ; it has a special effect on the involnintary muscles of the intestines and womb, and is also largely used as an expectorant in chest diseases, and as an emetic in these affections also. It is the root of a South American plant, and comes to this country in small pieces about the thickness of a goose quill, possessing a brown, wrinkled, and knotty appearance. Ipecac should be coustantly kept in the houses of every one who has children, as it is most useful in spasmodic croup and all affections of the chest. In dysentery it has a specially curative effect, but where this disease exists it is necessary to give the powdered ipecac in very considerable doses, or little good will be obtained. When ipecac is combined in the preparation of one part of powdered root with one part of powdered opiun and eight parts of sulphate potash, it forms Dover's powder, which is a popular remedy at the beginuing of colds and in inflammatory affections. Ten grains of this powder given at bedtime in a hot gruel induces free perspiration, and has a most beneficial effect in such circumstances as have been mentioned. This drug is usually combined with an alkali, such as carbonate of soda or carbonate of ammonia, paregoric, and syrup of squills. As an expectorant the most useful and popular mode of administering this medicine is in the form of wine or tincture. This is made by the powdered root being immersed in sherry wine for two or three weeks and then filtered.
Iridin is a resinous principle derived from an American plant, and seems to exert considerable influence upon the liver. It possesses aperient and diuretic properties, and is given in doses of one to five grains at bedtime.

Iris is the coloured portion of the eye surrounding the pupil, and placed between this and the white of the eye. Its colour is entirely due to a deposit of pigment within its structure, and it opens and shuts according to the amoint of light that is to be admitted into the retina.

Iron is largely used as a medicinal agent, and is administered in a great variety of its preparations. It enters into the composition of many mineral waters, and it would appear that when thus administered it acts more beneficially than when it is prepared artificially. Iron should never be taken by persons who are of a costive habit, and where it is employed as a medicine no benefit will be derived if the bowels are not kept freely open during its administration. It is a splendid blood tonic, and in cases of anaemia produces wonderful results in a very short time by restoring the blood to its normal condition. Perhaps the best preparation that can possibly be given in such circumstances is the fresh carbonate which is produced by the chemical decomposition which takes place in Blaud's pills, if these are properly prepared. The sulphate of iron is combined in these pills, along with carbonate of soda or potash, mixed with a little gum tragacanth. They are prepared with these ingredients in a dry condition, so that the two salts retain their integrity until they become mixed with the fluids of the stomach, when the sulphate of iron becomes transformed into the carbonate, and the carbonate of potash into the sul phate. Absorption, in these circumstances, of the iron then takes place, and more readily than if the carbonate of
iron had been prepared in a laboratory, It is always desirable in prescribing lBlaud's pills to combine with them a small portion of alocs, which tend to kcep the bowcls in a state of action, and thus promote the medicinal effects of the iron. The tincture of iron, or steel drops, is either prepared from the per-chloride or from the action of muriate acid upon iron filings or wire, the latter, or the nuriate of iron as it is called, being preferable to the per-chloride. The tincture of the inuriate of iron, as well as that of the per-chloricle, has powerful antiseptic qualities, and the former especially seems to have a specific effect upon erysipelas if given in ten-drop doses every two hours. The sulplate of iron, or green vitriol, is also frequently administered as a blood ronic, either in solution or in the form of pill. Other preparations, sucli as ammonia tartrate and citrate, comblned with quinine, are very useful preparations, and possess the advantage of being soluble in water. Clemical food, or Parrislis syrup. contains iron in the form of phosphate, and is very popular in children's diseases on account of its being very easily taken. Another pleasant mode of giving iron is in the form of the saccliarated carbonate, and in combination with arsenic it forms the arsenate of iron, in which form it acts both as a blood tonic and nerve tonic combined. The principal waters containing iron are those of Harrogate, Tunbridge Wells, Moffat, and various other places which do not possess any more than local reputation. During the administration of iron the evacuations of the bowels always become dark, or even black in colour, and this is due to its combining with matter within the intestines containing tannin. The grand point to be observed in taking iron as a medicine is to see that it is given in small and repeated doses, or in a state of great dilution with water.
Itch, or Scabies, is a highly contagious parasitic discase of the skin. It is characterized by an eruption of small pointed vesicles, which confine themselves largely to the flexures of the joints, especially those of the fingers, toes, elbows, knees, and thighs. It is, however, liable to spread over the skin generally. It is always attended with excessive itching, especially when the person gets warmer than usual, such as in bed, or standing near a fire, or in taking stimulating food or exercise. This disease is produced by a minute insect called the Acarus Scabiei, whicli burrows under the cuticle of the skin and deposits its eggs there, where they are hatched, and produce the intense itching which is characteristic of the disease. It occurs very freguently amongst those of uncleanly habits, and is therefore more often met with amungst the poor, and especially in those whose constitutions are undermined by bad nourishment and clothing Fortunately, it is a disease which can be easily cured by the inunction of an ointment containing the flowers of sulphur or storax. The latter is to be preferred, because it does not produce such a disagreeable odour, and is quite as efficacious as sulphur. The proper plan to adopt in the treatment of this disease is to put the patient into a warm bath and sponge him thoroughly down with soft soap and water, and, after drying, to rub the body all over with the ointment. This should be continued for at least two days, when, as a rule, the disease will be found to have disappeared. A useful adjunct to this treatment is the administration of sulphur in teaspoonful doses night and morning. It is needless to state that the clothing which a person affected with this disease has worn, and the bed-clothes in which he has lain, should be thoroughly scalded, so as to destroy any vestige of the disease which may remain upon these articles. It must be remembered that when sulphur ointment is employed this preparation is liable of itself to give rise to an eruption which should not be confounded with that of the disease. As storax does not produce this unpleasant effect it has this additional advantage over sulphur.
Jalap is a well-known purgative, and is employed largely in affections of the kidneys, with a view to produce free watery evacuations from the bowels, and thus relieve the kidneys to a certain extent of their functions. The best form to administer it in is the compound powder, which is composed of five ounces of jalap, nine ounces of cream of tatar, and one ounce of ginger, well mixed together? the dose of this being
thilty to sixty grains given every morning till free purgration results.
James's Powder is a prepiration of antiniony, and at one time was held in high repute ha the treatment of febrile disturbances, it requires, however, to be given with great caution, and, as other preparations are now in use which possess safety and greater efficiency it is sesirable that these should be preferred.
Jaundice is a scondlary result of disense, either In the hever, gall-bladder, or gall duct, and is essentially bloorl-poisoning, arising from au accunulatlon of bile within the circulation. It is easily recognized by tho colour of the whites of the eyo aud of the skin which it produces, giving a yellow appearance to these tissues, while at the same time the stools become white, in consequence of the absence of bile in theur. On the other hand, the urine partakes of in intense porter-lika colour, due to bile being excreted by the kienneys, and often the perspiration even may be tinged. Tho causes of jaundice are so varied, and the consequences so very serious, that it is essential to call in medical aid on the appearance of the discase. If thls is not at hand, then in the first instance a blue pill may bo administered, followed within a few loours by a brisk purgative of four grains of calonel combined with a purgative taken at intervals of twenty-four or thirty-six hours. (If the disease arises from organic mischief within the liver it is generally incurable, and as a rule is an indication that death is not far distant, whereas if it arises fron cold, as it frequently does, thus producing a catarthal and thickened condition of the gall duct, it will as a rule spcedily pass off. This will also be the case if it has its origin in the blocking of the duct by gall stones, which are in reality only pieces of congealed bilc. When gall stones are the cause of jaundice, these may readily be suspected by the severe colic which their passage through the gall duct gives rise to. and in such circumstances great benefit may be derived by the frequent, even hourly, administration of one or two 'tablespoonfuls of olive oil. How this acts it is clifficult to say, but that its effects are most bencficial is beyond dispute.
Jejunum is the lower portion of the small intestine.
Jelly is manufactured from nunerous fruits combined with sugar, but those which are taken cognizance of mostly in medicine are those gelatinous substances which are supposed to have a nutritious effect in clebilitating diseases. No greatér mistake can possibly be made than this, as gelatine, so far from doing good in a state of debility, does positive mischief, as it is a uscless substance so far as nourishment goes, and only incommodes the stomach.

Jelly Fish, Stings of the, are frequently met with by bathers on the sea coast. These creatures have the porver of ejecting from their tentacles a poisonous substance which, when coming in contact with the skin, produces redness, swelling, and pain, so much so that 3 whole limb or a considerable area of the body may be thus affected. The symptoms usually subside spontaneously in the course of three or four days if allowed to do so, but in the meantinie they cause considerable suffering of the part affected, and may render the limb useless and cause a great deal of needless anxicty. The best application to make in these circumstances is an alkaline solution, such as a weak solution of ammonia, bi-carbonate of sodz or potash. It is of no material consequence what streugth be employed, but a weak solution frequently applied will have a better effect than a solution of greater strength.

Joints, technically called Articulations. The mobility and exposed situations of the joints render them liable both to accident and to disease. In either case considerable patience on the part of the patient as well as upon the attendant is called for, and absolute rest must be enjoined in any such affection. Although serious disease may locate itself in the bone or covering of a'joint, as a rule this may be successfully treated cither by the surgeon (if the use of the knife is required) or hy the physician (if medical treatment is applicable). Apart from actual organic disease, the joints are liable to inflammatory attacks, more especially that portion of the joint which envelops it, and is called the synovial inembrane. This incmbrane provides a thick glairy
secretion, which acts as a lubricating substance, just as oil is cmployed in lubricating machlucry. Intiamata tlon of this membrane, or synovitis, as it is called, though common to all the jomts of the body, is most frequently met with in the knee, and, 36 a rule, arises from injury, such as too much kneeling, or a bluw upon the knees but it may also result from cold or a rheumatle condition of the part, due to acidity of the blood, Like inflammation of other parts it is accompanled by severe pain, especially on movement; there is alsu swelling and tenderness to the touch, and when fluid exists It may be detected by the fact that it yields in elastic and hluctuating sensution to the fingers. When tho diseaso is acute great relief may be aflorded by the application of leeches, followed by warin fomentations so as to encourage the bleeding, and afterwards con. plete rest should be enjoined. On the other hand, many surgeons advise the application of cold in the form of ice bags, or the application of an evaporating lotion, whlch extracts the inflammatory heat from the part. The evaporating lotion, however, is mostly applicable in those diseases of joints which are due to direct injury. Tho various joints of the body are also liable to tubercular disoase $\{$ especially is thls the case with the hip joint. In such circumstances the aid of the surgeon is generally necessary, and tho diseased portion requires excision. At tho same time it is essential that the general health be attended to and complete rest enforced, while the muriate of calcium should be given regularly after each meal, for there is no doubt that this useful liune salt has a specific effect in tubercular disease wherever it may be located.

Jugular Veins are the large veins circulating in the neek which convey the blood from the head and face back to the heart. Injury of these veins is always serious, not so much perhaps because of the haemorrhage that may result, but from the fact that air is liable to be admitted into the heart by the exhaust action of the right auricle.
Juniper is a plant which yields an oil, and is em. ployed in combination with other medicines for exciting the action of the kidneys. It is this oil which gives the peculiar flavour to gin; thus this spirit is frequently prescribed for persons whose kidneys are sluggish. with a view to promote a diuretic effect. Spirit of juniper is used in medicine, the dose being from thirty minims to one drachm, and when the oll is given alone two to ten minims is the dose.
IEamela is a reddish powder which is scraped from the fruit of an Eastern plant. It is employed chiefly as a remedy for tape-woms, and is probably the most efficacious medicine that can be employed in the treatment of this loathsome disease. It is not such a nauseous medicine as the oil of male-fern, nor does it produce sucll painful symptoms. It should be given in sixty-grain doses on an empty stomach, either mixed with treacle, honey, or jelly; and after an hour or two, a dose of castor oil will materially assist in its action.
EIdneys are those glands which are situated on either side of the spine, just below the region of the liver. Their office, is is well known, is the secretion of urine from the blood. The kidneys are supplied with blood-vessels, which proceed directly from the aorta, or main blood-vessel of the body. The glandular structure is so arranged that the ducts flow into a cup. like cavity called the pelvis or base of the kidney, and this is continuous with a tube leading to the bladder called the ureter. The kidneys are enveloped by a strong membrane or capsule. As is well known, these organs are subject to diseases which often prove fatal ; but as these require the skill of the medical man to treat, it is beyond the scope of this book to enter fully into them. It may, however, be of great service to note that if the secretion of urine is scanty, this is not necessarily a symptom of disease, as it may be the consequence of a limited supply of liquid being taken into the stomach, while the skis has been unusually active. Scanty urine may also result from nervous exhaustion. On the other hand, a free and limpid fow of urine may be due to nervous excitement, and this is specially the case in nervous and lhysterical women. When the urine deposits a red sediment on standing, one is apt to blame the kldneys for this. This, however,
is an error in many instances, as the most frecuucint cause of thels deposit is an acid condition of the blood clue to clyspepsia, or to a rhemmatic or gomy habit. If there is a large secretion of uritu, accompanied by excessive thirst and gradually encroaclring delility, dlabetes must at once be suspected; while, it the urine on belng boiled becomes thick, in inflammatory affec. tion is probably present, and no time should be lost when cither of these symptoms are present to consult a conpetent medical man.
IKing's Evil is the old name for Scrofula, and originated in the now exploded superstition that the touch of the king would cure the disease. The practice originated in the relgn of Edward the Confessor, and was continued down to the time of Queen Anne.
IKino is the gum resin of a tree brought from the East Indics. It is a powerful astringent, and is therefore employed in the treatment of diarrhoea, and may be given in the form of powder or an electuary in from ten to twenty-grain doses every three or four hours. It is also administered in the form of tincture, when a teaspoonful mixed with chalk mixture is frequently employed for the same purpose.
Knee is one of, if not the most important joint of the body. It is formed by three bouse, viz., the extremity of the thigh-bone or femur, and the upper extremity of the tibia or large bone of the leg, and the knee-cap or patella, which lies in front of the joint, and is attached to the lange muscles of the front of the thigh by means of a powerful ligament, and also to the tibia or leg.bone by another ligament of equal strength. It is a joint which is very liable to both serious disease and injury, and being complicated in its nature, is therefore somewhat difficult to treat. The rounded ends of the thigh-bone rest upon two concave surfaces on the expanded head of the bone of the leg. These concavities are surrounded by cartilaginous cushions called the semi-lunar cartilages. The knee-cap protects the joint in front, and acts to a great extent the part of a pulley, while the several parts of the joint are bound together by means of strong ligaments. The whole of this, as other joints, is covered by a dense cartilage, which is a most elastic body, and prevents concus. sion to a large extent. The knee.joint is liable to inflammation, either of an acute or chronic nature, caused by violence or wounds, or as a result of a diseased condition of the blood, such as rheumatism, gout, or tuberculosis. Whatever be the cause of the disease, it should at once receive serious attention by a competent medical man. If the joint has been opened by accident, the first course to be adopted in the absence of a surgeon is to cleanse it as quickly as possible with carbolic lotion, one in forty at least. Close the wound lby means of a pad soaked in this lotion, and afterwards place and keep the leg in position by means of a splint secured by appropriate bandages, and to prevent the onset of inflammation ice bags should envelop the injured parts. The patient at the same time should be kept on nutritious but smple diet, and constipation carefully avoided. Betore the application of antiseptics was introduced, an injury to the knee was almost tantamount to its complete destruction; now, however, by preventing decomposition within the cavity of the joint, no such fear need be entertained. When the knee-joint swells to an inordinate degree, this is generally due to inflammation of the synovial or lubricating membrane, and if this is accompanied by redness and tenderness to the touch, leeches should be applied freely round the joint, to be followed by repeated and prolonged hot fomentations, never of course forgetting that absolute rest is also essential in such cases. White swelling is a disease naturally very much dreaded, as it very frequently culminates in complete destruction of the parts composing the joint. It is due to the deposit of tubercle, and fof course requires to be treated as much constitutionally as locally. Till medical aid is called in, the part must be kept at perfect rest, and the inflammation and swelling treated by cooling applications together with anodyne lotions freely applied. Hot fomentations freely sprinkled over with a liniment composed of two drachms of menthol, and dissolved in two ounces of belladonna liniment, will prove to give considerable relief. The tubercular symptons may be successfully
treated by the administration of muriate of calcium regularly after food in from ten to twenty-grain doses, white the gencral strength must be maintained by a liberal supply of easily issinnilated mourishment. This discase, lowever, may not in cwery case be amenable to medical treatment, and frequently it las been necessary to perform amputation to get quit of the discase. Various accidents may occur to the knee-cap, such as fracture or dislocation. These of courserequire surgical aid, and no time slould be lost in obtainimg this. Housemaid's knee is an inflamatory condition of the synovial membrane of the sac by which the knce-cap is surrounded. It is not usually a painful disease, and, as a rule, may be successfully treated by a succession of blisters applied over the seat of the swelling. Sometimes, however, the disease may be acute and go on to suppuration, when of course it requires to be opened and treated as an ordinary abscess.

Koumiss is fermented milk prepared by causing natural fermentation. When milk is fermented in the process of producing koumiss, carbonic acid gas is generated to a large extent, so that great care must be taken in opening the bottles, or the whole of the contents will be expelled, and thus the fuid lost. It is a useful article of diet in cases of irritability of the stomach, and at the same time is most nutritious and very easily digested. Originally it was prepared from mares milk, but now cow's milk is largely employed for the purpose, and is reconmended by medical men for various forms of debilitating disease, as, besides being a most nutritious, it is a refreshing and also agreeable beverage.

EXousso, or Cusso, is a valuable remedy for tape. worm. In many cases which have resisted all other treatment, the parasite has been dislodged when kousso was administered. The author has found it a most successful remedy in this parasitic affection Although an infusion has beell introduced into the British plarmacopocia, it will be found much more efficacious it the powder is employed, the dlose required being half an ounce taken upon an empty stomach, followed in a few hours by the administration of a dose of castor oil.

Labour. (See " Woman in Health and Sickness.")
Laceration is the term applied to wounds which are produced by tearing of the tissues. The wound should be immediately cleansed, and an antiseptic solution, such as carbolic lotion or bi-chloride of mercury in a weak solution, applied. If the wound is cleansed, putrefaction may be prevented by dusting it over with iodoform, aristol, or boracic acid, but if none of these remedies are at hand, a weak solution of Condy's fluid may be applied until the parts can be properly dressed.

Lactation is the secretion of milk, and may be promoted, if the mammary glands remain inactive, by the application of poultices composed of castor-oil leaves. As a rule, however, a deficiency of milk is difficult to remedy.
Lameness arises from so many causes that it will be necessary to refer to the different joints involved in the movements of the body.
Ianguor is a general symptom of disease; true, it may be due to over-indulgence, but even in this case it is an indication of an unhealthy condition of the inuscles. A febrile condition cannot exist without languor being also present; therefore, whenever a person complains of being languid without a cause, it is mecessary to find this out, as frequently very serious disease is manifested in the first instance by a feeling of languor.
Lanoline is a natural oil which exudes from the sheep at the little bulbs which supply the wool with nourishment, and at the same time keeps it oiled and impervious to the atmosphere and rains.
Lard is the pure fat derived from the fatty covering of the intestines of the pig. It is extensively employed in the inanufacture of ointments, and also as an inunction where absorption of fat is desired.

Laryngitis is inflammation of the lining mom. brane of the larynx. which is situated in the upper part of the windpipe. It is generally due to exposure to cold and domp, or to the inlalation of some irritating vapour. It may also be produced by the local action
of some Irritant, such as boiling water or carbolic acid, The symptoms are very sinilar to those of croup or diphtheria, but may be clistinguished from these by the cause which has excited the inflammation. The symptoms are-honrseness, dilficulty of inhaling air (sometimes producing such is senstition of suffocation as to give rise to lividiry of the countenancel) and a very fecble but rapid pulse. If the inhalation of steant cloes not give immediato relief, it may be necessary to open the windpipe, and thus permit the admission of air to the lungs $i$ so that in any case it is imperative that inedical aid be called in.
Laryax is the organ of voice which contains the vocal chords, and is situated at the upper portion of the windpipe.
Eaudanuma, or Tincture of Oplum, Is one of the most useful medicines which we possess; it is employed largely by the physician and surfeon, and not only by these, but as a houschold remedy, thougl one whlch should not be employed extensively. It is prepared by infusing for two or threu weeks opium in rectified spirits. It should always be renembered that laudanum, or opiurn, in any form has a specially marcotic effect upon young children, and the dose may be said to range with the age of the patient up to manhood, one drop being given to a child one year old, two drops to one two years old, and so on; the miaximum doso should rarely exceed twenty to twenty-five drops. In severe case of local pain hot fomentations upon which laudanum has been freely sprinkled afford considerable relief, especially is this the case in colic. It is also frequently given in injections for dysentery and diarthoea; for an adult in such circumstances, thirty drops nixed with two ounces of thin starch may be injected every four hours until relief is obtained.

Laxative is the tern applied to medicines which have a purgative effect upon the bowels. These areso numerous that it would be quite impossible to detail them in this work. The most popular and useful laxatives, however, which we know of are those natural mineml waters which exist so universally over the whole face of the globe. These, for the most part, owo their properties to sulphate of magnesia, or common Epsom salts. It therefore may be usefully employed when a laxative is required, but always in a very dilute solution, when its effects are very much more comfortable than if taken concentrated. Castor oil, senna, sulphur, cascara, rhubarb, and magnesia unay also be enumerated amongst the more popular laxatives.

Lead is a most important metal, both because of Its poisonous and medicinal properties. Lead has the peculiarity of being, to a certain extent, soluble in pure water; it is therefore essential that lead pipes should be avoided in certain localities, especially where the water is soft and free from lime. Leaden cisterns are also pregnant sources of lead poisoning; but as it is always risky to drink water out of any kind of cistern. these should be avoided entirely for domestic purposes. Lead is also to a certain extent volatile, and leas poisoning very frequently results in factories where this metal is being manipulated, not only througln the at mosphere, but also by absorption in consequence of the skin coming in frequent contact with it. The salt of lead, which is most frequently employed in medicine, is the acetate, or as it is most commonly called, the sugar of lead, in consequence of its sweet taste. It is given intemally in obstinate diarrhoea, and, as the lead and opium pill, is frequently prescribed in the diarrhoea of typhoid fever. As an external application it enters into the composition of Goulard's extract, lead plasters, and as a lotion in diseases of the eye and ulcers of the akin. It should never be used in stronger solutions than about five grains to the ounce. When lead is taken into the system in minute doses for a prolonged period it produces obstinate constipation, associated with severe colic, which goes under the name of lead colic. Painters, type-founders, and workers in lead generally are most liable to this affection. Lead poisoning may generally be detected by the appearance of a blue line which forms round the margin of the gums, and frequently paralysis of the wrist, or as it is popularly called 'drop wrist, 'results from the effects of this metal. The treatment in such cases is to remove the
patient from all rlsk of poisoning, and administer iodido of potassium three or four tines a day, in from 5 to to griin closes.
Leeches are an invaluable aid in the treatment of certain cliseises, notably thosco of an acutcly inflammatory type, and also in sprains, if the lecehes are applied with sufficient promptitude. The general appearanco of the leech is so well known as not to require any description here. Those leeches which are used for medicinal purposes are mostly lmported from the south of Europe, but come by way of 1 hamburg, where they are collected by merchants from different parts of the continent. They are also found in India. When it is desirable to apply leeches to a part, the surface of tho skin should be thorouglaly cleansed with pure water, then dried, and the leecli held in position by means of a paper box or a tube made for the purpose. When the leech has become sufficiently gorged with blood it usually falls off, and may be made to cject the blood which it has drawn from the patient by applying salt to its extremities. The leech bite is peculiar in its claracter, and frequently not a little difficulty is experienced in checking the bleeding. This may be effectually accomplished by pressure, by ineans of a pad tightly bound down over the round. The general rule is, however, that bleeding from leech bites requires somes little encouragement, and this may be done by tho application of warm water, not hot water, as this is liable to coagulate the blood and prevent bleeding. Some constitutions are liable to inflammatory attacks of the surface of the skin surrounding the leech bites: it is then better to resort to some other plan of bloodletting if this is the case. The most important affections which are influenced favourably by the applications of leeches are-acute infiammatory attacks; such as pleurisy, inflammation of the joints, peritonitis, inflamanation of the membranes of the brain, etc. The severe pain of a sprain will be very quickly relieved by the applicition of four or five leeches round the ankle or wrist, as the case may be. This is not very generally known, but it is a remedy which can be so easily applied, and is so very helpful, not only at the time, but in the future treatment of the injury, that it may be resorted to even by the unprofessional.

Leg, White, or Phlegmasia Dolens, is one of the most troublesome affectlons which follow child-birth. It arlses from an inflamed condition of the veins causlng coagulation within these vessels, and therforo obstruction to the return flow of the blood. It is generally preceded by shivering, and is always accompanied by fever. The leg becomes swelled up, bright, glistening, and painful to the touch. The thigh, especially the parts about the groin, feel hot, stiff, hard, and painful, and frequently the size of the leg may be increased to double its bulk. The most judicious treatment to npply in these circumstances is to keep the leg elevated and moistened at frequent intervals with hazeline, while gentle friction miy also be made during its application, but the rubbing must always be upwards towards the body. The bowels must be kept freely open, either by mild laxatives or by enemata, If the pain is excessive this should be soothed by the adininistration of one grain of opium at intervals of three or four hours. This disease invariably leaves the limb very much weakened for a considerable period after convalescence has set in: the limb, therefore, should be rested as much as possible, and gentle friction made (always upwards) with a continued application of hazeline, cither as liquid or in the form of ointment. After each rubbing an elastic bandage not exerting too much pressure should be applied so as to support the parts. In every instance it is essential that medical aid be called in.
Lens. The crystalline lens of the eye ls that transparent disc lying behind the pupil. The shape of this lens and its position, together with its translucency, lave the most important bearings upon vision, while its opacity constitutes that disease which is known as cataract, and removal of the cataract is simply the removing of the opaque lens. (See EYE.)
Lentils belong to the pea tribe of plants, and are a most nutritious article of diet when they are properly prepared. They are also very easy of digestion and assimilation, and are frequently of great service in the
dietetles of dyspeptics. Lentll soup has of late hecome n popular article of dlet, and as it can be marle at small cost, its popularity shouled still further lncrease. It is both nourlshing, easy of digestlon, and contalis a large proportlon of introgenous matter, or flesh-forming substance. It also contains a large proportion of phosphates; it thus tends to promote the mitrition and development of bone. As ls well known, lentils, in the form of flour or meal, are sold under the name of revalenta.
Leprosy is a loathsome disease of the skin charac. terlzed by thlckenligg and milceration of its surface. Although not probably Infectlous, it is at least contagious to a considerable extent, and like tuberculosis it is heredltary, and indeed would appear to be closely allied to this disease.
Lethargy, or an unnatural tendency to sleep and doze, is closely allied to languor and debility, and in many instances would almost appear to verge upon coma. It usually arises from some nervous dlsturbance, due either to flethorn of the blood-vessels of the head or from an opposite condition, which we name anaemia, of the braln," or in other words It ls a pauclty of the blood supply to that organ. Lethargy also frequently arlses from a poisoned or impure condition of the blood, such as that which is consequent upon constipation, Jaundice, typhold fever, bllious diarrhoea, or a scanty flow of urlne. It may, however, and frequently is, the result of over-indulgence in intoxicants and narcotics, and often the difficulty has arisen to determine whether an individual in a lethargic condition is suffering from disease or from some toxic condition of the blood. Great care should therefore always be taken to differentlate between the two, especially does this advice apply to persons in a public or official position.
Leucorrhoea is a white, milky-looking discharge which exudes from the vagina in women who are suffering from a catarrhal affection of that canal or of the womb. It is always a symptom of disease, and slould be treated with as little delay as posslble, as it invarlably tends to propagate itself, and not only to do thls, but to encroach upon the healthy mucous membrane higher up in the genital tract. When the discharge becomes greenisli or yellowish this fact indicates that the lining inembrane of the womb is probably affected, and as a rule concomitant symptoms are liable to develop in the nervous system. The patient becomes dejected, Irritable, easily fatigued, and ofttimes most unreasonable in her whole derneanour. These symptoms are generally aggravated just before the menstrual periods, while at the same time the congestion that exists in conjunction with this discharge renders menstruation excessively painful. The treatment to be adopted should always embrace the daily use of the vaginal douche, the liquid employed being rendered antiseptlc by the addition of boracic acid, carbolic acid, or the bl-chloride ot mercury, and it should always be used as hot as the patient can bearit. (See 'Woman In Health and Sickness.")
Lice, or Pedlculi, are probably the most loathsome of all parasites. Want of cleanliness is always associated with these loathsome creatures. Mercury applied in the form of ointment is the most effective agent to employ for their destruction. The ova or nits which becoine attached to the hair may be destroyed by the free application of acetic acid.

Life. In a work of this kind this subject can only be considered as to its duration. Such a variety of circumstances exercise their influence upon the duration of life that it will be quite impossible even to enumerate them in the'space that can here be devoted to the subject. There is no doubt, however, that in children especially the mortality might be very much reduced were dietetic rules and hygienic laws, especlally as regards clothing and ventilation, more rigidly enforced; and this pertains not only to the years of childhood, but also to those of youth and maturity. The more naturally an individual is fed, and the more conscientiously that he observes the laws of nature, the greater are his chances of longevity ; c.g. eating and drinking to excess, and especially partaking of indigestlble foods and the indulgence in alcoholic stimulants, though acting slowly, gradually undermine the system, and by inducing faulty action of the various organs
invarlably result in an mentincly death. Then, agaln, livhig In an overcrowded and vitiated atmospliere, by lowering the valality of the individual, renders hint more lialle to disease, ind consequently adds to the risks of his heing carried of prematurely. Dr. Farr's table, extending over il period of thinty-four ycars, yields the following statistics:-

| All ares, | - |  |  |  | Males. Females |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unders years |  |  | - | - | 23 | 2 |

N B. -The figures, of course, represent the deaths of every housand living
The average life of the middle classes would appear to be 45 years, that of tradesmen and their families 39 years, and that of labourers, servants, and their families 34 years. Doubtless the variations in these instances are largely due to more careful living and better venthation in the longer-lived as compared with those whose longevity is shorter. Then, again, it is ascertalned that in country districts longevity is greater than in towns, and this evidently Is accounted for by the simpler mode of living which obtains in the country than that which is prevalent in towns. Of late years it is well known that longevity has Increased considerably; and this, without a doubt, is only accounted for by the fact that sanitary legislation has become more advanced and hyglenic precautions more rigidly observed by the population at large.

Ligaments are composed of dense fibrous inelastic bands which bind the bones together and retain them in position.

Light is essential to the existence of man; nothing is more depressing than darkness; and no greater punishment can be endured than that of being precluded from the influcnce ot this beneficent agent. It is a well-known fact that, in certain valleys where light penetrates very feebly, the children produced there are apt to become deformed and dwarfed. In fact, light is almost as necessary to the maintenance of health as fresh air and pure water are. It is therefore most desirable that dwellings should be so constructed as to admit light freely; and it will be found that houses constructed on this principle will be less liable to harbour infectious disease than those into which light is not so freely adnitted. There is not the slightest doubt that the action of the sun has a powerfully destructive effect upon the germs of disease, and is nature's best disinfectant. As is well known, light has a most powerful stimulant effect upon the eye, so much so that when it is excessive it may produce inflammation in that organ by the bright glare, and even blindness is liable to occur in Arctlc regions from the excessive glare of the snow.
Lightning produces injury or death by its action upon the nervous system, although it also produces local injury by its scorching effects. Individuals who are prostrated, but not killed, by lightning, invariably suffer from temporary, if not permanent, effects upon the nervous system, such as blindness and insensibility. In such cases it is essential that the animal warmth be maintained, which, in consequence of the shock, is liable to become diminished. If the respiration is feeble and tends to cease, then artificial respiration may be advantageously employed, just as in the case of drowning. A little stimulant, such as sal volatile or brandy, may also be administered, and a mustard poultice applied across the region of the stomach and heart. and also to the spine. Many accidents from lightning occur from want of knowledge on the part of those who are suddenly overtaken by a thunder-storm. In such circumstances the open fields, although the individual is exposed to the drenching rain, are much safer than when shelter is taken under trees or at the side of
baildings, as these attract the clectric fuid nnd thus expose those seeking shelter to much greater risk. Umbrellas should not be used for this reason, and contact with metallic objects should also be carefitlly avoided. It is also dangerous to sit in a draught when a thunder-storm is prevailing, such as between the window and the fire, or the door and the rire, as this seems to exercise considerable infuence on the course of the electric huid.
Ilme is the oxide of calcium. Calclum, however, also combines with acids, such as carbonic acid, when It forms marble, chalk, or linestone rock: with chlorine, when it forms the chloride of calcium; sulplutic acid, when sulphate of line or gypsum is the result: sulphur, when sulphide of calcium is the product, etc. Quick line is formed by expelling the carbonic acid from a carbonate by means of heat. On exposure to the atmosphere, however, it rapilliy absorbs carbonic acid (for which it has a strong affintey) and water, and is again converted into the carbonate of line. As is well known, lime enters largely into thera. peuties as carbonate or chalk, whlch is employed in the hanufactare of chalk mixture and is prescribed in the erentment of diarrhoea. Chloride of calcium possesses very valuable therapeutic properties, and is one of the raost useful remedies in tubercular complaints, and also where there is malnutrition from inactivity of the absorbents of the intestine. Lime dissolves very sparingly in water, so that a saturated solution, which goes under the name of lime water, is very readily prepared and can be manufactured at a very nominal cost. This proparation is largely employed as an ant-acid, and is specially useful as an addition to the dietary of children rendering milk very easy of digestion, while at the same time it provides lime for the formation of bone, Equal parts of lime water and olive oil were at one time largely employed in the treatment of burns. Carbonate of lime, or chalk, is a powerful antidote in carbolic-acid poisoning, while it is well known that chloride of lime, or rather chlorinated lime, by parting with its chiorine so readily, is a powerful antiseptic, White-washing walls and roofs with lime also acts as a disiefectant Burns frequently result from the contact of quick lime with the skin, in consequence of the powerful caustic effect of this substance. These of course must be treated as ordinary burns,
Iniment is an application which is made to the skin in cases of congestion or inflammation of an Internal organ or a joint. It usually contains a counter. irritant as well es a soothlng agent, the counter-irritant acting upon the nerves and blood-vessels of the surface, thus infuencing the disease in the internal organ. Liniments are alsb composed of soothing substances, such as menthol, chloroform, belladonna, and optum A good all-round liniment which may be applied in cases of bronchitis, asthma, whooping cough, swollen glands, nod sprains, is that which is sold under the name of 'Ertell's' liniment. It contains compound camphor liniment, soap and opium liniment, and belladonna liniment, and may be employed with the greatest safety in any complaint requiring slight counter-irritation combined with a soothing effect.
Linseed is the seed of the common flax, containing a hxed oil which is procured from the seeds by pressure When boiled, the seeds also yield a thick mucilaginous substance, which is frequently employed as a demulcent in cases of bronchial catarrh. Linseed oil was at one time largely employed, mixed with lime vater, In the treament of bums; it has, however, been quite superseded by olive oil comblned with carbolic acid. Linsced meal is made by grinding. the seeds, not after the oil has been extracted, as was formerly the case, but in thelr natural condition, and by this method linseed meal exercises a much more emollient effect, and does not tend to get hard and caked as when the oil had been extraceed. Poultices of linseed meal are invariably employed in the treatment of suppuration, and when combined with mustard are popular applica. tions in the treatment of bronchitis and other affections of the chest. (See POULTICE.)

IInt was formerly made by scraplng old linen, which produced on one side a woolly surface, but now it is manufactured for immedlate use, and is made from cotson instead of linen, both on account of its cheapness
and becauso $1 t$ is equally serviceable as that made from linen. As a rule, this substance is rendered antlseptic either by the lntroduction of boracle acld, salicylic acid, or by being lmpregnated with some other antisoptic;solution, such as that of bi-chloride of mercury or carbolic acied.
Lip. Thescolour of the lips is due to their being covered by a mucous neenbrane which is extremely vascular. The colour of the lips reflects that of the blood, and Indicates very plainly the condition of this fluid. If onaema is present, that is to say if the blood is deficlont in red corpuscles, the lips beconse pallid, or if the blood is not properly oxygenated, as in cases of heart disease or pneumonia, they take on the livid appearance, and in extreine cases of jaundice the yellow colouration which tho blood assumes is manifested in the lips. The llps are liable to disease, either of a passing or perslstent nature. As an example of the former, herpes and fissure may be mentioned, and of the latter, cancer. The lips are also liable to be the seat of cysts, whicl, however, can be easily removed.
Liquorice and Liquorice Root are obtamed from the root of o pod-bearing plant, and are generally imported from Spain and Southern Europe, but the plant is also cultivated in this country. The extract of the . wot is known as liquorice, or Spanish juice, and is largely employed as a demulcent in courhs and irritation of the throat. It is also taken in cases of heartburn and in constipation. It does not disorder the stomach like common sugar, and its taste persists for a considerable time after it has been partaken of. It forms the basis of many sweetmeats, such as delectable lozenges, jujubes, and Pontefract cakes. The powdered root enters largely into the composition of a very popular laxative medicine which goes under the name of compound liquorice powder; the purgative properties of this, however, depend largely upon the powdered senna and sulphur which it contains,
Iiver is the largest of all the glandular structures of the human body, weighing on an average about four Ibs. in the adult. It occupies the upper part of the right side and right froot of the abdomen, just beneath the diaphragm and pyloric orifice of the stomach. It is attacbed to the diaphragm by ligaments composed of peritoneum. The liver is divided into various lobes, but it is generally considered to consist of a rlght (which is the larger lobe) and the left (whlch is smaller in size). The gall bladder occupies the fore part of the under side of the right lobe. The structure of the liver is lobular, each lobule being about the size of a millet-seed, which is composed of capillary bloodvessels and of cells which separate glycogen and bile from the blood, together with ducts which convey the secreted bile into the larger common ducts; these again converge to the one main duct of the liver, through which the bile flows either into the gall bladder or into the duodenum direct. The glycogen secreted by the liver becomes transformed into fat, and the bife on entering the duodenum aids in the digestion of the food, and also produces a laxative effect upon the bowels. The circulation in the liver is very extensive, and it is from the fluid circulating in this gland that the aforesaid substances are extracted. The liver is a large organ, yet it is irequently blamed for conditions of the system with which it has no connection. It is easily thrown out of order however, especially when constipation exists and when anything interferes with the action of the heart. It is specially liable to disease in those individuals who indulgeinordinately in the use of alcohollc liquors. Intemperance, therefore, is frequently the cause of enlargement of this organ, in consequence of the inflammatory action which its absorption produces. The enlargement may go on for a considerable time, but when the discase has attalned a certain point the change is reversed and contraction of the organ takes place, so that cirrhosis, or gin drinker's liver, is established. This is characterized by a hard condition of the organ, which usually results in its becoming unable to perform its proper functions, and gradually jaundice supervenes, speedily followed by death. The liverls also liable to inflammation, when feverish symptoms, accompanied by severe pain and tenderness on pressure over the right side, will be the prominent symptoms. Of course in such circumstances
inedical aid must at ouce be called in. Sluggishness of the liver is generally indicated by a patucity of blle appearing in the stools, and probably an excess being present in the urine. What, however, is usually tormed billonsness is quite as frequently attributable to ordinary dyspepsia combined with constipation without anything leing actually wrong with the liver itself. (See BILIARy Disorder, Gall Stones, JAUNDICE, etc.)
Lobelia, or Lobelia Infata, is a plant commonly found in North America. It has been employod in tho treatment of astmma, and in some instances has proved ol service, but this has generally been due to the emetic action which it has produced. It partakes largely of the nature of tobacco, and it is not advisable that it slould be employed without medical advice.
工ochia. (See "Woman in Health and Sickness.")
Loclejaw is the popular name for Tetanus. The severe spasin which affects the muscles of the jaws in this disease, although a prominent symptom, is not the only one which exists, as all the muscles of the body are more or less seriously involved. The effects of tetanus very much resemble the symptoms produced by stryclnine poisoning. It has recently been ascertained that this disease is highly contagious, and is frequently transmitted to human beings from horses affected with the disorder. It is undoubtedly due to the introduction ot a special germ into the wounded surface, and this germ appears to exist within the soil of different localities. The germ acts specially upon the nervous system, producing the violent spasms which are characteristic of the diseasc. Many remedies have been suggested for the treatment of this painful and dangerous affection, amongst which may be mentioned the administration of chloroform vapour, calabar bean, cliloral, etc., but recently a much more success. ful method of treatment has been introduced, this being the injection under the skin of the attenuated virus of tetanus, or the antitoxine of Tizzoni and Cattani. This disease, however, invariably requires the attention of a medical man.
Loins, or the Lumbar Region, is the seat of that painful form of muscular rheumatism called lumbago.
Longevity, or Prolonged Life, is popularly believed to be hereditary; people, however, should not calculate upon this as an invariable fact, as frequently the longest-lived parents have a very short-lived progeny, whereas parents who have died young have frequently borne children who have lived to a good old age. It is also a fact that those who in infancy and childhood have shown indications of great weakness have survived till they have attained ages long beyond the orthodox three-score years and ten. Old age very much depends upon the care that is taken by the individuai when he has had youth and iniddle age on his side. If the age of forty-five is passed in robust health and the individual is of steady habits, his chances of longevity are very good indeed.

Lotions are liquid applications composed of various substances in solution with water. They are employed for diseases of the eye when they contain an antiseptic solution combined with an anodyne, such as the following:-Five grains of sulphate of zinc, thirty drops of laudanum, and one ounce of water, or one grain of bi-chloride of mercury, half an ounce of wine of opium, and four ounces of rose water. A teaspoonful of either of these may be mixed with a teaspoonful of hot water and applied to the eye three or four times a day in cases of ophthalmia. There are also stimulating lotions which contain substances such as anmonia, turpentine, or acetic acid. Astringent lotions are those containing tannin in some form or other, such as an infusion of oak-bark. Soothing lotions are those which contain only agents such as belladonna, opium, cocaine, menthol, etc. The most important lotion, and one which is most frequently employed, is that which pos. sesses antiseptic properties. This may consist of bicluloride of mercury, carbolic acid, boracic acid, Condy's fluid, etc. These substances are largely employed in the treatment of injuries to the surface, or to disinfect the vagina in cases of disease of the womb. An excellent lotion is simply water which has been boiled and then applied to the part as warm as it can be bome.
Iow Diot is a term which is appiied to a modified
system of starvation, and therefore should never be resorted to in cases of discase, when all the energies of the individual require to be sustained in the endeavour to combat the disease process.

Lumbago is a form of muscular rheumatisin attacking the muscles of the loins. It is an exrensely painful affection, and especially so when the affected muscle comes into play. It would appcar that the excruciating pain whicli results from movement is due to a large extent to the fact that the sheath of the muscle becomes inflamed and adherent to the muscular tissue; this, when the muscle contracts, this acutely inflamed membrane becomes dragged upon, and gives rise to the suffering which is experienced. Lumbago is generally the result of cold, but it may also be brought about by a sudden false movement, by which the muscular tissue is strained and inflammation set up from this cause. It resembles very much cric in the neck. When lumbago is present the treatment should always be commenced by a sharp purge, after which the patient should take a hot sitz bath for half an hour, and then the affected part should be well rubbed over with the following liniment:-Menthol two drachms, chloroform half an ounce, belladonna liniment one ounce and a half. This application may be rubbed in a intervals of two or three hours, and ten drops of the tincture of actaca racemosa taken in water every two hours. The patient should keep his bed for a day or two, and during the intervals between the applications of the liniment a hot water cushion should be placed in. such a position that he can lie on it, and thus keep it in constant contact with the affected part. After a day or two a systell of massaging the part will prove of very great service, as by this process the adhesions of the sheath to the muscle will separate, and thereby the muscle be enabled to perform its movements without dragging upon the inflamed membrane. The best preventative against lumbago is to keep the loins comfortably warm, and employ considerable friction over the parts every morning when taking a bath.
Lumbar; or belonging to the loins, is the region occupied between the ribs and the baunch bones. In delicate children it is not unfrequently the seat of abscess, and, as has been stated in the previous article it, is an affection of the lumbar muscles which constitutes lumbago. Pain in the lumbar region is also symptomatic of many diseases, such as small-pox, influenza, and other febrile disturbances.
Jumbricus, or Worm, is the name generally applied to that special kind of worm which in many respects resembles the common aarth-worin. It is readily removed, by the administration of santonine, which should always be given on an empty stomach, and followed by a purge of castor oil.
Iunacy. (Sec INSANITY.)
Eunar Caustic, or Nitrate of Silver, is the most popular cauterizing agent that is employed, both by the medical man and the lay public. It is also employed as a lotion in certain forms of ophthalmia, and has a beneficial effect in such circumstances, not only as a caustic, but as an antiseptic. It is also a popular remedy for the destruction of warts and corns, and also when proud fiesh makes its appearance upon a granulating surface.
Lungs are those spongy-looking and vascular organs which are entirely engaged in the function of respiration. They occupy the two sides of the chest. the left lung being smaller than the right, on account of part of the space on that side being occupied by the heart and large vessels. The air passes into the lungs by means of the windpipe, or trachea, at the top of which the larynx, or box of the voice, is placed. At its lower extremity the windpipe bifurcates into the two bronchi, one of which passes into each lung. These bronchi again divide and subdivide into innumerable branches, which ultimately teminate in the air-cells. These air-cells are minute cavities covered with a delicate membrane in which ramify innumerable minute capillary vessels which bring the blood into contact with the atmospheric air, and thus secure its oxygenation, while at the same time the carbonic acid which has been generated within the system is thrown off and ejected in the process of expiration. This transmutation of gases is brought about by the process of osmosis.

