# GUIDE TO WATCHING WHALES IN CANADA

ORDER : CETACEA  
 SUBORDER : MYSTICETI  
 or BALEEN WHALES

General characteristics of baleen whales:  
*paired blowholes and baleen instead of teeth.*

RORQUAL FAMILY (*Balaenopteridae*)

streamlined body

falcate dorsal fin

flat rostrum  
broad and short baleen plates

paired blowholes

ventral grooves

- BLUE WHALE
- FIN WHALE
- HUMPBACK WHALE
- MINKE WHALE

(6 species in North America)

p. 18-19  
 p. 20-21  
 p. 22-23  
 p. 24-25

GRAY WHALE FAMILY (*Eschrichtidae*)

natural mottled body  
 pigmentation and presence of barnacles

lack a dorsal fin, but dorsal ridge or bumps

short baleen plates

paired blowholes

few folds instead of ventral grooves

- GRAY WHALE

(1 species in North America)

p. 26-27

RIGHT WHALE FAMILY (*Balaenidae*)

thick body, large head

no dorsal fin

narrow and long baleen plates

paired blowholes

no ventral grooves

- RIGHT WHALE
- BOWHEAD WHALE

(2 species in North America)

p. 28-29  
 p. 30-31

See page 4 for relative sizes

**RELATIVE SIZES (ODONTOCETI)**

Relative sizes refer to adult animals.

# FOREWORD

Whale watching is fun and educational, but certain precautions must be taken to ensure the safety of both the whales and the people watching them.

The guidelines presented in this brochure reflect the opinions of a number of scientists who study whale behaviour in Canada.

These guidelines include general tips on how to watch whales safely from various types of boats without disturbing the cetaceans. It should be remembered, however, that specific precautions may be in order when you are watching particular species in certain areas under given sailing conditions. Some specific cases are mentioned in this guide, but further details may have to be obtained locally.

The section on the characteristics of various whale species is intended to assist the reader in identifying the animals sighted. The information provided is very basic, however, and to learn more about these creatures we suggest you consult the publications listed at the end of the brochure.

The Department of Fisheries and Oceans (Government of Canada) welcomes your comments and observations regarding these whale watching guidelines. Please address your correspondence to:

Director General  
Communications Directorate

---

## General note on status

The International Whaling Commission has passed a moratorium (zero quota) for the commercial kill of whales from all stocks for the 1986 coastal and 1985-86 pelagic seasons and thereafter. This moratorium is not binding on the governments of Japan, Norway and the USSR, which have in accordance with the terms of the International Convention for the Regulation of Whaling, 1946, lodged objections to the moratorium.

---

# WHALE WATCHING IN CANADA

The popularity of whale watching has grown considerably in recent years, and many excursions are now available to allow you to observe these animals in their natural habitat. The killer whales and gray whales of the eastern coastal waters of the Pacific, the belugas of the Arctic and the St. Lawrence Estuary, and the right whales, blue whales, and humpback whales of the western Atlantic coastal waters have thus become tourist attractions.

At certain locations in Canada, whales can be watched from the shore. Examples include St. Mary's and Trinity bays in Newfoundland, the Quoddy area in New Brunswick, the northwest coast of Cape Breton Island, the Saguenay area and north shore of the St. Lawrence Estuary in Quebec, Churchill in Manitoba, Pond Inlet and the shores of the Arctic Ocean and Beaufort Sea in the Northwest Territories, the Pacific Rim National Park and the Johnstone Strait area in British Columbia.

Whales are not hunted commercially in Canadian waters, but whale-watching has become a popular pastime in recent years, and examination of any effects this activity may have on these animals is certainly warranted.

The Department of Fisheries and Oceans of the Government of Canada is concerned that uncontrolled observation may modify the whales' behaviour, cause them injury, or keep them away from certain habitats at critical times. For example, whales can be seriously injured by propellers. Divers

with scuba gear who hitch rides on the cetaceans' dorsal fins or boats that race them or move in too close can so disrupt mating, nursing, feeding and resting such that the animals will prefer to go elsewhere. They can also be disturbed by sustained noises, such as the droning of aircraft or boat engines, or sudden noises such as shouts or gunshots.

The lives and safety of observers can also be threatened. Breaching whales have landed on boats, injuring, and even killing, occupants. And divers who hitch rides risk a similar fate.

By following the rules in this guide, you can watch whales safely and avoid injuring or disturbing them in their traditional feeding, mating, and migration areas.

Please note that Canada Fisheries Act regulations specifically prohibit harassment of whales, dolphins and porpoises.

