The term ending (from Latin Disinner - "continuing") has been used in various linguistic contexts since the 16th century. The traditional meaning of the term was reduced to the definition of the word, which changes according to the decline, which normally coincides with its last part. In a more modern and formal but still ambiguous lexicological definition, this term refers to a certain grammatical morpheme that can only be defined in the context of the supporting language. In the past, the term "fine" was also used as a synonym for suffix. At the moment, it is only used in these meanings outside of the specialist language area. In fact, contextualization and identification of endings are still confusing today. Different definitions of endings are confusing, which means that the context must be determined every time the word has ended. In isolated languages like Chinese there is practically no elasticity and therefore no final concept.

In the past, the term "fine" was also used as a synonym for suffix. At the moment, it is only used in these meanings outside of the specialist language area. In fact, contextualization and identification of endings are still confusing today. Different definitions of endings are confusing, which means that the context must be determined every time the word has ended. In isolated languages like Chinese there is practically no elasticity and therefore no final concept. Mainly isolated languages such as English, even with a minimal surplus, the ending is easy to determine, as can normally be found according to the lemma; Four possible ends can be found in the example form of the verb: the forms created, the shape and the formed word are therefore called zero or zero ends and sometimes indicate a number 0: Form0. In agglutinating languages, the flexion is gradually connected to attachments, which are normally concerned. It follows from this that the end of these languages coincides with the order of attachmentIn the article or in the lexicology section, it does not mean or is not enough for resources. You can improve this post by adding quotes based on quotes. From the 16th century (from the Latin Desin \XC4 \x95re, "until the end") the term disinza (from the Latin desin \xc4 \x95re, "until the end") was used to specify the final part of the word in various linguistic contexts. The traditional meaning of this term has been defined part of the word, which changes according to the declaration and usually coincides with its final part. In a more modern and formal but still ambiguous lexicological definition, this term refers to a specific grammatical morpheme which can be defined only on the basis of the reference language. Previously, the term "fine" was also used to define the cold and as a synonym for extension. **fonisocicrola** Currently, these meanings are still used only outside the technical linguistic area. The contextualization and identification of the limbs are actually confused today with different definitions of the limbs that must be clarified every time the end of the word must be determined. In isolated languages, like the Chinese, there are practically no turning point and therefore the final concept. Usually in isolated languages, such as English, which even have a minimal turn, the end is easy to detect as it is usually lemma: In the example of the verb, it is possible to find four possible arts: forms, formats, form and word form so called zero extremity or end zero, sometimes indicated in number 0, considered applicable: form0 form0. Gradually adding the suffixes, which are usually the suffixes; This means thatIt is known that Italian combines verbs: I love, love, America, you love and so on. When we study ends, we usually do not worry about irregular wrinkles, because injustice is usually only on topic rather than at the end (see more details). In the field of descriptive grammar, the term of one morpheme is narrowed by analyzing different forms of connection and finding the model; For example, this orientation and orientation Italian conjugation can distinguish personal endings -O (love, I love), -i (love, you love), -a (love, beloved) and others that repeat. with minimal variations, other times and ways. By the way, it determines a larger number of topics, which means that it is possible to analyze their relationship. The final and the tops of the object vowels are usually divided into folding classes; For example, the first noun propagation in Latin or the third verb conjugation in Italian is discussed to determine specific final classes. In general, to find out which folding class belongs to the word, we rely on the morpheme of a specific topic called topics in the voice; The newly created examples of Latin nouns belong to the first decoration with themed voice -à -(which ends -, for example, rosà) and belongs to the third conjugation of Italian verbs with themed voice -i -(lemma ends with "lemmas" ends. ; At some ends, themed vowel may not be (ros -is, dormitory -o), and at the other ends it is preserved (ros -à -rum, dormitory); This behavior is independent of a particular topic or east, but is characterized by a specific purpose (this orientation mood is one of the first person's end -o loses themed vowelLatin names second and fifth Latin statement and so on. The end of irregular bending in the case of irregular bending, is some of the Lexim shapes are created by limbs of those who differ from LeMem, unevenness is usually limited by the source of the subject and does not reflect at the end; For example, the Italian verb is irregular because it changes the topic of its bending, but regularly uses the ends of the first conjugation: I go, let's go, go as well as love, love, love, love. Finally, the inhibition also occurs only in random cases that usually explore isolation: for example, Italian auxiliary verbs that should be either an English child produced by plural. Inguliasis can imagine if there is an end; Sometimes the absence can be expressed without thematic changes (as in English verbal forms of the past and still presents the sacrament) Fiurk-lite).