PEARS' CYCLOPAEDIA.

## MEDICAL DICTIONARY.

Madness. (See INSANITY.)
Magnesia is an akaline salt in which the metal magnesum forms the base. What is generally ternued magnesia is the carbonate, of which there are twu forms, viz., the light carbonate, which is soluble tu a considerable extent in water, and thus constitutes the fluid magnesia which is sold in the shops; the lecavy carbonate is more employed than the light because of its occupying less space and being more active in its ctfects. It enters largely into the composition of Gregory's mixture, As an ant-acid and gentic purgative It has few equals, in consequence of its being transformed by the acids of the ןstomach into a soluble salt. and thus produces a gentle action upon tho bowels. It is also usefully empluyed as a tooth powder, having many advantages over other preparations which are used for cleansing the teeth. Magnesia in combination with sulpluric acid forms the sulphate of magnesia, or Epsom salts. Citrate of magnesia is usually sold in a granular condition, and effervesces when mixed with water, thus renderiug it a very agreeable aperient. The acidity in children which is characterized by sour stomach, greeu evacuations, heat spots on the body or a tendency to nettle-rash, is very much benefited by giving small doses of magnesia nixed either with water or milk three or four times a day after food. It must always be remembered, however, that magnesia does not act as a purgative unless it mixes with some acid contained in the stomach or bowels, and therefore it should not be given as a routine medicine without some degree of acidity is suspected, as otherwise it may accumulate and form concretions in the bowels. Fluid magnesia in doses from half an ounce to two ounces will prove a gentle purgative, especially if it be followed with the juice of a lemon mixed in water.

## Malaria. (See AGUE.)

Male-Fern is interesting because of the oil which is procured from it. This oil is employed as a remedy against tape-worm, but in admuistering it, it is necessary to clear out the bowels by a dose of castor oil beforehand, and then from twenty to forty drops of the male-fern oil may be given in mucilage on an empty stomach. This should be followed in a few hours again by another dose of castor oil, when as a rule, if not the whole, at least the greater portion, of the sorm swill have been expelled.
Malic Acid, the acid peculiar to the apple,
Walignant is that term which is applied to diseases such as cancer, ulcers, etc., which are known to have invariably a fatal termination. The term is also applied in cases of sore throat which occur in the course of scarlet fever, diphtheria, etc.
Mamma is the technical term given to the fernale breast.
Marrow is that oily matter which is contained within the slafts of the long bones. As an article of diet it is easily assimilated, and possesses very much the same properties as other fats.
Marsh Mallow was at one time largely used in the form of infusion as a denulcent in catarrhal affections of the chest. I have also known the leaves to be employed as poultices, especially in suppurations of the breast. Now, however, it has fallen very much out of use, even as a popular remedy, and with the exception of the marsh-mallow lozenge we rarely hear of this substance being much in daily use.
Mastication is one of the most important points to be attended to in considering the treatment of indigestion. If mastication is not thoroughly completed, the stomacla has more work to do than its share, and is less able to do it in consequence of the food not having been properly mixed with the saliva before it has left the mouth. If the teeth are deficient in number in persons suffering from dyspepsia, they should be replaced by false teeth, so that the process of mastication may be thoroughly and properly carried out.

Watico is a strong astringent, and is employed both as a local and a constitutional agent in haemor. rhages. The leaves are frequently used in obstinate bleeding from leech bites and cuts. This substance, however, does not possess any advantages that make it superior to any of the other astringents.

Maw-Worm is the term applied to the thread worm which lodges within a few inches of the end of
the bowel. 'rlicy can gencrally be removerl lyy repeated injectious of salt ind water, Although irequently occurrimg in adules, they, as it rule, are more in child's clisease, and in girls sometimes catuse considerable irritation la conseguence of finting their way into the vasina, and there creating considerable inflammatory action and unhealthy discharges.
Wreasles is one of the eruptive fevers, and, as a rule, only attack a person once in a lifetime, It is, however, not quite so uniform in this respect as scarlet fever or sntall-pox, as 1 have known in person to have at least three attackis of measles within the space of a very few years. Meisles require fourteen days from the inoculation belore they attan their maximum intersity, that is to say, eleven days after contact with the poison. The symptons commeuce by a running at the nose and eyes, accompanied by an irritating cough and feverish symptoms. There is also shivering, licadache, loss of apperite, and possibly vomiting, with slight sore thront. The symptoms do not appear till the fourteenth day after contact, or till the fourth day succeeding the first active symptoms, when all eruption begins to appear, generally on the temples and forehead first, then on the wrists, ankles, and neck, and gradually extends until the whole body is covered. The eruption of measles has a peculiar appearance, assuming confgurations of a horse-shoe shape, the colour being reddish-purple, and it is very slightly elevated above the skin. In the course of a few days this eruption gradually declines, and by the seventh day, as a rule, it will have entirely disappeared, leaving the skin slightly rough. Shortly afterwards the cuticle begins to peel off, so that it is advisable to disinfect the patient every day by means of a bath containing Condy's fluid. The complications which are most liable to attend the course of measles are inflammatory affections of the eye, bronchitis, and pneumonia, while afterwards the kidneys may be the scat of disease, if proper precautions against cold are not taken. If the inflammatory condition of the mucous membrane of the nose and eyes has been very severe, permanent injury may result to the eye and to the ear, so that the greatest possible precautions should be taken during the period of convalescence. The fact must not be overlooked that a very malignant or putrid form of measles may develop itself, when the death of the patient is a matter of only a few hours. While measles may be treated (if the disease is very mild) without the aid of a medical man, yet, as a rule, it is the safest plan to employ one, as so many complications may arise which would puzzle the attendant, and at the same time imperil the future health of the patient, The principal points to attend to in the treatment of this disease are to see that the bowels are evacuated every day, that the patient be kept in bed, not too warmly but comfortably clad, that he has plenty of milk and milk diet for the first few days, that the room be shaded from light and kept at a moderato temperature, while, if the cougls is inveterate or severe, mustard and linseed poultices should be applied to the back and front of the chest, and a small dose of ipecac and squills given by the mouth. The convalescence from this disease should be attended with the greatest care, as exposure to cold and draughts may set up such violent mischief in the parts that have been weakened by the disease as to leave permaneut traces of injury in organs such as the ear, eye, chest, and kiclneys. (See "Our Children: How to keep them Well and treat them when they are III.")
Feconium is the dark tarry-looking discharge which constitutes the first evacuation from the bowels of the newly-born infant.
Megrim, or Migraine, is a neuralgic affection of the head generally confined to one side, and affecting the temporal nerve. It is a disease which is liable to come and go, but is always associated with a debilitated condition of the system at large, and this is generally combined with constipation causing a sluggish action of the liver. The best remedy for this painful affection is two grains of caffeine combined with eight grains of phenacetin, which may be repeated at intervals of four hours if necessary. This is very much more efficacious than the old method of treatment by quininc, while it
does not produce any of the unpleasint sensations which cquinine is lialbe to give rise to.

Mombrane is a thin deicate tissue possessing constderable strength whach covers the various cavities of the body, such as the mucous membranc, which lines the air passages and alimentary canals as well as the various internal organs; the serous membranes which are spread over joints and the abdominal and thoracic cavities; while the epidermis, of cuticle, is the nembrane covering the skin,
Memory is that power of the mind which retains impressions, ind which we have every reason to sup. pose is imperishable. How this extraordinary function is perfonned is a mystery which will probably never le solved. That it only remaius white the brain is in a state of health is a wcll-known fact, but we know that it can be recovered from when the brain again resumes its healthy functions. Loss of memory may always be accepted as a symptom of some cercbral mischicf going on, or at all cevents of some contamination of the flood supplying the brain substance with nourishment.

Menstruation. (Sce "Woman in Health and Sickness.")

Menthol is a kind of camphor or volatile gum which rentains after the distillation of the essential oil of peppermint. It is crystalline in appearance, very much resembling the crystals of Epsom salts. Its effects are those of an anaesthetic, and when applied locally it destroys the nervous sensation of the part, and conveys to the individual a feeling of numbness very similar to that experienced in paralysis, The effects of menthol, however, are very transient, yet while they last relieve the pain, and are very grateful. It is largely einployed internally, also as an antiseptic in certain affections of the stomach, and its anaesthetic or sedative effects have been very largely taken advantage of in the treatment of obstinate vomiting, when it often proves of very considerable service.
Mercury, or Quick Silver, is that well-known metal which remains fluid at ordinary temperatures, and furnishes some of the most important medicines which art employed by the physician. Those which are most popular as internal medicines are blue pill, grey powder, and calomel, all of which have a powerful influence upon the functions of the liver. Mercury; however, should invariably be administered under medical advice only, as its effects, if not carefully watched, may be most serious. The dose of blue pill is three grains, and it should always be combined with a purgative, such as colocynth and thenbane pill, to aid it in its effects upon the liver. Eight grains of grey powder may be given to an adult, and probably the best mode of administering it is in combination with thirty grains of rhubarb, thirty grains of bi-carbonate of soda, and ten grains of ginger. The ordinary dose of calomel is four grains, and it may be combined very much in the same way as has been recommended for grey powder. Corosive sublimate, or the bi-chloride of mercury, is used both internally and extemally. In the former case it is very efficacious in the treatment of syphilis, and externally it is one of the most useful antiseptics that we possess, and is also employed in the treatment of ophthalmia, when one grain in four ounces of rose water makes an admirable lotion. In antiseptic surgery a solution of one in acoo to one in 5000 of water is the strength employed. The red oxide of mercury is used largely in the treatment of affections of the skin, in the form of ointment, and no better application can be made for dandriff or scurf on the scalp than a pomade containing one part of red oxide of mercury ointment added to three parts of an ordinary pomade. Calomel is also used as an external applica. tion, and proves most useful in the treatment of ulcers on the comea, when a little may be dusted into the eye every second day. The green iodide and red iodide of mercury are preparations which are also largely employed in the treatment of syphilis, and in affections of the skin such as eczema and psoriasis. (See special articles.) When mercury is taken for a lengthened period it is liable to produce many unplensant symptoms, such as salivation and softening of the gums, so that the teeth may drop out if the medicine is pushed to an undue extent. At the same time there is produced considerable constitutional disturbance accompanied

## PEARS' CYCLOPAEDIA,

by fuer, and it must be remembered that certain indivituals are peculiarly susceptille to the effects of mercury, so that white in one cise would produce no syuptoms worthy of note will in others act in a very unpleasant manner. It Is quite a mistake to imagrine that it is essential to produce these synuptoms to obeain the medicinal effects of this powerful medicine. If the symptoms of mercurial poisoning, however, have been developed, a mouth-wash containing alum and carbolic acill shunld be employed very freely, both to nct as ant astringent and to remove the foetid odour that is apt to rise when the grums become affected by mercury. Another excellent mouth wash suitable in these cir* cumstances is composed of equal parts of tincture of myrrh, tincture of cinchoma, and spirit of camploor, a terspoonful of which may be nixed with a whe-glassful of witter and used as a mouth-lotion. Condy's fluld in water also makes a good cleanser, which is applicable in these circumstances. The nethod by which mercury acts would appear to be entirely due to its antiseptic qualitics upon poisonous matter contalned within the blood, ind also upon its stimulating effects upon the biliary secretion. When inflammatory condefons exist and it is decmed advisable to employ mercury for their alleviation, it is usually combined with opium to obviate its purgative effects. Wher administered as an alterative $\ln$ these circumstances, one-half to one grain of calomel combined with onehalf to one grain of opium may be given every four hours; but when a purgative effect is required, it is necessary to administer it in from four to eight-grain closes, either as has been before recommended, combused with a purgative, or followed by a purgative a few hours atterwards. Mercurial poisoning is liable to occur in those employed in the manufacture of mirrors, also in furriers and others who come much in contact with the metal. They then become liable to a peculiar palsled condition of the hands and arms, and sometimes of the whole body, which is indicated by a peculiar tremor of the muscles, and which compels them to abandon their occupation. The same symptoms frequently occur in those employed in quick-silver mines. The well-known pigment vermilion is mercury in combination with sulphur. White precipitate is the ammonia chloride of mercury, and is largely used as a parasiticide, especially in the destruction of lice. In the form of ointment it is frequently recommended in the treatment of fissure of the anus, and in that disagreeable itching which frequently exists around the
Mesentery is the broad fold of peritoneum, or lining membrane of the bowels, by which the small Intestines are attached to the posterior part of the abdomen and retained in their position. The mesentery is a most important fold of membrane, as it contains numerous glands as well as blood-vessels.
Miasma is the peculiar poisonous emanations which take place in warm climates and give rise to ague In white people who have taken up their residence in the neighbourhood.

Microbe is a term very similar in its meaning to that of bacillus; indeed, microbe, bacillus, bacteria, micro-organism, germ, etc., all have very much the sarme meaning, and apply in every instance to the microscopic objects which possess the power when introduced into the human frame of multiplying to an incredible extent, thereby producing the various diseases to which the human frame is subject.
Midriff is the popular name applied to the dia: phraem.
IRIIIs, the naturat rood of all young animals, is able to maintain life at whatever age it may be partaken of. It is a well-known fact that the longest-lived race on the globe, viz., the Arabs, subsist largely upon milk and dares. Nilmerous experiments have been made upon the nutritious properties of this important fuid, and livariably these have resulted in the fact that it is more capable of sustaining an animal in perfect health for in indefinite periorl than any other known sub. stance. The digeatibility of milk is very much Increased by the addition of a little salt. and although some people profess that they are unable to assimilate milk in any form that it may be presented to them, this would appear to be merely a matter of prejudice
rather than lack of power on the pmrt of their digestion. Atilk seems to supply every requirement of the human frame, and thls is placed beyoud doubt when we look at the leathy child who is being brought up on its mother's breast. In every family milk diet should enter largely luto the dally monu. Fresh milk cannot always be readily obtained, but an excellent substitute is always nt hand in the various preserved or colldensed milks which have been introduced nind can be purchased alinost everywhere.

Milk Fever, or, as it used to be temied, 'Weed,' is a condition of the blood which induces fever of conlsiderable virulence. When it does occur it usuilly manlfests itself a few days after child-birth, and is said to be connected, with the difficulties attending the secretion of milk. This, however, is a popular fillacy, as there is not the slightest doubt that when fever does occur, and 1 have no hesitation in saying that it never should, it is due to the absorption of foetid matter which has been retained within the womb or genital passages. Ot course it goes without saying, that if there is a very great rush of milk to the breasts, and these become congested in consequence, a febrile condition of the system may be consequent upon this, but what is generally called milk fever arises from the circumstances which have just been enumerated. (See " Woman in Health and Sickness.")
Mineral Acids are composed of the various elementary bodies which combine with hydrogen and oxygen.
Mineral Waters may be described as water issuing from the surface of the earth impreguated with various mineral salts.

RIinim is the Goth part of a dracl:m, and may be roughly compared to a drop-e.g. 60 minims of water make a drachm, and 60 drops of water are supposed to occupy an equal volume.
Mint is an old and popular remedy, which has been extensively employed in the treatment of flatulence. There are two varieties-one peppermint and the other spearmint. The former is that which is usually entployed in the treatment of flatulence and pain arising therefrom. It is a popular remedy when taken in the form of peppermint lozenges and peppermint water in flatulent distention of the bowels. In the preparation of the oil of peppermint a gummy substance called menthol is extracted, which has of late years come into popular use as a local annesthetic. It is also a powerful antiseptic, and there can be no doubt that the popuiarity of oil of peppermint has largely depended uyon the fact, which until recently was unknown, that it possesses powerful antiseptic properties, (See MENTHOL.
IIIscarriage, (See "Woman in Health and Sickness. "
Mixtures is the term applied to compounds of medicinal substances in a fluid form.
Nioles. This term is applied in two distinctly different connections. In the first place, pigmentary, deposits upon the skin go under the name of 'moles.' As these are in all cases unsightly, the individual who is afflicted by these marks invariably desires their removal; it is not, however, quite safe to do this, as frequently, when they have been interfered with, cancerous disease has been known to develop on the site from which they have been excised. The tern is also applied to false conceptions, so called; but that Such a thing as false conception could ever occur seenls to be most absurd, and the only explanation of this form of mole is, that the conception, when it did take place, lad become the seat of some diseased condition, and was then immediately expelled.

Monkshood. (Sce Acontic.)
Monomania is a species of unsoundness of mind arising from a debilitated condition of the nervous system. It may take on a suicidal, homicidal, or religious trait ; or, as is frequently the case, it may develop a thieving propensity, when it is called 'kleptomania; or an inclination to take alcoholic stimulants to an undue excess, when it is termed 'dipsomania.' Again, it frequently occurs in young men who contemplate marriage, when the mental condition becomes concentrated upon a fallacious iclea that their physical condition is such is to render them incompetent,

Morphia is one of the most energetic num useful of tho alkaloids obtained fron opinn1. It is prescribed both by the mouth and by the bowel in flie form of suppository, and it is also extensively used hypodermically. lirom $1 / 8$ to 14 of a grain of morphiais is a fair dose when taken by the mouth; in the form of suppository it is usually administered from $1 /$ to $3 / 2$ a grnin; nud hypodermically no stronger dose than $1 / 6$ of a grain should be given at the commencement. It may, however, be increased to if of a grain if the pain is very severc.
Mortiffcation, or Gangrene, is the term given when deatlo has taken place in a limited portion of tissue. Sloughs, which frequently occur after injury to a part, boils, and carbuncles may also be termed mortification of the parts which are thrown off. The term, however, is mostly applied in cases where a considerable extent of the living tissue has been deprived of its nourisliment, and has hence died. The appearance of mortification in these circumstances is, blackening of the part, which is separated from the living tissue by a bright red line, and this blackening and death in the tissue are accompanied by a very offensive odour. At the commencement the surface of the skin may present an angry, inflanied appearance, but it is not accompanied by the severe pain which usually exists in acute infarmation of the surface. On the contrary the part becomes deadened in its sensibility, and that in consequence of the blood supply being cut off. Constitutional syinptoms invariably exist when mortification is present-viz., great prostration, coldness of the body, rapid pulse, brown tongue, and a high temperature, whereas, if the disease exists, which it is very liable to do in old people, when it is termed 'senile gangrene,' the prostration increases as the gangrene spreads towards the body, and usually terminates in death. Sometimes, however, a line of demarcation forms-that is, the living tissue may become separated from the dead-and in these circumstances amputation of the affected part may prolong the life of the patient for some time; this, however is usually a forlorn hope. When gangrene of a limited portion of the tissue exists, the proper treatment is to apply antiseptic poultices and sustain the vitality of the body while nature is endeavouring to throw off the dead matter, and in certain cases it may be desirable to place the patient under chtoroform and separate, by a process of scraping, the dead from the living tissue, which frequently will have the effect of checking the spread of the disease and promoting a rapid cure, Of course other causes may produce mortification besides those which have been mentioned in this article-e.g. very acute inflammation of a given part may result in the death of the tissue; but in these circumstances the term 'slough ' is generally applied to the dead tissue, which, as a rule, Is thrown off by nature's efforts, assisted by antiseptic soothing poultices.
Wouth is the cavity which is composed of the upper and lower jaw, lined by a mucous membrane which is connected to the subjacent muscular apparatus. It contains the tongue, teeth, and gums, and is bounded on the front by the lips, and posteriorly by the fauces and uvula. Many diseases arise in and around the mouth-the lips are subject to herpes, fissure or crack, cysts, and cancer; while the gums are also liable to ulcers, depending upon either thrush or infiammatory affections and diphtheria; while the tonsils, which form the posterior part of the throat, are liable to tonsilitis. which frequently develops into quinsy, aphtha, and ulcerations arising from inflammatory action. Every affection of the mouth, however, is traceable to some disorder of the stomach or general system, except in the case of malignant disease, which of course may attack any portion of the body. (See special articles.)

Mucilage is a thick fuid generally composed of gum or starch in solution, and is employed either as a medium for taking medicines of heavy specific gravity or as a demulcent.
Mucous Membrane is that membrane which lines the air passiges, alimentary canal, and the various internal organs, such as the bladder, womb, fallopian tube, kidneys, etc. It is a smooth surface secreting a glutinous-looking substance called 'mucus,' which protects the tender membrane from the action of the
various substances which othcrwise would conce in contact with it and irritate it. When these surfaces secrete mucus in too large quantities they_are said to be subject to catarrls.
Mucus is the thick viscid secretion which the mucous membranes throw out so as to protect their surfaces. It is composed of mumerous cells of a globular appearance foating in a fluid. This secretion is alwiys very mucl increased in quantity if any irritation is applied to the surface of the inucous menbranc, or any inflanmatory action is set up by cold or any other cause. If, however, the irritating action proceeds beyond a certain point, the cells of the mucous incmbrane become paralyzed and secretion ceases altogether, so that the nembrane becomes dry and ex. ceedingly irritable and sensitive. Au ordinary cold in the head is a good excniplification of the effects of a slight irritation of the inucous membrane, but if the effects of the cold have been very severe, there is no flow of mucus down the nostrils, but, on the contrary, the mucous membrane is dry, hot, and exceedingly sensitive, when as a consequence a most disagreeable burning sensation is felt over the surface of the air passages.

Mumps is an infectious disease of a somewhat epidemic character, and consists essentially in an inflammatory condition of the salivary glands on either side of the jaw. It is essentially a disease of childhood, and commences with more or less fever preceded by a shivering sensation. After the fever the neck on either side of the jaw becomes very much swollen, and may. interfere very much with both swallowing and breathIng, and in every instance prevents the jaws from being opened to their full extent. In four or five days the swelling and acute suffering begin to disappear, and rarely does the inflammatory action proceed so far as to produce suppuration, but this contingency should always be held in view. The proper treatment is to keep the child indoors, attend to the bowels, and apply over the swollen surface a flannel dipped in olive oil, or saturated with a liniment of belladonna and soap liniments in equal proportions. After a day or two the application may consist of equal portions of belladonna, soap and opium liniment, and compound camphor liniment. It is a curious coincidence in affections of the parotid glands, of which mumps is one, that the disease may by the process of Metastasis disappear from the neck and appear on the testicle in boys, or in the breasts of girls. Mumps may be looked upon as a disease quite devoid of danger if properly attended to, (See "Our Children: How to keep them Well and treat them when they are IIL. '")

Wuriatic Acid is the old name for hydro-chloric acid, or spirit of salt. It enters very much in a diluted form into numerous tonic preparations which are used in the treatment of certain stomachic disorders.

Muscles are those portions of the human body which correspond to that which is known as the lean portion of meat. It is by means of the muscles that the movements of the body are effected, and when the muscles are under the control of the will they are designated voluntary muscles. Numerous muscular fibres, however, exist within the animal frame which are not under control of the will, such as those of the heart, the intestines, the bronchial tubes, and arteries. These are called involuntary muscies, they being under the sway of the sympathetic nerrous apparatus. The muscles which are under control of the will are stimulated into action by the spinal nerves. Muscles are not very liable to disease, but they may be ruptured or injured by direct violence, and may be the seat of tumours. If a muscle is observed to shrink in volume and decrease in its power, we may as a rule infer that there is some nervous disorder at the root of it, and it should always receive medical attention.

Mustard. Black and white varieties of mustard plants are grown throughout Europe and cultivated for use. Mustard is a well-known condiment, and no doubt when taken in moderation assists digestion to a certain extent. It is also employed in cases of poisoning as an emetic, when a dessert-spoonful may be mixed in a teacupful of warm water and taken at a single dose. As a counter-irritant it is unsurpassed, not only because it is easily applied in the form of poultice, but is always
at hand and produces a rapid action. For theso reasons It is most popular as a reutedy in slight intlamuatory affections of the breathing apparatus or other organs. One very important fuet with reference to the applica. tion of mustard in tho forn1 of ponltice is, that it can marely if ever do any larm. Mustard is employed largely, especially in the treatnent of children's comphints, in the form ofmustard bath, when a tablespoonfut of minstard may be stirred up in the child's warm bath before it is put to bed. These mustard baths aro speeially useful in inflammatory affectlons of the chest and stomach, and where convulsions aro present. $\Lambda$ mustard foot-bath is also a very popular remedy in the treatnent of ordinary catarrh of the hoad, and nustard poultices aro specially useful in the treaturent of eougested conditions of the head, such as apoplexy, epilepsy, meningitis, and convulsions from whatever cause they inay arise. Mustard leaves are preparatlons which are sait to be composed of mustard powder spread on thin calico. Tho nustard leaves, however, which are sold alnost invariably contain a large amount of capslcin is their composition, which renders the application vory much more painful than an ordinary mustard poultice would be.
Myrrh is a gum resin which is extracted from trees growing in the neighbourhood of the Red Sen. It is a slight stimulant, and is also employed occasionally as an expectorant, but its principal use is in the form of tincture, which in combination with spirits of camplor and tincture of cinchona forns one of the most uscful mouth-washes that can be reconmended. $\Lambda$ teaspoonful of a maxturo containing equal proportions of these tiareo ingredients, added to a wine-glassful of plain water, makes one of the most agreeable and tonic mouth-washes that can be made use of.
Naevus is the techalcal term applied to Mother's Mark Naevl may appear on the face, head, or any other part of the body. When upon the face they cause considerable disfigurement, but this may be removed by surgical operation. These marks are due to an enlargenient of the blood-vessels of the skin.
Nails are of the same composition as the hair and outer layer of the skin, or cuticle. In short, they are prolongations from this membrane. They are composed of flattened cells compressed together into a sort of horny matter. These cells spring from a matrix in the outer skin, which we term the root of the nail. There are here placed numerous vascular points from which the nail is developed and is continually pushed forward by the development of new matter from behind. The nail rests upon a soft vascular cushion which is situated on the true skin and is popularly termed the quick. At first the nail is thin, but as it advances in growth it becomes thicker by the addition of new cells, which are derived from the quick and which serve to fix the nail in its proper position. An injury to the root of the nail may for the time being arrest its development, when the portion anterior to the injury may be cast off and cause considerable inconvenience by its ragged edge. Constitutional disturbances of any kind, such as fever, frequently interfere with the growth of the nails, and this can be seen on persons who have passed through a severe illness. The most annoying and painful affection of the nails, however, is that which so frequently occurs in the big toe, where the nail is liable to grow in upon the flesh. In this way ulceration takes place, and may cause considerable pain. The ulceration may often be arrested by the application of powdered nitrate of lead to the raw surface, but the chief point to attend to is to prevent the recurrence of this contingency, and the method to adopt is to keep the nails pared in the centre more than at the edges, so that when the nail is cut it presents a concave front. When the disease, however, has progressed to an extent which interferes with locomotion, it may be necessary to apply to the surgeon to have the whole nail removed. In many instances where consumption is present the nails assume a curious shape fron the clubbing of the fingers so frequently met with in consumptive patients.
Narcotics are those medicines which have a sedative effect upun the nervous system, and therefore are employed for the rellef of pain. They always require to be given with the greatest amount of care
and consideration. Those whilch aro most frequently lu useare-opiun, henbaue, henrlock, chloral, sulp honal, cocaine, ctc.
Nausea is that disagreable sensatlon which produces the inclination to vonit without actually acconnplishing this. It is frequently present in dyspepsia and a disordered condition of the liver, but it also arises from inpressions received by the nervous systen which are due to unpleasant motlon, such as in sailing, riding backwards, etc. It may also be due to direct injury to the head, spine, or abdonen, and in sensitive people disagrecable sights of odours frequently produce nausea. It is also, as is well known, a frequent coneomitant of pregnancy, and in many patients who sutfer from an affection of the womb or ovaries. Tho treatinent of this sinpleasant sensation depends in every instance upon that ol tho disease from which it ariscs.

Navel is that indentation in tho abdomen from which tho unbilical cord has sprung and has leen separated.

Neck, the bond of union between the head and trunk of the body, is anatomically and surgically the most inportant region of the frame. It is the channel of communlcation ol the nervous apparatus supplying the body with that of the brain, and through it runs the large blood-vessels named the "carotid arteries," which supply the brain with blood; and through it descend the importalt veins carrying the blood from the head. Within the neck also are the oesophagus and windpipe, in front of which lics the thyroid gland, which becomes enlarged in goitre and bronchocele. In the neck also are situated the parotid and sub. maxillary glands, which secrete the saliva. The cliseases of the neck, from the great number of important vessels and organs which it contains, are very numerous. The muscles which keep the head balanced in its proper position are liable to rheumatic affections and contractions. Cric is one of those acutely painful affections which may suddenly develop in the muscles of the neck, when the slightest movement gives rise to the most excruciating pain. To soothe this the follow. ing liniment will be found most efficacious:-Menthol, 2 draclims ; chloroform, $\frac{1}{2}$ an ounce ; belladonnaliniment, I $\frac{1}{2}$ ounces. A little to be well rubbed in every two or three hours. Wry neck, on the other hand, is due to a spasmodic contraction of one of the lateral muscles of the neck, anatomically termed 'sterno mastoid." This disfigurement may be removed by surgical measures, viz., by dividing the muscle.
Neryes, and Nervous System, is that complicated mechanism by which we think, feel and move. It is composed of two distinct parts, one of which is white and opaque in appearance, and which, when examined under the nticroscope, presents a tubular and fibrous structure; the other is of a reddish-grey colour, and is composed of cells filled with granular matter. Theso two distinct nervous substances would appear to be essential to the working of this important organic apparatus. The opaque white matter forms the larger portion of the brain substance, spinal inarrow, and nerves; while the grey, although more sparingly distributed, is essential to the generation of nerve force, the tubular portion of which acts as a conductor, and there seems to be little doubt that an amount of circulation exists in this tubular portion. This is made quite apparent when the grey substance of the nervous apparatus enters into the composition of nerves, which are distributed throughout the whole body. These nerves at their roots aro connected with the grey substance, with the cells of which their fibres are coinpletely intermingled. When this union takes place an enlargement or swelling, termed a 'ganglion,' is formed; and each of these ganglia would appear to be a distinct nervous centre of itself, and reflects the sensation produced in one part of the body connected with it to another portion to which it sends nervous filanents. The divisions of the nervous system are-the brain or cerebrum, together with the cerebellum; the medulla oblongata, which occupies the upper extrenity of the spinal cord; the origin of the optic nerves; the olfactory; the pneumo-gastric, which supplies both the lungs and stomach; and the phrenic, which supplies the diaphragm. Continuous with the medulla oblongata is the spinal cord, which is carried within its
special eanal In the vertebral colnmm, and from whieh the spmal nerves are given off to supply the body and linuls with notor and sensory power. In iront of the spinal cord within the chest are situated the splanchnie ganglion and solar plexis. These are tho centres of the sympathetic nerves, and control the vascular system anduthe functions of digestion und assinilation. The involnutary muscular systen is entirely under the eontrol of the sympathetic nerves. The brain, which consti. tutes so large amass of the nervous systenn, is in itself clevoid of sensation, for it may be shaved off when protruding through an injury in the skull without the indivldual expersencing iny pain: neither does it appear to have any special relation to the carrying on of the functions or even the life of the individuat, as it lins been proved by experiment that the brain may be gradually removed without causing the death of tho animal for some time. It has been asserted that the brain $1 s$ undoubtedly tle organ upon whicl the manifestations of will, intelligence, inemory, and sensation depend, and wherein consciousness and memory exist. This, howeyer, is purcly lypothetical, as there are distinct evidenees that the brain is neither more nor less than an immense reservoir of nerve force from which the spinal and sympathetic nerves draw their supplies to enable them to carry on their special functions; and if we look at the effects of grief and joy, we will observe that they are not experienced in the brain, but rather in the ehest, viz., within those immense ganglionie masses which are caljed splanchnic ganglion and solar plexus. This, of course, is also liypothetical, but it would appear from the fact that these centres are concerned, at all cyents, in pleasure and sorrow, and that they are more closely related to the soul than the brain itself. The spinal cord is the mediun by which the will is exercised and sensation is conveyed; but it will be found that in every spinal nerve there are sympathetic flaments entwined, and it is quite possible that these filaments of the sympathetic system derive their nourishment from the medium by which they are surrounded. The cerebellum, or little brain, is believed to be that portion of the nervous system which regulates the equilibrium and harmonizes the various movements of the body. This portion of the brain is connected with the processes of respiration, swallowing, and the circulation of the blood, but these various functions would seem to be stimulated by nerves which supply their nourishment from the base of the brain more than from the brain substance itself. The special senses have each their special nerve, viz. those of sight, smell, taste, hearing, etc.
Nervous Disease is invariably associated with some loeal mischief which impoverishes the nervous system by constantly draining away its force, either by the eonstant pain or continuous irritation of the part. For this reason females are much more liable to nervous disease than males, because they are liable to affeetions of the womb and ovaries, which are supplied with a very sensitive and important nervous apparatus, and these nerves being by disease kept in a constant state of irritability drain away nervous energy from the body at large. This, to a certain extent, explains liysterieal conditions which women labouring under disease of the sexual organs frequently suffer from. When nervous prostration exists it is always accompanied by a very serious depression of spirits, asso. cinted with irritability of temper. There is also a languid condition of the eireulation resulting in coldness of the extremities and of the surface of the body. This is combined with disorder of the various functions, such as those of the stomach, liver, heart, and kidneys. The depression of spirits may proceed to such a degree as to develop a species of monomania, and the disordered digestion and assimilation may result in weakness of the whole body, accompanied by emaeiation. This nervous disease is invariably issociated with slecplessness, which, in consequence of the nervous apparatus not receiving that amount of rest and repose whieh is essential to its being sustained in a vigorous state, aggravates the disease. It is a great mistake to treat nervous complaints by the administration of stimulants; the first thing to be done in the circumstances is to find out the source of the drain of nervous energy, and proceed to treat the organ or organs that
may bo primarily nffeeted. Next ascertaln if the func. tions of the bowels isre in a healthy condition, if not, this should receive serious attention. Tlien the paticnt should be rennoved fronn all that may cause anxiety and worry, and at the same time au almurlance of fresh air and uleasinst society slould be provided. If, as is most ushatly the case, the womb is the origin of the misclicef, this must be put right, and the following frescription will prove of great avail as a herve tonie, viz., 2 grains of extract of lemlock, $2 \%$ grains of valeriusate of zisc, made into a pill and given forenoon and afternoon for ten or twelve days in succession.

Nettle-Rash is so called from the fact that its symptoms are the appearance of a rasli rescinbling very much the sting of a eommon nettle. It is coni. posed of slightly elevated whitish areas surrounded by a red colouration of the skin. Tlie rash is intensely itchy, and especially so when the body is warm. It nay disippear for a sliort time and then reappear, but as a rule it passes off within the period of twenty-four hours. Sonctines, however, it becones chronie when it persists for a much longer period, and is in these circumstances not easily removed. Nettle-rash is invariably due to some disorder of the digestive organs eaused by the partaking of indigestible food, sucla as erabs, lobsters, and other kinds of shell fish, underfed meat, and meat which has been cooked in an unwhole. some way. Certain fruits also, such as the almond, nut, plum, etc., are liable to cause nettle.rash. The treatment, therefore, naturally suggests itself, viz., the clearing of these unwholesome substances from the alimentary eanal by a smart purge, and, as the disense is invariably associated with an acid condition of the system, magnesia combined with rlubarb and ginger in the form of Gregory's mixture is one of the best rensedies that can be used. If the itching is very severe, it will be found that the application of a solution of carbolic acid in water of the strength of one in thirty, to which an ounce of eau-de-Cologne or spirit has been added, will prove very soothing, and to aroid a repetition of the attack it will be necessary to regulate the diet very carefully.

Neuralgia, or Pain in a Nerve, may find a seat In any of the sensory nerves which ramify in the head, body, or limbs. As is well known, it is one of the most painful affections to which the body ean be subjected. The most common seat of neuralgia is the head, when it is usually termed tie-doloreux. Toothache is a species of neuralgia, but its causes are not so difficult of explanation as the pain of neuralgia when it affeets other nerves. In most instanees the pain is really the only symptoin that exists, but it may be acconmpanied with marked constitutional disturbances. The exact cause of the disease is sometimes a little difficult to decipher, but it is due either to pressure upon the nerve extemal to itself, or in consequence of inflamma. tion taking place in its sheath or within the nerve substance itself, or, as in the case of decayed teeth, it inay proceed from the irritation of one of its branclies, which irritation is conveyed to the whole of the nerve from which this branch takes its origin. It may generally be accepted as a rule, that when neuralgia exists it is more a symptom of general debility than a disease in itself. There are, of eourse, exceptions to this rule, and especially is this the case in sciatica, which is neuralgia of the sciatie nerve. Then, again, neuralgia is not unfrequently associated with gastrie disturbances, which give rise to an acid condition of the system, developing a gouty or rheumatic condition of the blood. When the disease arises from such a eause it is generally of a more persistent and acute character than when it simply depends upon an impoverished state of the nervous system. It is quite unusual for this disease to attack two sides of the body simultaneously, but is usualty located in one side of the head, neck, body, or limbs, although it may leave the one side and fly to the other. It is characterized by excruciating pain, this being of a paroxysmal and piercing character, sometimes increasing to such an extent as almost to produce deliriun. It then disappears when the paroxysm lias spent itself, but only again to return with renewed violence in a longer or shorter period. Some forms of neuralgia are quite periodic in their attacks; these are generally associated with some malarial condition of the
bood. The great remedy for neuralgia used to bo quinine, and sometimes fit was taken to such in extent as to produce serious infury to the organs of hearing, upou which it exercises a specin! infuence. It is, however, no use trusting to medicine alone in tho treatinent of this painful disorder. The tirst point to attend to is, to endeavour to hring nip the general health by suitable nourishment and stimmlants, if need be, while the condition of tho bowels should be most carefully attended to, and, If the paroxysms are severe, 8 grains of phenacetin with 2 grains of caffeine, repeated at intervals of four hours, will probablygive relief more rapidly than anything elsc. At the same time a tonic containing quinine 2 grains, catfeine $x / 3$ srains, extract of belladonna $3 / 3$ of a grain, and extract of hop 2 grains, made into a pill, may be taken three or four times a day with great advantage, If tho blood is attenuated, which frequently is the case when neuralgia exists, tho administration of iron wlll be essential. As a local application the following liniment will probably give the speediest relief, viz:-3 drachms of menthol, $3 / 2$ an ounce of chloroform, isf ounces belladonna liniment, mixed, a little of which should be well smbbed in over the pained part at frequent intervals. The following ointment has also proved very efficacious in the author's hands, viz:-6 grains of veratrum, 6 grains of morphia, rubbed up with $3 / 1$ an ounce of vaseline, and a piece the size of a small pea to be well rubbed in over the painful part. In sciatica, menthol plasters placed over the course of the nerve have frequently given great relief, Unfortunately, many suffering from sciatica havo resorted to the pernicious habit of injecting morplia subcutaneously for the relief of the pain. This is a great mistake, as frequently the opium habit has been contracted by such a practice. In persons who are subject to neuralgic attacks it is essential that partlcular attention be observed in the matter of clothing, and flannel should finvariably be worn next the skin, whilst exposure to dainp and cold should be avoided as much as pos: sible. When neuralgia is very persistent a change of alr to a dry bracing atmosphere will frequently prove very beneficial. In these circumstances, that is when the disease has become chronic, phosphorus administered for a lengthened period in the form of a pill will often prove of great service, When neuralgia attacks the stomach it is termed 'gastralgia," when it affects the muscles of the chest it is called 'pleurodynia,' when the heart is affected very dangerous symptoms, termed angina pectoris,' may result, and this not unfrequently terminates in death. Earache, or otalgia, is another form of this painful affection of the nerves, and must be distinguished from abscess or inflammation of tho internal ear.
Nightmare is that pecuilar vivid haliucination which so frequently occurs during the night in those who are suffering from indigestion or constipation. It is In reality a hyper-active condition of the brain without the control of the will being brought to act as the balancing power and prevent it from having its fuli sway. It f́requently gives rise to what are called night-terrors in children, and in many instances, even In adults, appears so real as to affect the nervous system very seriously when it occurs. Nightmare generally partakes somewhat of the nature of a tragedy, and the scene which rises before the imagination of the Individual is one full of horror, and appears for the time being to be so real as to give rise to screarms, indicating the terror that the sleeper is possessed with. So real does the scene that is being enacted appear to the sleeper, that it frequently results in somnambuisin. In short, nightmare is neither inore nor less than a temporary delirium in a person whose functions are only disturbed for the time being. The proper remedy for this distressing nervons disturbance is, to avoid everything that is indigrestible and pay proper attention to the bowels, as it will certainly recur if either of these Injunctions is ignored.
Nipples, (See "Woman in Health and Sickness. ${ }^{\text {b }}$
Nitrates are salts, some of which are larsely employed in medicine, such as nitrate of potash or saltpetre, nitrate of sliver or linnar canstic, these saits being made up of a base in comhination with nitric acid Nitric acicl, or aqua fortis, is one of the most
canstic of the minneral acids. It is never found in its free state in nature, but is procured by distilling saltpetre or the nitrato of potash with the oil of vitriol. The composition of nitric acid is-z atoms of hydrogen, zaton of nitrogen, 5 ntoms of oxygen. Nitric acid has frequently been employed as a caustic, or rather as a corrosivo, in inflammatory affections of the womb, nud in cancer of this organ; it has frequently been applied in its concentrated state with considerablo benefit. It should, however, only be used with tho most extreme caro, ancl never at haphazard, as its destructive power upon the living tissuo is so very great. Internally it has been prescribed largely in slugyish action of the liver, but only in a very dilute solution. Nitric acid in a dilute form combined witll pepsine has miso found much favour in the treatment of certain forms of diarthoea occurring in children. When poisouing hy nitric acid occurs, the destructive effect of the substance upon the llving tissues renders an antidote almost useless. If, however, the accldent has been discovered in tine, the administration of carbonate of soda or chalk in sufficient quantity may destroy the viruleuce of the poison to some extent.
Nitro-Hydro:Chloric Acid, or Aqua Regia, so named from its being the only compound that had nny solvent effect upon gold, is employed very largely In medicine as a tonic in functional weakness of tho stomach and liver, The nitro-muriatic or nitro-lydrochloric acid is composed of three parts of nitric acid, four parts of hydro-chloric acid, and twenty-five parts of water, and is not only employed intemally in affections of the liver, but frequently externally by being sprinkled freely over hot fomentations which are appiied over the seat of the liver in sluggish action of that orcan.
Node ls an enlargement which takes place on the surface of a bone, and is due to nn inflammatory exudation taking place undermeath the periosteum. It is frequently the result of syphilitic disease and rheumatish. The most common seats of nodes are the shin and bones of the skull, but any bone may be similarly affected. While the disease is in its painful and acute stage pérfect rest should be enjoined, while leeches, fomentations, and poultices may be applied with considerable benefit. At the same time, however, constitutional ireatment should be actively employed; and amongst the most potent remedies for this painfal affection are iodide of potassium and mercury, which rank in the first place, Medical aid in this affection must be called in.
Noise in the Ears, or Tinnitus Aurium, thougl not lalways, is very frequently due to disease of the internal ear. It, however, frequently arises from accumulations of wax in the external ear, and from the effects of certain medicines, such as quinine and salicine.
Nose, the organ of smell and the natural passage of the air in inspiration, is lined by a vascular mucous membrane largely supplied with cilia, or minute hairs, which act as a filter to the air in its passage to the lungs. The part of the nose occupying the face is chiefly made up of bone at the upper part, or bridge, and of cartilage where the nostrils expand. The internal canal, which communicates with the pharynx, or back of the throat, is tortuous to a considerable extent, in consequence of the mucous membrane spread over the spongy bones having a convoluted surface. A blow upon the nose is generally accompaned by considerable bleedlng, in consequence of the vascular condition of tbe mncous membrane. The nose is also liable to fracture, when, of course, the bleeding may be excessive. As is well known, it is the seat of what is popularly called catarrh, or cold in the head, when the mucous membrane, being irritated by the congestion which accompanies this affection, secretes mucus in abnommal quantitles, and causes considerable difficuity in breathing, as well as inconvenience otherwise, If bleeding from the nose takes place and becomes excessive, this may be checked in many ways, such as actually plugging the nares. Cold applied to the spine frequently assists to arrest the bleeding, and holding up the hands has also a like effect. If the bleeding has become so lncontrollable as to require plugging of the nares, this will require to be indertaken by a modical
man. lirequently foreign bodies, especially in children, are introduced into the nose, when cunsiderable skill unay be required for thelr extraction, In syphilis the nose is frequently serinusly allected, and ulceration results. When this ulceration attacks tho natucous uenbrane, and, as it may clo, attincks tho bones on which it is spread, a most loathismue nad distressing disease, called 'ozaena, resnlts, and from the surface of this ulcer a most offensive discharge, giving rlse to a disagreeable foetor of the breath, ensues. The treatment of this distressinfy affection must be both constitutional and local. Iodide of potassium in five- or tengrain doses, given three or four times a day, should be taken for a considerable time, while the ulcerated surface should be thoroughly scraped, and all the diseased tissue removed. The surface should afterwards be freely dusted over with aristol at frequent intervals, after which the nasal douche should be diligently and frequently employed. The interior of the nares are liable to be affected by polypi, which interfere not only with the passage of air, but with the sense of smell. These can be readily removed by the forceps, which operation, as a rule, entails little danger.
Nurses for the Sick. So many institutions have now been esta blished for providing efficient nurses, and they are so readily procured at the present day, that it is quite superfuous in a work of this kind to indicate what their duties should consist of. It is quite different now from what it was some years ago, when any old washerwoman or charwoman was supposed to be sufficiently capable to assume charge of the sick.
Nux Vomica is the seed of an Indian tree. Its active principle, and that upon which depends its medicinal properties, is strychnia, which, as is well known, is a most powerful poison, though at the same time a most valuable medicine.' Many instances of strychnine poisoning are on record, the symptoms of which are most painful; violent spasms coming on quickly attack the whole muscular system, and cause death by suffocation in consequence of the severe spasm that attacks the muscles of the chest. Chloroform inhalation is one of the inost potent methods of giving relief, while animal charcoal taken into the stomach is a useful antidote. Calabar bean has also a most beneficial effect in cases of strychnine poisoning. As a medicine nux vomica, either in the form of tincture or extract, is largely employed in the treatment of atonic conditions of the stomach, intestines, and muscular system generally. The tincture may be administered three or four times a day, in ten-drop doses, with great advantage where constipation is a prominent symptom, or when there is a want of activity in the muscular structure of the stomach. The extract may be similarly administered in half.grain doses three or four times a day, while the powder, in two.grain doses combined with eight grains of bismuth, is frequently given as a stomachic shortly before meals. In failure of the heart's action and in alcoholism one-sixtieth to one-fiftieth of a grain of strychnine, injected subcutaneously, has frequently proved of great service.
Oats, as an article of diet, should occupy the first place of all the cereals, containing as it does a larger amount of gluten and fiesh and bone forming substances than the others. It is most largely used in Scotland, and forms the staple food of the agricultural classes. It is, first of all, kiln dried, stripped of its husk, and nfterwards coarsely ground, in which state it constitutes Scotch oatmeal. Oats are also employed in the form of groats, which are simply the oats crushed after being dried in the kiln. There is probably no more nutritious article of diet than well-made oatmeal porridge, when taken with milk. It is also employed, as is well known, in the manufacture of gruel, and in the form of oatcakes. When oatmeal is partaken of largely as an article of diet it is liable to give rise to acidity of the stomach and heartburn. This is due to the fact that it gradually ferments in the stomach if it is not immediately digested, and people who take oatmeal require a considerable amount of exercise to make it agree with their stomachs; hence its popularity amongst those whose occupation is out-of-doors. In some people, when oatmeal is eaten it produces an eruption on the skin, due to the acidiby which it is liable to give rise to. Oatmeal has the advantage of acting as a slight laxa-
tive, so it is especially useful to those who are of a costive habit. It should always be thoroughly cooked, as when it is takcu raw it is lialle to form concretions within the intestines.

Obstetrics, the art of nidwifery. (See "Woman in llealth and Sickness." ${ }^{\text {" }}$

Occiput is the bone which is situated at the back of the liead.

Oedema is a term applied to a swelling of the skin and tissues underneath the skin, and is due to the eflusion of the watery part of the blood into the subcutaneous cellular tissuc. It may be due to disease of the kidneys, heart, or liver, or it niay be the consequence of pressure in the pelvis preventing the free return of the venous blood. It is always a symptom of considerable gravity, and should be dealt with very promptly.

Oesophagus, or Gullet, is the tube leading from the mouth of the stomach. (See GULLET.)

Oils used in medicine are all more or less odoriferous. They are generally limpid, and should be colourless, but, for the most part, they are of a slightly yellow tint, and are invariably pungent in taste. Like the fixed oils, they produce greasy stains on paper or cloth, but this gradually evaporates under the infuence of heat, and the stain passes away. Turpentine, oil of lemons, juniper, inint, lavender, are examples of volatile oils; while the principal fixed oils employed in medicine are-almond, cajeput, castor, cod-liver, croton. linseed, and olive oils. They are all more or less aperient in thelr properties, but are employed externally as emollients or as an adjunct to some stimulating preparation.

Ointments are usually prepared with lard, vaseline, or lanoline, which are employed to dilute and render easy of application certain medicinal substances, e.g. mercurial ointment, gall and opium, etc. (See various articles:)

Old Age is usually said to commence in women about the fifty-third year, and in men about the sixtieth year, although manymen and women retain their healuh and vigour for a much longer period. As old age advances, disease of a serious nature is more liable to develop than at an earlier period of life, such. for exanple, as gout, gravel, theumatism, apoplexy, paralysis, cancer, etc., and it is at this period of life that the eflects of dissipation and excess in early life are liable to manifest themseives. Old people should always be well nourished, and care should be taken how they attempt to depart from the habits which they have formed, either in the way of eating or drinking, or clothing, as a little thing at this period of life may result in very serious consequences. Particular attention should be given to the preservation of the teeth, and if these have disappeared they should be immediately replaced by artificial ones, as mastication is essential to digestionand to the prevention of dyspepsia If there is difficulty in mastication, the table mincer should be brought to the aid of the individual. The meals should all be light, and not at too long intervals. The principal meal of the day should be taken about one or two o'clock in the afternoon, and not late in the evening. Then, particular care should be observed in clothing old people, as their power of resisting cold is very much decreased by advancing years. Woollen clothing should therefore be worn next the skin by all elderly people. Exercise to a moderate degree should be taken every day, but over-fatigue carefully avoided. Injuries of all kinds are more apt to end seriously in the aged than in younger people, partly in consequence of the more languid state of the circulation, and because the nervous isystem is not so able to sustain shock. Sleeplessness is a common complaint in elderly people, but fortunately sleep is not so essential to their healt. as it is in younger people. When, however, sleep is difficult to procure, it will be found that taking a light meal shortly before going to bed will aid very much in inducing sleep. Constipation is also liable to occur in elderly persons, and this must be carefully guarded against by judicious administration of aperient medicine, or an enema corpposed of a tablespoonful of salt dissolved in a pint of warm water may be given every second day. As is well known, the faculties are liable to give way more or less as age advances, especially those of sight and hearing. When these symptoms
appear in their incipient stages a great deal can be clone by obtaining medical assistance.

Olive Oil is prepared by crnshing the ripe fruit of the oive tree or olives. It shankl be of n pate amber colour, and devoid of taste or smeli. It is frequently adulterated with inferior fixed oils. In many instances, what is sold as pure olive oil is not this article at all. It possesses gentle aperient properties, and may be usefully employed in children who are subject to constipation, as it is both nutritious and also produces aperient effects. It is a useful laxative for ladies ciuring preguancy. Of late years large and frequently repeated closes of olive oil have been found efticacious in tile treatnent of gall stones.
Onychia is a disease attacking the root or side of the nanl, and may result in the formation of ran abscess, or the parts uay become ulcerated, and in every instance it is attended with severe pain. When the side of the nail is ulcerated, polvelered nitrate of lead dusted over the part often gives inmuediate relief. If the pain is great, and matter is present, the part will require to be poulticed and fomented at frequent Intervals, and if pus has formed it will be necessary to allow its escape by a free incision with the lancet. The discase may be so persistent that it becomes n necessity to apply to the surgeon with a view to have the nail removed. which may be done either without pain, if cocaine is used localiy, or under the influence of chloroform or laughing gas.
Oplithalmia, or Inflammation of the outer covering of the Eye, may be due to exposure to coid or the introduction of some foreign matter into the eyc. Its symptoms are-intolernnce of light, pain on movement of the eyelids, and a congested or bioocl-shot appearance of the white of the eye. Great relief will Le alinost instantaneously obtained by the introduction Into the eye of a drop or two of a five or ten per cent. solution of cocalne, while one of the following lotions should he empioyed every two or three hours after:5 grains sulphate of zinc, I drachm of opium wine, and rose water to make onc ounce-a few drops to be introduced into the eye every two or three hours; or. I grain bi-chloride of mercury, $\frac{1}{2}$ an ounce of opium wine, 4 ounces rose water-a teaspoonful of this to be added to a teaspoonful of hot water, and the eye to be freq̧uently bathed. As internal remedies in this affection, 10 grains of salicine every two hours, or 2 grains of quinine every four hours, will be found highiy beneficial.
Opium is one of tire most useful and most popular of medicines. It coasists of the milky juice which is extracted from the garden poppy, which when dried becomes of a dark brown colour. Opium has given more relief probably to human suffering than any other medicine which we possess. The drug is chiefly cultivated in Asia Minor, Egypt, and India, but it can and has been prepared in Great Britain. The efrects of opium are very delightful when taken 'in small quantities, and in consequence of this the opiun habit is very easily acquired, and when once it has taken possession of an individual it is very difficult indeed to get quit of. As is well known, amongst the Orientals this drug is employed as a stimulant, just as we employ wine and alcohoiic stimulants, and even in this country there are inany people who indulge in this pernicious nethod of procuring intoxication. It is a curious fact that opium, when taken in small quantities, acts as a stimulant, and that when pain exists a much larger dose is required to produce sleep than when the person is free from suffering. It is also noteworthy that when persisted in for a long time the systemı becomes so accustomed to it that enormous doses can be taken without producing anything more serious than a feeling of ecstasy, so much so that a single individual may be abic to take at one dose as much laudanum as wouid kill two ordinary peopic. Chidren are highly sensitive to the effects of opium. and a dose of hadamum (which is the tincture of opium) should correspond in dirops to the number of years of the patient up to maturity, after which the dose should not exceed 25 drops. If a dose of opium las been taken which produces heavy slumber, with stertorous breathing, and if there is a fear that death may ensuc, the patient shouki be kept moving about and the surface of his body sivitched and irritated
by some suhstance or other (for this purpose nettles have been frequentiy employed) untii the effects of the dirug leegin to pass away. Inat before these measures are commenced an etfort should be made to enpty the stomach, either by means of emetics or the stomaci pump. The stomach pump is preferable, becanse aiter the stomach has been cmptied by this instrument it can be washed out by means of wann water. In some cases opiun neither produces sieep nor pleasint excitement, but may give rise to feverisly restlessness, headache, thirst, etc. When relief from pain is sought to be procured by opiates, the present method of employing the hypodernic injection of morphia gives the nost satisfictory resuits. Opium modifies the action of the mucous membranes of the liver and kldneys, and also constipates the bowels, but it causes free perspiration. The quantity of opium which maty produce a fatal result if taken into the stomach may be estimated roughiy at from four to five grains, and from one drachm to two drachns of laudanum. The average tinic at which death ensues from opium poisoning is about twelve hours, but if the dose has been large It may occur much earlier. As a medicinc, opium is employed in a great variety of diseases, such as pneumonia, pleurisy, diarrhoea, cholera, prostration, and sudden coliapse after confinements, bronchitis, asthma, and as a locai application in the form of liniments. The acting principles of opium are morphia nnd codeia, the latter being largely einployed in $t$ e form of lozenges for irritation of the windpipe, and aiso in the form of pilis in the treatment of diabetes.
Opodeldoc is the popular name for the oid form of soap liniment, which has been superseded by the soap and opium iiniment.

Optical Ithisions or Delusions are the result of a disorded action of the nervous system. These delusions are always indicative of disturbance of the functions of the brain which are reflected through the optic nerve. They may also arise from a vitiated condition of the blood circulating in the nervous system, this impure condition being produced by absorption of faccal matter from the coion of bile or of urea. Optical ifusions are ahvays present when alcohol has been indulged in to excess, and these are invariably the first symptoms which show themselves in delirium tremens.

Ossification is the formation of bone. It proceeds from various points or nuclei, which are situated in the extrenities of the long bones and in the centre of the short bones. As is well known, the anatomy of infants is remarkable for its absence of bony tissue, the limbs being occupieci by cartilage where bone afterwards exists. The principal components of bone are phosphate of lime and carbon. Bone, like ail the other living tissues, is subject to disease, the most important of which is caries, this being due to a deposit of tuberculous matter within the substance of the bone, which is iiabie to invade the neirybouring structure and cause its death, when it gives rise to abscess, sometimes of considerable dimensions, and frequently having most serious consequences. Carics usually attacks the extremities of the bones; necrosis, on the other hand usually attacks the surface irrespective of position, This may be induced by direct injury or by acute inflammation of the periosteum. In process of time the dead bone is thrown off, and health is restored ; but in many instances it will be necessary to resort to surgical Interference for the removal of the dead tissuc. (Refer to Cartilage, Fracturbs, etc.)

Our Chlidren: How to keep them Well and treat them when they are III." The Informatlon Is too extended to come under the scope of this work, but will be found In a treatise with the above-named title.
Ovariotomy is the term applied to the operation for removal of cysts, or tumours, formed in, or in connection with, the ovary. In former years it was an operation which was rarely attempted, in consequence of the aimost uniformly fatal resuits which followed. Nowadays it can be undertaken with aimost a certainty of success, find littie fear need be present in the minds of those who require to undergo this operation if the operator is skilful, and if he is surrounded by an efficient staff of nurses. During the past two years the
nuthor has operated in over eighty cases with only one deatlo.

Ovary" (See "Woman in Ilealth nud Sickness.") Ovum, the Latin word for anchg, is the term which Is applied to the gerns which, on impregnation, develops Into tho futuro being. This, in the human subject. usually takes place within the cavity of the womb, but it has froquently been observed to occur in the fallopian tube, or even within the abdominal cavity itself.

Oside of Bismuth is employed in the treatment of heartburn and acid dyspepsia. Its dose is from 6 to 10 grains, three times a day, about half an lour before food.
OXYgen Gas is one of the elementary bodies. mud is sixteen times heavier than hydrogen. It is the most important of all the gases, being essential to the sustenance of animal and vegetable life, It occupies zo per cent. of the atmospheric air, and it is due to the imhation of oxygen that the blood is purified within the lungs, or, as it is said, becomes oxygenated, the oxygen gas taking the place of the carbonic acid gas, which is formed within the blood during its progress through the tissues. When combined with hydrogen it formis water, so that in every particular oxygen may be looked upon as an elementary body without which life could not exist. It can be artificially prepared by the action of certain acids upon oxides and bin-oxides, and has in recent years been largely employed in the treatment of diseases which interfere with the oxygenation of the blood, such as pneumonia, and in many instances doubtless has been the means, when thus adninistered, of tiding over a crisis which otherwise would have been fatal. It is due to the action of oxygen that the animal leat is maintained, and when administered in larger doses than that which is contained within the atmosphere it acts as a direct stimulant. In combination with many metals it forms what are called basic oxides, suct as the oxide of potassium or potash, oxide of sodium or soda, the oxide of iron, etc. It is soluble to a considerable extent in water, and in consequence of this fish are enabled to live in this fluid; were it not for this fact they would soon perish from suffoca. tion. Oxygen is also in that form which we call 'ozone, which is supposed to be a bin-oxide of oxygen, a powerful disinfectant, and is the agent which acts in the bleaching of articles exposed to the atmospheric air. Water may be highly charged with oxygen, and has been sold as a medicinal substance as oxygen water, the water being surcharged with oxygen under considerable pressure.

Oxymel is a mixture of honey and vinegar, and was at one time much more largely used in the making of cough mixtures than at tlie present day. The oxymel of squills is made by mixing 5 ounces of squill vinegar with half a pound of honey. The syrup of squills, however, has largely taken the plince of the oxymel.

Ozone is a substance of a penetrating odour, and is supposed to be generated in the atmosphere by the action of the electric fluid. It is a powerful antiseptic and oxidizing ngent, and performs in the atmosphere many important functions, the most notable of which is the decomposing of organic and offensive matters in the atmosphere, and thus purifying it. It is found in the greatest abundance near the sea and during snow and thunder-storms, and may be readily detected by exposing a paper moistened with a solution of iodide of potassium, which it turns brown by combining with the potassium and liberating the iodine. As has been stated in the article on oxygen, ozone is supposed to be the peroxide of oxygen, or oxygen in a concentrated condition, just as we know the diamond is carbon in a pure and more concentrated state. The peroxide of hydrogen is now employed in surgery is a deodorizing and antiseptic application where suppuration in deepsented cavities exists.

Pain may be described as an aggravated irritation of the nerves. It may be said that it is due to an aggravated irritation, of which sensation is the modified form. Injury to the nerves in every instance produces pain, whereas slight contact imay produce a pleasing sensation, which, when increased, maygive rise to what we recognize as tickling, and this may be carried to such an extent as to so excite the nerves as to produce
nctual pain, and if persisted in, delirium, Pain, in one sense, is a provision of nature to enable us to recogruizo injuries, and the fear of it is such as to make us tako every precaution to avoid it. By the fact of pain being present in any particular locality of the body, the physician is enabled to form his diagnosis, and the character of thic piain will often enable him to determine whetler it is of inflammatory, neuralgic, or rheumatic origin. It is a well-known fact that nervous people bear pain with much less fortitude than those of a more phleg. matic nature. It is therefore not always an evidence that the pain is severe because the paticut conyphins bitterly of it. Some people would appear to be eutirely devold of the sensation of pain, even when they require to undergo operations of a serious nature, while others are the very antipodes of this, Nature lias, lowever, provided means by which pain can not only be alleviated, but entirely destroyed; and operations which were at one time impossible are now, by the introduc. tion of chloroform, rendered not only painless, but free from many of the risks which formerly would have attended them, The author has frequently had patients under chloroform, who have required opera. tions necessitating the greatest care, attention, and leisure in their performance, without the slightest appearance of danger presenting itself, When pain is local or due to disease, the most popular remedies are-opium, hyoscyamus, cocaine, etc. A substance called exalgine has been recently recommended in the treatment of certain painful affections, but, so far as the author's experience goes, it has proved perfectly useless. (See NERVES, OPIUM, COCAINE, etc.)

Painter's Colic is due entircly to the absorption of lead from the paints which he enploys in his daily occupation. Its symptoms are-severe colicy pains, amounting to cramp in the abdomen, attended with obstinate constipation, and generally a blue line at the margin of the gums will co-exist.

Painter's Paralysis is a more advanced stage of lead poisoning than the foregoing, and the disease usually attacks the wrist, causing what is termed ' drop wrist.
Palate is divided into hard and soft; the hard is that portion of the mouth which is arched by bone and covered by mucous membrane and is continuous with the soft palate, which stretches backward towards the uvula and is devoid of bone. The soft palate is bounded on the posterior aspect by the uvula and the two pillars of the fauces, between which, on either side, is placed the tonsil. The soft palate acts during swallowing, and prevents the food from getting access to the posterior nares. The mucous membrane covering the palate is liable to many diseases, amongst which may be mentioned, aphtha, or thrush, which most frequently attacks infants or those suffering from acid dyspepsia; diphtherin, which, as is well known, is due to the deposit of a specific germ upon the mucous membrane; and paralysis, which is invariably due to some disease of the brain affecting the nerve supply of this important memprane. Both the hard and the soft palate may be the seat of an abnormal condition called 'cleft palate,' which is due to incompleteness of the union which takes place between the two sides of the body in the foetus. This, however, can be remedied by operation, by which the deformity is safely overcome. It would not appear that the organ of taste resides in the palate; on the other hand, it seems to be confined o the tongue.
Palliatives are medicinal agents which are intended to relieve symptoms rather than cure the diseases which these symptoms indicate. Too frequently there is no alternative in the treatment of certain diseases than to administer palliatives, for the cogent reason that the disease is beyond all human aid; e.g. when cancer has gone beyond a certain point, and is no longer within the range of operative interference, all that can be done is to palliate the syinptoms by administering anodynes, and thus render the life of the patient more endurable than it otherwise would be.
Palpitation of the Heart consists in a perturbed jand tumultuous action of that organ of which the patient is painfully sensitive. It may give the sensation of a futtering movement about the region
of the heart, or of a thumping sensation ngraiust the walls of the chest. l'alpitation may be either functional or organic in its origin, or it buay depend, as it freguently does, upon an excited condition of the Individual, either fear or joy producing this unpleasant sensation. It is a very common symptom in certaln nervous diseases, and is especially prevalent in nervous women, and when anaemia is present, especially after slight exertion. The distended condltion of tho stomach arlsing from dyspepsia likewise frequently gives rise to this unpleasant sensation. In these circumstances, palpitation is more due to mechanical interference with the proper action of the heart, and is therefore not to be viewed with such surfousness as people are liahle to estimate it int. Hysterical women are especially liable to palpitation, and in consequence may become very apprehensive as to their bodily health, whlch invariably las a most perniclous effect upon their already weakened organisin. Palpitation, however, may, and very frequently does, accompany actual disease of the organ liself, when, of course, it becomes a matter of very serious import both to the individual and to the medical attendant. When palpitation arises from nervous disturbance it becomes necessary to ascertain from whence this arises, and by judicious treatment endeavour to accomplish its renoval. When due to liysteria. as it frequently is, temporary relief may be given by the administration of a teaspoonful of the ammoninted tincture of valerian, in water, every two or three hours. When the stomach Is at fault the same medicine will often prove beneficial; but, of course, the great point is to endeavour to regulate the diet and improve the functions of digestion. If anaemia is the cause, then iron should be given after each meal, but always accompanied by a slight laxative, as it will be found in these circumstances that the lower bowel is sluggish. When this distressing symptom, howerer, depends upon disease of the heart it will be necessary to administer digitalis, preferably in the form of infusion, in tablespoonful doses, three or four times a day, or tincture of strophanthus in five-drop doses, every four or five hours.
Palsy is the old name which has now been superseled by that of Paralysis, which see.

Panada is a food which may not only be partaken of by children and invalicls, but by the robust as well. as it contalns all the elements which the body requires for Its nutritlon. It is prepared by pourlng boiling milk upon bread, and allowing it to soak thoroughly, after which it may be sweetened to taste and partaken of freely.

Pancreas is that narrow gland which ls sltuated behind the lower portion of the stomach, and extends from six to seven inches in length. It secretes parcreatic Juice, which resembles in many of its properties the saliva, possessing as it does the peculiar properties of digesting starch and emulsionizing fats. Its duct enters the duodenunt by the same opening as that whlch carries the bile from the liver; and the two fuids mingling with each other act upon the digested food, or chyme, and transform it into chyle. (See

## DIGESTION.)

Papilla, or Little Pap, is a small eminence upon the surface of the mucous membrane or skin. Those minute points on the tongue upon which the nerve of taste is distributed are called papillae.

Papules, or Pimples, occur as slight elevations on the surface of the skin, and are characteristic of many discases of this membrane; small-pox, chicken-pox. herpes, acne, lichen, impetigo, all commence as papules at first, as also do boils and carbuncles.

Paralysis is the loss of sensation and the power of motion in one or other parts of the body which are supplied hy nerves whose functions have been obliterated by disease or injury. Occasionally, loss of sensation may exist without the power of motion being interfered with, but this is a very rare occurrence Indeed. Generally, it is the power of motion which is affected, that of sensation lieing left intact, or if it is involved, it niay be only so to a slight degree. Paralysls of motion may he confined to a limited portion of a limb or to the whole of it, or it may extend only to the lower extremities while the upper portion of the body is unaffected, In a few instances it may affect the
whole muscles of the voluntary system, so that llfo is entirely dependent upon neryous nctivity leeing still produced in the involuntary or sympathetic nerves. When paralysis affects one side of the borly it is generally due to some dnterference with the blood supply, or to the rupture of a blood.vessel and a deposlt of clot In the opposite side of the brain. This fornt of paralysis Istermed "hemiplegia," and is, In tho majority of instances, due to apoplexy, which refer to. There is, how ever, nnother form of brain disease, called 'congestive apoplexy, in which actual rupture clocs not take place, but wheru ettusion within the cranium is liable to occur. Such cases may, and do, frequently recover, hut when the congestion lias procceded so far as to cause undue pressire upon tho brain substance, it is not so liable to pass off without leaving some paralysis behind it. Paralysis may llkewise occur from pressure upon the brain, as the result of accident or from tho presence of tunnours or abscesses within the cranium. Of late years surgical measures have been devised by which these can be removed and the paralysis cured. Certain symptoms which the case points to will enable the surgeon to locate the seat of the tumour, upon which lie may be able to cut down by means of the trephine and remove the cause of the mischief. The symptoms which generally Indicate that paralysis is pending are, first, a feeling of numbness and prickling in the part, and when such symptoms do appear particular attention should be paid to them, and every effort made to remove thelr cause. When, however, paralysis comes on suddenly it is generally accompanied by a plethoric condition of the blood-vessels of the head and a tendency to vomit. Under these circumstances the judicious abstraction of blood and the administration of a free purgative should at once be resorted to, while to the extremities and abdomen mustard poultices should be freely applied. Frequently the first symptom indicative of paralysis will be observed in the face, when the mouth appears to be twisted in consequence of the muscular action being confined to the healthy side, by which the paralyzed side is drawn out of position. When paralysls has been established for a considerable time much may be doue to restore sensation and motion to the parts by the judicious and persistent applicatlon of nassage combined with electricity. At the same time the various functions of the body should be carefully attended to, and the patient be kept warmly clothed. It is a curious fact that, although paralysis so frequently results as a consequence of apoplexy, the mental functions of the individual may not be interfered with to any great extent for a considerable period after the attack; as, however, one attack is frequently succeeded by another and another until death ensues, we may conclude that the paralysis Is not due so much to disease of the brain Itself as to an unhealthy condition of the walls of the arteries, whlch. In consequence, are easily ruptured, and effusion of blood within the brain consequently takes place. If the attack occurs in a person of a very full habit of body the chances are that apoplexy is the cause, although the disease may, and frequently does, attack people of the very opposite temperament. If an attack occurs during the absence of medical assistance the patient should be kept very quiet, cold being applied to the liead and heat to the extremities, while, if possible, a free evacuation of the bowels should be ensured either by a brisk purgative or by the administration of an enema, whife, if there is much faintness, the patient may have a teaspoonful of sal-volatile or a little brandy water administered every little while with a view to overcome the shock which necessarily follows. When the lower limbs are paralyzed and the upper portion of the body is left unaffected, this form of the disease is named 'paraplegia,' and is usually due to some injury or disease of the spinal cord or its membrane. If arising from disease of this important structure it may generally be looked upon as hopeless. When injury, however, or pressure is the cause a great deal can be clone by rest and counter-irritation. The premonitory symptoms of this affection are, an intense hyperaesthesia of the skin, accompanied by the sensation as if insects were creeping over its surface; when this occurs, it is well that the most careful investigation should be made into its cause, Many forms of local
paralysis frequuntly present themselves for treatment, such as paralysis of the optic nerve, called ' amaurosis'; or the check may be paralyzed temporarily by exposure to cold; one hand also may be paralyzed in a simgle night by the effect of pressure upon the nerves which supply it. In such circumstances, that is when the paralysis is brought about by any sucl local injury, a smart mustard poultice or a fly blister may frequently give relief to the symptoms. Then, agan, paralysis may occur in some of the nerves of special sense, such as that of sight, as has beell nlready noted, or hearing, taste, and smell. Then, again, the power of articulation or swallowing may be lost or deteriorated by the motor nerve supplying the lips, tongue, aud other organs within themouth being affected. Loss of voice is not an uncommpn effect either of cold or hysteria, both of which give rise to a depraved condition of the nerves supplying the larynx. Lead Parlysis, or Drop Wrist, has been referred to in the article upon lead poisoning. This, of course, is due to the poison having gained access to the system, and producing its specific effects upon the nerves supplying the fore-arm and hand: but it may effect other muscles besides that of the arm, such as those of respiration, when, of coursc, the disease rapidly proves fatal. Shaking Paralyzis is generally the result of old age, and is, as a rule, traceable to some degeneration coming on within the brain substance. Alcohol also may produce this temporarily by its pernicious effect upon the nervous system. Mercurial tremor is also a form of paralysis which is due to the absorption of mercury by those who work with that motal. Paralysis, however, is a discase of such import that in every instance medical assistance should be called in without loss of time wherever even a failing of the nerve force seems to be apparent. (Sce APOPLEXY, NERVES, BRAIN, etc.)
Paralysis, Infantile, or Children's Paralysis, is a subject which has for long occupied the attention of the medical profession. It may take its origin from some irritation quite distant from the part of the body affected-that is to say, the irritation is reflected through the nervous system by the nervous centres which supply that particular portion of the body: Amongst the most potent factors in this disease are irritation of the bowels, either from the retention of faeces, the effects of worms, or indigestion. A dose of scammony and calomel will generally suffice to restore the parts to their active condition, while the paralyzed limb should be well rubbed with some stimulating embrocation. In some instances, however, the disease does not yield to treatment, and chronic paralysis may result from what appears at first sight to be comparatively a trivial cause. Electricity combined with the administration of strychnine in small doses will often have a most beneficial effect even if the disease has become chronic, and if this is combined with massage for a lengthened period the disease may frequently be overcome. A peculiar form of infantile paralysis has been named 'St. Vitus's dance, from the fact that the muscles, in consequence of the nerves supplying these being affected, place them beyond the control of the parts. This affection, however, is usually associated with a rheumatic condition of the constitution, and may result in a child of this peculiar constitutional tendency being exposed to damp, or having been affected by some local inflammation, or irritation from teething, worms, constipation. It may follow in the wake of violent coughs, such as spasmodic croup or hooping cough, but in every instance there will be a hereditary or congenital tendency to the disease. Then, again, a fall or a blow may give rise to paralysis in children. Tubercle, when it affects the brain or its membranes, not unfrequently results in infantile paralysis.

Paraplegia, or Paralysis of the Lower Portion of the Body, is due either to injury or disease of the spinal cord or its membrane. (See Paralysis.)
Paregoric, or Paregoric Elixir, is the compound tincture of camphor, or camphorated tincture of opium, as it is now called. Half an ounce of thisliquid contains one grain of opium, and it is used principally in the treatment of affcctions of the air passages. It is a useful curative agent in the incipient forms of catarrh. when it may be taken in ten.drop doses every two hours by an adult, and will frequently cut short an attack.

Parietal Bone is onc of the bones of the skull, which refer to.

Parotid Gland is the largest of the salivary glands. It is situated a little below, and in front of, the ear, and fills up the space bencath the angle of the lower jaw. Ihis gland is frequently the seat of disease, and would appear in some unaccountable way to have peculiar relations with the ovaries and testes, for we find that diseases which attack the parotid gland may, by the process of metastasis, fly to one or other of these distant glands. The parotid gland is that which is affected in the disease called 'mumps'; it is also frequently the seat of tubercular disease, and abscesses in these circumstances may readily form within its substance, and when neglected give rise to ngly scars upon the neck, which are popularly termed
crofulous.'
Paroxysm is a periodical aggravation of certain symptons occurring in the progess of a disease, such as neuralgia, toothache, ague, mania, coughs, cramp, etc.

Parturition is the term applied to the giving birth of young. (Sec "Woman in Health and Sickness.")

Pastry is an article of diet which should not be indulged in by those having a weak digestion, as from its composition the stomach has considerable difficulty in acting upon it.

Patella, or the Knce Cap, is that small oval bone which is inserted in the powerfultendon of the extensor muscles of the thigh. It scrves at once to protect the knee-joint, and at the same timic acts as a pulley in the movements of these muscles. The knee-cap is liable to injury, and especially to fracture. It may be torn across when the muscle is in strong action and the person falls upon the knee, or from a direct blow upon the part. The fracture is not difficult to detect because of the powerful contraction which takes place in the muscle, by which the upper fragment is drawn upwards so that a deficiency is occasioned by the separation of the upper fragment from the lower. It is somewhat difficult to replace and kecp these fragments in position, and this object can only be attained properly by suturing the two fragments together by strong wire, a hole being bored in the upper and lower fraginents, and the wire afterwards passed through these holes and secured. Such an operation can now be accomplished without encountering the dangers of suppuration if antiscptic precautions are employed. The limb must then be kept at perfect rest until complete union has taken place between the fragments.

Pathology is that science which treats of the nature of disease. Without a thorough knowledge of this important department of medicinc, no one can be conspetent cither to diagnose or treat disease.

Pearl Ashes, the name applied to ordinary potash, which was originally obtained entirely from the ashes of burnt wood.

Pediculi, Ticks, or Lice, are invariably the result of filth and negligence. They inhabit the hair and skin of certain individuals, and are frequently an indication of debility of the individual infested with them. Cleanliness, however, will as a rule remove them and be a preventive of a future attack. With a view to their destruction the parts should be thoroughly washed and a little mercurial ointment well rubbed in. which will nct as a direct poison upon the parasites, while the nits or eggs which are attached to the hair may be destroyed by applying strong acetic acid.

Penny-Royal is one of the nint tribe of plants found in wet places in England and throughout Europe. It is not a drug that should be used indiscriminately, especially for the purpose of exciting the functions of the womb. The only popular method in which it can be employed safely is for the purpose of driving away fleas, which power it is said to possess.

Pepsine. There are several forms of pepsine, which differ only in the fact that the stomachs of various animals are used in its preparation. When made from a pig's stomach it is probably to be preferred before any other, and this is due to the fact that the pig's stomach resembles the human stomach in its adaptability to an omnivorous diet. There can bc little doubt that pepsinc, when given to pcople suffering from a weak condition of the stomach, aids very much in promoting digestion. It may be taken alone or
combined with an aromatic, or with an alkall, or with both. The following mixture will prove a most useful preparation of pepsine, which may be taken by persons suffering from incligestion, in whicln thatulence is a prominent symptom:-Pig's pepsine and aromatic pow. der, of each three drachnis; bi-carbonate of soda, one ounce; calcined magnesia, half an ounce-mix, and take half a teaspoonful in water three times a day after meals. The method of preparing pepsine is as follows:The stomach of the animill should tirst of all be washed with cold water, and all the nucous membrane scraped off with a blunt knife. This pulp is spread out on flat glass or porcelain vessels, and drlecl at a temperature not exceeding 100 degrees. The clried residue is then reduced to powder and preserved in stoppered bottles.

Perforation is that tern which is applied chiefly to the formation of an operning from some portion ot tho alimentary tract into the peritoncal cavity, When this takes place, peritonltis with n fatal consequence must be anticipated if very prompt measures are not taken, and the abdominal cavity opened so as to ascertain the seat of the perforation and restore the integrity of the vowel, at the same time cluinsing the peritoneal cavity of any foreign matter tlat may have found entrance into it. Perforation may take place as a result of ulcer of the stomach, or in the progress of enteric fever. Females who are anaemlc are more liable to ulceration and perforation of the stomach than those in good health. The severe pain that results from thls accident may be, for the time being, relieved by the judicious administration of laudanum or solid opium20 to 30 drops of the former may be administered every two hours, and from one to two grains of the latter may be given at like intervals; but the most efficacious nuethod that can be adopted is the subcutaneous injection of morphia.

Pericardium, the bag in which the heart is enclosed. Its ioner surface resembles that of the symovial membrane of the joints, and is provided with a lubricatiog fuid somewhat similar to that which Iubricates the joints.
Pericranium is the membrane which covers the inner surface of the bones of the skull, just as the periosteura covers the outer surface.

Perineum is that space which is situated between the anus and the genital organs. It is liable to serious injury during childbirth, in consequeoce of rupturo which sometimes occurs during the passage of the child's head. When this accident occurs it should immediately be repaired by the medical man in attendance, as, if it is allowed to persist, it invariably gives rise to displacemeot of the womb, in consequence of its being deprived of the support of the perineum. If, however, the rupture has been permitted to exist, and the consequences due to it have arisen, it can be repaired by surgical operation. Falling astride upon any hard substance may bruise the perineum, aod give rise to serious mischief in the urinary passage and bladder. This, of course, requires surgical interference, (See "Woman in Health and Sickness. ")

Periosteum is that membrane which adheres closely to and eovelops the bones of the body, except where cartilage exists in the joints. Inflammation of the periosteum causes most intense pain, in consequence of the closeness with which it adheres to the bone, so that effusion taking place between the periosteum and the bone is uoable to find exit or expansion, and therefore the pressure of the parts is intense and the pain excruciating. The periosteum is tiable to rheumatic affectlons, when nodes or elevations take place and constitute highly sensitive points. If the periosteum is destroyed, death of the denuded portion of bone generally takes place.

Peritoneum is the membrane which lines the abdominal cavity covering both the inner surface of the abdominal walls and its contents, to which is given the general name riscera. The peritoneum is a complete sac composed of one continuous membrane. It secretes a serous fluid which enahles the various organs contained withln it to move freely and without infury to themselves. Certain diseases, especially of the liver, heart, and kidneys, give rise to dropsical effusion, which exudes from this membrane, as also does inflammation. The peritoneum requires to be opened in all
operations where the ovarles, falloplan tubes, or womls retpuire surgical interference; and since antiseptic nesasures have been adopted and carried out thoronghly, these operations can be performed with almost uniform success, whereas, in the olden days, beforo sepsis was thoroughly understood, the death-rate was something enomoms, so much so, indeed, as alnost to precludo any operative interference which necessitated the opening of the abclominal cavity.
Pormanganate of Potash is employed in solution as an antiseptic and disinfectint. Condy's fluicl is simply a solution of permanganate of potash. It is also prescribed in riils to bring on menstruation when It is tardy.

Perspiration, the natural secretion of the skin, whereby radiation takes place and the temperature of the body is kept at its uormml standard. Excessivo perspiration, especially at nisht, is frequently a grave sympton of discase, and gencrally exists where consumption is far ndvanced. A dry skin, on the other hand, always indicates an unhealthy condition, and is invariably an accompaniment of fever. (Sce SKIN.)

Peruvian Bark is the proper name for cinchona bark, from which quinine is manufactured. It has excellent tonic properties, and before the discovery of its alkaloid it was largely employed in the treatment of ague.

Petechiae are spots which appear upon the skin in some fevers, such as typloid, when they appear upon the abdomen; typhus, when they appear upon the chest. They resemble fleas' bites in appearance, and are not unfrequently mistaken for them. These spots when characteristic of fever, have certain localities where they appear and develop in colour and form according to the distinctive fever of which they are symptomatic.

Pharynx is that part of the air passage which is continuous with the back of the nares and the upper part of the windpipe and throat.

Phlebitis is inflammation of the veins, and is recognized by pain, a corded feeling of the vessels, and swelling in the neighbourhood. It may arise trom blood poisoning, but is most frequently encountered after child-birth, when it goes under the name of white leg, in consequeoce of the swollen and glossy appearance that the leg presents when phlebit is is present.

Phlobotomy is the cutting of a vein, and is the term usually applied to blood-letting.

Phlegmo is the popular term applied to mucus, such as is secreted in the air passages.
Phlegmasia Dolens is white leg, referred to in the article on Phlebitis, It occurs after child-birth, and is due to an inflammatory condition of the veios of the leg, which, preventing the return flow of the blood, gives rise to dropsical swelling of the limb and tenseness of the skin, which causes the glossy appearance characteristic of the disease. It is an affection very difficult to remove, and inyariably leaves the patient weak for a considerable period after it has apparently disappeared. When this disease makes its appearance medical aid should be procured without delay. (See " Woman in Health and Sickness.")
Phlegmon is the term applied to that very acute form of inflammation which results in the death of the tissue that has been attacked, such as in erysipelas, when the subcutaneous tissues have been involved and slough has formed in consequence of the virulence of the poison.

Phosphorus is that elementary body which oxidizes so rapidly, that immediately it comes in contact with the atmospheric air it bursts into flame. It is a deadiy poison, having most irritating properties, and yet, when taken in small doses, is one of the most useful medicines which we possess, especially In the treatment of various kinds of neuralgia. it enters largely lnto the composition of animal bodies, but is always found there in the shape of salts, such as the phosphate of lime, which enters largely into the composition of bone. It is contained in the seeds of crains, and is also a constituent of the albuminous fibrous compounds of the human frame. It was discovered in 1669 , and was at that time prepared from urine, from which it was extracted by distillation with charcoal. It is now, however, procured by decomposing the
varions salts, viz, those of linne, nagnesla, notash, ctc., which exist in the soil. It is also an important element in the composition of brain and nerve. When given as a medicine in its pure state it requires to be prepared with the very greatest of care, as the most minute partlcte of phosphorus coming in contact with the mucous inembrane of the stonach would sct up intense irritation. It should, therefore, be rubbed up with some substance, such as wax and balsam, so as to divitle the phosplorus and distribute it completely through tho substance which is selected, Irom 1-5oth to 8 -3oth of a grain of phosphorus, given after food, is quite sullicient for a dose, Of late years phosphorous pills have been manufactured on a large scale by pillmakers, and at so small a cost that when thls substance Is prescribed it is much better to nune the maker in the prescription, so as to ensure its proper mimufacture. There are several firns who devote themselves largely to the manufacture of pills, and one of these should Invariably be selected. The emanations from phosphorus, especinlly in the nianufacture of matclies, is well known to give rise to disease of the bones in those employed in the factories. The lower jaw-bone is specially apt to become affected, and necrosis, or death of the bone, to ensue, causing abscesses in the immediate vicinity of the necrosed bone, and necessitating operative interference for its removal. These accitents from inhalation of phosphorus, however, are becoming rarer and rarer in consequence of the phosphorus not being employed in its old form, but in what is termed the amorphous condition, and which does not volatilize, like the ordinary plıosphorus. Considerable risk is sometimes run by children getting possession of lucifer matches and sucking the heads off, Numerous cases of poisoning are on record which have resulted from this accident. If a child has found a box of matches from which he has sucked the phosphorus the mouth will be found to be quite luninous in the dark, and the child will probably complain of considerable pain in the pit of the stomach, The first thing to be done is to induce vomiting as rapidly as possible, and give milk in large quantities. The white of egg is also another good antidote, but the great point is to have the stomach well washed out. Stimulants may be necessary if great prostration exists. Oil should not be given, because it has the power of dissolving the phosphorus, and thus distributing it to the intestines and promoting its absorption. One important point with reference to phosphorus seems to be ignored, both by our corporations and by individuals, and that Is, that phosphorus is contained in large quantities in the excreta of the human body, both urinary and faccal, and yet, although it is a well-known fact that phosphorus in its various compounds is essential to the growth of vegetable llfe, this excreta, at considerable expense, is shipped away and buried in the sea instead of being utilized as it ought to be upon the land, while at the same time, at enormous cost also, phosphates, in the form of guano, are shipped from South America to act as fertilizing agents; such an extraordinary paradoxical combination it is difficult to comprehend.

Phrenitis, or Inflammation of the Brain. (See Brain.)
Phthisis is a term which is applied to tubercular disease of the chest, when it is called 'phthisis pulmonalis,' and of the bowel, when it is termed 'phthisis abdominalis. It is due to the deposit of the bacillus or tubercle, which develops within the chest cheesy looking messes, which, eventually breaking down, cause uiceration of the lung tissuc, and results in what is generally known as consumption. When it occurs in the abdomen it attacks the glandular structures, and results in atrophy, or emaciation, of the tissues of the body at large. (See CONSUMPTION.)

Physiolopy is that science which treats of the functlons of living bodies, and embraces biology, bac. teriology, and pathology, and in fact dips into every branch of medical science.
Piles, or Haemorrhoids, are in reality, in the first place, a varicose condition of the haemorrhoidal veins. Thls extended condition of the veins excites inflamma. tory action in the piles, when thev become strangulated. and herce the severe pain which accompanias these
little tumours. It is to the rupture of these enlarged veins that the haemorrhage, which so frequently talies place cluring the evacuation of the bowels, is due. When they are extruded from the anus and cone to the surface the mucous membrane which covers the piles becomes transformed into skin, and the term 'external piles' is employed. As is well laown, latemorrhoids are always accompanicd by more or less painn and uncasiness at the anles, the pain ofttines becoming very severe and overpowering. Tlicy also give rise to a grinding, down-bearing sensation round the loins, and altogether a martyr to piles is in a most melancholy condition ilmost continuously. The irritation caused by piles is frequently conveyed to the bladder and womb, and gives rise to irritability in both of these organs. The peculiar construction of the haemorrhoidal veins makes them very liable to become varicose if anything obstructs the flow of blood within the vesseis, and this is accounted for by the fact that these veins are not provided with valyes which would otherwise give support to the colunn of blood contained within theni, They are, in fact, simply tubes, and anything which interferes with the circulation in them naturally causes a congested condition of their lowermost ramifications; therefore constipation and a sluggish action of the liver are predisposing causes of piles. Pregnancy, in consequence of the pressure which is brought to bear upon the veins of the pelvis, is also a predisposing cause of this painful disorder; hence haenorrhoids are not at all an unfrequent occurrence in women who have borne children. The preventive treatinent, therefore, of piles is to assure a healthy evacuation of the bowels every day, and not only will this act beneficially with regard to this disease, but upon the general health of the individual as well. There is no reason why one person should suffer from piles and another not, and there can be no real predisposing cause except neglect of nature's laws. It is a fact, therefore, that no one need ever be aflicted with this painful malady. If the bowels require assistance, and a tendency to piles exists, the best purgatives that can be employed in the circumstances are, cascara sagrada and milk of sulphur. Allen \& Hanbury's tabloids of cascara may be taken in doses of one to three at bedtime, or a teaspoonful of the milk of sulphur may be employed instead; but the weight of experience all points to the fact that cascara is most beneficial. If piles actually exist it becomes a necessity that the bowels be moved by these means daily. Locnl applications are also to be employed, and the best of these is the extract of hamamelis or hazeline. The hamamelis can be employed either in the form of ointinent or suppository, but to either of these preparations it is advisable to add some soothing ngent, such as the extract of coniun, or powdered opium. There would appear, however, to be only one real cure for haenorrhoids, and that is their removal by operation. The author can speak on this point from a very large experience, and invariably the results have been not only gratifying to himself, but surprisingly so to the patients, and as the operation can be performed with perfect safety it seems a pity that it should not be more universally resorted to.

Pimples are usually due to some unhealthy condition of the blood, and, as a rule, are dependent upon constipation, or to some inefficient action of the sweat glands. (See ACNE, BOILS, etc.)

Plague is, or rather was, a disease well known long ago, happily, however, it lias passed into oblivion, from which it is to be hoped it will never emerge. It is a disease which evidently depended largely upon non-observance of hygienic laws. Nothing authentic upon this important, and at one time deadly, disease seems to be on record. Probably it was a virulent form of typhus fever. Its symptoms came on with a feeling of intense languor and lassitude, something like thes precursors of typhus fever. Like other acute diseases it had a cold stage, though seldom of long duration, in irritation within the body as to give rise to a high temperature. There was intense pain in the head and forehead, the eyes were heavy, dull, and muddy, just as we observe in patients who have the first symptoins of typhus fever. It would be absurd to state as a fact
that the temperature of the patients suffering from dhgue become very high ; at the same time, juclsing case, and it was to on uncontrolled that the high death.rate wai evidugh clue. It is stated that the expresision of the counten. ance in phague changes in a very remarkable manner -sometimes there is a wild and furious look, some. tinles a look which clains sympathy and commiseration in consequence of the sunken eye and contracted features which exist. Perhaps the most striking of all the early symptoms of this discase is the loss of power to retain the equilibriun which the patient fuels, and this muscular weakness is evidently due to the strong current of fever which is runuing through the frane of the patient. All the finctions are disturbed-the stomach becomes irritable, the tongue white, the bowels torpid, accompanied by most olfonsive discharges ; faltering of the speech is present, from the same cause as the staggering which has been before noted; the pulse becomes hard, rapid, and in a short time compressible Afterwards, large purulent buboes appear on the surface of the body. Tluese are evidently due to the fact that the skin, in endeavouring to throw off the poison, becomes destroyed at certain points by the virulence of the viris. After two or three days, at the most, pains in the groin and armpits, or any other place where glands are present, indicate that pus is being formed in these localities. These pains are frequently very acute, and unless speedily followed by suppuration in the glands, the patient dies delirious from blood poisoning. Carbuncles appear about the same time ou any part of the body ; spots with purulent heads are, however, much more frequent than carbuncles, and when death is imminent it is frequently preceded by extensive haemorrhages from the uucous membranes. The durasion of this rirulent disease is various-sometimes a patient has been known to die within a few hours of the attack; to many it has proved fatal duringr the first paroxysm or period, which includes the time from the evening of the attack to the close of the following night. The third, fifth, and sixth days are, however, mostly to be dreaded, that is, if the patient survives the first paroxysm. If the fifth day is passed, and suppuration has taken place in the glands which have been attacked, the patient may be said to be almost out of clanger. The convalescence, however, is always tedious from the excessive debility which succeeds the continuous high temperature, this being due to the fact that an elevated temperature existing for a considerable time always bas a most reducing effect upon the muscular activity of all the organs; therefore the heart suffers to a very great degree. In the present state of our knowledge it would be quite out of place to attempt to give any rules as to the treatment of this terrible disorder, but common sense and experience would suggest that the first thing to be done, if plague again attacks the community, is to reduce the temperature as rapidly as possible, and keep it as near the healthy standard as possible, by means of antipyretics.

Plasters are compounds of adhesive substances spread upon calico or leather, and may be classed as mechanical supports to cut surfaces, or, when combined with anodyne substances, as soothing applications, and when with irritants, such as cantharides, capsicum, mustird, etc., as counter-irritants. The various plasters which are in daily use are-the ordinary adhesive or resinous plaster, belladonna, menthol, cantharides, mustard, capsicum, pitch, lead, etc.

Plethora, as its title indicates, is a fulness, and is the term which is applied to that condition of system in which the blood-vessels are turgid and over-loaded. It is generally the result of indolence, over-eating, and over-indulgence of any kind. Some people are more prone to this condition than others, in consequence of their sanguine temperaments, while leading a life of inactivity and over-indulgence in food and drink This condition predisposes to many diseases having most serious consequences, such as apoplexy and haemorrhages from the mucous membranes generally. When these haemorrhages take place in the nose, stomach, or lungs, this generally acts is a safety valvo, and relieves the pressure upon the brain, whereby apoplectic
seizures are frequently averted. Ievers, or any disease in fact, occurring in such persons are ienerally attenderl with much more serious consequeuces than when they attack those whose circulation is in a lealthy condition. The great point to observe in the avoidance of plethora is to live naturady, to take plenty of exercise, to attend carefully to the duily evacuation of the bowels, and to avoid stinulants.

Pleura is the scrous membrane which lines both the inmer surface of the chest walls and covers the lungs. It is a contimuous membrane very closely resembling in comstruction the peritoneum. The surface of the lungs, and that of the chest, in consequence of being closely invested by this membrane, from which exudes a lubrichting fluid, are enabled to move over each other with pertect freedon and without friction. When, however, this becomes inflamed the surface in which the inflamution exists becomes roughened, and therefore friction results during the movements of the chest, and intense pain is comsequently experienced. Pleurisy is then said to exist, and in consequence of this inflamed condition the serons surfaces secrete the pleuritic fluid in undue quantitios, which gives rise to what is called dropsy of the chest, or hydrothorax.
Pleurisy, or Pleuritls, is a term given to that intlamed condition of the pleura which causes roughening of lts surface, and, in consequence of the friction which is induced, intense pain becomes a prominent symptom of the disease. It is rarely, however, that the pleura is affected without disease in the neighbouring portion of the lung being also present, when pleurow pneumonia is saicl to exist. It is always attended with a short, dry cough in its first stage, but afterwards the cough is accompanied by a rusty-coloured expectoration, and there is, invariably, considerable fever accompanied by a high temperature. Nothing seems to give relief to pleurisy so rapidly as the prompt application of leeches over the part affected. If, however, the disense has existed for a day or two, a fly-blister should be applied over the seat of disease. When the temperature is high, phenacetine in ten-grain doses should be administered every four hours until this is reduced, while the bodily strength should be well maintained by a copious supply of milk diet in the form of arrowroot, sago, or tapioca gruels. For the intense pain, one grain of opiun with one grain of calomel may e administered at intervals of three or four hours.
Pleurodynia is an affection of the chest wall which, by many ignorant medical men, is often confounded with pleurisy, and many cases which are diagnosed as pleurisy are nothing more than neuralgia of the intercostal nerves. The pain that accompanies pleurodynia is sometimes most acute and commanding. and may well be confounded with the more serious disease, pleurisy. It, however, is unaccompanied by fever, and is generally the result of a weakened condition of the physical strength accompanied by nervous prostration. The subcutaneous injection of one-sixth to one-fourth of a grain of morphia will give inmediate relief, or eight grains of phenacetine combined with two grains of caffeine, given every four hours will also be found to be beneficial; while the parts affected should be well rubbed in with a liniment composed of 2 drachnis of menthol, $\frac{1}{2}$ an ounce of chloroform, id ounces belladonna liniment every hour; and with :1 view of preventing a recurrence of the attack, the following pills given every two hours will act most beneficially, viz., $1 \frac{1}{2}$ grains quinine, I grain cafieine, $z$ grains of extract of hop, made into a pill, and taken as directed.

Pneumonia, or Inflammation of the Lungs, is, doubtless, a disease due to the invasion of a specific germ. Of course this germ cannot develop its virulence in a healtly subject, the health of the individual must be, first of all, so far deteriorated as to pernit its making a soil for its development and propagation within the lungs. Pneumonia is invariably acconpanied by very high fever, rapid breathing, lividity of the countenance, and a hacking cough, which, in a day or two, is accompanied by an expectoration most viscid in character, and having more or less of a rusty. coloured appearance. On percussion, the chest over the seat of the discase is invariably dull, and if the stethoscope be placed over the dull area, a fine crepita.
tion or crackling sonnd will be audlble, this, as time goes on, becontes more and more of it crackling and afterwards of a bubbling mature. 'lite great point in the treatinent of pucumonia is to keej) the temperature low, and this can bust be accomplished by giving phenacetine in E.grain doses for an adult every four hours, white considerable bencfit may illso be derived by the upplication of a tly-blister over the seat of inflanmation. At the same tine, the vital powersmust be thorouglily sustained by an abundance of nutritious food, and careful attention should be given to the bowels. The patient should be kept lit a well-ven. tilated room, the air of which may be kept warm if the cough is yery persistent. The old method of treating pneumonia by opinn and calomel is, however, not to be ignored, as the calomel would appear to act powerfully as an antiseptic and alterative, while the opinn soothes the pain which almost invariably accompanies pneumonia, in consequence of the pleura in the neighbourlood being also in a state ot inflanumatory action.

Podophyllin is a resin possessing a greenish brown or sometinies an altogether brown colour. It is procured from the American May apple, which is a well-known fruit in the United States, and is generally called by its more popular name of 'mandrake.' The dose of podophyllin should never be large, and its action is always to be obtained by giving it in small doses at frequent intervals. $5 \cdot 20 t h$ of a grain given three or four times a day will have a much more beneficial effect than $\downarrow$ or even $\frac{1}{2}$ a grain given at once. It should always be combined with some other purgative such as colocynth, and an anodyne such as henbane, together with a carminative like powdered capsicum, which will prevent the griping, and not at all interfere with its beneficial effect. Podophyllin is largely used in bilious derangement, as it exercises a considerable stimulating effect upon the liver and its secretions. It at one tine possessed such a popularity that it was deemed far superior to all the preparations of mercury, and it was thought that it mighlt supersede this drug altogether in the treatment of liver complaints. This, however, has not proved to be the case, as mercury still holds its own, and probably will do so in the future, as being one of the inost useful remedies that are known in the treatment of bilious disorders. The tincture of podophyllin can be administered in very minute doses and at repented intervals, and is therefore a very useful preparation, but the commonest form of administering this drug is that of pill, of which the following may be considered one of the most useful compounds:Podophyllln \& grain, powdered capsicum I grain, colocynth and henbane pill 4 grains. This to be mixed and made into a pill, which may be taken at bedtime when the liver is sluggish.
Poison. It is difficult to define this word, as so many substances are deleterious in their effects, and therefore literally poisonous without being actually destructive to life. Those articles which usually are recognized by the public as poisons are, strychnine, arsenic, prussic acid, corrosive sublimate, oxalic acid, opium and its alkaloids, belladonua and its alkaloids, aconite and its alkaloids, etc. Then, again, there are what are called specific poisons, which develop disease within the systen and often result fatally, such as that of the various fevers, cholera, 'dysentery, diphtheria, etc. The great point to attend to when poison such as arsenic has been taken into the stomach is to endea. vour to produce vomiting as rapidly as possible, or if the stomach pump is at hand to empty the organ by this means and afterwards wash it thoroughly out with warm water, while suitable antidotes should be given with a view of counteracting the effects of the poison upon the system at large. If an emetic is the only convenient means ot emptying the stomach, then mustard and warm water nixed together is one that is always at hand, or sometimes vomiting may be qulckly effected by tickling the throat with a feather or pushing the finger down the throat with a view of causing sick ness. But the great point in all such cases is at once to send for professional aid, at the same time stating the circumstances which are exciting suspicion, so that proper appliances may be brought without loss of time. There are certain poisons which have well-known anti-
dotes, a list of which is given in 1)r. Garrod's work on "Materia Medica":

POISONS.
ACIDS,

ALKALIES,
Vlnegar and Water, (oil.
ANTIMONY, - Decoction of Bark and other preparations, containing T'an13in in solution.
ARSENIC, - None; but Charcoal may be given, or Magnesia and Iiydrated Peroxide of Iron.
CHLORINP,
Cyanides or prus. SIC ACID,
IODINE.
LEADSALTS, :
MERCURIAL'SALTS,
OPIUM, Ammonia, Magnesia.
Solutions of Chlorine, mixed Oxides of Iron. Starch.
Sulphate of Soda or Magnesia. White of Egg.
Animal Charcoal, which absorbs Morplia.
Nitrateof Silver, Common Salts and other Chlorides.
SULPHATE OP ZiNC, Carbonate of Soda in dilute solution.
Polypus is the term applied to tumours which are attached to the tissue from which they have grown by a pedicle. They vary in size considerably according to their position, those of the nose being suall, while those of the womb sometimes attain enormous dunensions. When they appear in the nares they frequently give rise to considerable distress in consequence of their interfering with the breathing. They are, however, as a rule, very easily removed by being laid hold of with a pair of strong forceps and then twisted, and thus discounected from the mucous inembrane. Polypi, however, may appear in the ear, the rectum, and in the larynx, when they generally partake very much of the nature of the surface from which the pedicle takes its origin. When they occur in the womb they invariably in the first instance develop within the tissue of the wounb itself, and then by virtue of the muscular action which is exercised in consequence or the presence of the tumour, become expelled either into the cavity of the womb itself or outside into the peritoneal cavity. Some idea of the size of these tumours, which have become converted into poypi, may be given when the author can state that in his own experience he has removed them as large as the head of a newly-born infant, and on one occasion from the abdominal cavity he reinoved as many as eight of these tunours by abdominal section, the largest of which woukl be the size of an ordinary cocoa-nut, white the smaller varied from the dimensions of a hen's egg to that of an orange. From the nature of these growths it is quite intpossible that they can be treated except by a professional man.
Porrigo is a disease of the scalp developing crusts in which sero-purulent discharges accumulate. It is somewhat like eczema in its appearance, and is essentially a disease of the epithelial covering of the scalp. The treatment of this disagreeable affection consists, in the first place, of washing the scalp thoroughly with carbolic soap, and after drying, an ointment composed of one part of red oxide of mercury ointment, with three parts of ordinary poniade, with which two drachms of quinine have been thoroughly mixed, should be applied night and morning.
Position. The position of any part suffering from weakness, injury, or illness, is of the greatest importance and requires to be taken into serious consideration in accident and in disease. In the case of a fracture, for instance, occurring beyond the reach of medical assistance, it is of the greatest importance to. the patient that the injured part should be kept in such a position as to prevent the ends of the bones penetrating the skin, as, otherwise, what might have remained a simple fracture is turned into a compound one, and therefore the peril of the limb very much increased, Again, if a joint is affected by disease, the position must be studied, so that if stiffening is inevitable, the

Himb may bo in such a position as to render it most niseful in the circuustances. Then, ngain, if a patient is sick or faint the recuubent posture will bo found most acceptable to him, and chable hin to rocover more rapidly than if the crect posture was maintained. In bleeding at the nose position is also of great in. portance, iss, naturally, the bleeding will be less liable to continue if the erect posture is mambained, and further assistance will be given by keeping the hands elcyated above the head. Then, in dropsical conditions of the lower litnbs especially position is of the utmost importance, as, if the legs are allowed to droop as in the ordinary position of sitting, the swelling will, from this mechanc:al arrangenemt, be more liable to lncrease: whereas, if the limbs are elevated and kopt in the horizuntal position, the flow of blood will be materially assisted and the swelling thereby reduced. Then, ogain, with regand to fatigue either of the mind or budy. it has buen said that a rest in bed for 24 hours is equal to a change of air extending over somo clays: nond this, doubtless, is the case, and can be accounted fur by the fact that the whole of the tissues of the body, together with the anhad, are in perfect repose and have an oppurtunity of regaining their wasted energies. There can be no doubt whatever that sleeping in a chair. instead of being beneficial, is frequently preudicial, wherens nothing is more refreshing and invigorating than sleeping in the recumbent posture. When the bodily strength is so far exhausted as to prevent the ladividual from changing his position in bed, it is essential that this should be done for him by the nurse in attendance, otherwise his condition becomes very much complicated by the development of bed sores, which are due to long continued pressure upon one part. whereby the circulation of the part is interfered with, and therefore it loses its vitality. Not only is shifting the posture of the patient beneficial in this respect. but it conduces very much to his comfort otherwise by the relief which his muscles obtain by having the position of the body altered.
Potash is the oxide of the metal potassium, and is ycry widely distributed throughout all nature. It is found in tho soil, in all living bodies, both animal and veyetable. It is very largely employed in medicine. the most generally used salts of this metal being caustic potash, carbooate and bi carbonate, fcream of tartar, or bi-tartrate or potash. acetate of potash, saltpetre or nitrate of potash, chlorate of potash, iodide of potasslum, bromide of potasslum, citrate of potash, and permanganate of potash. (See speclal articles.) Caustic potash in solution is employed as an ant-acid in certain diseases, especially in those affecting the urine, bicarbonate is also used as an ant-acid, and in similar circumstances. Caustic potash is also used as a caustic for the destruction of norbid growths, and has been found very useful in the treatment of carbuncle, by which means the recovery of the part is said to be very much hastened. Caustic potash requires, however, to be handled with the greatest of care, as its destructive effects upon the skin are very pronounced. Acetate of potash is a compound, as its name innplies, of acetic acid and potash. It is a popular remedy as a diuretic, and may be given in from 3080 40-grain doses in water. three or four timesa day. Chlorate of potash is largely used in the treatment of diseases of the mouth and throat, and is specially useful in the treatment of aphtha and stomatitis. Bi-tartrate of potash, or cream of tartar, is a popular remedy, and also possesses diuretic properties. Nitrate of potash or saltpetre is also used as a diuretic, but it is not such a safe medicine as the bi-tartrate. It has been frequently employed in the treatment of sore throat. The iodide and bromide of potassium are the two most popular salts of this metal. and are invaluable in the treatment of diseases of a constitutional character; the iodide of potassium being employed largely in the treatment of syphilis. rheumatism, enlarked glands, and swollen joints. It has also been recommended in the treatment of diphtheria,' but other remedies are much to be preferred. When taken in excess it is liable to give rise to very copious exuda. tion from the cyes and nostrils, and seems to have a peculiar effect upon the mucous membranes generally. This effect can be somewhat modified by combining it with carbonate of ammonia, Bromidct of potassium, by
its action upon tho arteries of thu brain, causing them to contract, produce's a soothing and soporific effect. It is a useful remedy in the treatinent of epilepsy, and cloubeless acts by its elfect upon the blood-vessels supplying the sensitive portion of the brain from the congextion of which the convulsions seem to be due. Permanganate of potash is the substanco which givos the disimiecting properties to Condy's fluid. It is a wetl-known and deservedly popular disinfecting agent. (See Permanganate of potash.)

Poultice is an applicatlon which is intended to act as an emollient, to afford molsture, and produce a soothing effect upon tho part to which it is applied. The great point in making a pouttico is to see that it is made very soft and very warm when it is applied, as upon cooling it becomes stiffer, therofore less emolilient in its effect. Poultices are made of several different articles, amongst which may bo mentioned-bran, linseed meal, oatmeal, marsh matlow, and charcoal, which of course is nlways mixed with some other substance, such as linseed meal and hembock for soothing purposes.
Prussic Acid, technically known as Hydrocyanic Acid, exists in a great innuy vegetable substances, such as the kernels of alf stone fruit, e.g. the peach, plun, cherry, etc. It is also contained in the leaf of the laurel. It is composed of three elementary substances, viz, nitrogen, hydrogen, and carbon. It has a most powerful, peculinr. pungent odour, and if inlialed in any quantity is apt to cause sudflen and serious depression of the heart's action. Prussic acid, which is employed in medicine and for commercial purposes, is not prepared from vegetable substances, but is procured by the decomposition of cyanide of potassium. It is a most valuable needicine when prescribed by the physician, its action being both sedative nnd anodyne to the nervous systen. In sickness and nervous irritability it proves of linmense service. Its poisonous properties, however, necessitate that it be employed with the greatest caution. lits actlon as a poison is very rapid, as it acts immediately upon the heart, producing paralysis of that organ. When a smalloverdose has been taken the symptoms produced are--a feeling of weight and pain in the head, confusion of the inental faculties, nausea, and a rapid pulse. The antidotes which are usually employed in poisoning from this substance are-cold water dashed freely over the body, and the spine especially ; stimulants, such as ammonia, alcohol, and digitalis, are also called for: while, if a medical man is at hand, the subcutaneous injection of strychnine may prove of great service. Chlorine, however, in the form of vapour seems to be the best antidote that is known for this poison; or thirty drops of the solution of chlorinated lime or chlorinated soda may be given in water by the mouth, the vapour at the same time being inhaled. Artificial respiration should also be employed, and electricity if It is at hand.

Puberty is that important epoch in the human life when the sexual organs become fully developed. In English law the time of puberty is considered in the male to be at fourteen years of age, and in the female at sixteen, but these periods are not actually correct so far as the physiological development of the individual is concerned, as the age of puberty varies very much in different individuals. Great care should be taken in the management of an individual attaining the age of puberty, as it is a critical period of life, when latent disease is apt to develop its activity, especially is this the case with regard to tuberculosis. Menstruation in girls is the first indicatlon that puberty is attained. white in boys it is generally indicated by the appearance of hair upon the face and genitals.

Puerperal is the term applied to affections which are incident to the child-hed, such as puerperal fever, puerperal inania. etc. (See "Woman in Health and Sickness."
Puerperal Fever is in every instance due to some oegligence on the part of the medical attendant. and is invariably the result of blood poisoning, either communlcated by him or as a result of decomposition taking place within the womb or its neighbourhood. It was at one time deemed an incurable disease, but with the adyance of inedical scicnce it can now be treated
with ahnost certain success, if active mensures are enployed to reniove the decomposing matter, and at the same time clisinfect the parts that have been contaminated.

Pulmonary is the tern applied to everything connected with the lungs, such as puhnonary consump. tion, gangrene, or cancer, etc.

Pulse is that sensation which is imparted by tho waves of blood passing througlo the arteries, and indlcates cacls beat of the heart, the condition of the circulation, and the strength of the individual. A regular, steady pulse, which is not easily obliterated by pressure, indicates a good condition of the general health, whercas if the pulse beat intermits, this fact usually points to some faulty action of the leart. Iapidity of the pulse may indicate either a high state of lever or a condition of nervous excitement. When fever is present and the pulse is rapid it is generally full, and round, and casity compressed. The average pulse in a healthy man in the prime of life may be estimated as beating 72 times in a minute, but though this is the average there are many deviations, and even in the same individual the pulse varies greatly accord. ing to the time of day it is taken, and the condition of his nervous system at the time. A quick pulse is never an indication of health, although some people appear to be fairly well with the pulse ranging from 80 to 90 , in others the pulse may be exceedingly slow, and may not exceed 40 beats in the minute, and yet apparently fair health is enjoyed.

The following is a table drawn up by M. Quetelet:-

The most convenient part of the body for feeling the pulse is the wrist, where the radial artery lies upon the bone and is very superficial. In affections of the brain, causing great depression, the pulse is usually slow, whereas in peritonitls it is very rapid and thready in character. In recent years a valuable instrument named the sphygmograplh has been introduced, which registers the exact movements of the heart by the tracings which are obtained from it. By this means a great deal of information has been obtained with regard to the circulation,

Pupil of the eye is the transparent portion of the cornea, and is surrounded by the iris or colouring matter of the eye. It permits light to pass directly through the lens to the retina. Opaque spots upon this important portion of the eye-ball should beattended to with the greatest promptitude, as their existence may not only disturb, but even destroy the vision altogether.

Purgatives are those medicinal substances which excite and accelerate the movements of the alimentary canal, and increase the discharges from it. Purgatives are divided into simple laxatives and drastic purgatives. A laxative effect may be produced by certain articles of diet, such as brown bread, porridge. uncooked foods, or even by drinking cold water before breakfast. These are generally described as dietetic laxatives, and act, more or less, by the mechanical irritation which they produce upon the mucous lining of the bowel. Injections also act as laxatives by washing out the bowel, and are most useful in the treatment of a sluggish condition of the colon. Their more general use would add very much to the comfort of those troubled with constipation or an Inefficient action of the colon. Amongst the more gentle laxatlves may be included-olive oil, almond oil, extract of malt, phosphate of soda, hyposulphite of soda, cream of tartar, prunes, sulphur, and tamarinds. Those having a more energetic effect are-aloes, cascara sagrada, podophyllin, Epson salts. Glauber salts, jalap, calumel, grey powder, blue pill, rhubarb, senna, and magnesia, when there is an acid condition of the stomach; while those having a more drastic effect are substances such as colocynth, scammony, gamboge, etc, The great
point to observe in taking purgatlves is to ascertain what is the direct cause of constipation. It may be due to errors of dict. want of exercise, Indigestion, or habitual neglect of the cills of nature, when of course the lower buwel becomes clistended and sceni-paralyzed. in consequence of the accumulations which have existed so long within its canal, because the parts have got stretclied and unible to act by unaided efforts. If the laws of nature were properly attended to purgatives would be rarely called for, but when they are necessary it is important that they should be employed without hesitation, as nany evil consequences arise from constipation, and predisposition to disease is induced by accumulations within the intestine, while the absorption of foetid fluids naturally arises therefron.
Pus is the discharge which is found in abscesses, upongranulating surfaces, open wounds, and ulcers. It varies very much in character, but in every instance it is the result of decomposition. At one time pus was thought to be essential to the act of healing; now, however, it is always considered an unnecessary evil, as its presence can always be avoided by the judicious and careful employment of antiseptics, except of course in the formation of abscesses which are beyond the controf of the gurgeon until they have actually formed; yet, by prompt interference, these abscesses can be frequently aborted and prevented from extending in their dimensions. The formation of pus is due to the action of certain minute organisins which prey upon the secretion of the inembrane, granulations, or other part which has been weakened either by disease or injury, and thus rendered an easy prey to these microbes.
Pustules are slight elevations on the skin and contain pus. They are invariably due to decomposition taking place in serum which has been effused in limited areas on the surface of the skin. They generally appear as clear vesicles, and these undergo a purulent change. The formation of pus in such circumstances, if the eruption is extersive, as in some cases of small-pox, is always attended by very high fever; hence the great danger which attends the development of pus in this disease, and which gives rise to the secondary fever of small-рох.
Pustule, Malignant, is due to the introduction of the poison of anthrax or charbon into the skin. It is a most painful, and at one time was considered a fatal, disease; now, however, by the introduction subcu. taneously of antiseptics round the neighbourhood of the pustule the disease can frequently be destroyed, in consequence of the parasite being killed. In olden times it was thought necessary to avert a fatal issue by' excising the pustule along with a considerable portion of the healthy skin, or else to destroy the diseased area by the use of powerful caustics. There can be little doubt that this disease may be communicated by means of flies, which have been feeding on putrid matter, alighting on the skin and depositing the poison there; so that if irritation commences after the bite of one of these insects the greatestivatchfulness should be paid to its immediate effects.

Pyaemia literatly means pus in the blood, and is alwaysattended with very high fever, whicl may abate for a period, but always comes on again with renewed vigour. The fever is due to the blood being poisoned from absorption of foetid matter from any, given point. The suppuration occurs in the blood itself, but this invariably gives rise to coagulation of the blood in its immediate neighbourhood within the vessel. The pus germs, however, invade this clot and reduce it to pus, when a fresh exacerbation of the fever immediately ensues. This succession of feverish attacks comes on for a limited period, but sooner or later the patient succumbs to the general septicaemia which always results if the disease has not been checked. In olden times, before antiseptics were thoroughly understood, pyaemia, or septicaemia, was a very common occurrence in the practice of surgery; now, however, thanks to elcanliness and antiseptics, and the laws which the employment of these substances have naturally developed, this disease is rarely or never met with, and if it does show itself it can always be traced to negligence on the part of the medical man or the nurses in attendance upon the patient. It commences with
rigors and high temperature, followed hy profuse perspirations. denoting great prostration of the individual A succession of these symptonis, together with their temporary abeyance, is quite characteristlc of the disease.
Pyrosis, or Water-brash, is always due to indiFestion, and is trequently associated with heart-burn. It is a most disagreeable symptom, and is recognized by eructations of a disagreeable watery fuid welling up into the mouth. In many people certain articles of diet, such as oatmeal in any form, broths, soups, stuwed meat, and boiled meat, give rise to this form of dyspepsia. The best mediciual agent in the circumstances is bismuth, 10 grains of whichs may be taken halfan-hour before food three times a day.
Quinine is the principal alkaloid which is obtained from cinchona bark, commonly called ' F'eruvian bark. It possesses most excellent properties as an antidote for ague, as a curative agent in neuralgia, as
in anti-pyretic in certain furms of fever, and as a tonic in debility. It also has valuable medicinal properties when applied locally, as in eczena, psoriasis, pityriasis, and other skin afrections. The dose of qumine varies very much according 10 circunstances-in ague it is sometiues given up to 25 igrains, but as a rule one or two grains every hour or tivo is quite sufficient to produce the desired medicinal effects of this substance. When quinine is taken for any length of time it gives rise to peculiar singing or rushing noises within the ear, which may actually develop into complete deafness for the time being. This is called cinchonism. Quis:ine also in many instances acts as an irritant to the stomach; this, howerer, is only the case when chronic congestion of the mucous menbrane exists.

Quinsy, or Tonsilitis which has gone on to suppuration, is one of the most painful affections that can possibly attack the throat. It is closely associated with rheumatism, and as a rule, only develops in rheumatic subjects. The author has found it frequently to precede an attack of rheumatic fever. When the inflammation of quinsy has proceeded to a certain extent, it is liable to give rise to an abscess within the tonsil, which is accompanied by considerable fever and excruciating pain, especially when any attempt is being made to swallow. Quinsy rarely attacks an individual who is in good health, but, as a rule, is indicative of a lowered state of the general system, which is accompanied by constipation. a highly acid condition of the urine, and a theurnatic condition of the blood. When tonsilitis appears it is well to suspect that quinsy may be in the background, and with a view to prevent its occurrence the following mixture should always be in readiness, and should be taken every two hours when the least indication of inflammation of the tonsils is present:Chlorate of potash and salicine, of each $2 \frac{1}{2}$ clrachms ; guaiacum mixture, 6 ounces-mix, and take a dessertspoonful every two hours.
Quotidian is the term applied to agues whose paroxysms occur every 24 hours. (See AGUE.)
Radius is the bone of the fore-arm upon which the land is articulated at the wrist-joint, and is so called because of its power of revolving round on the ulna.
Rash is that term which is applied to the discolouration of the skin, or eruptions which occur in certain diseases, such as scarlet fever, measles, mettlerash, erythema, etc. Small-pox and chicken-pox, on the other hand, develop vesicles whicla are termed the eruption of these diseases.

Regimen is one of the most important adjunctsto medicine in the treatment of every disease. In dyspepsia especially mothing conduces so much to the welfare of the patient as strict attention to regimen. In such circumstances the diet must be carefully con-sidered-articles of certain descriptions being prohibited, while those of a more digestible character should constitute the fool of the patient. Regimen, however, goes very much beyonl the region of diete:ics. The daily routine of the patient requires to be modified in such a way as shall be most beneficlal to him in his endeavour to obtain restoration to health. (See indigestion, Gymastics, diet, Hygiene, etc.)

Respiration is the term which is applied to the whole process of breathing, from the time the air com.
mences to enter the lungs, to that in which it is completely expelled. The respiration is frequently an unportant guide to the physician in his endeavours to diagnose diseases, especially thuse atlectiug the cliest and heart, although any illness which disturbs the circulation or nervous condition of the patient invariably has mure or less it direct effect upon the breathing. llence, if a person breathes with difficulty, even without exertion, this is generally caused by some atfection of the lungs, either directly or indirectly. If, ons some slight mution, the breathing is increased in rapidity and renclered more difficule, we nay rest satisfied that either the lungs or the heart are the seat of serious diseasc. Y'et, such fib condition may be produced by causes quite external to both the lungs and heart, such as distension of the stomach from dyspepsia, etc. The number of respirations per minute in an adult, when he is in good health, should be from sixteen to twenty; when they are increased beyond this the fact is generally explained by disease being present in one form or another, either within the chest itself or in the abdomen.

Respirators are instruments inanufactured for the purpose of filtering the air before it enters the mouth and nose. This may be fitted in such a manner as to enable antiseptic renedies to be constantly applied in a volatile form, and at one time great faith was placed in creasote and carbolic acid being inlaled for hours at a time by those suffering from consumptive disease. The great bencfit, however, which the wearing of the respirators confer is that they prevent the inhalation of minute particles which are held in suspension in the atmosphere, and which are very injurious to those suffering from bronclitis, asthma, and consumptive disease. They are aiso useful in yielding a certain amount of warnth to the atinosphere before it is inspired. In obstinate cough many substances may be introduced into the respirator which will have a soothing effect, such as chloroform, creasote, menthol, belladonna, conium, henbane, etc.

Retina is the expanded membrane composed of nerve tissue which is derived from the optic nerve and is spread over the inner surface of the eye-ball. It is this membrane which receives the impressions of external objects, and conveys these impressions by means of the optic nerve to the brain. When viewed through the ophthalmoscope it has a beautiful reddish golden tint when free from disease. When this portion of the organ of vision becomes inactive, the disease called amaurosis is said to exist. The functions of the retina may also become disorganized by a dropsical condition occurring behind the membrane and detaching it from its matrix, or a blood-vessel may rupture within the nembrane and thus destroy the vision.

Rheumatism may be said to be composed of tivo varieties, viz., the acute and the chronic. The direct cause of rheumatism is the acid condition of the blood, the acid contained being uric. It is invariably associated with constipation and dyspepsia of the acid type. Certain individuals are more prone to this disease than others; but the author's conviction is, that even an individual who has a hereditary tendency to this disease may escape it altogether if he pay sufficient attention to the daily evacuation of the bowels. There is hardly a tissue of the body that may not be affected by rheumatism. The acute variety, however, invariably attacks the joints, and serous membranes, sucli as the pericardiuna, pleura, peritoneum, as well as those of the joints. It is characterized by very high fever, a thickly furred tongue, and excruciating pain on the least movement of the parts affected. It is not unfrequently preceded by an attack of tonsilitis, or quinsy, which may proceed to suppuration. This, however, only goes to prove that these diseases are of a rheumatic nature, and owe their origin to the same poison which develops the disease in other parts of the body. Acute rheumatism, however, now-a-days, has been robbed very much of its painful symptons and duration. This has bcen due to the discovery of the fact that constipation always lias a great deal to do with the development and continuance of the disease, and also that salicine has a powerful influence over it, this influence being probably due entirely to the fact that salicine is an antiseptic, and has the power of destroying the virus which gives rise to the chemical change
which takes phace whthln tho blood. Clironle rheumatism, although not so excessively painful, and not productive of the feverish symptons which the acuto variely gives rise to, is a disease which cutails mucls snifering and distress. Hoth of these varicties maty be very mach relieved ly applying to the parts agrents that have a soothing etiect upon the nerves surrouncl. firg the affected areas. Amongst these agents may bo nuentioned-carbolic acid in solution, menthol, chloroform, belladonna, opium, etc. In every instance. however, the chicf object of those who are in attendance upon the patient should be, to ensure the daily and free evacuation of the bowels, to regulate the clict so as to promote digestion to its fullest extent, and to keep the patient clothed in flannel. Salicine may be given according to age, in from 5 to zo-grain doses every two loours, in the acute form of the disease, and it will also be found beneficial in the chronic variety. If the disease attacks the throat and quinsy is threatening, the following inixture will generally prove most efficacious in arresting its progress:-Salicine and chlorate of potash, of each $2 \frac{1}{2}$ drachms; mixture of guaiacum, 6 ounces-to be mixed, and a dessert-spoonful taken every two hours. It should always be remembered that rheumatism may attack portions of the human body which may appear to be unlikely places for it to locate itself, such as the eye, the mucous membranes, the ovaries, etc. People affected in this manner are generally exceedingly susceptible to the influences of cold, and from this fact alone a rheumatic condition of the system may be recognized. Thickening of the joints is frequently the result of a rheumatic state of the system, and what is often designated as rheumatic gout is neither more or less than chronic rheumatism. At the same time we must not overloci- the fact that gout is very closely related to rheumatism, and is simply a plase of this disease. A chronic congested condition of the throat is almost always of rheumatic origin, and it will be found that people suffering from this painful affection will procure great relief by taking salicine, or the salicine and guaiacum mixture which is mentioned above. It is a well-known fact that individuals of a rheumatic temperament are very seusitive to changes of temperature and climate; therefore, a dry, equable climate is to be preferred for those who sufter from this disease. Many medicinal springs have been found most useful in the treatment of this disease, and in consequence of their curative properties have become historical as health resorts. Anongst the most famous are those of Aix-les-Bains on the continent, Bath and Buxton in this country.

Rhubarb as a medicine is obtained from the root of the ordinary rhubarb. The climate, however, in whlch it grows seems to exert a considerable influence upon its medicinal properties, Turkey rhubarb being the best in the market. The great portion of the rhubarb, however, employed in medicine is grown in India and Chinese Tartary. It Is a medicine of very great value, combining not only purgative fand antibilious, but tonic properties as well. When of good quality, its odour, though feeble, is anything but agreeable, and its colour sloould be of a bright yellow. There are few medicines which are more extensively employed than rhubarb, and few possess greater value or are safer remedies. Its peculiar characteristics are those of a mild but effectual aperient. It does not gripe ; it is a tonic: and after lts action it is a slight astringent. It is taken largely in the form of 'Gregory's mixture, where its tonic effects combined with the carminative effects of the ginger contained, and the ant-acid and purgative effects of the magnesia, render it most usefil in cases of constipatlon associated with acidity or indigestion in any form. It also enters largely into the compound rhubarb pill, and is also prescribed as the tincture, and for children there is a sweet essence prepared which is not only easy to take, but very efficient in its action. There is no doubt that rlubarb has a slight stimulating effect upon the action of the liver: hence, it is frequently combined with grey powder in the treatment of bilious disorders. The ordinary dose for an adult is from 20 to 30 grains, while for a child one year old 5 grains may be given with perfect safety. When rhubarb is mixed with sherry wine or brindy it is deprived to a large extent of its
nauseous taste, or a few drops of eau de Cologne, chloric ether, or spirits of nitre, may be added with a view to take away the characteristic taste of the drug.

Ribs are the bones which form the arcli of the thorax in front, whicle has its foundation upon the vertebral colum, and encloses the orgians of the chest and thuse of the upper part of the allodomen. They are twelve in number on each side. The upper seven are directly commected witls the breast bonc, or 'sternum,' by means of cartilaginous attachments. These are called the 'true' ribs. The remaining five have no direct connection with anything but the vertclal column, and they are named the 'floating' or 'false" ribs. The cartilages conuecting the true ribs with the breast bone, together with the mobility of the ribs thenselves, enable the cliest to expand and contract int the process of respiration. The ribs are liable to fracture from direct violence, and this frequently gives rise to very alarming symptoms, especially if the rib perforates the lungs, when haemorrlage may take place from the lung substance, and emphysema result in the tissues external to the cliest, in consequence of the air finding exit through the ruptured lung into the cellular tissue of the body. Fracture of the rib is always acconpanied by severc pain in the immediate neightbourhood of the injury. It, however, is a lesion which generally can be repaired without much trouble.

Rickets is a discase in which the bones are deficient in the liase salts which enter so largely into their composition, and hence they lose the hardness which is essential to their healthy condition. In consequence of this, they are liable to become malformed and bent in various directions, according to the weight which is brought to bear upon them. Rickets, as a rule, are entirely due to want of proper nourishment. It has been erroneously attributed to a deficiency of lime in the water of certain localities, but this is a great mistake, as nature has provided for a sufficiency of lime being present in every healthy article of diet. It is, therefore, a matter beyond dispute that rickets invariably result from children being fed upon sloppy and unnatural articles of diet; in short, rickets resolves itself into a species of starvation. Where rickety children exist it will always be found that there is improvidence on the part of the parents. They are usually dissipated, and care less for their children than they do for their own individual comforts, luxuries, and excesses. It is quite a mistake to suppose for a moment that rickets is a natural disease, and that it can be cured by the administration of medicine. A wholesome regimen must be adopted, or certainly the disease will develop into the usual outcome, viz., tuberculosis. Rickets are characterized by deformities of the limbs, of the pelvis, of the spine, and of the ribs, and, in many instances, of the bones of the skull. The best medical renedy, combined with wholesome nourishment, is the muriate of calcium, along with the syrup of the hypophosphites.

Rigor is that condition of the body which, although associated invariably with a very high temperature, gives the impression to the individual that he is, intensely cold. It is invariably accompanied by shivering. It is usually the precursor of some feverish condition resulting from a contamination of the blood, such as is experienced at the onset of acute fevers and inflammations. It may, however, also result from some nervous irritation, when, of course, its import is not so great as if it was due to some septic influence acting upon the blood.
Ring-Worm is due to the presence of a fungus which locates itself within the hair follicles of the skin, and by the development of its progeny there spreads sometimes over a considerable area. It rarely attacks the hair of adults, but in children it frequently produces most disastrous results, and is a disease always difficult of eradication. It radiates from a centre-hence the origin of its nam.-and in its progress it destroys the hair, or rather it destroys the power of the hair bulbs to develop new hair. The proper method to treat it, if recognized in its very earliest stage, is to apply some powerful parasiticide, such as acetic acid, carbolic acid in solution, or strong mercurial ointment. Before applying any of these substances, however, it is necessary to wash arvay from the surface which is invaded all greasy
matter, by means of carbolic soap. Another renedy which has been advocated for this affection is tnrpellture, frequently applied to the part. When the diseabe attacks the bearcl, whiskers, or monstacle of an adult, it is thell very much more difficult to eradicate, and in these circumstances it is absolutely necessary that cvery hair be pulled out by the root, and an ointment, composed of one part of oleate of mercury ointment, une part of the oleate of zinc ointment to which has been added one-eightls part of aristol, be applied. This ointment should be well rubbed into the amected fart night and morning, and continued for a considernble period after all traces of the discase appear to have disappeared. At the same time the health of the Individual should be strengthened by the administration of cod-liver ail, together with an äbundance of nomishment. There can be little clonbt, although it has not been tried on a very large scale, that the application of pure chloroform repeated at frequent intervals, would have a most bencficial effect upon this disease. The author, however, has found that it lus proved very efficacious in this loathsome affection.

Rupture, or Herma, is the protrusion of one or other portiun uf the bowel, or of any of the contents of the abdominal cavity. This protrusion nsually takes place in the groin, when it is called an "inguinal hernia," although it miay also pass through at a lower level than this, when it is termed a femoral hemia, the distinctive names being given to the rupture which passes througlt the inguinal or fermoral rings. Hernias not unfrequently take place at the umbilicus, or navel. These are most frequently met with in females who have borne children, and are called umbilical hemias. In infants a slight protrusion frequently takes place at the navel, but this, as a rule, is easily put right by a properly applied bandage. Hernias are said to be congenital or acquired. When a child is born with a hernia it is most desirable that a properly fitting truss should be immediately procured and worn constantly, so as to prevent the bowel coming down. If proper precautions be taken in this respect the probabilities are that the swelling will soon disappear, at least within the course of two or three years, and not be liable to return unless the parts are subjected to some severe strain. When a rupture is acquired it is generally due to some powerful muscular strain which has forced the bowel down through the apertures or rings before mentioned. If the rupture has been ploduced in this way it must be reduced with as little delay as possible, and afterwards a truss worn to prevent its recurrence. When a rupture is due to this cause it is not so likely to be recovered from entirely, and it will be a necessity for the patient to wear a truss ever afterwards. There are surgical means, however, which may be adopted for the cure of hernia, and as these operations involve little risk they are to be recommended, as the comfort of the patient is so much increased and his peace of mind assured when there is no dread of the rupture returning. When the rupture comes down, and cannot be returned again to the bowel by the individual himself, medical aid should at once be called in, and every expedient resorted to with a view to get the bowel replaced in the abdomen. Otherwise, it is liable to become strangulated, and when this occurs it becomes most painful from the inflammation which necessarily is set up, and may even prove fatal if operative measures are not immediately resorted to for its rednction. If the medical man fails by the process of what is called - taxis ' in getting the hernia reduced, then it will be necessiry to supplement this by the administration of chloroforn with a view to relax the parts thoroughly. The employment of an anaesthetic in these circuinstances is always attended with very great benefit, and generally enables the surgeon to reduce the swelling. If this fails, then the sac in which the bowel is contained, and which is composed of peritoneum, will require to be exposed, and the neck of the sac divided. so as to permit the bowel being replaced within the abdominal cavity. If this is not done with sufficient promptitude gangrene of the bowel will certainly result, when, of course it will be almost impossible aftervards to avert a fatal issue. When a truss is worn for the rellef of a hernia the greatest care must be taken ln its selection and prope- fit, and it is always safe and
expedient to get the oplnion of a medical man is to tho proper kind of truss to purchase. Everyonte who sutturs from liernia shoukd be particularly careful about the daily evacuation of his bowels.

St. Uitus's Dance is a peculiar involuntary action, or perliaps it wonkl be more correct to say an inability to direct the action uf the voluntary muscles. It is a disease purely confued to the nervous apparatus of the body, and is very closely allied to, if not dentical with, rheumatism. It probably is entirely due to a rheunatic condition of the blood and a tendency to the development of this discase in the system. It is at all events a curious fact that chorea is closely associated with nany of the symptoms and conseguences which are pecnlar to rheumatism. It is a disease for the most part confined to young persous, but may becone so cluronic in these as to last beyond the age of puberty and even beyond that of manhood. The inost marked symptoms in this disease are the involuntary movements of what ought to be voluntary muscles-that is to say, inuscles which, as a rule, are under the control of the will, refuse to act as the will directs, but make most erratic excursions in their endeavour to fperform what is required of them. It is a disease which is associated with a considorable amount of twitching about the face and neck, and especially about the muscles of the mouth, the most extraordinary grimaces being made by those suffering from St. Vitus's dance, while on asking a child affected in this way to clutch or grasp any object his will scems to lose the power of directing his hand to do what he wishes, Many things have been blamed for the development of the symptoms of St. Vitus's dance. The probability, however, is that it, like all other rheumatic affections, takes its origin in a constipated state of the bowels, thereafter an acid state of the blood, and consequently a poisoned condition of the nervous apparatus, which culminates in a rheumatic affection of the whole system. The nervous apparatus in these circumstances is first affected. The great point therefore in the treatment of this disease is to observe strict regularity of the bowels, to counteract the rheumatic condition of the blood by means of salicine or salicylate of soda, and at the same time soothe the nervous symptoms (which naturally arise from the vitiated couclition of the blood acting upun the nerves which have become erratic) by means of valerianate of zinc counbined with extract of coniunsay, for a child of ten years old, $1 \frac{1}{2}$ grains of valerianate of zinc, and I grain extract of conium, made into a pill and given three times a day.

Salicine is obtained from the bark of the willow tree; and from the fact that the willow grows in dasnp, marshy districts, and rheumatism is prevalent wherever there is dampness and humidity of the soil, it would appear that nature has so arranged that wherever disease is developed by certain circumstances its antidote is at the same tine provided in the immediate neighbourhood. Salicine is a peculiar bitter substance forming in crystals very like the other alkaloids with which we are so well acquainted, such as quinine. It is not only a remedy, but a specific for rheumatism, especially that of the acute character; but it matters not what the nature of the rhemnatism is, whether it be acute or chronic, whether it be due to some deposit within the joints or inflammatory affection of the tonsils, or chorea ; in short, if rheumatism is the cause of the suffering, salicine will invariably be the medicine that should be prescribed. Many a case of acute rheumatisin has been cut short by the action of salicine, and in the author's experience no case of tonsilitis need ever progress to the stage of suppraration if salicine, combined with guaiacum, be properly administered. There are other preparations of salicine which are also employed for similar purposes, viz., salicylate of soda, salicylic acid, and salicylate of varions bases whicit it is quite unnecessary to enumerate. All, however, have fpeculiar antidotal properties over rheumatism. There can be little doubt that this important medicine acts very much in the same way as other antipyretics act, vlz., by destroying the poison which is generated by the fever producing the attack.
Saliva, is the secretion of the glands surrounding the gums, which have their exit in the cavity of the month, and are stimulated by the act of clicwing, and
especially the chewing of savoury footls. It is entirely che to the action of the saliva that starch, or farinaceous matter, is digested. Starch, by the action of the saliva, is transformed into glucose, and thereby becomes fit to be acted upon by the biliary and pancreatic secrutions, and then transforned into chyle. Gastric julce, however, on the other hand, has no effect upon starch, so that In the partaking of starchy food it is essential that these be thoroughly masticated and mixed with the saliva before passing into the stomach. It is a wonderful fact that the very idea of partaking of food often sets the salivary glands into action, and we frequently findi that even the odour of cooking is sufficient to excite the appetite and operate on these glands. Thus, we hear of onc's mouth watering, or one's teetly watering, when odours are experienced. It is quite manecessary for one in a work of this kind to enter into the various chemical constituents of this most interesting fluid; suffice it to say, that its acting principle is clue to the presence of ptyaline, which has the power of acting upon diastase and starch, and transforming these into glucose or saccharine matter. Saliva inay therefore be considered to be one of the digestive juices, as without its aid a great many distressing symptoms, such as acidity, flatulence, disteusion, and inconvenience would be experienced.

Salivation is the excessive secretion of saliva, and may be due to mercurial poisoning, the administration of iodide of potasslum in excess, or to a diseased condition of the nerves regulating the action of the salivary glands. Some people have a peculiar faculty of secreting saliva to a degree which can neither be pleasant to themselves nor agrecable to those in their company.

Salol is a coal tar product employed in the treatment of rheumatism. It has been employed in solution as a lotion, and when it is applied round inflamed and rheumatic joints is said to be of considerable service. Its benefits are most powerfully and permanently demonstrated, however, when it is partaken of by the mouth, the dose being from 5 to 15 grains every two hours in cases of rheuinatism or feverish attacks. This substance, however, neither possesses nor does it deserve the reputation which has been obtained by saliclne, its compounds and phenacetine.

Sal-Prunell is a purified form of saltpetre, whicls is generally sold in the form of marbles. It is an old but exploded remedy for the treatment of sore throat, but no doubt it has had its day, and has proved of service in these circumstances.

Salt is applied to everything which is soluble in water, and has an elementary body, such as potash, soda, lime, or magnesia for its base. It is usually applied, however, to the salt which is employed for domestic purposes, although it must be understood that it is not because of this term that the general cognomen has been adopted. Salines and salts are identical as far as chemical composition goes. In this paragraph, however, the term must be confined to that of the chloride of sodium, which is the salt that is em. ployed for domestic purposes. It is composed of equal portions of chlorine and sodium, and is contained in large quantities in various springs, in mines, and, as is well known, In sea-water, Without it, it would be impossible for the stomach to secrete the various juices which are essential to digestion. Chlorine, for instance, enters largely into the composition of gastric juice, and without common salt it would be very difficult to procure chlorine. Salt, as is well known, has many properties beyoud its uses as a digestive agent. It has wonderful antiseptic and, in consequence, preserving powers, which before the knowledge of antiseptics was so perfect as it is at present, were made available for, and utilized to a very large extent in, the preservation of animal food.

Salt of Tartar is an old name which was applied to the impure carbonate of potash. It was largely employed for cleaning purposes, especially where it was desirable to remove grease, paint, and stains of any kind.
Saltpetre has been described under the article of Nitrate of Potash and Sal-Prunelle.
Sal-Volatile is the aromatic spirits of ammonia, and is both astimulant and an antiseptic, and is espe-
cially useful in the treatment of fainting, fatulence hysteria, recovery froll drowning, hanging, prussicacid poisoning, or any circumstances which deprass the heart's action.
Sanitas is one of the most agreeable and efficient antiseptics and deodorizers that we possess, It is manufactured from common turpentine, which is oxidized by certain chemical processes, and which transforms this substance into one which seents to be closcly allied to ozone in its chemencal properties. It may be employed by sprinkling it over the carpet, upon the bed-clothes and hangings of the room, none of which it injures in any way, and its vapour when thus employed gives a pleasant character to the atmosphere of the sick-roon. It can also be employed in the form of spray in sore throat, or to any portion of the body where it may be thought advisable to use it as an application.
Sanitation. Sanitary regulations and laws are daily acquiring greater and greater iutportance, both anongst the public and medical profession. Nunerous Acts of Parliament have been passed with a view of enforcing certain sanitary laws, the observance of which not only adds very much to the comfort of the population at large, but to individual health; and hence the longevity of the population has been very much increased in consequence of the abolition to a large extent of certain diseases which at one time were prevalent to an enormous degree. Were it not for sanitary enactments our large cities, which to-day are alnost free from typhus fever, would still be the hot beds of this terrible scourge. Cholera, by these measures, has been almost made impossible in this country, while typhoid fever and all other zynotic diseases have been reduced very much, not only in virulence, but in the frequency of their attacks. Sanitation, however, does not entirely depend upon Acts of Parliament. The individual must also be educated in this branch of science, and he, by his own eflorts and care, will be enabled frequently to avert disease when it may be threatening, or to prevent its possibility, by adopting suitable measures which have for their object free and abundant ventilation, cleanliness, and exclusion of foetid gases from dwellings, and the obtaining of pure water and milk. As is well known, many of the dis. eases which we call infectious are communicated by these two fluids much more frequently than they are by inhaling a contaminated atmosphere. Perhaps one of the most important advances that has been made in recent years with regard to sanitation is the closing of graveyards within towns and cities; but what would be a greater advance still would be to do away with burial of the dead altogether and adopt cremation instead. The process of decomposition which goes on after burial in the long run only culminates in what crema. tion would accomplish in a few minutes, while in the process of the chemical change which naturally takes place after death the living are injuriously affected, in consequence of the atmosphere being contaminated by the foetid gases which naturally emanate from decomposing tissue.

Santonine is a valuable remedy in the 'lumbricus,' or round-worm. It is the active principle of wormwood, and possesses poisonous properties as regards the above-mentioned parasite. The dose of santonine is from two to six grains, but its administration should be preceded by a dose of castor oil. It may be taken in milk at intervals of eight or twelve hours, and afterwards followed by a dose of castor oil each time. Such a course of treatment usually results in a complete evacuation of the worms from the intestine. As is well known. these worms wander about all througln the intestinal tract, and may be either passed by the bowel or vomited by the mouth; indeed the author has known them being vomited into the nares and actually passed through the mose. It is needless to say that the presence of these creatures is highly prejudicial to liealth, and gives rise not only to great weakness, but to many nerrous symptoms which of times become very alarming, such as convulsions, etc.

Sarcinae Ventriculi are fungoid develop. ments within the stomach, alway's accompanied by great distentlon of that organ, with sickness and vomiting. They are always associated with a higlily
acld condition of the secretions of the stomach, and the vomited matter is Invariably found to contain these peculiar fungold developments. Under the microscope they appear as sniall packages, ancl are often associated with the ordinary yeast plaut, or 'torula cerevisiae. The treatment of this troublesome form of dyspepsia can only be undertaken by a qualified needical nam. but it is a mistake to suppose that by simply destroying the fungus we eradicate the discase, because the fungus can only cxist when the secretions of the organ are unhealthy; therefore. while sucli substances as the sulphite and hyposulphite of soda destroy the vitality of the parasite for the tine being, it will alnost certainly recur if measures are not adopted to improve the digestion and inviyorate the stomach. The occurrence of this particular form of indigestion is most frequently dict, such as potatoes oatineal, and bread a vegetable fore very common in some parts of Scotland, and also In Ireland. When this peculiar condition of the stomach exists it is wery liable to be accompanied by distressing nervous symptoms, such as great depression of spirits, irritability of temper, and a norbid condition whicli may almost appear to horder upon mania.
Sardonic Smile, or Grin, is in characteristic symptom of lockjaw and many other convulsive affections. The peculiarity of this suile is that the corners of the mouth are drawn back and the teeth exposed.
Sarsaparilla at one time was a most popular medicine, and was believed to be possessed of wonderful purifying effects upon the blood. It is extracted from a creeping plant, native of the central and northern portion of South America. The root is brought to this country tied up in bundles, which are cut up into chips for the market. Sarsaparilla is usually prescribed in the form of decoction or infusion, and has found considerable favour by some medical men, especially when combined with iodide of potassium. in the treatnent of syphilis and other constitutional disorders.
Savine is used both externally and internally. When employed as an application it is usually made up in the form of ointment, and in consequence of its irritating properties has been frequently employed as an application to blisters to prevent them healing. Intermally it is said to have considerable stimulating effects upon the functions of the womb; hence it has been prescribed in delajed menstruation, or when functional weakness wis present in the sexual organs.
Scabies is another name for itch , in consequence of the disease being due to the insect called 'acarus scabies. (See ITCH.)
Scald is a burn produced by the application of hot water or fuid of any kind. When a scald has been sustained the best application is a solution of Condy's fluid in water, applied on bits of cotton or linen, and frequently changed, by which means the heat is extracted from the part and decomposition is prevented if the blister bursts, and hence healing is very much hastened.
Scald Head is a term applied to many loathsome encrustations which affect the scalp, but the term should be entirely confined to that disease which is called 'porrigo favose,' which is a skin affection having a vegetable or fungoid origin. the fungus clipping down into the hair bulbs very much in the same way as that of ring-worm does. The irritation prodheced upon the scalp by thls parasite develops an infusion of serum which exndes and forns crusts or scabs upon the surface, within which the fungus exists and develops its spores. It is a disease which is always associated with filth. The encrustations may advance to such a degree as to cover the whole scalp. From the diseased surface a most peculiar odour ol a disagrecable character constantly escapes. The dlsease produces itching, which aggravates it in consequence of the scratching which it excites, and the consequent irritation and crosions which are produced, where the disease locates itself, and thus forms new centres from which it radiates. The treatment to adopt in this affectlon is to apply a poultice to the affected part. so as to enable the crusts to be lifted off entircly, after which equal portions of the oleate of mercury and oleate of zinc ointment should be well rubbed in night
and morning. Another excellent ointnent in the circumstances is composed of 8 parts of oleate of zinc ointhent, 8 parts of oleate of mercury ointinent, 2 parts of quiline, and a part of chrysaroblu. This also should be rubbed in nilght and morning.
Scalp or Skin of the llend, is ehicker .and denser than the integnunent of the body, and it is connected with the parts inmeeliately beneath it by cellular tissue. These characteristics give it a peculiar power of resisting the eflects of violence, as its elasticity and vascularity render blows and brnises not only less injurions, but also unore easily recovered from. A cut in the scalp heals very readily, and the effects of a bruise very soon disappear. Great care should be taken in all curs or alrasions of the scalp that they be cleansed thoroughly from dirt which nay have found entrance there. Aiter the wound has been thoroughly cleansed an antiseptic solutiou should be applied, such as liriar's balsam, a 5 .per cent. solution of carbolic acid, or a very weak solution of bi-chloride of mercury, or even pure whisky. By the application of such substances the tendency to suppuration will be very much reduced. If the wound is deep and gaping a few stitcles may be necessary, but as a rule these can be dispensed with in injuries to this part of the integument, as afcer the hair has been cut off round the injured portion the lips of the wound can be drawn together by plaster, and kept in position by these ustil union takes place. Bleeding from wounds in the scalp is often very profuse, especially if an artery has been injured. In such circumstances it will frequently be necessary to have these picked up by means of artery forceps and tied. Simple pressure, however, often arrests the bleeding very quickly, and can be reatily applied to the scalp in consequence of the hard skull which lies Immediately beneath. One considerable danger, which should never be lost sight of in injuries to the scalp, is the tendency for erysipelas to attack a bruised or contused wound. This, however, can only be the result of carelessness on the part of those in clarge, as erysipelas is. well known to be a poison introduced from without. It is therefore imperative that the wound, as has been berore indicated, be thoroughly cleansed and protected from atmospheric influences by means of antiseptics carefully and efficiently applied, In many instances the edges of a wound of the scalp can be kept together by plating the hair on each side, and bringing the lips in contact by drawing the hair across the line of incision, tlus keeping them fixed there. The scalp is often the seat of small cystic tumours, which are filled with a peculiar-looking matter resembling porridge in its appearance. These little growths are generally hereditary in their mature, and although not dangerous, yet cause considerable inconvenience to those affected. They can always be removed without much pain, and at no risk, by incising the scalp and drawing the tuinour out in its entirety by means of forceps. Great care, however, should always be exercised in extracting these tumours, as it matters not how little of the cyst remains, it will always give rise to another growth if it is allowed to retain its vitality. These tumours go under the name of atheroma, which name is derived from the peculiar appearance of their contents. The scalp is the seat of various forms of skin disease, such is ring.worm, scald-head, eczema, pityriasis or dandriff, prorigo, alopecia, etc. In consequence of the dense character of the scalp, and the peculiar punctuated condition of its structure, there is a large area and peculiar facilities for the development of fungus diseases, in conseguence of these insinuating their filaments within the hair fnlicles, where they are often very difficult to reach ly parasiticicles. The proper method to adopt, therefore. in all affections of the scalp is to remove the hair by shaving, and thereafter rub well into the lair follicles the parasiticide which it is advisable to adopt in the peciliar circumstances. The remedies which are most efficacious where infectious diseases of the scalp exist are-the olcates and nitrate of mercury ointment. the acetum cantharides, turpentine, chloroform, chryso. phanic acid, chrysarobin, etc. It must be borne in mind, however, that although the disease may seem to have been eradicated the spores are lialle to exist for a considerable period after all traces of the disease seem to have disappeared It is, therefore, illways wise to
continue the applleatlous long after the disense las apparently been cured. While the local treatnent is gong on it is essential that the children shonld be well nounshed, hive plenty of tresh air, have their bowels regularly attended to, and be placed in circumstances which shatl be most conducive to their being kept in good vigrorous liealth.

Scammony is a ghm resin possessing cathartic propertics of a drastic character. It is procured from a species of convolvulus which grows in the countries of Southern Europe. It is a most valuable purgative, both on account of its powerful action and also because it is easily taken by children. It is, however, a pretty expensive drug, but in consequence of the small cluse required to effect its purpose, this need not be taken into accompt. Combined with calonel, scannuny is a nsetul medicine in thread-worm, It is also serviceable in certain conditions of the liver, especially when this organ is sluggish, and even in jaundice it proves highly efficacious because of its energetic and rapid action. In cases of incipient jaundice the author invariably begins by prescribing 4 grains of calomel with 20 grains of the compound scammony powder-this to be repeated in six hours if the evacuations continue to be white. The dose of scammony for a child three years old is about 5 grains of the compound powder, in which form it is usually prescribed, as scammony itself would gripe too much. If thread-wonns are present in a chitd of this age 3 graius of calomel may be mixed with 5 grains of compound scammony powder, and given early in the morning before any food has been taken.
Scapula, or the Blade of the Shoulder, is a flat triangular bone through which'a ridge runs for the attachment of muscles. It is one of the means of connecting the arm to the trunk of the body, and pernits of its free motion by the scapula being articulated to the muscles at each side of the spine.

Scarl Skin, or Epidernis, or Cuticle, is the outermost layer of the skin, and is composed of epithelial cells of a horny character. This epidermis ur scarf skin, is liable to certain diseases, such as pityriasis, psoriasis, eczema, and when the scalp is attacked dandriff or pityriasis is liable to occur. All diseases of the scarf skin should be particularly attended to, as they are llable to become chronic if neglected.

Soarifications are slight incisions or scratches made upon the skin or upon the mucous membranes. Scarifications are used for many purposes, such as for the performance of vaccination, for the relief of any congested portion of a tissue in the neighbourliood, such as In congestion of the womb, when the cervix is frequently scarified, although much more useful methods of treatment have recently been adopted. The gums are also scarified in children who are teethIng when there is any obstruction to the teeth passing through thelr gummy sheath.
Scarlet Fever and Scarlatina are synonymous terms whlch go to describe one of the most dangerous diseases that childhood is subject to. It must not, however, be taken for granted that childhood alone is subject to scarlet fever, as it not unfrequently attacks the idult and the aged. In children, however, its virulence seems to be most manifest and its malignity most clearly exemplified. It is a curious question what the origin of scarlet fever is. For my part I am inclined to think that it is a disease which does not take its origin in the human species, but is the result of the partaking of inilk of cows affected by a specific disorrler. Of course, it is a disease which is highly infectious; but it would seem, in almost every instance where an epidemic breaks out, that its origin takes place in a dairy, or perhaps it would be more proper to say from the partaking of milk supplied by one or more dairies whose sources of supply are almost, if not altogether, identical. The disease is peculiar in its attack. It invariably manifests itself by the development of sore throat accompanied by vomiting, together with a considerable amount of febrile disturbance. In from twelve to twenty-four hours after these symptoms have shown themselves, a red brilliant rash appears upon the chest and gradually extends to the trunk and limbs; along with this there is high fever, and sometimes the disease may be so virulent as to produce gangrene of the throat accompanied by terrible pros-
tration. The affections of the mucous membrane do not always finis! where they begin, but very frequently spread by continuity of tissue into the nose, eyes, and cans, and are in consequence productive of mamense disorganization of these lighly sensitive portions of the economy. in other cases the disease niay liave been imbibed by the indivielual, but his vitality may be se impoverished that the is unable to make even an attempt of throwing it off either by the throat, stomacl, or skin, or what is very much more likely, the duse of the poison which he has imbibed has been so great as to entirely paralyze the whole functions, and thus disable them from even making the attempt to throw off the poison. By the development of the peculiar symptoms which are characteristic of it such cascs are usually called suppressed scarlet fever. This, however, is not the case at all; it is neither more nor less than an overpowering of the system by a virulent poison which exerts lits full force, and results invarially in the speedy death of its victim. Scarlet fever, doubt less, finds its entrance to the system through the mouth, not through the lung, as so many suppose. Ay reason for inferrmg this is, that the poison invariably manifcsts its existence in the first place upon the tonsils, which glands, as is well known, secrete a tenacious fluid, and not only entrap the poison of scarlet fever, but that of diphtheria also. Jortions of the poison, however, escape this trap, if it may be so designated, and enter the stomach, and there create an amount of disturbance which results in the stomach making violent efforts to get quit of the poison; hence tle vomiting. This poison, therefore, has two modes of gaining access to the body, viz., by the tonsils and by the stomacl., and by oue or other it makes sure as a rule of its progress being unimpeded. As soon as the poison has entered the blood high fever sets in, which may have been scarcely noticeable before the constitutional symptoms became apparent. It was, however, present even at the very onset of the disease, although possibly not quite so marked. When this fever develops thoroughly, the rash, the peculiar scarlet rash characteristic of the disease, develops upon the chest and limbs. As soon as this has thoroughly developed, the disease as a rule may be said to be within control, that is to say if the strength of the patient is well maintained. The fever may be modified, however, very much by the administration of plenacetine, and by the administration of diaphoretics, every two or three hours. The diet at the same time should consist largely of gruels thinned with milk, and administered in a warm condition, until the skin has been encouraged to act to its fullest extent. It is also necessary, however, to keep the bowels freely moved every day, while the condition of the kidneys should be particularly attended to. After the lapse of three or four days the rash will subside, but the sererity of the eruption has been the means of paralyzing the skin to such an extent as to disable it from performing its healthy functions and developing to its full perfection its epithelial layer, The cuticle, or epithelium, is thrown off in flakes until the skin has sufficiently recovered from the effects of the poison which has so taxed its efforts to get quit of. Six weeks therefore must necessarily clapse before the patient is exposed to the ordinary surroundings of life, as until his skin has become so mature as to enable it to perform its healthy functions perfectly contagion may still exist in the individual, and again we must remember that not only does the external skin become disabled by the effects of the scarlet fever-poison, but the mucous membranes also participate in the destructive effects upon their epithelial lining; hence the kidneys frequently suffer if the paticut is exposed to cold before their mucous membrane has become thoroughly reestablished in health. The mucous membrane also of the Eustachian tube and of the internal ear, as well as of the nose and throat, require a certain time to elapse before they can be said to be free from susceptibility to disease, and therefore to the tendency to prejudice the organs of sense with which they are in immediste communication. The grand points in the treatnent of scarlet fever are to keep the patlent quiet $\ln$ bed in a well-ventilated room, comfortably clothed, and at the same time attend to the daily evacuation of the bowels, while for the immediate symptoms which exist, such as
sore tharoat, clilorate of potash haty be given in it saturated solution with water every lialf hour or so. The fever may be controlled perfectly by the adminis. tration of phenacetine, and if necessary the action of the skin promoted by the administration nt frequent intervals of a diaphoretic nuixture. The diet shonld be light and simple, and largely composed of farimaccous gruels thimed with milk, whose object is to pronnoto the action of the skin and of thekidneys. At the sanne tinie thu sturcliy matter which it contains tends very autuch to conservo the strength of the patient by providing pibulun for the fever which is raging. It must always be remembered that scarlet-fever patients retain their powers of communicating the diseaso to others for a very cousiderable period, and they shoutd lasariably be put into quarantine for forty-two days before lecins permitted to minglo with other clitidren. It is a cunfort, however, to know that lf once a patient has sullicred from scar er fever he will never suffer from it again, and the rreatest care should therefore be taken to discriminate carefully between scarlet fever and other raslies which may frequently resenmble it as far as the skin affection is concerned. I have frequently seen cases of ordinary nettle-rash and erythema dingrosed as scarlet-fever, and the parents of the children so suffering liavo been put to a very great inconvenience, and expense as well, in their endeavours to isolate the patients and prevent the disease being communicated to the other children, when the disease was one which in the ordinary course of nature would have passed off in a few days. When scarlet fever has manifested itself in any house, the first duty of the parents is to communicate the fact to the sanitary authorities, who will take every precaution to prevent its spread from this?particular source, but who will at the same time have their attention directed to what they consider the original fountain of the disease, and this may probably be ascertained to be in sone neigh. bouring dairy. The powers of the Health Act are sufficient to enable the sanitary authorities who are thus apprised to frequently stamp out an epidemic at its very outset, and thus be the means of saving not only many valuable lives, but an immense amount of anxiety to parents and friends. Every parent and Fuardian therefore should, in all instances, have no besitation in reporting the cases that may occur in their own houschold at once to the sanitary authorities.

Sciatica takes its name from the fact that the sciatic nerve is affected in this disease. Sciatica, therefore, is the term which is applied to neuralgia of this particular nerve. It is the largest nerve of the body, and from it proceed the various branches which supply the lower limb from the thigh down to the toes. As has been inferred, it becomes at times the seat of very severe neuralgic pain, which is felt not only in the course of the nerve itself, but also in its various branches. The pain, however, may confine itself to the upper part or trunk of the nerve; but, as a rule, the trunk alone is not only involved, but the different offshoots supplying the cald of the leg and the foot also participate in tho painful affectlon. It is a disease of the acutest nature, so far as pain is concerned, but beyond the fact of this, and that it disables the victim from moving about, and at ine same time interferes with his rest, it is not in the least danrerous to life. The disease may arise from a debilitated state of the system, and, in consequence, a hyper-sensitive condition of the nerve results; but, as a rule, sciatica is due more or less to the fact that the sheath of the nerve has become affected by a rheumatic condition of the blood, which tends to produce con. gestion of this membrane, and therefore pressure upon the nerve. Any affuction of the blood which indicates a departure from health may induce sciatica, such as an acid conclition, or a vitiated condition arising from other causes, the most noticeable of which is tle absorption of foetid matter due to constipation of the lower bowel. The first thing that should be done with regard to the treatment of this painful disease is, to effect a clear and healthy condition of the lower bowel, after which, if the pain docs not subside, salicine may be given in regular doses of 20 grains every two or three hours for an adult, when, if it does not succeed in relieving the pain, quinine In 5 -prain doses every four hours miny be employed; and should these measures fail, 20 grains of
plienacetne fong with a grains of caffeine may be given every four hours, and, as a rule, this will have tho eflect of at least alleviating the severe suffering. At the sunle time, however, it will be essential that the grencral liealth of the individual be maintuined as far as possible by the administration of good nourishing food, conbined with port wine or stout, if these be required. I'lospliorus, in the form of the compound pliospliorous pill, slioukl also bo given regularly, at least tiree tines a day. Constitutional treatnent, however, does not always succeed la relieving this painful affection, and it may bo necessary to resort to counter-irrltation, either over tho roots of the nerve or along its course. In the first instance liniusents luaving a counteroirritant, and at the same time soothing effect, may be employed with consislerable advantage-such as a lininent composed of acetic acid, compound camplior lininent, soap and opiuns liniment, of each equal parts; a little of this to be well rubbed iuto the parts affected every three or four hours. If this does not succeed in relieving the pain, then the following liniment nay be applied at the same intervals, viz. :-Menthol, 3 drachuns ; chloroform, $\frac{1}{2}$ nn ounce; belladonna liniment, $1 \frac{1}{2}$ ounces-a little of this may be applied, either rubbed well into the part affected or upon a fannel saturated with the mixture. In every instance it will be necessary that the patient be kept at rest, so as not to irritate the branclies of the nerve by movement of the muscles which it supplies. There is another treatment which has been frequently recommended for this disorder, and that is, the subcutaneous injection of morphia. It is needless to say that such a metbod of alleviating the pain of this dis. order is to be condemned without stint, and this because it is very liable to give rise to a most pernicious habit which may cause the patient very considerable trouble to rid himself of.
Scirrhus is derived from a word indicating hard, and it is applied to a form of cancer which is specially liabe to attack the breast. If this disease is not taken in time it is liable to ranify and involve the tissues in its unmediate neighbourhood. Scirrhus is the form of cancer specially liable to set in in the breast, but when it is detected in its early stage can readily be eradicated by means of the knife. Any other nethod will have no effect in removing the disease, whereas if an operation is undertaken at a sufficiently early perlod, the patient may rest assured that the malady can be effectually and thoroughly removed. The great danger lies in procrastination, as no disease is more amenable to treatment than cancer when it is detected in its earliest stages and means are taken for its complete removal. If time is allowed to elapse, and the disease permitted to gain hold upon the constitution, it is much wiser not to attempt its removal, as thereby the life of the patient, which is already in danger, is placed in very much greater jeopardy than if no operation had been attempted.
Sclerotic is the second layer of the eye, and is composed of a fibrous material. It lies subjacent to the sclerotic coat. It is the nembrane which is exceedingly liable to rheumatic disease, and when it is affected the appearance is quite different from that which is manifested in inflammation of the conjunctiva, the latter being of a rosy red colour, whereas, where inflammation of the sclerotic occurs, it assumes more the appearance of alivid congestion. When sclerotitis, or inflammation of the sclerotic, occurs, it is of much greater import than when the disease has affected the conjunctiva alone. Inflammation of the sclerotic is always accompanied by severe aching pain surrounding the eye-ball, whereas in conjunctivitis the pain is confined to the surface of the cye-ball alone.
Screaming of infants is invariably an indication that the child is suffering from pain of some particular organ of the body. As a rule, this is generallytraceable to some digestive disturbance, and is the effect of dyspepsia, producing flatulence, and therefore griping, The first ain, therefore, should be to ascertan whence the cause arises, and if the bowels be distended a dose of castor oil sliould be administered withosit delay. Should this not remove the cause of distress, a carminative milxture composed las follows should be administered, viz. :-Bi-carbonate of soda, 30 grains ; tincture of ciardinoms, spirit of nitre, of eacli two
drachus; aniseed water to make two onnces-a teaspounful of which may be given every two or three hours, and probably this wlll be followed by considerable relief; because, as a rule, dyspepsia or indigestion in children is usually associated, especially in boys, with a difficulty in making water, and thls mixture will not only act as a carminative to the bowels, but also as ati aid to the difficulty which is experienced lin the passing of urine. Screaming, however, may arise, and very frequently does, from some external injury, especinlly the pricking of a pin or some injudiclous movement which has been made by the nurse who has charge of the child. It is therefore necessary to satisfy oneself in every instance where any circumstance has occurred of this nature which has produced pain. (See "Our Chikdren: IIow to keep them Well and treat them when they are Ill."i)
Scrofula is one of those disagreeable terms which have been applied to certain constitutional tendencies appearing in the young. It is, in fact, synonymous witl tuberculosis, and is a term which should at all times be discarded as conveying an erroneous impression, and which brands the individual to whom it is applied with a loathsomeness which is quite beyond what it really indicates. Many individuals are condenned in a way which should never have obtained credence, by the fact that they have scars upon their neck. Now, these scars may not, and frequently do not, result from scrofula, They are simply the effects of abscesses which have formed within the parotid or submaxillary glands, and which do not in the very least, in many instances, indicate that these children have been tubercular or the subjects of scrofula. An inflamed condition of these glands may develop into abscesses, which, if not properly attended to, result in scars which are very offensive, and exceedingly disfiguring. The scars, however, are invariably the result of a want of knowledge on the part of those in attendance; as even if an abscess does form, which frequently will happen when the disease in a gland has proceeded to suppuration, any subsequent mark can be avoided by prompt measures being taken by the medical attendant. These measures consist in evacuating the pus before the skin has become so attenuated by the progress of the abscess, and therefore its vitality interfered with to such an extent as to prevent it healing; as it otherwise would do had the abscess been opened and the pus allowed to escape in its early stages. No doubt, when these glands are diseased and this proceeds to suppuration, the child is in a condition of health which may require medical treatment. This, however, should not altogether be depended upon, because nature will be very much assisted in its efforts to throw off the disease or to procure its resolution, if the general health is assiduously attended to. When there is a tendency to a glandular affection of this kind, many medicines prove of immense service ; but the most prominent of these is the muriate of calcium, which, if administered regularly after food, will have a specific effect in affording to the glands an amount of vitality which may enable them to throw off the disease entirely. Cod-liver oil and extract of malt are also very valuable medicines in these affections, and should invariably be prescribed, but not to the exclusion of muriate of calcium, which probably is the most efficient remedy, both in preventing disease of the glands, and at the same time enabling them to throw off disease when it has taken possession of them.

Scurf is always a most disagreeable thing to contend with. It arises from an unhealthy condition of the cuticular or epithelial layer of the skin of the scalp, and is entirely due to the fact that the cells which cover the outer layer of the skin in this region are inmature, in consequence of some unhealthy condition of the integument, the result being that these are thrown off before they become thoroughly matured. The object, therefore, should always be to promote a lhealthy condition of the outer membrane of this particular portion of the skin, whereby their tendency to exfoliation will be diminished. When dandriff exists the following pornade will be found very efficacious in removing the disagreeable consequences of this troublesome, though not serious, affection, viz., I part of the red oxide of mercury ointment, combined with three
ounces of ponade, and applied every day fust as pomate is nsed in the ordinary way. Ine head, how. ever, slould be washed at least once a week witl carbolic soap, and afterwards thoroughly dried, after which the pomate should be applied.

Scurvy is a disease which noly fortunately is very little met with, thanks to the fact that it is not essential to bay in a stock of salted meats to the same extent that was necessary in olden times, and also to the fact that vegetables can be preselved in such a way as to retain all the peculiar qualities which they possess in the fresh condition. The human frame requires the daily employment of vegetables as an article of dict, otherwlse the blood becomes deteriorated and its health interfered with. It is, therefore, essential tlat fresh vegetables as well as fresh meat should enter into the dietary of every individual, or the blood will beconle deteriorated and its vitality reduced. In by-gone days, when long voyages were undcrtaken, such dietetic arrangements could not possibly be made, in consequence of the lack of knowledge which now happily we possess, and therefore scurvy was a disease very largely prevalent amongst sailors, whereas now it is a disease which is very little heard of; and I question very much whether any young practitioner has ever come across an example of this painful affection which at one time was one of daily occurrence. The treatment ot scurvy, when it does exist, consists in the frequent adminis tration of lime or lemon juice, which substances go to supply the deficiency which exists within the blood; and it is a well-known fact that, with a view of avoiding the occurrence of scurvy amongst saidors, the Government insisted that a certain supply of these vegetable juices should accompany them upon each voyage, so that they might by this means be provided with a substitute which the absence of fresh vegetables necessitated them to partake of, with a view of preserving them from this painful disorder. The symptoms of scurvy gencrally inanifest themselves first in the gums, which become spongy and have a great tendency to bleed; frequently this proceeds to such an extent as to loosen the tecth, which drop from their sockets. These symptoms are generally followed by an ulcerated condition of certain portions of the skin, especially that of the legs, which are difficult to heal even after the cause of the ulcer has been entirely removed. The bones also are liable to become affected; in fact, the disease culminates in a generally unhealthy condition of the blood, which has affected all the tissues to a greater or less degree. It is a matter for thankfulness that now-a-days this painful disease has been alnost entirely eradicated, in consequence of the precautions which are taken to preserve the sailors' health, by supplying them with an abundance of fresh and wholesome nourishment, instead of the rubbish that was at one time deemed sufficient for their wants.

Scybalae are hard lumps of faeces which result from the absorption of the liquids from these accumulations within the lower bowel. The presence of scybalae is always more or less injurious, partly because they obstruct the passage of the bowels, and also because of the irritation which they give rise to in the nervous system. The presence of scybalae in children frequently induces high fever (especially at night), a lethargic condition of the system, and not unfrequently may be the cause of convulsions,
Sea-Bathing is more a luxury than a medicinal agent, although doubtless in many instances it possesses slight tonic effects upon the skin and muscles when swimming is also engaged in, as no better form of gymnastics exists than swimming. It should always be made a rule, when sea-bathing is indulged in, to come out of the water long before the temperature of the body has been so far reduced as to interfere with a healthy reaction.

Sea-Water contains many constituents which are highly advantageous wher it is employed as a bath. Amongst these constituents are-chloride of sodium or common salt, sulphate of magnesia or Epsom salts, sulphate of soda or Glauber salts, and chloride of magnesia, nuriate of calcium, iodides and bromides ot sodium and potassium, etc. In consequence of these salts being contained in solution in the sea its specific gravity is ,very much increased;
therefore its buoyancy is greater and the tendency to rednce the sperific gravity of the blood is to a large extent done away with, wbereas if a person is innuersel in pure water an enervating result follows in conse. quence of the blood beconnitg thin by absorption of the water and parting with a purtion of its soluble contents. Sea-ivater, in consequence of the salts it contains, would act as a purgatlve if taken in large quantities. It is also very usefully employed as an conema, as a uteritte douche, and in warm and tepid spray, shower, and doucle baths, Tidman's sea-salt is supposed to be simply sea.water evaporated down to erystallization, and when dissolved in ordinary water may be substituted for sea-water when a bath of this nature is required
Sea-Sickness, as is well knowt, is one ot tho most disagreeable forms of sickness that can possibly exist. It may continue to sucli an extent, as the author has seen it on one occasion, as to end in death. 111 any case, when it is persistent, it has a debilitating effect for the time being, although afterwards it is generally followed by an enomous appetite, a goorl digestron, and a speedy making up of the tissues whicli have been wasted. One of the best preventives against sea-sickness is to support the abdominal walls and those of the clest with a stout, firmly fixed bandage. At the same time very particular attention should be paid to the daily emptying of the bowels. Anongst the medioines which have been recommended for seasickness, and which have proved very serviceable, aro _-pbenacetine in 10 grain doses, bromide of potassium in $30 \cdot \mathrm{grain}$ doses, chlomal in 15 -grain doses, and other substances of less utility. The great point, however, is to endeavour to have the organs of the chest and abdomen kept as fixed as possible until the nervous system gets accustomed to the motion of the vessel.

Seasons have a most important effect upon tho health of mankind. The seasons vary so much in different countries that it must be apparent to any observer wbat the consequences are of the clinatic changes which take place at different periods of the year. It does not appear, however, that a variable climate such as that of Great Britain tends to sliorten life, but rather it would seem to be conducive to longevity. Possibly this, however, is due to the fact that greater care is taken in the matter of clothing, ventilation, and general hygiene, than in climates where the changes of temperature can be calculated upon to a aicety. In this country, doubtless, the winter months are most trying to the health, and have a larger deathrate than summer, whereas in some of the continental countries the death-rate would appear to be higher in summer than it is in winter. It may be that local causes have something to do with this, and certainly if sanitary measures are not carried out very strictly in those climates where the weather is intensely hot during summer this must add very much in the development of disease and consequent fatalities.

Sebaceous. The sebaceous glands or follicles are tbose minute glands situated in the skin which secrete the oleaginous matter which keeps the skin moist and elastic. Tbey are most common on the face and nose, and are larger in dimensions in that locality than in any other portion of the integument. Comedones, or what are popularly called 'shilcorns,' wbich are indicated by black points upon the nose especially, are the orifices of tbese glands, upon the sebaceous matter of which the carbonaceous matter of the atmosphere has become deposited and fixed. When they are squeezed a yellowish matter exudes. which is the contents of these sebaceous follicles. When these follicles become inflamed they give rise to reddish pimples, which are called 'acne.' The proper way to keep the sebaceous glands in a healthy state of action is by washing the face with warm water and soap, and after. wards using a considerable amount of friction in drying. If, however, these glands have become diseased and acne is produced, an application of the following lotion every night at bedtime will prove very beneficial:One drachm of fowers of sulphur, two ounces of rectified spirits, one ounce glycerine, and five ounces of Elder-fower water. The lotion to be well shaken before the application is made. (See ACNE and SKIN.)

Secale Cornutum is the technical name for crgot of rye.
Secretion. This term is applied both to vegetables and animals, and it signifies the powers which the several organs liave of sefzarating certain substances from the circulation, such as the saliva which the salivary glands secrete, the sastric juice which the glands of the stomach secrete, the bile which the liver secretes, and so on.

Sedatives are medicines which restrain the activity of the varions functions, and at the same time remove sensibllity to pain. It is quite evident that sedatives act entirely through the nervous system, their first effects being upon the nerves, and througli these influcncing the vartous secretions. Sedatives may be either local or gencral in their action; e.g. Inenthol, chloroform, belladoma, opium, ice, etc., inay act locally, if applied to a limited portion of the integument. If taken internally they then act as sedatives to the body at large.

Sedentary Occupation should always be abternated by a fairamount of exercise, otherwise the bodily health will certainly suffer by a too prolonged confinement within doors in consequence of the depressing effect of this upon the vital functions.

Seidlitz is a well-known Bohemian spa possessing excellent aperient properties, in consequence of the presence of sulphate of magnesia within the water. There is said to be 100 grains of this substance in every pint of water issuing from the spa.

Seidlitz Powders, which are supposed to be an imitation of this water, are composed of Rochelle salt or the tartrate of potash, together with bi-carbonate of soda and tartaric acid to produce effervescence.

Seltzer Water is distinguished by the large amount of carbonic acid which it contalns in combination with carbonate of socla, carbonate of magnesia, and a small proportion of lime. The soda salt, however, predominates, and it also contains a small amount of chloride of sodium or common salt. It is now manufactured largely artificially, and is a popular effervesciur drink.

Sending for the Doctor should be attended to with as little delay as possible, as disease can always be more readily overcome in its early stages than if it is allowed to proceed to any length before treatment is commenced. It should always be the object of the patient to give the doctor information as early in the day as possible when he is required, so that he may be able to economize his time to the greatest extent, and not be compelled to travel over the same ground more frequently than is necessary. A great many thoughtless people put off till they can do so no longer, and usually their fears come to a point when evenlng, or even night, is far advanced. These fears, perhaps, may be aggravated by the fact that disease gonerally ussumes a much more formidable appearance at ulght than it does in the morning. Then, again, if the disease is not showing any very alarming symptons, the patient, or the patient's friends, should not demand an immediate visit; on the other hand, if the symptoms are alarming, urgency should always be indicated by a special message. A great many people, especially those of a timid and nervous temperament, become alarmed at very little, and attach to symptoms a meaning which they should never possess. Such people are very liable to be left in the lurch some day or other, for if the doctor has been repeatedly summoned to such patients, and found upon his arrival that there is little or nothing the matter, he will be very apt to take for granted that this may invariably be the case, and thus not attend so promptly as othervise he would have done, when serious disease may have manifested itself.

Senna. Themedicinal part of the senna plant is the leaf. It is one of the most useful purgatives that we possess, and has been used by the Arabians as such for a very long period of time. The plant grows abundantly in the northern portions of Africa and India. That grown in Northern Africa commands the best price, and is proferable to all others. Senna, when infused in cold water for twelve hours, yields all its purgative properties without any of the extractive matter entering into the infusion ; and if this method
of preparing senma as a purgativo be adopted it acts gulte as efficiently as if lt was infused with boiling water, and it has not the nauseons taste which the lattor method produces, nor does it produce the griping effects which an infusion in hot water illways does. The old black draught, which is composed of a decoction of semna combined with Epsom salts and ginger, is a most namstous medicine, and always produces griping to a greater or less extent. A very excellent preparation of semna, which is specially applicable to chidelren, is the sweet essence, as it is easily taken and acts most beneficially. It is not generally known that cold water extracts the purgative properties of the senna leaf, and from the fact that this method of extracting the essential constituent of the leaf does away with griping it should be generally adopted. Powdered senma leaves mixed with powdered liquorice root and carminative substances is sold under the name of compound liquorice powder, or Prussian powder. This substance likewise acts without producing any griping effects. Powdered senna leaves are also made into a kind of electuary by rubbing up the senna leaves with treacle. This is called the conrection of senma, and is also a useful method of administering the medicinc. Senna seems to act almost certainly upon the colon, or large bowel, and therefore is specially useful in habitual constipation, as it may be taken at frequent intervals without aggravating the tendency to constipation.

Serous Membranes are those which envelop and enclose the cavities of the chest, abdomen, skull, spinal column, and joints. It is a semi-transparent, smooth membrane of considerable elasticity and tenacity, which secretes a lubricating fluid, and this enables the parts to move over each other freely and without friction. When inflammation, however, of this membrane takes place the surface becomes roughened, and friction of the inflamed surfaces is productive of considerable lancinating and acute pain. When inflammation of the serous membrane takes place an excess of the serous fluid is secreted, and is productive of dropsy of the various cavities where the disease exists.
Serpent Bites. (See SNAKB Brres.)
Serum is the watery portion of the blood, or liquor sanguinis, and is that which is left on the formation of a clot in the process of coagulation of the blood. In a scald, burn, or blister, the fluid which accumulates underneath the cuticle is serum, and exudes from the mucous coat or the skin on the destruction by the irritant of the cuticular layer. The liquor sanguinis, or serum, holding the fibrine of the blood in solution is the liquid portion of the blood holding in suspension the red and white corpuscles, and in solution certain salts of potash, soda, lime, and iron.

Shingles is a peculiar disease of the skin due to an inflamed condition of the peripheries of the nerves which supply the area of the affected part. Technically it is termed 'herpes zona' or 'zoster.' This particular forin of herpes is situated upon the trunk of the body. When herpes attacks the lips, cheek, or any other part of the body than that of the trunk, it is named 'herpes labialis,' which indicates herpes of the lip. or other designation according to the particular region which it attacks. As a rule, shingles indicates a lowered condition of the vitality of the individual attacked, and like neurngia is more a symptom of disease than actual disease itsel, although, from the fact that an eruption is coincident with its development, it is classed as a disease. When the eruption manifests itself it is always accompanied by considerable pain, and invariably occupies a region supplied by a particular nerve. At first the vesicles are full of clear serum, which, as time progresses, become transformed into an opaque liquid, and afterwards dry up into a crust, and thereafter separate like an ordinary scab. As shingles is due to an inflammatory condition at the very extremities of the nerves supplying the skin of the particular region affected, it not unfrequently happens that even after the disease has disappeared considerable pain is experlenced in the part which has been affected. When this is the case It may be necessary to apply anodynes of conslderable power to destroy the sensibility of the part, such as veratrium, inorphia, aconite, menthol, or chlorofom.

A good ointuent to ruls in under such circumstances is composed of 6 griains of morplisis, 6 gritins of veratrium, ind half inn ounce of vascline, mixed toretherat picce the size of a splitopea to be well rubbed in night and morning. Another grood application is made up of three drachins of uienthol, half an ounce of chloroform, one ounce and a half of bellidonna lini-ment-a little of which should be rubbed in uight and morning, or as often as the pain is severe. In every instance where shiugles exist they should le treated by all abundanco of good wholesonne and nutritious food, accompanied by stimulants if the system is reduced to any great extent; while the bowels should be carefully attended to; the vesicles projected so as to prevent thens bursting and laying bare the irritated extremity of the nerve upon which they are situated, and thus obviating a troublesome ulceration which may follow such an accident. At the same time the patient should be well clad and every protection taken against exposure to damp and cold, these conditions being exceptionally hurtful where the system is in such a susceptible condition, as far as the nervous apparatus is concerned.
Shivering is a symptom which frequently indicates the onset of some febrile disturbance. Its technical term is 'rigor.' It is very frequently the first indication of some inflammatory or febrile condition which threatens the system. When shivering exists the individual experiences the sensation of extreme cold, so that the limbs shake and the teeth chatter in a most extraordinary manner, and any one looking at one in this condition would naturally suppose that he was suffering from a reduced condition of the animal temperature. If, however, the thermometer be introduced, either under the armpit or into the mouth when this shivering is present, it will be ascertained that actually the bodily temperature is very mucla above the normal, and indicates a considerable amount of fever. It is therefore desirable, when this symptom of fever is present, to take measures which shall promote a free action of the skin and at the same time reduce the temperature of the body. With this view the patient should be put to bed and warm gruels administered, together with ten grains of phenacetine, which medicine may be repeated every four hours till the temperature of the body is reduced.
Shock is that depressing effect upon the nervous apparatus which is produced either by some distressing news or other influence which affects the nervous system independent of the body, or by direct violence to the tissues by accident or otherwise. The extent of a slock depends entirely upon the impresslon which has been conveyed by its effect, either upon the mind or pliysique of the individual. In every case, howerer, it is the nervous system which receives the impression, and it must always be attributed to the ultimate effect upon this portion of the animal economy. When nervous shock exists it is indicated by a slow and feeble pulse, combined with a collapsed condition of the exterior of the body, and threatening death from positive weakness. The means to take, therefore, to remove these conditions should invariably consist in the application of external heat, and the administration of stimulants, such as salvolatile, brandy, whisky, or ether, and afterwards in the free administration of beef juice and other stimulating fuids. If there has been much loss of blood connected with an accident. and which of course will render the slock more permanent, it may be necessary to have recourse to transfusion, which is the introduction of blood obtained from a healthy individual who can afford to part with some of his blood, and thus directly supply the deficiency which has resulted from the loss of the vital fluid sustained by the injured person. It is a remarkable fact, however, that where a severe injury has occurred, and shock in consequence is the result, that if the patient be placed under chloroform, with a view to having the shattered limb remo"ed or the injured tissue repaired, the shock will pass off during the period that the patient is under chloroform, and this possibly may not return after the operation has been completed. In olden times it was always thought necessary to allow reaction to set in before any operation was undertaken. Now, however, thanks to chloroform, such an idea is entirely exploded.

Short Sight is entiruly due to a malformed con. dition of the cornei, and, as it invariably is, to say tho le.zst of it, an inconvenience, shoukd be placed under medical suparvision.
Shoulder. The shoulder is one of the most finportant joints or the whole body. It is compused of the muscles and soft pirts surrounding tho joint, to. gether with the bones, the joint, the shoulder-blatle, and a portion of the collar-bone. Altogether, the parts entering into the constitution of the shoulder are benatifully inoulded aud splendidly, adiapted to the purposis for which they aro urlained. The shoulder. foimt is not at all dlificult uf displacement, but fortumately such a displacement is casy of reduction if it is pruperly manipulated. It nay be necessary, if the foint has been out for a considerable timo, to have recourse tu chloroform to relax the muscles, which invariably becone very much contracted if reaction has existed fur any length of tinio. If, however, chloroform is adminititered the muscles inmediately relax, and the joint is very readily placed in its normal anatomical position.
Sickness is the tern which at one time was entirely confined to in inclination to vomit, or vomiting itself. Now, however, it is a general tern applied to the condition of one who is suffering from illness of alnost any description. (Kefer to VoMiTING.)

## Sickness, Sea. (Refer to SeA-Sickness.)

Side. Pain in the side may arise froin very various causes, and may indicate ailntents from a very slight to a very serious importance. If the pain is intensified by breathing, especially taking a long breath, then suspicions should he aroused in case this may be due to some inflammatory affection of the pleura. If the pleura is affected it will invariably give rise to a febrile condition of the system, and at the same time a friction sound will be heard if the stethoscope is placed over the seat of pain. If, on the other hand, the pain is not accompanied by fever, but rather by a lowered condition of the system at large, the probability is that it is of a neuralgic character, and is then called pleurodynia. This pain is frequently erroneously termed 'pleuritic, and many ignorant persons are apt to desip. nate it pleurisy or infammation of the pleura. It is needless to say that when the affection is neuralgic there is no danger connected with it, whereas if it is pleuritic considerable danger may exist, and the treatment or the one is so different from the treatment of the other that It becomes a matter of great importance to differentiate between the two. If the pain is on the right side and low down it may be due to some affection of the liver, or to muscular rheumatism or neuralgia of the part. Pain on the left side again is usually associated with a distended condition of the stomach. In females, however, a pain in the side carries with it considerable importance according to its position, especially if it is seated low down near the groin, when it generally Indicates some ovarian irritation.
Sight. Too much importance cannot be attached to this important sense, and every precaution should be taken for its preservation. If there is the slightest deviation from the healthy standard an oculist should immerliately be consulted and his advice carefully followed. (See Eye.)

Sinapism is another name for inustard plaster. (Sce MUSTARD, COUNTER-IRRITATION.)
Sinking Sensation at the Pit of the Stomach is due to the effects of indigestion, grief, or nervous depression from some cause or other acting upon the large sympathetic nerves, which are situated behind the stomach. Stlmulants are naturally craved for under such circumstances, but they should be avoided, as their effects are only temporary and will be followed by greater depression when the stlmulation has passed away. The great point is to remove the actual cause by treating the stomach for the indigestion, and the source of the nervous depression by local or constitutional treatment.
Skeleton. This terin is applied, as is well known, to the bones which form the foundation of the human frame, and are composed as follows:-(s) The bones of the skull and face, the former having eight and the latter fourteen, entering into the formation of the skeleton of the head. (2) The spinal column, which Is
composed of twenty. fonr bones, sonnewhat of a clrcular or disc-like formation, are attached to each other by a liganentons structure, while it strung clastlc cartilaginous substance forms a cushion upon which cach bone rests upon its ueighbour; the spine supports the head and trunk of tho body, and is insorted into the pelvis at the sacrum, which sec. (3) The collar-bones and shoulder-blades support the arms in their respective places. (4) The ribs, which are twenty-four in mamber, are nade up of seven palrs of true ribs, which are attached to the sternum or breast-bone by means of cartilage, while the five remaining pairs oi ribs are termed foating ribs, having no ittachment in fromt, but yet giving support to the abdominal walls. (5) The breast-bone. (6) The bones of the arm, named the lumerus, those of the fore-arm, viz, the tibia and radins; the wrist or carpal bones; the palm and finger bones, or metacarpal bones. (7) The bones of the pelvis. (8) The bones of the lower limb are composed of the thigh-bone, the knee-cap, the tibia, and fibula, together with the ankle or tarsal bones, and the metatarsal bones, forming the arclt of the foot and the toes. Besides the bones of the skeleton proper there are others of the body, such as the ossicles of the ear, and the hyoid bone, which is placed at the root of the tongue, besides adventitious growths of bone on tendons, which, however, are not in every case present.

Skin. The skin is one of the most wonderful structures of the human body, and is essential to its life. As is well known, it acts as a covering to the body, and protects and retains in their various places the different tissues subjacent to it, as well as forming an elastic and strong envelope to the frame. It consists of two distinct membranes, viz., that of the epidennis or cuticle, which is the outer covering of the underlying layer, or true skin. The skin is continuous with the mucous membrane of the various passages, such as the mouth, nose, anus, etc. The epidernis consists of a thin, transparent, horny membrane, which is very similar in its structure and uses to the outer layer of the mucous membrane. It is composed of a layer of cells called 'epithelial cells.' These are flat on the outermost surface, and overlap euch other so as to form a coinplete covering. Those that are exposed to the atmosphere are comparatively hard, aud are more flattened than those which lie immediately underneath. The undernost layers of the epithelial are softer and moister in their structure, and were at one time supposed to constitute another layer of the skin, which was termed 'rete mucosuin.' In the epithelial structure of the skin the pigment cells exist, these cells containing the colouring inatter which gives the varied hues to the skin of different races, being most distinctly exemplified in the negro. Freckles are a development of an excess of pigment in these pigment cells. The outer or flattencd layer of the epithelial cells which overlap each other and form the horny covering of the skin are constantly being removed in the process of friction or washing, but they are replaced by those lying immediately underneath. The effects of a blister, scald, or burn destroy the vitality of the epithelial layer, when this rises up by the effusion of fluid underneath. It, however, is soon replaced again on the removal of the irritant. As is well known, the epithelial layer of the skin is entirely devoid of sensation, which fact may be demonstrated by introducing a pin and raising a portion of it up by this means, when it will be found that no pain is produced. It is a well-known fact that this layer of the skin varies very much in thickness, always being denser on those points where the greatest amount of pressure is brought to bear; hence it is stronger and more dense at the heel, and on the hands of those who have a great deal of manual labour to perform. It also varies considerably according to age, the skin of the infant being very much softer and more elastic than that of elderly persons. The true skin, which lies underneath the cuticle, is very much thicker, and consists largely of cunnective tlssue whose fibres interlace and enclose the blood-vessels, nerves, and glands, which are essential to the structure of the skin. From the fact of the nerves and blood-vessels ramifying in this structure it is extremely sensitive, and requires for its protection the covering of the cuticle. An erosion of the skin is invariably excessively painful tu the
touch, and there are few people who have not been able to demonstrate this at one time or other. At the surfice of the true skin will be found innumerable little cminences, or 'papilae, as they are technically called. upon which the nerves of sensation are distributed. These are distributed most profusely on the point of the fingers, where sensation to touch is most acute. The skm varies very numch in sensibility, this being accounted for according to the nerve supply of the various portions. Ilte deeper layer of the true skin is composed of fibres, which furm al network with which are mingled elastic fibres and muscles. These minute muscles which ramify through the skin are attached to the huir bulbs, and have the power of contraction or expansion just as any other muscular tibre has. This is readily demonstrated by the fact of the little eminences which are raised upon the skin during exposure to cold, and which go under the name of 'goose skin,' this being due cotirely to the contraction of the minute muscles inserted into the hair follicles. It is in consequence of the contraction of these muscles that the hair of different animals is enabled to become erect, as is seen in the cat when its hair is said to stand on end. Besides being a protective covering to the body, the skin has other duties to perform, viz., those of a secret ing membrane, by which office it is enabled to preserve the heat of the body at a certain temperature. Throughout the whole structure of t..e skin exist innumerable glands which secrete sweat, and these by radiation enable the skin to throw off an enormous amount of heat, or on the contrary to restrain their secretion and thus preserve the heat of the body. This is well exemplified in the Turkish bath, where an individual may exist and be beuefited by exposure to a heat which would otherwise prove very injurious; e.g. a man may enter into a room, the temperature of which is above that of boiling water, and remain there for a considerable period, notwithstanding the fact that if such a heat did not excite the action of the sweat glands of the body and drain from its surface an immense amount of fluid, scalding must necessarily ensue; but because of the effect of this dry heat upon the secreting powers of these minute glands, the temperature of the body is actually unaltered although surrounded by an amosphere of such intense warmth. The sweat glands do not only secrete water, but separate from the blood certain impurities, and assist very inaterially the action of the kidneys in their in portant function. Were it not for the action of these minute glands the heat of certain climates would be quite inconsistent with the preservation of health. In cold climates their powers are restrained, so that they are enabled by the circumstances in which they are placed to retain the body at an equable temperature. Besides the sweat glands there are the sebaceous glands, which have already been referred to. These secrete a fluid of an oleaginous nature which tends to keep the skin moist, soft, and elastic. The skin, as is well known, contains, besides those glandular apparatus, blood-vessels and nerves in very large quantities, and besides these there are absorbent vessels. The latter, probably, are more venous than anything else in their nature. Some curious calculations have been made with refereace to the number of the sebaceous and sweat glands contained in the skin. As many as 3500 have been counted upon the square inch, so that some conception may be formed of the immense service which these little organs perform. As is well known, the skin is subject to various diseases-these may affect either the nerves, the blood-vessels, the glands, or the tissues of the skin itself. When the skin is affected it is generally the outcome of some disease of the blood acting upon this membrane; indeed, it would appear that every affection of the skin is dependent upon the blood entirely for its existence. Amongst the affections of the skin with which we are most familiar are-eczema, psoriasis, pityriasis, elephantiasis, leprosy, etc. ; while amongst the acute affections which attack the skin are those which are entiraly due to its efforts to get quit of various blood poisons, such as small-pox, scarlet fever, measles, erysipelas, furunculus, etc. (See special articles on each of these diseases.) If the skin is destroyed in its entirety it never becomes replaced, but the interval between is
made up by the formation of an adventitious tissue called a 'cicatrix.' This is devoid of the elas. tlcity of the skin, and so tends to contract. This may be demonstrated when any one has been so unfortunate as to liave the entire structure of the skin destroyed by burns or severe scalds, by the formation of cicatrices, or what are popularly called "ecars, these freq̧uently producing deformitics by tlicir tendency to contract. This is specially noticcable when such acci. dents liave occurred upon the neck or face or near a joint. The daily use of cold water to the surface of the hody, either by means of the sponge, spray, shower, or plunge bath, slould be carefully observed. Comnon soap, which simply roughens and hardens the skin, slould be avoided, and perfectly pure soap used. 'ears' soap, which has stood the test of over a cen. tury, Is the ideal of perfection; its purity is sucl that it may be used with perfect confidence upon the tenderest and most sensitive skin-even that of a new-born labe.

Skull. The skull is the bony cavity which contains the brain, and forms the foundation of the face, inouth, eas, and the important organs of smell, taste, hearing and vision. The skull in the new-born infant is com posed of various bones which consolidate into a uniforim mass in advancing years. These bones in the infant are united together by serrated margins called 'sutures,' which in the process of parturition are enabled to overlap each other, so as to permit of the passage of the head with the least difficulty to the soft parts of the mother. That suture which forms the junction between the frontal bone, or the bone of the forehead, with the two side bones, called 'parietal,' is named the transverse suture. Where the parietal bones are joined to the temporal or temple bones, the suture is different, this being formed by the thin margin of the temple bones overlapping the edge of the parietal. Altogether, the bones are so arranged as to give the greatest amount of strength for the protection of the brain, and represent very much in their formation the structure of an arch, so that immense weight can be brought to bear upon the exterior without injury being conveyed to the contents or the cranium. Within the cranium or skull the brain with all its ramifications of blood-vessels and nerves is contained, and is preserved from injury by the bony covering which has been provided for its safety. The skull is prorided with various apertures, such as that of the spinal cord, which is situated at the base of the skull, and those at its anterior aspect for the passage of the optic nerve, with the blood-vessels, also the nares and mouth ; while numerous smaller openings exist for the transmission of the blood-vessels and nerves supplying the brain itself and the tissues in its immediate neighbourhood. The interior surface of the skull is variously grooved for the accommodation of blood-vessels which are concerned in the circulation of the head. To the cranium or skull proper is articulated the lower jaw, which, as is well known, is hinged to the upper jaw, upon the movements of which mastication and speech are so dependent. The bones of the skull, like the bones of the body at large, are covered by a membrane named the 'periosteum,' or, 'as it is termed in this instance, the 'pericranium,' while the inner surface is covered by the dura mater or endocranium. The scalp is that dense skin from which the hair takes its growth, and which is loosely attached by connective tissue to the periosteum or pericranium. (See BRaIn, SKELETON, etc.)
Slough is a small portion of dead tissue which is still attached to a living body, and by which, therefore. it has not yet been cast off. It may be the result of injury or strong inflammation of the part, either of which has destroyed the vitality of the tissue affected. To assist in the separation of a slough, and to destroy the offensive odour that in variably is associated with it, it is necessary to wash the affected part well with an antiseptic solution, and afterwards dress it with an antiseptic such as carbolic lotion, bi-chloride of mercury lotion, or cover it over witb some substance such as boracic acid, aristol, or iedoform.
Small-Pox is probably the most loathsome of all the contagious or zymotic diseases which are known in modern times. It is characterized by the most overpowering and distressing premonitory symptoms, being
quite unlike in their severity the symptoms appertaining toelly other infectlous disorder. It commences with a feelng of shivering, lassitude, intense pain and dis-
comfort in the back, together with a sinking sensation comfort in the back, together with a sinking sensation the third day, intense headache, thirst and fever. On continued day after the above symptoms have set in and is accompatied by the appearance of minute red spots, very much resembling those of the preliminary stage of chicken-pox, over the forchead, neck, wrlsts, anms, chest, and abdomen, and latterly upon the legs. Such is the course of the cruption which is characteristic of this disorder, the lower extrenities being invariably the list affected. The eruption gradually becomes more and more pronounced until each spot attains the character of a vesicle. Frequently, however, tho eruption does not permit of the isolation of each vesicle, as several may appear so closely together as to becoule confluent-that is to say, running Into each other. In such a circuustance the disense is named "confluent sumall-pox. There is one particular characteristic ot the pustule of gmall-pox, and that is, it becomes depressed at its ape.x, or, as it nay be termed, 'umbilicated,' because it soluewhat resembles the appearance of the navel. About the sixth or seventh day after the vesicles have reached their maturity-that is to say, after they have attained their full size--their contents become more and more opaque, and latterly purulent, the serum which they had originally contained having been transformed into pus. At this period of the lisease-that is, when about the eleventh day, or upon the eighth day after the appearance of the eruptionthe disease is said to have matured, which indicates neither more nor less than that decomposition has taken place within the vesicles; then the so-called secondary fever cuntes on, and the fe brile symptonis, which liad toa large extent abated before the eruption had reached this stage, become aggravated. At this period of the disorder the greatest danger is to be apprehended, for it is then that death most frequently occurs. Now, it is an extraordinary circumstance that, though this socalled secondary fever is so much dreaded, there should be no necessity at all for its appearance. The author has had a large experience in the treatment of smatlpox, and has been the means of instituting a treatment of this !oathsome disorder which entirely does away with secondary fever, and therefore reduces the deathrate from small-pox to 2 very great extent. Not only is the secondary fever by this treatment abrogated, but the course of the disease is at the same time yery much modified, while the tendency to pitting is greatly reduced. The treatrment consists in the application to every vesicle of a solution, containing one part of carbolic acid to fifteen parts of glycerine, night and morning. By this means the irritation caused by the eruptlon is alleviated, and the tendency to itching lessened. "Suppuration is also avoided; hence the vesicles disappear without suppuratlon, and there belng no irritation developed no scratching is indulged in. and the skin resumes its normal condition without having undergone destruction at the particular points where the enuption has appeared, which was wont to be the case. In every work upon the symptoms and treatment of small-pox a great deal of stress is laid upon the fact that the chief danger occurs about the tinue of the secondary fever; this, of course, being due to the development of pus within the vesicles, as there can be no doubt that these vesicles are produced by the efforts of the skin to eliminate the poison which, coming to the surface, produces acute inflammation at these various points; and the germs of the disease being located where this depression of the vitality of the skin has heen induced, develop there to a large extent, and make a nidus of the skin wherever opportunity offers. If aniseptics, however, such as carbolic acid, are applied to the surface of the skin where the eruption exists, the ritality of these germs is destroyed; their virulence therefore is aborted, and the effects of the disease suppressed; in short, no secondary fever ever appears, and the patient sails safely over a crisis which at one time was thought to be inevitable, and in every instance most dangerous. It is a well-known fact that small-pox need hardly ever exist, in consequence of the beneficent effects which vaccination produces;
this being evidently due to the fact that vaccine in the cow is identical with small-pox in the lhuman being, just as grease on horses' feet and distemper in dogs are supposed to be due to the same poison. If, therefore, the disease whilch has been attenuated in the system of the calf is introduced into that of the human being, the effects produced destroy the susceptibility which would otherwise exist. The author has observed on more than one occasion when snall-pox was prevalent the effects of the vaccine virus and that of sinall-pox cilninating almost at the same period within the human systen, when invariably the vaccine virus, probably because of the start it had got, has overcome that of smadl-pux and aborted it-the vacclne coming to a head while the small-pox simultaneously receded and entirely disappeared. As is well known, vaccine disease is not infectious in the human subject, white snallfpox is hilyhly so. Again, vaccination is devoid of danger, while suratl-pox is highly dangerous. It therefore behoves all who have charge of children to insist upon their early vaccination and re-vaccination, if necessary, during the prevalence of the disease in the neighbourhood. The medicines which are usually given in this disorder are those which act as slight aperients and keep the blood pure in this manner, the most valuable of which is Epsom salts, which, given highly diluted with water, forms a grateful and at the same time bencficial purgative. The diet should consist of the most nutritious and easily digested articles, such as an abundance of gruels made up with milk and farinaceous substances, together with chicken soup. drinks of barley water, rice water, or oatmeal and water. (See Vaccination.)
Smothering, or Suffocation, is due to the fact that the air which has entered the lungs is not permitted to be renewed by the inspiration of fresh air, so that carbonic acid, which, as is well known, is a deadly poison, becones re-inhaled and pruduces its poisonous effects upon the blood stream.
Snake Bites may be comparatively innocuous or rapidly fatal. Venomous snakes insert their fangs into their victim, and introduce the poison to the circulation by means of a perforation in the tooth. which is connected with the poison gland. If surgical means are at hand the injured part sbould be immediately excised, or the poison may be counteracted by the introduction of some strong alkali, such as ammonia, into the wound. Such measures, to be successful, however, must be employed without any loss of time. If the poison has entered the circulation strong stimulants should be administered by the mouth, the best of which are-alcohol and ammonia, If there is great prostration the subcutaneous injection of ether may be resorted to, but beyond these a much more powerful remedy consists in the subcutaneous injection of strychnine, which would appear to act in direct opposition to that of the poison. (See Cobra di Capello.)
Sneezing is a convulsive movement produced by a reflex action affecting the nervous centres which control the secretions of the mucous menibrane of the nostrils. This convulsive effort causes a forcible expulsion of air through the nares, as a rule carrying with it the irritating agent which has produced the actthat is to say, if it is due to the introduction of some foreign substance, such as snuff. Sneezing, again, may be produced, as it invariably is, in the pretiminary symptoms of catarrh, measles, influenza, or any diseased condition which affects the air passages, because of the irritation produced in the nostrils by the poison which has located itself there, and endeavours to become resident for the time being. The act of sneezing is nature's effort to dislodge the poison and protect the system from the disease which characterizes it. Contimal sneczing frequently results from the irritating particles consisting of the pollen of grasses and flowers, which culminates in hay fever. Persistent sneezing, however, also occurs where no foreign matter apparently has found entrance to the nostrils, but is caused by a catarrhal condition of the mucous membrane lining this portion of the air channel, and which is due to a rheumatic condition of the mucous membrane. In this case it is always accompanied by considerable catarrh of a somewhat acrid nature; it is then termed 'coryza.'
Snuffos is a term sometimes applied to catarrl of
the nasal mucous membrane of infants. Its name is derlved from the fact that the child makes a cunsiderable nolse in its efforts in breathlug because of its instinctive desire to breathe ouly through the uostrils The best treatment for this affection is to keep the child In as equable a temperature as possible, and introduce withu the nostrils a little vaseline, and anoint the nose and forehead frequently with sone animal fat, such as lard.

Soap, if properly made, should not injure the skin to any degree, but on the contrary, as Sir Erasmus Wilson has remarked, should prove very beneficial to it; but some soaps, especially those of a cheap manufacture, contain su much alkali in their composition as to produce an irritant effect upon the cuticle, and develop, especially in cold weather, chapped hands and chilblains. Properly speaking, soap should be coniposed of cither aniunal or vegetable fat, with a sufficient amount of alkali (usually soda) to neutralize the oleic acid which it contains, and thus form the fat into an enulsion, which thereby becomes soluble in water. The most useful soap for toilet purposes Is, according to the eminent dermatologist above quoted, unques. tionably Pears,' as its emollient effects on the skia are so very pronounced. Carbolic soap, again, is specially useful in the treatment of dandriff, eczema, and parasitic diseases of the skin. Various other forms of medicated soaps are reputed to be useful in certain affections, but the benefits which they possess must be entirely due to the fact that in them there is incorporated some antiseptic substance, such as borax, eucalyptus, terebine, pumuline, tar, etc. Castille soap is largely employed in the preparation of pills, and soap if made into a pill possesses slightly aperient properties. As is well known, soap is also pretty frequently employed as a component part of injections. A piece of soap the size of a walnut dissolved in a pint of warm water may be injected with considerable benefit in certain constipated conditions of the lower bowel.
Soda is an alkali, and is used both for domestic and medicinal purposes in the form of bi-carbonate of soda. It is largely used in the treatment of dyspepsia, especially where acid is a prominent sympton. It is a mistake, however, to employ bi-carbonate of soda too frequently, and in large doses, for the reason that it necessarily acts under these circumstances as an excessive stimulant to the gastric glands. It, however, nlay be safely taken in acid indigestion, if the dose is not too large, and if the salt is well diluted with water. An excellent remedy in indigestion is composed of the following ingredients, of which soda is a prominent component, viz.:-Pepsine, 3 drachms; conpound aromatic powder, 3 drachms; bi-carbonate of soda, 1 ounce ; and heavy magnesia, $\frac{1}{2}$ an ounce-to be mixed well together and half a teaspoonful taken in water thrce times a day after meals. Bi-carbonate of soda is extensively employed in the manufacture of effervescing drinks, when in combination with citric or tartaric acid it dissolves and produces a refreshing beverage. Soda water, the popular effervescing drink, contains very little of the alkali, but sufficient to make it grateful when combined with the carbonic acid with which the water is saturated under pressure. Hyposulphite of soda is an excellent saline, and acts as a gentle purgative, and is a beneficial agent where piles are present. It is also employed as an external application in certain fungus diseases of the skin, especially that form whicl goes under the name of chloasma or liver spot. It is also einployed in that form of dyspepsia where sarcini are developed within the stomacls, when it acts as a destructive agent to these little fungi. Sulphite of soda also acts in a similar manner to the hyposulphite. Chlorinated soda is prescribed as a disinfectant in ulcerations, especially of the throat and moutl, when it is employed as a gargle or mouth-wash. It is also useful in poisoning by prussic acid, when it is given in solution, and has a powerful antidotal effect upon this powerful agent. Phosphate of soda is a very mild aperient in large doses, and as it is devoid of taste is frequently employed in children's diseases when a purgative is desired. It has so little taste that it may be given in soup or any other nourishment that the child may be partaking of. Sulphate of soda, or Glauber salts, possesses very much the same properties as Epsom salts,
and may be employed for a similar purpose. Bi-borate of soda, or borax, is an excellent antiseptic agent, and is speciatly useful combined with honey and glycerine In the treatment of thrush in children, and also in the aphthous sore throats of adults. Chloride of sodium, or common salt, is one of the most useful agents whicli we possess, is from it the stomach derives the hydrochloric acid which is essential to the gastric juices. Bromide of sodlum, agrain, is frequent!\} employed in the treathent of hooping-cough, as it possesses valuable antlspasmodic properties. Salicylate of sodal has recently become a most valuable medicine in the treatment of rheumatic affections, some preferring it to salicine itself.

Somnambulism, or Sleep-walking, is due to an unhealthy condition of the nervous system brouglat by the presence of some irritating matter, usually within the alimentary canal. This excites the nervous centres to a state of unnatural activity during the epoch of sleep, or rather it should be said that sleep is disturbed by a species of wakefulness. As a rule, somuambulisin is associated with dyspepsia of one form or another, or a constipated state of the lower bowel; these causes being removed, therefore, will usually result in the cessation of this disagreeable and sometimes dangerous manifestation.

Sore Throat may be of several varieties, such as relaxed throat, catarrh of the throat, tonsilitis or quinsy, diphtheria, scarlatina, etc., but in this para. graph quinsy or tonsilitis accompanied by a rheumatic condition of the blood will be specially considered. As is well known. certain individuals are peculiarly liable to this affection, but invariably these are of a rheumatic diathesis, andithe inflammation which exists very frequently develops into an abscess within the tonsils, causing most excruciating, pain on any attempt at swallowing, accompanied by high fever, and liable to be succeeded by acute rheumatism after it has disappeared. It is invariably ushered in by a feeling of slivering, great prostration, and considerable fever, together with a very furred tongue, and constipated state of the bowels. Whenever quinsy is suspected to be threatening, the best remedy to administer internally is the following:-Salicine and clalorate of potash, of each $2 \frac{1}{2}$ drachms; guaiacum mixture, 6 ounces-a dessert-spoonful to be given every two hours to an adult, and a teaspoonful to a child eight or ten years of age every two hours. At the same time the system should be well kept up by a stimulating and rutritious diet, port wine being especially bencficial, and egg flip, strong chicken soup, beef juice, and plenty of milk being amongst the most valuable forms in which nutrition can be administered. If these measures are energetlcally and promptly adopted, the disease will frequently be cut sliort and an immense amount of suffering prevented, while at the same time the aftereffects will be annihilated. It is a great mistake to think that quinsy can be averted by the old-fashioned and obsolete niethods of treatment which have been, and at the present day are yet frequently prescribed, such as mustard and linseed meal poultice, blistering, gargles, etc. Aconite, however, has been and frequently is still employed in the treatment of these affections, and no doubt proves very beneficial when there is no specific disease present. This remedy; has many advocates, and no doubt has been specially useful in ordinary congestive attacks of the throat. It, however, simply acts by its effect upon the circulation, thereby reducing the tendency to congestion and favouring resolution without the inflammation having proceeded to suppuration. Its benefits, however, are not nearly so great as those conferred by the administration of the guaiacum, chlorate of potash, and salicine mixture, before mentioned. With regard to the local applications which are made by means of gargles, these, it must be confessed, have a certain beneficial effect by the astringent properties which they usually possess, while, if combined with some antiseptic, such as sulphurous acid, carbolic acid, or vinegar, they may act directly as destructive agents to the polson which is exerting its influence in the developing of the inflammation, and therefore on this account they are not to be deprecated, but at the same time I would insist that they must not be depended upon. Quinsy;
tonsilitis, or sore throat, in any form whatever, is usially secondary to a lowered condition of the vitall powers ; and this is, as a rule, if not directly due to, clependent for its start upon a constipated coudition of the lower bowel.
Sound, or Sounding. Is a tern applied to the investhgation by the ear of the condition of the variuns orgills contained in the cavities of the body, especially those of the cliest. (See LiAR.)
$\mathbf{S p a s m}$ is a painful contriction of the voluntary or involinitary minscles of tho body, such as cramp in tho legs, colic of the bowels or womb, angina pectoris when the heart is affectod, of the biliary duct when gall stones are present, or of the ureter when a calculus is pissing from the kidneys towards the bladder. It is characterized by sudden agonizing pain in the region of the part affectel, which in a sloort time subsides, but only to be renewed when further muscular action is brought into play. The very severe pain that is induced in any form of spasm makes it important to procure speedy relief, and this can only be obtained by the action of some marcotic antispasmodic agent. Anony the most useful and universally beneficial of which in these circumstances is the subcutaneous injection of morphia; next to this, the frequent appllcation of very hot fomentations freely sprinkled over with landanum, and afterwards the administration of opium by the mouth, or the administration of chloroform by inlalation. If the spasm is in the alimentary canal, any local or constitutional remedies that may he applied should invariably be followed by the free administration of a purgative. If, on the other hand, the gall duct is the seat of the disorder, together with the subcutaneous injection of morphia and the local application of opium, olive oil should be administered In large and frequently repeated doses. If the ureter is the seat of disease, and the calculus is passing from the kidney to the bladder, great benefit may often be derived by setting the patient in a hot sitz-bath for a considerable period, at frequently repeated intervals. If the heart is affected, as it is in angina pectoris, the greatest benefit will be derived from the minalation of nitrate of amyl, or the administration of this substance combined with nitro-glycerine in minute doses, while the condition of the stomach should be carefully attended to, and antispasmodics administered by tho mouth-the most valuable of which are chloric ether combined with ammoniated tincture of valerian. Thero is another form of spasin which frequently attacks children, especially if the digestive organs or bowols are out of order. This is called spasmodic or spurious croup, and will generally be relieved by the administration of a good dose of castor oil, while the upper part of the chest and throat should be well rubbed with an antispasmodic liniment, such as the following:Liniment of soap and opium, liniment of belladonna, and compound camphor, of each equal parts-a little of which should be well rubbed into the throat and upper part of the chest every two or three hours.
Spasmodic Diseases are characterized by involuntary contraction; of the various muscles, e.g. lockjaw, which causes contraction of the muscles of the fiace; St. Vitus's dance, where the patient is unable to rlirect the voluntary movements in consequence of spasmodic contraction of the muscles which he wishes to bring lnto play. Colic is a spasin of the muscular fibre of the intestine. Gall stones produce spasmodic contraction of the muscular structure contained in the gall duct. Gravel also causes this affection in the muscular tissue contained in the ureter. Cramp is another form of spasinodic discase, but the greatest development of this affection is found when epilepsy is present in an individual. An epileptic convulsion is neither more nor less than very strong spasmodic convulsions of the various muscles of the body, due to irritation at the base of the brain.
Spectacles shonld always be selected under the supervision of a competent optician, who will be able to adapt the lenses to the varions peculiarities which the individual may be subject to.
Speculum is an instrument largely used in the dlagnosis and treatment of diseases or the internal organs especially those of the ear. nose, bowel, and romb, As these have no special interest to the public
at large, it is quite unnecessary to go into details with regard to any of then,

Spermaceti is a hydro-carbon very nuch rescmbling in its composition paratlin wax. It is found in the liead of the spern whale, and is employed largely in the preparation of ointment, ponades, etc., as it is pussessed of no odour.

Spinach is a wholesome as well as it nutritious vegetable, and, as a rule, is easy of digestion. The taste for it, howeyer, is always an acquired one, and in consegnence of its peculiar liavour it is not a general lavourite.
Spine, or Spinal Colunn, is a chain of twentyolour bones which enter into the composition of its structure. They are arranged and fitted to each other in such a way as to pormit the nost extensive motion of the trunk of the body in all directions, and at the sance time enablu lt to retain its equilibrimm. Besicles being tho means of keeping the bocly erect, it acts the inmportant part of is shield for the spmal marrow, protecting it against the most violent slooks and concussions, From between the various bones which constitute the vertebral coltunn the different nerves are given off for the supply of the upper liubs, trunk, and lower limbs. Each vertebra has its peculiar claracteristic marks; and can be recognized from its appearance by any one who understands anatomy. The vertebral column is divided into several sections, such as the cervical vertebrae, the two upper of which are most especially concerned in supporting the head; the upperinost of these is named the 'atlas,' on which the head moves in the performance of its movements forwards and downwards, and backwards and downwards. The second vertebra, called the 'axis,' rests upon the bony ring of the atlas, and is kept in its position by strong ligamentous bands which run across from one side of the ring of the first vertebra to the opposite side, and cross the tooth-like process of the secoud vertebra binding them firmly together. By this arrangement the head is cenabled to move from side to side as well as from before backwards. When the neck is broken in the process of hanging it is the tooth-like process of this vertebra which presses forward upon the spinal cord and this extinguishes life. In all, there are seven vertebrae in the neck, the seventl or last being the most prominent of all, and is therefore called the "vertebra prominens. The next subdivision of the spinal colunn is the dorsal portion, which gives support to the ribs. After this come the lumbar vertebrae, the lower of them resting upon the sacrum, which see. This is composed of a series of vertebrae gradually diminishing in breadth, but noulded together. The spinal column is not straight, but has various curves which are natural to it. The principal of these is one outwards, which increases the capacity of the chest, and one which tends inwards at the small of the back, and these assist in maintaining the cquilibrium of the body, and also in supporting the viscera of the chest and abdomen. As a rule, there is generally a slight curve towards the right side, which when aggravated becomes transfornsed into lateral curvature of the spine. As the spine, like the rest of the body, is made up of two lateral halves, it may (just as in the formation of hare-lip), from an incomplete union of the two primordial halves of the body, at times remain deficient in the nelghbourhood of the loins, by which the nembranes llning the spinal canal are left unprotected except by the skin, and the fluid accunulating at this region distends the mentbraties and skin, and forms a lividlooking bag full of semi-transparent fluid, which is termed 'spina bifida.' At one time this was considered a fatal malformation, but at present, by operative ineasures being skilfully adopted, the tumour can frequently be completely anuihulated, and the Integrity of the canal re-established. Conctassion of tho Spine is not an unfrequent result of a severe injury from falls on the feet or on the back dlrectly. It may also occur from severe blows upon the back, and in consequence of this latter fact it frequently arises from the effects of railway accldents. The usual symptoms are-clepresslon of the whole system, with a complete or incomplete loss of power in the portions of the body which are supplied by nerves issuing from tho spine below the scat of the injury, and occaslonally acuto
pain comes on in the lower limbs, The organs supplied by these nerves are also liable to be itterficted with, such as the bowel and bladder, which frecjuently lose inll power of retaining their contents, and thus add very mucli to the distress of the patient. Until medical aid can be procured, the best thing to to in the circum. stances is to place the pationt carefully in the recumbent posture, and keep him perfectly quiet. Any inflammatory action which may supervene upon such an accident will require the usual treathient, such as leeching, cupping, fomentations, poultices, the application of soothing liniments, etc. ithe bowels snould be kept active by means of purgatives or enemata, as the case nay seen to warrant. Patients who are suffering from injuries of the spine, by constantly lying in one position, are very liable to be affected with bed-sores. It is therefore desirable that a water-bed be procured, which will not only add to the comfort of the patient, but at the same time reduce the tendency to bed-sores to a mininum. Surgical measures can frequently be employed now that antiseptic surgery is so well understood, and by these means pressure renoved from any portion of the cord where it may be found to exist. If there is actual displacement of any of the rertebral bones paralysis must necessarily supervene, in consequence of the pressure which is brought to bear upon the spinal marrow, Irritubility of the Spine is a condition which frequently exists in hysterical and nervous women. It is diagnosed by tapping the spine, and when percussion is applied to the point where the irritability exists the patient will complain of intense pain. This condition is usually associated with some diseased condition of the womb or ovaries, but local treatment by the application of an anodyne liniment or soothing plaster will afford consiclerable relief. Irritation of the spine is due to various causes, such as inflammation, rupture of the vessels within the cord, hardening or softening of the structure, Softening at the medulla oblongata, which Is that portion of the cordjnearest to the brain, is not an unfrequent concomitant, if not an actual cause, of epilepsy. The usual symptoms when the spine is irritated are-a disordered condition of the functions of sensation and motion, accompanied by twitchings of the parts supplied from the diseased portion of the cord. It is quite impossible that any lay individual can treat sucls a disease; therefore, it is imperative that medical aid be called in with the least possible delay. It would appear that lockjaw is invariably due to the poison of tetanus acting upon the spine. Cerebro-spinal meningitis in many instances would appear to be an infectious disorder. This is accompanied by ligh fever, and is usually ratal. Curvature of the Spine is due to a diseased condition of the bones, and is closely allied to rickets. It is associated very intimately with tuberculosis. The treatment most to be recommended when this unfortunate deformity exists is, to have the patient enveloped in a plaster of Paris jacket, and administer muriate of calcium in comnbination with the compound syrup of the hypoplosphites three times a day after ineals, and at the saine time maintain the strength by administering freely a nutritious diet. The length of time that the jacket should remain on is about three months. Lateral curvature, on the other hand, is not usually associated with disease, but is the effect of the body being continually or repeatedly bent in the direction which the curvature assumes, Of course it is very liable to occur in those of a delicate constitution, more so than in the strong and robust. This deformity was much more common before attention was directed to its prevalence by those having charge of the educational establishments of the country, before which time children were permitted to sit at desks which were quite unsuitable to their requirements. Plaster of Paris jackets are here again most useful to remedy the mischief which has been in ignorance developed. Gymnastics should also be recommended, and carried out very thoroughly.
Spirits, Low, are generally attributable to some functional or organic disease affecting the stomach, liver, womb, or ovaries.

Spitting of Blood may be from two sources, viz., the lungs, when it is termed 'haemoptysis.'; or from the stomach, when it is named 'haematemesis.' In either
case il is a symptom which requires very prompt attention. Until medical aid can be summoned, the patient should be kept perfectly quiet, and ice administered by the mouth, while eiglyt grains of gallic acid mixed in half a wine-glassful of watter to which twenty drops of elixir of vitriol have been added may be admunistered every two hours. If this does not succeed in arresting the haemorrhage, three grains or ergotine combined with fifteen drops of liquid extract of hamanelis may be administered with elixir of vitriol every four hours. It the haemorrhage procceds from the stomach, great care should be taken with regard to the food that is administered, and this should be composed of the most digestible substances that can be given, such as peptonized milk, Valentine's or Wyeth's beef juice, raw neat, etc.

Splint is an apparatus for keeping fractured bones in position. They can be made out of almost anything -a piece of wood, cardboard, or plaster of Paris, or starch laid upon a bandage and allowed to dry,

Spongio Piline is a mixture of sponge witl some other substance, such as cotton or linen, and afterwards covered with a waterproof substance such as india-rubber. It is frequently employed as an applica. tion when compresses or fomentations are indicated.

Sprain is the result of an accident, which either over-stretches or ruptures the ligaments surrounding a joint. The ankle and wrist are most liable to this accident. When such occurs it develops pain of a most excruciating character, which is immediately followed by considerable swelling of the part, and possibly dis-colouration-the swelling and discolouration being due to the rupture of small vessels which supply the part which has been injured. If the discolouration does not show itself after the accident it will undoubtedly do so at a later period, and if the limb has been placed in a horizontal position this discolouration may spread to a considerable extent up the limb. Sprains may frequently be confound ed with fractures, especially when the ankle is involved, as a small projection of the tibia and fibula, called in each case the 'malleolus,' may be factured, and when this occurs it of course adds very much to the gravity of the accident. In a sprain, however, pure and simple, no such complication arises. The treatment that is suggested in sprains is that which will give the most inmediate relief to the pain which has been incurred, and probably the most efficient method of treating this is by the application of four or six leeches over the seat of injury. The effect of leeches in such circumstances is very apparent and always beneficial-the pain will speedily subside, and the convalescence of the part be very much accelerated. 1f, however, the sprain has existed for a considerable time, leeches will not then be of the same service, and hot fomentations and soothing liniments may be applied at regular intervals, with a view of relieving the intense suffering that always accompanies the rupture of ligaments, which practically constitutes a sprain. After the liniment has been applied, a firm bandage should be brought to bear upon the parts which have been injured, both to promote absorption of the fluid that is being effused by the accident, and also to support the weakened joint, It is a mistake to keep a patient who has been suffering from a sprained joint too long in one position, as thereby stiffening of the joint is liable to result, so that after a day or two's rest slight movement should be encouraged (at the same time retaining the bandage in position), with a view of strengthening the weakened parts. In about ten days or a fortnight afterwards the joint should be placed under a douche bath, and afterwards rubbed vigorously with a rough towel, so as to stimulate the process of absorption which must necessarily go on until the sprain is completely recovered from.

Squill is grown on the banks of the Mediterranean, and is a bulb resembling in many of its external appear ances an ordinary onion. It is a useful medicine in bronchitis and catarrhal affections of the chest, and is usually administered either in the form of tincture, syrup, or oxymel. It also possesses useful diuretic properties, which render it a useful adjunct to other medicines, such as digitalis, ipecac, etc., in diseases which are dependent upon a catarrhal condition of the lungs or chest. The following mixture, into which
squill enters very largely, is most efficacions in bronchitis, viz.:-1pecac, 3 drachus; chlorie ether, 3 drachns; chlorodyue. 3 drachuns 1 and syrup of styuills to make 3 ounces -3 teaspoonful of whth is to be taken at frequent intervals when the cough is tronblesome.
Squint is due to a spasmodic contraction of the rectus muscle of the cye at one side or other. It is is moss disfiguring deformity, but fortunately it is one that can at any tinic be removed by n simple operation. In technical language it is termet 'strabisums.' The method of operating for the cure of squinting is exceedingly simple, and with the assistance of cocaine can be perfornued without any suffering on the part of the patient. In recent years, before the cliscuvery of cocannc, it was usually necessary to place the patient under chloroform to enable the operation to be suc. cessfully perfornued, and doubtless even at the present time this is preferable to cocaine.
Starvation, or Abstinence from Food, may proceed to a very considerable degree without actual danger to life accruing. It is a well-known fact that we eat much more than our body requires for actual nourishment. It is also well known that we ean live a longer period without food than we could without water. When starvation has proceeded to an undue extent and food again comes within reach, this shoukt at first be partaken of wery, very sparingly indeed, as otherwise the inclividual may die from the effects of over-eating; whereas, if food is given in very small and gratually-mereasin!' quantities, the stomach will become accustomed to it, and gradually açuire power to digest an ordinary meal. We all know the drendful effects of famine and of the enormous death-rate that aceompanies this dreadful calamity. If, however, the authonties in the districts affected were to take the precaution of husbanding all the foot that they could annex, a great deal of life might easily be saved by giving this out in small but sufficient quantities to the aflicted people. Several experiments have recently been made on the human body to test its powers with regard to abstinence from food. Such experiments, however, should not be encouraged, as they are only carried out by men who court notoriety and make money out of their exhibition. The body is alyays provided with a sufficient amount of fat to enable it to retain its temperature under even extraordinary conditions, and if starvation is accompanied by a warm teinperature, so that the animal heat can thus be retained, an individual will be enabled to endure starvation with much less risk to life than otherwise he would be able to do. The fat of course goes first in every instance of starvation, this being consumed in nature's attempts to retain the animal heat of the body. It may seem quite paradoxical to state that starvation very frequently occurs in the midst of plenty, but such is actually the case, for although a person partakes of quite a sufficiency of food to sustain him in ordinary circumstances, and keep him at the same time in good health, all things being equal, yet, although digestion may go on pretty faifly under such circumstances, the organs of assimilation may be so deficient as to be unable to absorb the food, and thus render it usefrul in the maintenance of health. This condition is peculiarly apparent in tubercular disease, which attacks the glands of the abdomen; hence wasting and debility supervene, notwithstanding the fact that an abundance of nourishment may be taken by the individual. In the gradual starvation which occurs where food is deficient the symptoms usually commence by great depression of the nervous system, this being apparent in the ordinary sensations and mental powers of the individual. This, however, will invariably be accompanied by an Irritable condition of the system, and possibly some aberration of the mental powers. The physiognomy of the person becomes sallow and dusky, the eyes inanimate, and a general appearance of innbecility appears to exist. The stomach loses its activity, and thus the digestion, as well as the appetite, is impaired. Languor and despondency, with a disposition to sleep, from which he is apt to wake in a drendful nightmare, usually are the symptoms which manifest thenselves in starvation. As is to be expected, there Is a sensation of chilliness, also breathlessness, palpitation, giddiness,
curious noiscs in the ears, possibly swimming or cloudiness before the eyes, and indeed blunting of all the sensations. In sonle districts of countries whicli aru inhabited by an intprovident and poverty-strickell population, starvatlon may, and frequently dues, give rise to a certain form of ferer called tanime or relapsing fever. It is dificult to account for the specific cause uf this fever, but it is probably due to the spores of the potato discase finding in entrance to the human body; and manifesting itselt in the pecullar symptoms whicts are present in this enervating clisease.

Steel is usually administered in the form of steel drops or tincture of iron. It is a uscful bluod tonic, and may be taken either in the form of tincture, solution in water, when of course it is the oxide of the metal which Is partly dissolved, and this constitutes the essential principlo of the numerous iron waters which are so popular as remedies in amemia, etc.; or in syrup. which holds in solution other salts of the metal-such as the iodidu, phosphate, hypophosphite, etc. The preparations of stecl, as a rule, are astringent in their properties, but not unfrequently one meets with individuats whose peculiar idiosyncrasy renders these salts purgative in their effects. This shouth always be borno in mind, therefore, when prescribing iron or steel in any form. It is a peculiar circumstance with reference to the salts of iron that they are very readily absorbed, and are therefore beneficial when prescribed in such a way that a fresh salt of the metal will be developed within the stonach-such as is aimed at in the composition of Blaud's pills, capsules, or palatinoids.
Stertor, or Sterturous Breathing, is almost symony. mous with shoring, only it is produced by a condition of the nervous systen which abrogates the sensibility of the throat, and therefore is always ans indication of approaching death in such diseases as apoplexy, bloodpoisoning, etc.
Stiff Joint is invariably due to some imflamatory action having taken place within the joint, and afterwards adhesions, resulting from the inflamed surfaces becoming united. It frequently results after fractures or infammatory affections of the joint, and is also a sequela of rheumatisin. In the treatment of stiff joint massage is a most useful agent, but often complete relief can be given by placing the patient under chloroforin and forcibly breaking any adhesions that may have taken place. Great care, however, should be taken when this course is to be adopted, as, if any inflamunation be present, it may have an opposite effect from that which was intended.
Still-EBorn. (See "Woman in Health and Sick. ness.")
Stimulants, Alcoholic. These are made up of fermented and distilled liquors, the principal of these being whisky, brandy, rum, gin, grape wines, malt liquors, and those prepared from the apple and pear. Distilled liquors, of course, may contain a nuch larger proportion of alcohol than those which are simply fermented; indeed, they are composed entirely of alcohol diluted with water, depending for their flavour upon certain oily constituents which they may contain. Alcohol itself is a narcotic poison; therefore, all alcoholic stimulants are nore or less poisonous in their nature, and this is too frequently made apparent by the effect upon the brain and circulation, which a too free indulgence in them produces. It is a matter of most vital consequence to decide whether stimulants are injurious or beneficial. If they are taken in moderation there can be no doubt that they are beneficial; but if, on the other hand. they are taken to excess, it is not difficult to impress upon any intelligent individual that they are highly pernicious. If then a person is unable to keep within proper bounds, that man should at once make up his mind to become a total abstainer. Indeed, I would go further, and say that if a person has once exceeded he should either make a point to confine himself to a limited quantity, or, if he is unable to do this, to resist the temptation of taking it altogether. There can be no doubt that stinulants are a great aid in the treatment of certain diseases, especially those which produce great exhaustion, and it is beyond doubt that many valuable lives have been saved by the judicious administration uf these beverages. When
alcohol in any form is prescribed as a medicine it fust Le kept in view that it becones a poison when once Hinshing is develojood by its 11se. Supposing it glass of port wine is ordered to a patient two or three tines a diay, and that glass of wine incluces a flushing of the countemance, then a glass is too much for his particular reguirements, because the very fact of flushing having occurred indicates that the alcohol contained in the whe has acted as a paralyziug agent to tho minute vessels which control the circulation in the face; lience its narcotic properties linve been developed. The effects of alcoliol upon the organs of digestion may be either hurtful or lielpful, and it remains for the individmal to find out what particular form of stimulant is nost adapted to his peculiar requirements. Nomedical man should ever take upon himself the prescribing of a partlcular form of stimulant, as the individual himself is alone able to arrive at a proper conclusion upon this important point. It is also a peculiar fact that certain people are affected very differently from others by stimulants, some being able to take a large anount without any apparent injury, whilst others are affected most seriously by a smaller quantity. The effects of spirits taken to excess are always inore serious, acting as they do; not only upon the nervous system, but upon the various oryans of the body, especially the liver and kidneys. Climate, again, has a most wonderful influence on the effects produced by stimulants; e.g. In warm climates like India large potations of stimulants Invaridbly produce much more serious effects upon the constitution than a similar amount would bring about In colder latitudes. Then, again, it must be remembered that over-indulgence in alcololic liquor invariably becomes such a dominant habit that it can with difficulty be relinquished; moreover, the children of drunken parents are born with the same craving which their progenitors have acquired. Alcoholic drinking to excess, again, produces many social evils which are to be deprecated by every right-thinking man, as there can be no doubt that insanity and crime are largely due to the over-indulgence in stimulants. On the other hand, it is a difficult problem to solve if stimulants are not useful agents in domestic economy, as we frequently, find that those who abstain entirely from the use of alcohol indulge to an inordinate extent in other ways, viz., as gluttons. My experience of teetotallers is, that they are enormous eaters, and are shorter lived than those who take food and stimulants in moderation. The difficulty, lowever, is to draw the line; and probably, from a moral point of view, the teetotaller has the advantage, simply, however, from the fact that over-indulgence in alcoholic stimulants does more harm to the individual and to society at large than overindulgence in eating does.

Stings of Bees, Wasps, etc., are produced by the insertion of the sharp-pointed and perforated sting, which permits the introduction of fornic acid into the part. It is always accompanied by intense pain and inflammation at the seat of injury. The poison is secreted by a small gland at the base of the sting, where it is contained in a minute sack. Individuals are affected very variously by a sting from these insects -in some it produces only trifling symptoms, while in others it may give rise to very serious consequences and prolonged suffering. Not unfrequently a sting of this nature has proved fatal. The first thing to do in the treatment of stings is to endeavour to extract the sting itself, and afterwards apply ammonia in a liquid form to the part, or if this be not at hand some other alkaline solution, such as soda, potash, or lime, which has the effect of destroying the acid which produced the irritation, and thus renders it inert.

Stomach, as is well known, is the organ which is chiefly concerned in digestion. Its position is more to the left than to the right, and it may be said to lie just below the heart ; hence distension of the stomach frequently gives rise to palpitation, in consequence of its encroaching upon the space which the heart requires for its own movements ; thus, pressure is brought to bear upon it, and it is liable to thump against the walls of the chest when the stomach is distended by flatus. The stomach is made up of tbree different coats or layers, the outer one being composed of peritoneum, which covors all the viscera of the abdomen. The
middle layer is composed of muscular tissues, whose novennenes are voluntary ind continuous during the process of digestion. It is by means of the muscular coat that the churning process is kept up when food is undergoing digestion. The immermost coat is made up of mucous menbrane, this being continuous with that of the gullet and inomilh, and that of the intestines. The mucous lining is drawn into folds or wrinkles called 'rugae,' which extend longitudinally. When the organ is at rest this lining membrane is of a prite pinkish colour, but whenever its functions are called into exercise it becomes much reddened by the increased supply of blood which it receives to enable it to secrete the gastric juice in sufficient abundance for its requirements. The chiet dlsorders which the stomach is liable to are-indigestion, gastralgia or neuralgia of the stomach, gastritis or infiamsuation of the stomach. It is also liable to organic disorders, such as cancer and ulcer. A blow over the region of the stomach produces intense prostration, pain, and a sensntion of impending danger. This is evidently due to the fact that the concussion affects the large nerve centres which lie inmediately behind this organ.

Stone is a term applied to concretions which form in the gall bladder and kidney.

Straining at stools is invariably an indication of some irritablecondition of the lower portion of the colon. This may arise either from constipation or a dysenteric condition of the bowel. (See CONSTIPATION, DYSENTERY.)
Stramonium is a drug which is largely employed in the treatment of asthma. The most beneficial effects are derived from smoking the stems and leaves of the plant. It seems in asthuna to exert a powerful antispasmodic effect. In the process of smoking it should be inhaled as deeply as possible into the lungs. It enters largely into the various preparations which are advocated for the treatment of asthma.

Strangulation, when applied to the throat, invariably results in suffocation, in consequence of the circulation of air being interfered with; therefore, the patient dies if the strangulation is continued for even a very short period. Tbe term is also applied to hernia or rupture, when the gut is said to become strangulated, and the part that is protruding becomes constricted and cut of from the neighbouring portion of the gut, when, as a consequence, gangrene of the ruptured portion is liable to occur if it is not speedily attended to.

Stricture is a term which is applied to a con. tracted condition of various canals, such as of the urethra, the neck of the womb, vagina, etc. In the two latter cases it is generally called atresia.
Strychnine is one of the most powerful tonic remedies which' we possess in muscular and nervous atony. Its poisonous effects are first of all apparent upon the muscles controlling the movements of the jaws, afterwards upon those of the chest, and lastly the muscles of the linibs become affected. As it is well known, strychnine is a deadly poison when given in lethal doses; at the same time, it is one of the most valuable medicines contained in the pharmacopoeia. It is especially useful as a subcutaneous injection in certain forms of paralysis which are not due to organic disease. It is also employed in this method in chronic alcoholism or dipsomania. Doubtless, in this respect it possesses properties which few other drugs can possibly lay clain to. It is also a valuable nerve tonic. and may be given with great advantage in certain forms of dyspepsia and muscular atony. Its effects are not only manifest upon the voluntary, but also upon the involuntary muscles; hence it becomes a useful agent in promoting a healthy action of the involuntary muscles, such as those of the heart, bowel. womb, bladder, etc. The dose of strychnine for an adult is one-twentieth of a grain, which may be repeated three times a day, while for a child from eight to twelve years of age one-fiftieth to one-tbirtieth of a grain will be found quite sufficient.
Stye is a pimple which forms upon one or other of the eyelids and proceeds to suppuration, sometimes giving rise to considerable inconvenience and constitutional disturbance. Invariably it is the result of a low state of the general health. With a view to arrest the progress of this disagreeable affection, the best
applicatlon is a poultice of tea leaves, which, by exert. lag an astringent effect, in many instances prevents tbe stye from coming to a head, and thus yields relief.
Sudden Death may occur from luany cruses, the principal of which, however, are lieart discease, apoplexy, embolism; the latter of which is the liberation of a clot from the heart, which fiuds its way into one of tho harge ressels which supply the brain with blood, and by blocking it deprives the brain of nourishment. which is essential to the existence of life.
Suffocation is the terun applied to the clrcuin. stances which deprive the individual of air containing oxygen, and thus death results from the failure of the lungs to receive a sufficient supply of this vital gas. Suffocation is the direct cause of death; therefore, in hanging, drowning, and any other method which is adopted for preventing fresh air from entering the pulninonary organs. Sutiocation, the retore, may result fron beith overlain by any aninal-such as a cat or dog-which is permitted to lave free communication with bedroonis, nurseries, etc. , in which young children are sleeping. It may also arise, and frequently does, from breathing an atuosphere which is largely impreg. nated with carbonic acid gas, and, as is well known, where persons are linnured from the falling of soil when excavating nines, tunnels, or other structures, and in clididren who are overlhin by their parents. Suffocation mayy also occur in infants during the pro. cess of parturition, when, if the cord is strangulated in any way, admission of air, or the circulation of oxygenated blood, is interfered with.
Sulphates are a combination of a metallic base with sulphuric acid, such as sulphate of soda, sulphate of naynesia, etc.
Sulphur is an elementary body, and is found in large quantities in volcanic countries. A large supply of the sulphur imported to this country comes from sicily. It is also found in combination as sulphides, such as the sulphide of iron, usually called 'iron pyrites,' from which both iron and sulphur are extracted. As is well known, this substance is found largely in combination with metals, such as line, magnesia, copper, etc., and also in the vegetable and animal kingdoms. In the latter it forms a constant element in all substances containing albunen, and this is well demonstrated in the egg. in which, during the process of decomposition, sulphuretted hydrogen is developed, and gives the cbaracteristic odour to rotten eggs. It is also contained in the hair and nails, and can be detected wben these are burnt. Sulphur is a very excellent laxative, and at one time was largely employed as a blood purifier on account of it being supposed to contain some special virtue. The bencficial effects, however, were not due so much to the sulphur as to the traces of arsenic which the flowers of sulphur at one time contained as an impurity. It was the arsenic, therefore, whicb acted upon the skin, and not the sulphur. As is well known, sulphur is a powerful antiseptic, and when burnt by the evolution of sulphurous acid which takes place, its beneficial effects as a disinfectant become apparent. In combination with hydrogen the gas developed is named 'sulphur. etted hydrogen.' which is soluble to a large extent in water, and conveys to various springs which are charged with it medicinal properties of a very high order, amongst the most noted of which in this country are Harrogate and Strathpeffer. When sulphur is administered as a laxative the dose should be about one to two teaspoonfuls taken at bedtine. The preferable form to take it as an internal medicine is in that of the precipitated or mith of sulphur.
Sulphuric Acid is a combination of sulphur with hydrogen and oxygen, and is one of the most valuable conmercial products wbich we possess, as by its action upon various substances many important products are obtained. It has a very strong affinity for water, and as oil of vitriol, which is the popular name for this acid. it is employed as an agent for extracting moisture from various substances, especially from air in the process of the manufacture of ice by Hardy's machine. It is manufactured on a very large scale directly from sulphur, which is burne In conjunction with nitrate of potash in large leaden chambers, sulphurous acid being at first produced. and this being converted into
sulphuric acid by tho absorption of an atom of water. As a medicine sulphuric acid is used in a diluted forn as a tonic. Poisoning by sulphuric acid, although not often nuet with, has frequently occurred. Its symptoms are of the most painful description, and, in consequence of the caustic ellect of the substance, is rarely recovered fron. The firsit thing to be done, when accidental pofsoning of this kind takes place, is to administer adkaline substances, such as magnesfia, chalk, potash, soda, ur even soap, and afterwards give some bland stubstance, such as oil or milk: 1n the absence of any allkali, which have been inentioned, auy kind of mortar or limo taken from a wall or any other convenient place should be given, as anything in the shape of an alkuli destroys the acid by converting it into a sululate. Tho aromatic sulphuric acid, or elixir of vitriol, is a popular tonic when taken in from 15 to a0-drop doses in is wine glassful of water three or four thines a day.
Sulphuric Ether is manufactured by the action of sulphuric actd upon alcohol, which produces an oxidation of alcohol and renders it much inore volatile. at the same time altering its properties both chemically and nedicinally. This substance is perfectly colourless, hawing a very light specific gravity and being very yolatile. Its odour is peculiar to itself, and diffuses itself very rapidly through any apartment 1 la which it may be placed. It is largely employed as an anaesthetlc. and by many is preferred to chloroform. It is also prescribed as a ditiusible stimulant and antiseptic, and in certain cases of great prostration it is aduninistered hypodermically to prevent collapse. In such diseases as angina pectorls, asthma, hysteria, etc., it is a very useful agent, and may either be inhaled or given by the mouth in from 15 to 20 -drop doses in water. Great care should always be taken by any one handling ether, especially when in the neighbourhood of light, as it is so volatile that its vapour flies of in great quantities, and, being heavier than the atmospheric air, it may float in sucll a volume as to becone lgnited and set fire to the liquid or substance with which it may be in contact. In consequence of the rapidity with which it evaporates, it has been employed as a local anaesthetic by means of a spray producer. This, however, produces such a hardening of the tissues that it is not at the present moment very popular.
Sulphurous Acid is composed of three parts of oxygen, and one of sulphur. Properly speaking it is a gas held in solution by water. It possesses a strong pungent sulphurous odour, and unless kept in well. stoppered bottles the gas is liable to fy off and leave the water, so that it becomes very much diluted. It is a most useful antiseptic, and is largely employed in consequence of its non-irritating properties. In the form of spray it is applied in sore throat, and as it is produced in the combustion of sulphur it is also enployed for catarrhal affections of the air passages and in disinfecting rooms where contagious diseases have been present.
Sunstroke, or Heat A poplexy, is a congestion of the brain produced by the heat of the sun. The effects of sunstroke are frequently very scrious, and often have a fatal result. In every instance the nervous system is so seriously affected that complete prostration and insensibility take place at the same tinue. These, if death does not result, invariably leave the mind in an unhealthy condition, in many instances giving rise to a form of insanity or mania which may be permanent, although in many cases it may be recovered from. Individuals of intemperate habits are much more liable to this affection than those who live a temperate life. Constipation is also a condition which superinduces sunstroke ; it is therefore imperative that those who are resident or travelling in hot countries abstain from over-indulgence in alcoholic stimulants, and at the sane time be careful that the bowels are satisfactorils evacuated every day. The greatest precautions must be taken to shelter the head from the action of the suus by suitable head-gear. Cold baths and exercise in the open air in the early morning are also considered to be preventive of an attack, while the body shouth be clothed in fannel, and the dress, as well as the covering of the head, made of a material devoid of colour, so that the sun's rays may be refected insteal of absorbed. The symptoms of sunstroke ofter come on very

Insidiously. They commence as a rule with headache, giddiness, igeneril prostration, accompanied by sickness and vomiting The skin becones hot and dry, the pulse quick at times, but at other times it may be musually slow, in consequence of the great nervous prostration that exists. The bowels become more than usually costive and the urine deficient in quantity. while there is excessive thirst and high temperature. After these symptoms have continued for some time the breathing becomes oppressed and rapicl, and the action of the heart tumultuous or palpitating, after which gradual or sudden unconsciousness will super. vene. When this state becomes developed the eyes are blood-shot and the pupils contracted, the face pale, and the surface of the body dry and hot, after which convulsions may set in and the patient suecumb. When cleath is near the pulse becomes intermittent, the breathing stertorous, and the pupils dilated. When recovery takes place there is always a tendency to some affection of the nervous apparatus, which may take the form of temporary paralysis, convulsions, or some form of insanity. The greatest variability as to the duration of the symptoms frequently exists-in some cases death has taken place within an hour or two of the attack, while it may occur at a much longer interval. The treatment of the disease consists in first of all having the bowels thoroughly well evacuated simultancously with the application of ice to the head, or the cold douche if the patient can bear it. It may also be necessary to extract blood by venesection or cupping from the nape of the neck, while the head should be shaved and a fly blister applied to the nape of the neck and over the base of the brain. Blood should be drawn towards the extremities and trunk of the body by means of mustard poultices, while strong tea or coffee, together with ammonia, should be administered to counteract the depressing effects which lave resulted, and if there is any difficulty in swallowing these should be administered by means or the enema while, to act as a rapid stimulant, ether may be injected under the skin. A great many theories have been advanced as to the cause of sunstroke-some of these being that it is largely due to the atmosphere being highly charged with electricity, while others hold that it is the direct effect of the sun acting perpendicularly. It is a strange circumstance that sunstroke seldom occurs in mid-ocean, although it is very liable to produce its effects in narrow seas and close to land.
Suppository is a method of administering medi. cine by the bowel. It is usually composed of cocoa butter made soft by the addition of olive oil, yet possessing a greater consistency than butter. The remedy to be employed is mixed in this and introduced into the rectum. The medicines which are mostly given in this way are-morphia, hamamelis, belladonna, ichthyol, santonine, iodoform, opium, etc. Food is also frequently administered by means of nutrient suppositories. These are specially useful in cases of disease where the stomach is highly irritable and unable to retain food to any extent.
Suppression in medical language applies to the cessation of the secretions of certain organs, such as the urine.
Suppuration is the formation of pus on or within the living tissue. (See PUS, ABSCESS, ULCER.)
Sweat, or Perspiration, is the fluid which is thrown off by the skin, and is invariably a healthy sympton when it is not excessive. In certain diseases, however, such as consumption, if it is too copious, it forebodes very grave symptoms. When the skin ceases to act it is invariably a symptom of high fever, and it should be the aim of the medical attendant to induce perspiration by first of all lowering the temperature and keeping the body warm, at the same time administering diaphoretics.

Swelling is an increase of the size of various textures of the body, and may consist either of fluid or solid matter. In the former case it is caused by a congestion of some of the tissues either immediately concerned or in some neighbouring tissue, and invariably arises from an oozing taklng place from the veins of the part or parts. Swelling of the leg, for instance, in dropsy arises from some impediment to the flow of blood towards the heart, and usually indicates disease
of a very grave nature, either affecting the kidney, liver, or heart. If in the abdomen, when it is named ' ascites,' it usually depends upon some obstruction of the clrculation due to serious disease of one or other of the above mentioned organs. When the swelling takes place on the surface of the body it usually contains pus, and may assume the nature of an aloscess, carbuncle, or boil. Swelling may also arise from the infiltration of air within the cellular tissue of the body. and tumours are another canse of this affection. (See IUMOURS, DROPSY, ABSCESSES, etc.)
Swine-Pox is a variety of chicken pox, and is characterized by vesicles very similar in aypearance to those of chicken-pox.

Swoon, or Fainting, usually arises from some mechanical or nervous condition affecting the heart's action. The patient should therefore be laid in the horizontal position, and cold applied to the forehead, together with the fumes of ammonia to the nostrils, and when the patient is able to swallow, a little salvolatile or brandy mixed with water should be ad. ministered.
Symptoms, as applied to medicine, are those conditions which enable the physician to make his diagnosis. They are said to be subjective and objec tive-in the former the symptons being described by the patient himself, whereas in the latter they are arrived at by examination made by the physician. Amongst the former may be mentioned pain and the various sensations which the patient experiences in the progress of disease ; in the latter the physician obtains information by the use of the speculum, sphygmograph, stethoscope, and chemical tests applied to the urine, etc. It is always wise in endeavouring to diagnose disease to go regularly to work, inquiring in a methodical manner the various train of symptoms that follow upon the supposed cause of the disease. In many instances it will be necessary to treat symptoms with a view of ascertaining their origin, and at the same time relieving these without necessarily curing the disease. This plan of action is specially necessary in malignant diseases where a cure is impossible In every instance, however, the symptoms should be so focussed as to enable the physician or surgeon to come to a correct conclusion as to the nature of the disease, with a view to having it reinoved, (Refer to DIAGNOSIS.)

Syncope is a severe form of fainting, and may terminate in cleath, especially, if it is due to organic inischief within the heart or lungs. With a view of averting a fatal issue, the patient should be treated very much in the same way as is described in fainting. but more energetic neasures may be necessary, such as the application of electricity, artificial breathing, or the subcutaneous injection of ether or brandy.

Synovia, or Synovial Fluid, is that which is secreted by the synovial membrane of the joints, and acts as a lubricating agent, permitting the cartilaginous substances of the bones to move over each other without friction. It coutains a considerable amount of albuminous material, together with an oleaginous-looking substance, and is popularly known as joint oil. When this membrane becomes inflamed the fluid is apt to be secreted in excess, and give rise to swelling of the joint. This is specially noticeable in what is popularly known as 'housemaid's knee.' When the joint becomes organically diseased, however, a chronic form of this inflammation exists, and is usually accompanied by a degeneration of the tissues composing the joint, and this is specially noticeable in the knee-joint, when it is known as 'white swelling.
Tamarinds are the fruit of a leguminous tree which is a native of India and other warm climates. The fruit is employed largely in this country as a slight laxative, and, as it is pleasant to take, is specially useful in constipation, which so frequently exists in children.

Tannin and Gallic Acid are the active principles which give the astringent properties to the gall nut, oak bark, and other astringent barks. The former is a yellowish powder, while the latter crystallizes in white, silky-looking flakes. Both are soluble in water, and are employed in medicine to a considerable extent in internal haemorrhages. Gallic acid in eight-grain doses, combined with fifteen drops of the elixir of vitriol, nay be given every two hours in half a wine-
glassful of water, and nay also be administered in the form of pill in smatl doses, Tannin and gallic acied are also given in the form of suppostory, and applied as external styptics, and are thus useful for arresting haemorrhape from wounds. Taunin mixed with gly. cerine is frequently employed as an astringent in relixed sore throat, when it should be painted upon the tonsils every hour or two.
Tape-Worm is one of the parasites which infest the intestines of various animals. That found 11 wan is generally duc to the eating of raw or under-done meat, which contains the larya of the worn. It camnot develop from the egk within the human intesthe, it being necessary to its developument that the egg be taken into the stomach of some herbivorous animal, such as the pig, sheep. or ox. Within the stomach of any of these animals the egg becomes developect into a small object called an "echino coccus." This hittle body is provided with a boring npparatus, by which it penetrates through the caats of the stomach and enters the circulation, and locates itself in one or other of the fibrous tissues of the animal, where it remains encapsuled for an indefinite period, its cycle of existence being arrested. When the antmal is eaten, and the flesh containing this echino coccus taken into the human stomach, a further development of the parasite takes place until it reaches its adult existence, this being the tape-worn1, which attaches itself by means of two hooks, situated on its head, to the mucous membrane of the bowel, from which it grows downwards, attaining a length of twelve feet in many instances. The segments of the worm, at the lower portion, are constantly being thrown off, and appear in the stools: but until the head is detached the cure cannot be said to be complete, as it retains the power of still developing fresh segments, each of which contains the generative organs of both sexes. Each segment, therefore, is a bi-sexual organism capable of producing the fertilized eggs, which may at a future time give rise to a complete specimen of the tape-worm. Amongst the many remedies which have been advocated for the cure of tape-worm are-pomeyranate bark, cusso, oil of male-fern, chloroform water, but the best of all, and probably the most recent of introduction into the pharmacopoeia, is naphthaline, which seems to act as a direct poison to the parasite. Chloroform water, which is a saturated solution of chlorotorm in water, is also a very useful agent, and seems to have a paralyzing effect upon the worm, so that it loses its hold upon the mucous membrane of the intestine, and can be cast off by means of a purgative.
Tapping is an operation which is employed for the removal of fluid which has collected in any quantity in any of the carities of the body, such as the pleura and abdomen. It is also had resort to for the removal of fluid from the scrotum when hydrocele is present, and also to remove a superabundance of fluid from joints and abscesses of large dimensions.
Taraxacum is the technical term given to the dandelion. In the form of liquid extract it is largely employed in the treatment of sluggish liver, the dose being one tenspoonful, and that of the solid extract about fifteen graius, three times a day.
Tartaric Emetic, or Tartarized Antimony, is a medicine which at one time was largely administered in febrile attacks. It has a powerfully depressing effect upon the heart's action, and possesses also expectorant properties. It is not now nearly so much used as it was in former times. The usinal mode of administering it is in the form of antimonial wine, which may be given iil froin ten to twenty-drop doses erery three hours, combined with some other expectorant. When given in a powder half a grain is a fair dose. It nust be taken with considerable caution, as it is a deadly poison when given in too larke doses.
Tartaric Acid is a vegetable acid, and is the characteristic acid of the grape, from which it at one time was altogether procured. It exists in fruits in combination with potash as biotartrate of potash or cream of tartar, and is met with both in the form of crystals and powder, generally the latter. It is largely employed in the rroduction of effervescing drinks, and it is one of the component ingredients of seiditz powders. It may also be employed as a solvent for
quinine, just as elixir of vitriol is used for the same purpose.

Temporal is the region of the head which is situated the temples, and gives the stane to the nerve and artery supplying this region.

Tendons are those strong fibrous bands loy which the inuscles are attached to the bone, and are popularly termed 'teaders.' Tendons are liable to injury either by overstrain, whereby rupture maty result, or if not, inflammation set up in the part, which always prochaces severe pain on movement, and consequently tameness. When rupture or division by a wound takes place tho portion of the timb inmediately below is hetpless. If the part has been strained the tendon will become thickened and sensitive to the touch; the treatument in this case consists in perfect rest, together with the application of a fly-blister over the part. If rupture or division from any cause is present, the parts must be relaxed so as to enable the clivided ends to come into posltion, and the limb fixed by a proper bandage or splint until union takes place.

Terebine is produced from turpentine by the action of sutphuric acid and hent. It is a colourless, volatile fluid having a rather pleasant resinous odour. It is much employed in bronchitis, when it may be given in from 5 to ro-drop doses on a piece of sugar at frequent intervals, It is also employed in the treat mert of inflammatory affections of the air passages by inhalation. It has been used as an antiseptic in the dressing of wounds, but is superseded by more ener. getic and more stable antiseptics.

Tertian. (See AGUE.)
Testicles are the organs of the male which are represented in the fenale by the ovaries. They are liable to inflammatory attacks, which are accompanied by swelling and severe pain. This requires to be treated by leeching, fomentations, poultices, and rest in bed, with the parts supported by means of a towel pinned round the upper parts of the thighs, and the inflamed parts raised up and permitted to rest on this. Afterwards a suspensory bandage will require to be worn, so as to give support to the greatest possible extent. These organs are liable to disease of a malignant type, and are not unfrequently the seat of cancer, when of course their removal will be a necessity.

## Tetanus, or Lockjaw. (See LockJaw.)

Thermometer, or Measurer of Heat, is largety employed now in the diagnosis of febrile conditions. By its employment a great advance las been made in medical science. When otherwise it would be impossible to diagnose the presence of fever, the thermometer indicates this with the greatest precision, thus enabling us to adopt measures for the reduction of the animal heat before a high temperature could otherwise be demonstrated. In this way the debilitating effects of a continued excessive temperature can be averted by the judicious administration of antipy retics, the most useful of which is plemacetin. The normal temperature of the body is about $98^{\circ} 4^{\circ}$, while in fevers it may rise to $106^{\circ}$ or eren higher. In collapse the temperature of the body falls as low as $80^{\circ}$, or even lower, which of course always indicates symptoms of the greatest gravity. The clinical thermometer is an instrument which can be employed by any one, and slould be in the possession of every one, so that on the least suspicion of fever arising it can be resorted to, and thus indicate the necessity of calling in the medical attendant. No time should be lost in doing this if the thermometer indicates a temperature of roo degrees.
Thigh is that portion of the lowes limb which is supported by the femur, this being the largest bone in the body, and is articulated with the hip and the knee. It is made up, besides this bone, of large muscles, the principal of which are the quadriceps-extensorfemoris. It is a portion of the body which, from a surgical point of view, is of the greatest importance, containing as it does the large blood-vessel called tho - femoral artery,' and the largest nerve of the body named the 'sciatic.' The groin, which is the junction of the thigh with the body, is of considerable importance from a surgical point of view also, as wounds in this region are exceedingly dangerous, in consequence of the femoral artery and vein passing through this region, The thigh, or fenoral bone, is liable to fracture in any
vortion of lts extent; but being a siagle bone, and of considerable dianteter, it is easily set if it is attended to by a competent surgeon.
Thorax ls the cavity of the chest.
Throat conprises that portion of the alimentary canal between the fauces and soft palate. It is liable to many diseases such as congestion, quinsy, diphtherin, scarlatina sore throat, aphetha, etc. It is also llable to neuralgic affections, when the ordinary treatment of neuralgia should be adopted. If quinsy is threatening it should be attacked by gargling the throat with an astringent gargle, such as the following:-Glycerine of tannin, I ounce; sulphurous acid, hali an ounce; acid Infusion of roses to make 8 ounces-the throat to be gargled every hour ; while the following mixture should be administered:-Salicine and chlorate of potash, or each 2f drachms; guaincum mixture to make 6 ounces -a dessert-spoonful of which should be taken every two hours. In diphtheria powerful disinfectants should be applied to the throat at frequent intervals, while the system should be well kept up by stimulating nourishment.
Thrush, or Aphtha, is an indication of an acid condition of the alimentazy canal, aud is distinguished by small white spots upon the throat, palate, and tongue. Its existence is due to a fungoid growth upon these parts where the sputs appear.

Tic-Douloureux is the name given to neuralgia of one side of the head, generally situated in the temporal nerve. It is characterized by its paroxysmal attacks, which occur at regular intervals or at regular hours. It can generally be alleviated by the administration of eight grains of phenacetin combined with two grains of catteinc, while the neuralgia is being treated by means of quinine, given $\ln$ two-grain doses every four hours, at the same time that a nourishing diet is partaken of.
Tinctures are solutions in spirits of medicinal substances which have been infused in this liguid-such as tincture of arnica, spirits of ammonia, spirits of camphor, tincture of calumba, tincture of cardamoms, tincture of catechu, compound tincture of camphor or paregoric, essence of ginger, tincture of ginger, tincture of henbane, liquid extract of hamamelis, tincture of muriate of iron, tincture of per-clsloride of iron, tincture of myrrh, tincture of opium or laudanum, tincture of valerian, tincture of rhubarb, tincture of squill, tincture of sombul, etc.

Toes are liable to bunions, corns, fractures, and in old people are frequently the seat of the commencement of senile gangrene. Bunions are an inflamed condition of the bursae covering the joints, while corns are an excessive development of the cuticle covering the joints. In fractures of the toes a splint is not necessary, as the fractured ends can be kept in position by binding the neighbouring toes together along with that which is fractured.
Tongue, or the Organ of Speech and Taste, is made up of muscular fibre covered with mucous membrane and cellular tissue, with which is mixed a certain amount of fat. It is a nost vascular organ, containing a large number of blood-vessels and nerves. It is covered by a dense tenacious mucous membrane, which is continuous with that of the mouth and throat, and on which are situated the papillae, upon which are distributed the nerves of taste. Sometimes these are very much enlarged, and can be seen as elevated spots at the back part of the tongue. The tongue is attaclied to the lower portion of the mouth by a band of fibrous tissue, called the 'fraenum.' At the back, or base, the tongue is attached to a small bone, called the 'hyoid.' This organ is liable to many diseases-such as inflan. mation, ulceration, and cancer, and it has also been frequently the seat of neuralgia of a most painful description. By means of the tongue the condition of the digestive organs can be readily ascertained, while it also gives indication of general disturbance of the system at large. When the tongue becomes swollen, and this is accompanied by a catarrhal condition of the mucous membrane of the throat, it nay be surmised that the stomach is likewise affected; while a dry tongue always indicates considerable prostration of strength. When inflammation of the tongue, or glossitis, is present, the organ may become so swollen as to
protrude from the mouth and threaten suffocation. The lest remedy in these circumstances is to incise it deeply so as to promote copious bleeding, and thus dinunish its size by relieving the congestion, Ulcerations of the tongue should be treated by the application of the glycerinc of borax and chlorate of potash, while the stomach disorder which has given rise to it should lee simultaneously treated. Frequently ulceration of the tongue arises from the irritation produced by its constant contact with the rough surfaces of dectyed tecth, or stumps of tectli. These should therefore be filed down, so as to remove the roughness of thelr edges. Cancer of the tongue can only be relieved by operation, when the organ should be removed, or at least the portion of it which is affected by the disease. In every instance, as is well known, the condition of the tongute gives valuable information to the nuedical man in the diagnosis and treatment of disease. A dry tongue in the morning gencrally points to the fact that the individual has been sleeping with his mouth wide open, and this circumstance is liable to prevent a prolonged and refreshing sleep. The habit, therefore, of sleeping with the mouth shut, and breathing through the nose, should be cultivated by every one, as thereby sleep is prolonged, and is also nucli more refresling. When feverish conditions exist the tongue invariably becomes coated with a white fur, and when prostration results ${ }_{\text {e }}$ in consequence of this, it is liable to become dry and horny to, the toucl. A great deal of information as to the state of a patient may be derived from the conclition of the tongue. In scarlet fever it invariably presents a strawberry appearance, and this in itself may frequently enable the physician to suspect the presence of this disease. When the tongue is very clean and red it generally indicates a considerable ainount of stomachic and intestinal irritation. This condition also exists in an irritable mucous membrane, which is usually due to a rheumatic condition of the system, and is generally accompanied by a very relaxed state of the throat, in which circumstances there is always a tendency to take cold very readily, in consequence of the chronic catarrh which exists in the mucous membrane. When the tongue is protruded. and diverges to one side more than the other, it is an indication that paralysis of one side of the body exists, so that the appearance and movements of the tongue constitute most valuable evidence in the diagnosis of disease.

Tonics are medicines which are given with the intention of promoting nervous tone, and thereby conveying to the various organs the vigour which is thus produced through the nervous system. Tonics are generally believed to be only applicable to certain conditions of health which produce debility by an inefficient action of the stomach. This, however, is not inyariably the case, as tonics can be prescribed which will affect various organs individually-such as a tonic for the stomach, for the liver, kidneys, or womb, etc. The most useful tonics which are known are those which exert a specific action upon the nervous ap-paratus-such as strychnine, quinine, zinc, the mineral acids, the bitter infusions, tinctures, etc. No medicine. however, can be considered a tonic which does not act in the first instance upon the nervous apparatus which supplies the organ intended to be influenced. Of course, beyond medicine, many things act as tonies, amongst which may be mentioned a wholesome and easily digested diet, a regular regimen as to hygienic measures, change of air to the country or to the sea. side, rest from business, accompanied by relaxation of one kind or another-such as golf, cricket, fishing. shooting, hunting, all of which are tonics when taken advantage of in their proper places.

Tonsils are the glands which are situated at each side of the throat, and which are enclosed in the pillars of the fauces or soft palate. These glands secrete a tenacious mucous fluid, and in consequence of the tenacity of this fluid it is liable to entrap certain substances in their progress towards the stomach, amongst which may be mentioned the germs of certain diseases, such as scarlet fever and diphtheria, and therefore, in consequence of this mucilaginous secretion, the tonsils are frequently affected in contagious or infectious diseases. Doubtless it is through the tonsils that dipl.
theria finds its entrance to the system at large. Tho tonsils :are also liable to intlunnation, whicla may in many iustances procecd to suppuration or quinsy. This condition should always be looked upon with suspicion, as it almost invariably indicates a rheumatic tendency of the individual; and, in sloort, quinsy may wiih perfect satety be looked upon as an indication of a tendency to acnte rheumatisu or some other rienmatic attection. It is a diseasc, however, which need never take hold of an juclividual, but may always be conibated by the physician insisting upon the bowels being kept open every day, while the following mix. ture should be taken at regular intervals of two hours:Salicine and chlorate of potash, of each $2 \frac{h}{\text { drachins }}$; guaiacum mixture to make 6 ounces-a dessert-spoontiul to be taken every two hours; while the throat should be garyled with sulphurous acid and water at frequent Intervals also. In many instances the tonsils ibecome chronically enlarged in consequence of some slight inflanmatory attack having located itself within these glands. If they do not subside by the frequent application of the glycerine of tannin it is possible that they may require to be excised. This operation, however, Is entircly devoid of danger, and can be accomplished without pain. It is extraordinary what an influence the muriate of calciun, combined with the syrup of the iodide of iron, has upon enlarged tonsils; for a cliild ten years old 6 grains of the former with 15 drops of the latter may be given tliree tincs a day in water, with considerable benefit.
Toothache is a painful, aggravating, peace-dis. turbing arfection, but as it is never attended with any danger to life it is generally viewed with contempt by all beholders. The best remedy for toothache, if the disease has proceeded to any great extent, is to have the tooth extracted-this, of course, goes without saying; but, on the other hand, if extraction is not thought advisable, the pain may be assuaged by first of all having the cavity of the tooth thoroughly cleansed by means of cotton wrapped round the end of a piece of match-wood and swabbed out by a solution of carbonate of soda, after which a pledget of cotton wool may be introduced, having been first saturated with a solution of carbolic acid, or a ten per cent. solution of cocaine. A dose of medicine, as a rule. proves very efficacious in relieving the pain from toothache, and this is especially the case with children.
Torpor is a condition of semi-coma, and always indicates some injury to, or disease of, the nervous system. If it is impossible to rouse a patient from the state of torpor into which he has fallen, either as a consequence of disease or the administration of a narcotic, the greatest fears may be naturally indulged in. Torpor, in fact, is another name for torpidity of the nervous system, and this, as is well known, is either due to the direct action of poison or of disease.
Total Abstinence. (See STIMULANTS.)
Trachea is that portion of the wind-pipe which is situated between the larynx and the bronchial tubes. It is liable to inflammatory attacks, but its greatest importance, medically. consists in the fact that in cases of threatened suffocation from diphtherin and other affections of this nature, it is this portion of the air passage whicla is opened, the operation being called tracheotomy.

## Trance. (See Catalepsy.)

Tremor is a sympton of nervous debility arising from either exhaustion, excitenent, or clisease. It is especially noticenble in drunkards and in the course of fevers, and is invariably a symptom of a very serious nature, as it always indicates a decadence of the vital powers.
Trichinlasis is a disease which las given rise to very considerable alarm, in consequence of its painful and disgusting nature. It is due to the invasion of the muscles of the human frame by a minute worn called the ' trichina spiralis,' and is generilly developed by eating under-cooked pork, the pigs from which it has been procured having, been infested with this disorder. The disease sets in within a few days after cating the infected meat, and commences with loss of appetite, sickness, prostratlon, fever, pains in the limbs, swelling of the fice, copions perspiration, and other signs of clepression. In the worst form of the disease these
symptoms are accompanied by lncessaut vomiting and diarrhoca, resembling very muclt tho symptons of typhoid fever, with which disease it at minly times has been confounded. Althouglt trichiniasis is such a lonthsome disease it at times is not necessarily fatal, as the munute worms which find their way into the muscles of the individual may become surrounded by a capsule, :und thus separated as it were from the muscle, where it renains cinbedded, causing little or no disturbance. It is needless to say that if such a disease is suspected a medical man should be consulted inmediately:
Trunk-Pack is tho hydropathic application which is employed frequently in the treatinent of febrilo conditions of the body, cespecially where the organs of thu thorax or nbdomen are inyolved. The method of application is to wring a towel out of tepid water as tightly as possible, nald wrap it round the body, nnd afterwards cover it with several plies of flannel or blaket, perinitting the patient to lic in this for a period varying from three-quarters of on hour to two hours. In this way free perspiration, together with is reduction of the temperature, is induced. Another method of applying the trunk:pack is to folcl a towel and pour boiling water upon it, afterwards wringing this dry by placing it in a dry towel and twisting the ends of this till all the superfluous water is expelled from the wet towel. This answers the purpose of a hot bath by covering the body with jt, and afterwards retaining the heat by means of dry flannel placed around it.

Truss is an instrument employed in the treatment of ruptures. (Sce RUPTURE and HERNIA.)

Tubercle is due to the development of a germ named the tubercle bacillus within the affected portions of the body, the lungs. glands, and bones being the special tissues affected. It may invade any of these tissues without producing any organic change; as a rule, how. cver, this is not the case, and its effects are destruction of the tissues involved, with a tendency to suppuration. In every instance where tubercle invades a part of tbe economy the vitality of that portion is destroyed to a greater or less extent, and it only requires the system to be reduced below' its ordinary standard to enable the disease to develop and promote its ravages. The treatment of tubercular disease consists essentially in the endeavour to keep the general health in as good a condition as possible, while the discase itself is counteracted by the administration of murinte of calcium, or this salt combined with hypophosphites. The muriate of calcium seems to have a particularly antagonistic effect upon the tubercle bacillus, and nuraberless instances are on record where the disease has been entirely cradicated by its administration.
Tumour is an adventitious growth taking place in any organ or tissue of the body. Tumours may occur in the brain, in the stomach, liver, womb, ovaries, testicles, muscles, fatty tissue, skin, nerves, ctc. In very many instances-such as the brain, tongue, gums, throat, laryns, womb, ovaries, abdomen, muscles, and fit-they can be removed by a surgical operation, and, as a rule, these operations can be accomplished with comparative safety. (Refer to CANCER, CYST. WOMB, etc.)
Tuxn of Life, Change of Life, Climacteric, are terms which nre enployed to denote the cessation of menstrmation in women. It is always a period of considerable anxlety, as the circumstances of the woman undergo an entire change. At this period latent disease is liable to develop if proper precautions are not taken against it.
Turpentine is the spirit derived from the resinous exudation proceeding from various specics of the pine tree. It is a volatile spirit, and possesses many medicinal properties. When applied extermally upon a hot fomentation it acts as a powerful counter. irritant, and is frequently employed in the treatment of inflammatory or spasmodic affections of the abdominal vlscera. It is also used in this way as an application in rheumatic affections of the muscles, nerves, and joints, especially in the treatment of humbago, sciatica, and pains in any of the joints. It enters largely into the coupositlon of many popular liniments, such as Tilliman's embrocation and the turpentine liniment of the British Pharmacopocia, Turpentine, $I$ believe, is
tho real constituent of that popular fininent cabled St. Jacob's oil. Internally it is useful, in sunall closes, for the relief of flatulence, and it also ncts upon the kidneys and increases the flow of urine. When it produces this effect it rives to the urine a peculiar odour very similar to that of sweet violets. In larger doses it nets as a jurga. tive, and it is very frequently employed in the treatment of worns. It is ialso beneficial internally as a remedy in certain cases of rheumatism, when it may le given in I5-drop doses three times a clay in milk. When en. ployed for flatulence, 10 to is drops may be given every three or four hours. It also acts as a haemostatic, preventing by its action haemorrhage, and in this way is especially useful in the treatment of bleeding from the nose, bleeding from the bowel, kidneys, or bladder. When a very large dose of turpentiue is taken inter* nally it is liable to cause intense sickness, with a feeling in the liead very closely resembling that of alcoholic intoxication, after which it is apt to produce powerful purgative effects very similar to those of castor oil. If the purgative effect of turpentine is uot freely developed it is liable to cause a feeling of stranguary similar to that produced by cantharides, which see. The best way to administer turpentine internally is by means of capsules, which are made to hold ten drops, and can be swallowed without any difficulty. The most important use to which turpentine has been applied is in the treatment of certain conditions of the lower bowel, where an accumulation of faeces, together with fatulent symptoms, occurs. In these circuinstances, it is einployed in the form of an enema, which should be composed of the following ingredients:-One table. spoonful of turpentine, the yolk of one egg, two wine. glassfuls of castor oil, well switched together, to which should be added one pint of thin oatmeal gruel which has been previously strained. This mixture should be injected into the bowel by means of an enema syringe. The patient should be enjoined to retain this for four or five hours if possible.

Fympanum, or Internal Ear, is that cavity of the auditory apparatus which lies within the drum of the ear.
ryphoid, although indicating a condition of the system which invariably prognosticates considerable danger, is a tenn especially applied to enteric fever, typhoid fever being a synonyin. (See ENTERIC HEVER.)

Typhus is an infectious fever, which is essentially the result of overcrowding and breathing a vitiated atmosphere. Altliough typhus is such an infectious disease in overcrowded dwelings it is almost innocuous to those who are in attendance when the disease occurs in a well-ventilated and airy house. Many curious experiences have been observed with reference to this fever in many instances. In Ireland especially, where the disense was at one time so prevalent, patients have been taken from their beds and put outside of the house under the impression that they were dead, when they have been known to recover simply from the fact that they were enabled to inhale a sufficiency of pure and unvitiated air. It therefore stands to reason that the grand point in the treatment of this disorder is to supply the patient with an abundance of fresh, unpol. luted atmospheric air, and doubtless the death-rate from typhus would have very inuch diminished had this simple precaution been carried out in the treatment of the disease in the past.

Uleer is a term which is applied to a destruction of the cutaneous tissue or mucous membrane. It literally means an eating away of the surface, and is invariably due to the fact that healing has not been encouraged by the prevention of the development of the germs of decomposition which have invaded the wound or injured surface. When a wound does not heal by first intention, or without suppuration, this is due to the invasion of certain organisms which have taken possession of the injured portion of the surface, and by developing therein prey upon the tissues. weakening the surrounding integument and attacking it, thus extending the area of the disease. The treatment there. fore consists in the application of antiseptics, which destroy the vitality of these organisms and enable the weakened tissues to recover their health to a sufficient degree to enable then to complete the repair of the
part. A great deal can be done in aiding the healing of an ulcer by keepings the limb or part at rest and in the liorizontal posture, while the debilitated portion may be stimulated by strapping the ulcer by means of ordinary adhesive plaster, itt the saut time dustlng the raw surface with aristol, iodoform, or any other lhand antiseptic. Ulcers very frequently occur upon the stomach, womb, and bowel, and in thesc circunstances the diet of the individual should be adipted to the weakened condition of the nucous membrane of the stomach; while antiseptics may be admanistered with a view to prevent the development of the organisuns which are essential to the existence of the ulcer; while in the bowel, if within reach, the parts can be treated locally, and this method is also advisable in the treat. ment of ulcerations of the womb. In every instance, liowever, it would be advisable to consult a competent medical man. Ulcers frequently arise from local irritation, such as that produced by the application of a bandage which has been put on too tightly, by lying in one position in bed, when the tissues are destroyed by continual pressure, as in bed-sores. They are also produced by the presence of varicose veins, and by an unhealthy condition of menstruation.

Ureter is the tube which conveys the urine from the kidney into the bladder. It sometimes is the scat of intense pain in consequence of the passage of what is calied a renal calculus, when the spasmodic pain produced is of a most excruciating and sickening character. The treatment under the circumstances is to apply hot fonentations well saturated with laudanum over the seat of pain and give morphia by subcutaneous injection.

Trethra is the canal which conveys the urine from the bladder. It is liable to be affected by various complaints, especially in males. In some instances it may be irritated by the passage of snuall stones or gravel, or urine of a highly acid character. The nost frequent affection of this portion of the urinary tract, however, is caused by the contact of poisonous dis. cliarges, such as gonorrhoea and other purulent discliarges from the female passages. When this occurs it is liable to set up such an amount of inflam. matory action which may result, when this has passed off, in stricture of the canal, and in many instances this lias becone so pronounced as to prevent the passage of urine altogether. The treatment of such an affection consists in the first instance of destroying the poisonous secretions of the part by means of the frequent application of antiseptics, and if stricture has manifested itself, to dilinte the passage by bougies graduated from the small to the large size, In every instance where this canal is affected be certain that only a qualified and respectable medical practitioner be consulted; never, under any circumstances, consult a quack.
Urine, or the Secretion of the Kidneys, conveys from the body certain products of decomposition. In sonse circumstances, however, it may contain blood, albumen, sugar, and au excessive quantity of urates, which is designated 'gravel." The secretion of urine is one of the most important in the human economy, as a liciltlyy urine is usually an indication of a sound conclition of the individual. When the urinary secretion produces irritation in the canal this is generally due to its condition being too highly acid, and this will usually he demonstrated by the fnct that a brickdust looking deposit takes place in the urine when it has cooled. This peculiar condition very frequently indicates the presence of rheumatism or gout within the system, and if the direct eridence of these affectlons has not manifested itself, yet the very fact of this red deposit being present should make the physician suspect that such in contingency may be near at hand. When the urine contains albumen, such a symptom is looked upon with very great gravity by the physlcian, as it invariably indicates an unhealthy condition either of the heart or kidneys. When sugar is present the disease called "diabetes" is known to exist, and in such circumstances there is also to be dreaded very serious results, and the greatest care must be taken to diet the patient in such a way that his nourishment will be assured, while the sugnry constituents of the food will be abstained from. In many instances the urine is a very powerful aid in the diagnosis of nervons disorders, as well as those of the bladder; e.g. if a person is passing very' large
quantitles of urine of a pale appearance and of light speclfic gravity", the physician will generally infer froun this that there is some cause of nervous irritation present, whereas, if the urine is of a high colour, it usually indicates fever or intense nervous prostration, white in many instances this may be due to the presence of bile or bloed within the urinary secretion. A careful examination of the urine in any of these circumstances will onable the medical attentlant to arrive at the exact cause of the abnormal condition. When the urine is passed at frequent intervals, and the last few drops are expelled with iconsiderable pain, it may be concluded that the bladder itself is the seat of disease, and that cousiderable irritability of its membrane cxists. In many mstances whern the urine is passod it will have the appearance as if water had been mixed with luilk in small quantities. On boiling this fluid the miliky appearance will still bo retained, but on adding an acid in small quantities it will disnppear. This is usually the evidence of tho presence of phosplates in the urine and in such circumstances the fluid is invariably alkaline in reaction. When the urine, on being passed, possesses a creamy look it will also be found to be alkaline in reaction, but on boiling and adding acid it will still retain its yellow and viscid appearance. In such circumstances the presence of pus should be suspected. The normal condition of the urine presents the following characteristics :-It should possess a palo brandy appearance in colour, have an acid reaction, and a specific gravity varying from rors degrees to roaz degrees. The quantity passed will be greater in winter than it is iu summer, in consequence of the fact that a larger amount of vapour is passed from the skin in summer than in winter, but tbe average quantity should be about 30 to 40 ounces per day. In urine there is always suspended a certain amount of mucus, which is thrown off naturally by the mucous membraue of the bladder. This, when the fluid is allowed to stand in a glass vessel, presents the appearance of a very filmy-looking cloud suspended in the centre of the fluid. When urine possesses a heavy odour this Indicates the fact that decomposition has been going on to a certain extent, and in these circumstances the urine will usually be alkaline in reaction. Now, whenever urine does not give an acid reaction it has to a certain extent departed from the healthy standard, and precautions should at once be taken to rectify this eondition of things. When urine contains blood of a dark, dull-brown appearance one may reasonably infer that the source of the haemorrhage is in the kidneys; when, however, it appears bright red we may conclude that the bleeding is coming either from the coat of the bladder itself or from the prostate gland, which lies at the base of the bladder close to its orifice. A healthy condition of the urine is one of the best indications of health, whereas an unhealthy condition should invariably be looked upon with the greatest amount of apprehension.
Vaccination is the introduction of the lymph obtained from cows or heifers suffering from vaccinia or cow-pox, which disease seems to be identical with that of small-pox in man. Other diseases are said to be also identical with it, such as distemper in dogs and grease on horses' feet. When vaccinia is introduced into the luman frame it produces a certain amount of disturb. ance, but this is so trivial compared to that which results from small-pox, and as it gives immunity from this loathsome disease, it has rightly become enacted that every individual should undergo the operation of vaccination. The effects of vaccination are truly marvellous; the author has seen cases where the premonitory symptorns of small-pox were actually present, ald he has vaccinated the individuals, and, in one instance in particular, he observed that the small-pox papules had actually made their appearance upon the skin at the time that the vaccination was coming to a head. The result was that the vaccination, as it were, beat back the small-pox and completely overcame it, so that small-pox never developed, but the vaccinia came to a head in the ordinary course. Doubtless, many diseases have been contracted by impure vaccinelymph having been employed, especially was this the case when it was invariably the rule to procure the supply of lymph from infants. This should never be resorted to,
as the puro lympla can be obtained in any quantity from heifers which are kept for the purpose of supplying it, and when it is derivod from this source there need bo no apprelacnsion on the part of those vaccinated that any disease can thereby bo introduced except that of vaccinla. The process of vaccination consists in simply excorlating the skin to a very linited extent-mot suflicient to produce bacnorrhage at all, hut simply a rawing of the surface-afterwards placing a small guantity of lymph upon the demaded surface of the skin and permitting it to dry there, when the lymph will be absorbed and produco its constitutional elfect, which will cone to a height about the cighth day, and nfterwards gradually pass off. In any case whero vaccination has been proporly performed, if the lapso of time has not been too great, small-pox will be conlpletoly prevented, whereas it will ahways have tho effect of inodifying the disease even if a longer interval than that which is necessary to produco hmmunity has elapsed. Revaccination, however, should be performed at certaln intervals, say after a period of seven years, when complete immunity will be alnost entirely secured.
Veins. These vessels convey the blood from tho arteries back to the heart, and communicate with the capillary arteries by means of the capillary veins. The arterial blood is of a bright red colour, whereas that of the veins is purple in consequence of its being contaminated by carbonic acid, which becomes liberated on its reaching the pulmonary circulation, and is thereby transformed again into arterial blood. The walls of the veins are quite different in their construction to those of the arteries, the former being tubular and elastic, while the latter are more of a membraneous character, and flaccid in their nature. The veins, with the exception of those conveying the blood from the various viscera of the heart, are supplied with valves opening only forwards, and therefore prevent the blood flowing back within the vessel. In the operation of phlebotomy, when the veins are incised with a view of extracting blood, one of the superficial veius is generally selected, as the bleeding from this can always be controlled by applying pressure. The veins are liable to distension, in consequence of pressure being exerted upon the larger trunks nearer the heart than those which are affected, the result being varicose veins, which, as a rule, appear upon the leg, but may also appear upon the scrotum and vulva. The veins of the leg are especially liable to inflammation, called 'phlebitis,' this being due to the coats of the vessels becouning inflamed. This induces coagulation within the vessels. White-leg in lying-in women is directly due to this cause. When a vein is wounded and haemorrhage is going on, this may readily be arrested by simple pressure applied to the part; whereas, if an artery is wounded, it will be with considerable difficulty that the haemorrhage can be staunched. In any instance where either disease or injury of a vein has taken place, it is very essential that a medical attendant be called in with as little delay as possible.
Ventricle is the chamber of the heart which distributes the blood to the circulation, the left ventricle supplying the clrculation to the body, while the right entricle supplies the lungs.
Vertebra is the term applied to the various bones composing the spinal column.
Vertigo, or Giddiness, is a symptom which should always be viewed with considerable alarm, as it very frequently indicates some mischief either within the internal ear or brain itself.
Vitriol. (See SUlphuric Acid and Sul. PHATES.)
Vomiting is a convulsive effort of the stomach by which it discharges through the gullet a portion or all of its contents. It may be produced by direct irritation from substances which have been ingosted, such as unsuitable food; by the effects of mechaslcal irritants, such as some of the poisons; or by nauseating drugs, of which ipecac may be taken as a fair example. Vomiting, however, frequently is the result of disease, and it may also be caused by blood either being swallowed or being effused from the mucous coat of the stomach. Certain diseases, such as dyspepsia (especially when this is due to the developinent of sarcinae within
the organy, irritition of the mucons membrane, ulecra, fion, cancer, ectio, ;ill intuce voniting, this being cluc to the irritable condition of the orginn which obtains, Voniting, as is well known, may also be caused by reflex irritation, as in certain dise:isus of the ovaries, in pregnancy, and sea-sickness. Obstinate constipation may also induce it, and when this has proceeded to an extraordhary extent, stercoraccous voniting may result, this distressing condition being due to the fintestines reversing their action and carrying faecal matter lito the stomacll. Various remedies are advocated, anoongst which may be recommended a simple diet, if need be the food to be partly dlgested by being peptonized before it is partaken of; the adininistration of pepsine and bismuth, which are also useful agents when taken immediately after food; effervescing drisks, powdered ice, drop doses of ipecacuanha wine, morphia in very small doses, carbolic acid, phenacetin, etc., have all been recommended, and doubtless are useful agents in overcoming these distressing symp. toms. The application of mustard over the pit of the stomach will often prove of great benefit, and in sea. sickuess a bandage tightly applied round the abdomen and lower portion of the chest will frequently be found of considerable service. In every instance where voiniting is persistent it is highly desirable that the lower bowel be kept in a state of daily action.
Wakefulness, or Sleeplessness, frequently arises from the neglect of taking food shortly betore going to bed. It is quite unreasonable to suppose that the stomach can be in a healthy condition if it is permitted to fast for a long period, as often elapses between dinner and breakfast; and frequently, when a person wakes in the middle of the night and is unable to sleep. the partaking of a little light nourishment, such as the white of an egg switched up in a teacupful of milk, or a piece of bread and butter with milk, will induce sleep which otherwise would be courted in vain. There is no doubt that sleeplessness frequently is a concomitant of advancing years, and this is partly due to the fact that sleep is not so essential to an elderly as it is to a young person, and in old age the body requires less sleep: consequently, elderly people are more wakeful than young people.
Warm Bath should always be taken with a certain amount of discrimination, as it invariably las the effect of opening the pores of the skin, and rendering the system susceptible to cold. When a wam bath is taken for cleansing purposes alone, it should invariably be followed by a cold sponge, so as to tone up the skin before drying. This form of bath is very popular as a remedy for colds, and in these circum. stances it is followed by beneficial results. When, however, it is taken in this connection it would be well that the individual immediately goes to bed, and in this way keep up the action of the skin, which lias been already induced by the bath.
Warts are a hypertrophied condition of the epithelial layer of the skin, and are of a horny structure. In every instance they are disfiguring, especially when they appear upon the face. They can, however, generally be removed by the application of strong acetic acid or chromic acid, both of which substances have a destructive effect upon epithelial structures. When the wart is pedunculated, as frequently happens, they can either be snipped off with a pair of scissors or tied with a piece of fine silk, when they will soon drop off. Warts on the hands of children may be treated very efficnclously by administering five to ten grains of the sulphate of magnesia or Epsom salts in a little water three tines a day. When warts are irritated, especially those which occur in elderly persons, they are apt to degenerate into a malignant growth called 'epithelial cancer.' When, therefore, it is desirable that a wart in an elderly person be removed, care should always be taken to do this in such a way as to secure the removal of a certain amount of healthy tissue in its immediate neighbourhood.

Wasp Stings may be treated by the free application of ammonia, bi-carbonate of soda, or potash, but the first point to attend to is to endeavour to extract the sting.

Wasting: (See "Our Children: How to keep them Well and treat then when they are In.")

Water, so abundantly distributed over the face of the globe, is most essentian to the maintenance of heialth both of plants and animals. It is much moro inportant even than food, as one could live much longer on water alone than on food alone. It enters largely into the composition of every living substance. the human body, for instance, contaning is much as $80^{\circ}$ per cent. of water. The amount of water required by the human frame depends entircly upon the character of the food which is partaken of-e.g. if vegetables and fruit enter largely into the dietary, then water wall be less necessary; whereas, if the food is of a drier nature. water will require to be taken in more considerable quantities. Although water is such an lmportant fuid. and, when pure, is so beneficial, yet by it naany diseases are communicated to the human budy-as, fore xample. cholera, typhoid fever, dystentery, and doubtless many others. Water, when pure, should contain no living organism; but, when it holds in solution urganic matter. it is thereby enabled to act as a nidus to various microscopic bodies, some of which are innocent, while others are most pernicious in their effects when taken into the system. The composition of this fluid is two atoms of laytlrogen combined with one of oxygen, and remains fuid until $32^{\circ} \mathrm{F}$. is reacled. At a temperature of $212^{\circ}$ F. it becones vapour, and passes off in the form of steam, in which condition it is frequently employed as an inhalation.
Water-Brash. (See Pyrosis.)
Water Dressing is applied to wounds, ulcers, abscesses, etc. The water whinch is employed for this purpose should always be rendered antiseptic by the addlition of some substance, such as carbolic acid, Condy's fluid, solution of bi-chloride of mercury, etc. The proper method to apply a water diressing is to saturate a piece of lint cut a little larger than the size of the open surface, apply it to the surface, and afterwards cover this with a piece of impervious dressing, such as oil-silk, gutta-percha tissue, etc., after whicl' these should be kept in position by nieans of a properly: fitting bandage.
Water in the Chest, or Hydrothorax, is the effusion of the fluid portion of the blood into the pleural cavity. It is, in the majority of cases, due to pleurisy, whereby the inflammation creates a congestion of the veins, which, in consequence of a lydrostatic effect. causes an oozing of the serum of the blood to take place through the thin coats of these vessels, and this may proceed to such an extent as to completely prevent expansion of the lungs to fulfil the necessities of respiration. If this fluid is permitted to remain for any period, if death does not supervene, in consequence of the mechanical obstruction which it produces, the liquid is liable to undergo a purulent degeneration, so that what was at one time a bland and non-irritating fuid, becomes transformed into pus. When this disease exists it can readily be detected by the fact that it causes a dull note on percussion, at the same time producing a slight bulging between the ribs, and, according to the amount of fluid that is present, more or less fever will result, while the respiration will be increased in proportion to the obstruction which it causes. No time should ever be lost in treating such a case in the most energetic manner: blistering over the surface may produce absorption of the fluid, but by far the best method of treatment is that of paracentesis, or drawing away the food by tapping. This operation can be accomplished with very little risk if proper antiseptic precautions are taken.
Water in the Abdomen, or Dropsy of the Belly, is also composed of the liquor sanguinis or serum. It is due to the obstruction to the flow of llood within the veins, in consequence of inflammation of the peritoneum, liver disease, Bright's disease of the kidneys, or heart disease. It is not nearly so amenable to treatment, at least in so far as to ensure permanent benefit, as dropsy of the thorax or chest. Great relief, however, can be obtained by tapping ; but, as a rule, the fuit will very soon tend to collect again. and the operation may have to be repeated time after tlme, until gradually the patient sinks from sheer exhanstion. A great dent of benefit can be often obtained in dropss; whether the water be in the chest, abdomen, or exfremities, by adnuinistering medicines which act upon
the cireulation, and also those which produce watery evicuations from the howels and a freer exeretion of urinu. Anongst the forner may be mentioned digitalis and strophanthus, while amongst the latter are compound powder of jalan and other drastic purgatives.
Wator in tho Head, or Hydroceplalus, is nlmost invariably in fatal disease, as its origin is usually of a tubereular nature. It is a sequela of tubercular menimgitis.

Weaning. (See "Our Clitdren: How to keep trem well and treat thom when they" are thl.")
Whito Leg is due to an inflamed condition of the veirs, in corsequence of which the blood becomes coagulated withut thent and thus prevents the free return of blood towards the heart from the extrenities. Effusion therefore takes place into the tissues, causing the ley to sivell and the skits to becone tense, glossy, and bright in appearance. It is generally che to the absurption of some foctid matter from the womb after eonfinement. The treatment consists in absolute rest In the horizontal position, hot fomentations, the administration of iorlide of potassium in five-grain closes three times a day, and careful atteution to the bowels, aloug with a simple ant nutritious diet.

Whites. (See "Woman in Ilealth and Sickne:s.""
White Swelling is the term applied to that disease of the knce-joint where degeneration of the cartilages and synovial mentbrane of the joint has taken place in consequence of prolonged infammatory acrion. It is in many instances associated witl a cubercular condition of the body. The treatment eonsists in keeping the limb at perfect rest by means of splints, ans-applying a dressing of mercurial ointurent to the part, while the condition of the general healsh receives particular attention, the patient being well nonrished and kept in a healthy atmosphere.
Whitlow is all abscess which forms on the thumb or finger, and is always dependent upon a very acute inflammation of one or other of the tissues of these parts. The bone, tendon, of fibrous tissue may be the sest of the discase. In consequence of the dense nature of the eovering of the thumb and fingers, and the resistance which the nail gives to the evacuation of pus, which invariably forms in this disease, the pain of whitluw is of the most excruciating character. The disease may spread, by continuity of tissue, up the whole finger or thumb and into the palm, when it becomes very serious indeed. The proper treatment to adopt when this disease is present is to lay the part open down to the bone, so as to permit free evacuation of the pus, and allay the itension which has naturally resulted from the disease. In some instances it may be necessary to scrape the bone, or even remove it, if the disease has involved it to such an extent as to threaten its destruction. The sooner the laneet is used the better will it be for the patient, as the reby the inflammation will be prevented from spreading and involving the neighbouring structures, and healing wilt progress much more rapidly than if nature were allowed to take its own course, and the pus be permitted to burrow its way to the surface. When the parts have leen laid open in this way poultices should be applied for some little time to loosen any slough which may have formed, after which a dressing, eomposed of one dmelun of aristol to one ounee of benzoate of zine ointment, may be applied night and morning, after the parts liave been thoroughly well bathed in warm water. During the treatment the hand should be placed in a sling, and all movement of the part prevented by the applieation of a splint, if necessary, while the general condition should be improved by nutritious diet, supplemented with port wine, quinine, and iron, if necessary. An abundance of fruit, especially oranges, scems to exert a beneficial effect upon this disease.

Windpipe, or Trachea, is, properly spenking, that portion of the air-passage whieh extends from the larynx to the bifurcation of the bronchea. It is liable to inflammatory affections like other portions of the respiratory organs, and this should be treated by Inltalation of steam, impregnated wlth some anodyno and antiseptic substances-such as menthol, carbolic acid, eucalyptus, pumuline, etc., while hot fomentations or hot poultices should be applied externally.
"Woman in licaltli and Sickness, or what she oufltt to know for the Exigencies of Daily Life." The intormation is too extencled to eune under the scope of this work, but will be fomed in a treatise with the abovenamed title.
Womb. (See "Woman in (lealth and Sickness.") Worms are very prevalent amongst cliildrew, especially in eotutry districts. They are a source of more annoyance than actual danger, thouglt not unfrequently they give rise to serlous complications, such as convulsions. The symptonis prothiced are picking at the nose, grinding of the tecth, starting in the sleep, feverisla attacks especially at night, fretfulness, restlessuess, languor, variatle appetite, changing colour, pinched and thin look about the nose and month, lark rims around the eyes, ashy complexion, and itching aronnd the anus. In girls I liave frequently seen inflammation of the vagina set up by thread-worms finding their way from the rectun into this passivge. We naust not forget, however, that many of these symptoms may be due to constipation, even when no worms are present. As a natural consequence delicate and weakly eliildren, especially those of a scrofulous habit, are more liable to worms than strong children. These parasites are always introduced into the body either by means of food or water; hence their more frequent occurrence in country districts where surface water is used for drinking purposes. The varieties of worms are:-(1) The long thread-worm, whose lhabitat is the large intestine; it is long and slender, and may be two inches in length. (2) Ascaris, or thread worm, which is very common; it resides in the reetum, and sometinies comes away in large bunches. (3) Roundworm, or lumbricus, which occupies the small intestines and frequently is vomited up; and I have known then being expelled through the nostrils after an attack of vomiting. In these circumstances they have crawled into the stomach. They resemble in appearance the common eartl-worm, and measure from three to nine inches in length. (4) Tape-worm, which also inhabits the small intestines. Recently a very simple and efficacious method of treating tape-worm has been advocated, viz., the administration of a tablespoonful of a saturated solution of chloroform in water every hour for eight or ten consecutive hours, and this to be followed by a smart dose of eastor oil, when the worm is said to be expelled in its entirety. Another quite as effectual, but eertainly much less pleasant, mode of treating the disease is to administer 10 grains of naplathaline every three or four hours till three doses have been taken. These two drugs appear to have a sickening effect upon the tape-worm and cause it to lose its hold on the intestine, when of course it can be readily swept away by means of a purgative. It should; however, be always borne in mind that 'tinea solum,' is a misnomer, as frequently several tape-worms have been discovered to exist int the same individual. They are rarely found in children under six years of age. Their length varies from five to ten feet. They aro composed of innumerable segments, each of which is a complete animal, having the organs of reproduction, male and female, contained within itself. The seyments making up the body are flat and white and the head is small and attaches itself to the walls of the intestine by means of four suckers. Another and larger tape-vorm is also described, but it is only found anoongst the inhabitants of Russia and Switzerland. The treatment of worms which infest the lowel bowel is best earried out by means of injections, combined with powders eontaining calomel and scammony. A dessert-spoonful of common salt dissolved in a break-fast-cupful of an infusion of quassia is very efficacious in dislodging these parasites. Another excellent vermifuge Is a breakfast-eupful of an infusion of quassia to which has been added a dessert-spoonful of tincture of steel, and employed as an injection. The food of the child shoukd be well cooked, and caten with plenty of salt, and fifeen drops of tincture of steel may be given In water three times a day after food, or, if preferred, a powder of caloniel and scanmony niay be given every second morning before breakfast. The following is the dose for a clitid three years old:-Calouncl, 3 grains; componnd powder of scammony, 6 grains. Mix. To be given in sugar autl water before brealifast. lior
round worms the best remedy is santonine, in doses of from $=$ to 4 grains, given at bedtlue (the clild having no supper that nighti, followed by a dose of castor oil in the norning before breakfast. "Fhis may berepeated every third mikht for three times. This drug sometimes gives rise to giddmess, disordered vision, sickness, and a peculiar tint to the urine, all of which symptoms soon pass off. Tape-worms are sometines very difficult to remove, from the fact that the head is not easily dislodged from its attachment, and if every vestige of the worm is not got rith of it will grow again. One of the most popular remedies is oil of male.fern, of which ten to thirty drops may be given in milk or gum nucilage. Beforehand the patient should fast for some hours then a dose of castor oil be given at bedtime, and in the morning the oil of the male-fern administered, and in four or five hours afterwards another dose of castor oil. Turpentine and castor oil are also useful remedies, but it requires a large dose of each, from a half to two teaspoonfuls of the former mixed with a dessert to a tablespoonful of castor oil. The oil of male-fern and turpentine frequently succeed in dislodging the round worm also. Kousso in drachu or two drachin doses, succeeded by a good dose of castor oil six hours afterwards, is niy favourite remedy. I have found it often to succeed when all other remedies have failed. When worms have been got rid of it is always wise to advise the patient to take a tonic of tincture of iron and infusion of quassia for a few weeks afterwards. Instructions should be given that no raw meat, especially pork, be partaken of. In conclusion, we nust always bear in mind that many distressing and apparently alarming symptoms may be due to the presence of worms-such as epilepsy, convulsions, giddiness, fainting, perversion of vision, squinting, dysenteric diarrhoea, etc. Thread-worms are indicated by itching around ithe anus; straining at stool and giddiness point to round-worms; and gnawing pain, usually felt above the navel, to tape-worm.

Wounds are injuries to the human body which invariably produce the separation of the parts involvecl. They are classified as incised wounds, lacerated wounds, punctured wounds, poisoned wounds, and gun-shot wounds. The treatment in every case should involve the one idea of preventing decomposition taking place within the injured part. The first duty then of those in atteudance is to apply antiseptics, at the same time taking care to prevent haemorrhage by securing any bleeding vessels that may present themselves, especially is this necessary in the case of haemorrhage due to division of an artery. Pressure, in the absence of the medical man, will be sufficient temporarlly, but in any case where the haemorrhage is severe it will be well to call in medical assistance. When the bleeding has been thoroughly stopped and the edges of the wound brought together, either by strips of plaster or stitches, the parts should be thoroughly cleansed by the application of an antiseptic fluid-such as carbolic acid in water in the proportion of one to twenty or forty, or a lotion composed of one part of bi-chloride of inercury in one thousand of warm water. The surface of the wound should then be dusted over with a substance which also possesses antiseptic properties-such as iodoform, aristol, or boracic acid. Thegreat point to be attained in the treatment of a wound is to endeavour to obtain union by what is termed first intention, that is union without suppuratlon intervening. As a rule this can usually be attained by the careful and efficient use of antiscptics; even when the parts are very much bruised this desirable end may be obtained if antiseptics are efficiently employed. In wounds on the face or any part which is highly vascular, stitches will not be so essential as in wounds upon the limbs or trunk, strips of sticking plaster being sufficient to keep the parts in approxination. If the wound is poisoned it will be necessary in such circumstances to take measures which shall either destroy the poison or at least extract it. If the poison is due to snake bite or the sting of an animal the application of amınonia to the part will usually act as a neutralizing agent. If, however, this is not at hand it will be necessary to exercise the injured part so as to remove the deleterious sub-
stance, which has been injected into the tissucs. In bltes from dogs it is usual to cauterize the parts with a view not only of destroying the poison, but at the same time producing death of the part which has been affected. In many instances where the wound is lacerated or contused dirt is liable to become adherent to the wound, and in such circunstances it will be necessary to induce suppuration by the free application of poultices or water dressing, and, if need be, keep the wound open by means of some irritating substance, such as blistering ointment. Suppuration frequently takes place in lacerated or contused wounds, and in such circumstances it is absolutely necessary that the part be kept perfectly at rest and in the horizontal position, while the surface of the ulcer may be dusted over once in twenty-four hours with aristol, when healing will usually be encouraged to the utmost.

Wry Neck. This well-known deformity is caused by a spasmodic contraction of the sterno-mastoid muscle, which is the principal muscle concerned iu the movements of the head from side to side. It may be congenital, but in most instances it is an acquired deformity. It can alnost invariably be remedied by dividing the muscle, or by wearing an apparatus which keeps the head in its nomal position.

צellow Fever is essentially a tropical disease, arising from an unsanitary condition of the localities in which it prevails. It is somewhat of an intermittent character, and its virulence seems to expend itself directly upon the liver. In olden times, before the action of antipyretics was theroughly understood, it was a most fatal malady ; now, however, it is amenable to treatment to a considerable degree. The great point to attend to is to keep the temperature reduced by antipyretics, at the same time paying particular attention to the evacuation of the bowels, thorough ventilation of the apartment in which the patient is living, and administering a liberal diet of the most simple description.

Zinc. The salts of this well known metal are largely used in medicine, the principal of these being the oxide, sulphate, and chloride. The oxide of zinc is a white, tasteless heavy powder, and is employed largely in the form of ointment, and also for dusting excoriated surfaces. It acts as an absorbent of unhealthy secretions, and thus is most valuable in the treatment of eczema, scald, ulcers, etc, Zinc ointment. combined with one part of carbolic to twenty of the ointment, is one of the best healing ointments that can possibly be prescribed. Internally, it is given in diseases such as epilepsy and St. Vitus's dance; but in such affections the best preparation is the valerianate of zinc, which may be administered in 2 2 -grain doses, three times a day, in the form of pill; and in such circumstances, when combined with two grains of the extract of conium, it is a useful and efficient nerre tonic. The sulphate of zinc, or white vitriol, resembles very much in its appearance ordinary Epsom salts, so that great care should be taken when administering the latter internally to ascertain that the one is not inistaken for the other. This preparation has powerful emetic properties, and is frequently given to produce vomiting when poisons have been inadvertently or intentionally partaken of. It is also employed in the preparation of an cye-lotion, when five grains to the ounce is the strength usually made use of, It is again employed in the treatment of ulcers and in infammation of the mucous membranes, especially those of the ragina and urethra. The dose as an emetic is from 15 to 20 grains in a wine-glassful of water ; but when taken as a tonic, it should be administered in the form of pill as before indicated. Chloride of zinc is a powerful caustic as well as an antiseptic, and is employed in the destruction of malignant and other growths. The acetate and carbonate of zinc have very much the same properties as those possessed by the oxide and sulphate, but they are not such popular remedies as the latter substances.
Zymotic is the term which is applied to those diseases which are of an epidemic nature-such as scarlet fever, measles, small-pox, chicken-por, typhoid fever, mumps, etc.

5

Soap is a pure soap, without excess of alkali or excess of fat. It is cheap, too, for being a perfect soap, and without admixture of water, it lasts longer than an adulterated article.

It has obtained
20 HIGHEST AWARDS, and has the largest sale of any Toilet Soap in the world.

Some Shopkeepers will not allow their customers to use PEARS' Soap, because they make so much more profit by recommending inferior articles.

## To persons whose skin

 is delicate or sensitive to changes in the weather, winter or summer, PEARS' is invaluable, as, on account of its emollient, non-irritant character, Redness, Roughness and Chapping are prevented, and a soft, velvety, healthful and attractive complexion ensured.

By permission of the Proprietors of "PUNCH."
"Two years ago I used your Soap, since when I have used no other."

Prench. April 26th, 1884.

[^0]:    Show, not shew.
    Shield, not sheild.
    Shiek, not shreik. Shrivel, not shrivell.
    Siege, not seige. Sieve, nut seive.
    Smallness, not smalness. Spoonfuls, not spoonsful.
    Storey, plural, storeys (of a building) ; not story, stories (tale, tales).