# GUIDELINES FOR WHALE WATCHING

## GENERAL RULES

- *Do not hunt, chase, follow, disperse, drive, or herd pods or individual whales.*
- *Do not disturb whales for example while they are resting, feeding and travelling.*

## GENERAL GUIDELINES FOR BOATERS

**S**everal types of craft are used for whale-watching: small, fast boats with outboard or inboard motors, cruise vessels, boats with diesel engines, sailboats, and inflatable dinghies. Each has its advantages and disadvantages.

Engine noise can annoy the animals and interfere with their communication. The high pitch sound waves produced by high-rpm engines, such as outboard motors, cause the greatest disruption of normal whale behavior. On the other hand, the silent approach of a vessel, especially one that moves in quickly, in low light conditions, may surprise whales and lead to possible collisions.

A small craft has the advantages of speed and maneuverability, while a large vessel provides better visibility at greater distances. There are specific safety and navigation rules which must be followed for each type of craft, but much is left to the navigator's judgment.

You can satisfy your curiosity in a safe manner and at the same time avoid injuring or disturbing the whales **by following these general guidelines:**

- *if one or several whales are sighted in the vicinity of your vessel, avoid any sudden speed or course changes;*
- *if you are less than 300 metres (1,000 feet) from an animal, reduce speed and advance slowly, using an oblique line of approach;*
- *avoid heading directly toward the whale;*
- *do not go closer than 100 metres (300 feet) of a whale, dolphin, or porpoise. The animal may choose to come much closer to you; if it does, do not chase it and be wary of any individual that appears to be tame. Keep clear of the flukes;*
- *when you are at a distance of 100 metres (300 feet), shift your motor into neutral or idle. If you must use your motor to hold your position, keep your speed down. If you have a sailboat with an auxiliary motor, leave it in idle to signal your presence or turn on your echosounder;*
- *when leaving the location, start out slowly and wait until you are more than 300 metres (1,000 feet) from the animal before accelerating;*
- *travel parallel to whales.*

Even if whale-watching is not the primary purpose of your excursion, be on the lookout to avoid collisions, especially in waters where whales have been sighted or reported.

— *If it is impossible to detour around a whale or a pod of whales, slow down immediately and wait until you are more than 300 metres (1,000 feet) away before resuming speed.*

## **GENERAL GUIDELINES FOR AIRCRAFT**

**T**he droning of an airplane engine and especially the beating of a helicopter rotor will be detected by whales near the surface.

— *Do not descend lower than 450 metres (1,500 feet) from the water.*

## **GUIDELINES FOR PARTICULAR SPECIES AND AREAS**

**B**ecause of whales' distinctive habits, problems related to the observation of certain species, and the geographic or oceanographic features of some areas, special precautions must sometimes be taken.

### **BRITISH COLUMBIA: KILLER WHALES OF THE ROBSON BIGHT ECOLOGICAL RESERVE**

**T**his reserve was created to protect a portion of the killer whale's natural habitat for research purposes. The following rules apply when watching this species:

- *keep more than 300 metres (1,000 feet) from the whales. Anyone wishing to observe whales at closer range within the reserve must obtain a permit from the co-ordinator of the Ecological Reserves Unit, 1019 Wharf Street, Victoria, BC, V8W 2Y9, (604) 387-1859. Outside the reserve, killer whales may be approached to within 100 metres without a permit;*
- *do not approach whales head-on, as the whales will disperse;*
- *be conscious of how your actions will affect the whales and avoid doing anything that will disturb or harass them.*

## **QUEBEC: BELUGAS IN THE ST. LAWRENCE ESTUARY**

**T**he beluga population of the St. Lawrence Estuary has been designated an "endangered" population by COSEWIC\* and strict measures for its protection are warranted. Do not try to approach belugas. If you are involuntarily near a pod, follow the general rules and guidelines noted above, as well as these additional precautions:

- *do not allow your boat to drift toward the animals. Keeping your speed down, use your motor to maintain a distance of 300 metres (1000 feet);*
- *be constantly on the lookout to ensure you are not breaking up pods or separating females from their young.*

The Beluga Protection Regulations under the Fisheries Act prohibit beluga hunting in the Gulf of St. Lawrence, St. Lawrence River and Saguenay River or their tidal tributaries. The Regulations also prohibit the willful disturbance of belugas.

\* COSEWIC: Committee on the Status of Endangered Wildlife in Canada.

## **NEW BRUNSWICK AND NOVA SCOTIA: NORTH AMERICAN RIGHT WHALES IN THE BAY OF FUNDY AREA**

**I**n addition to the porpoises, dolphins and porpoises that frequent this area, right whales also visit during summer months.

By the end of the 19th century, the right whale had been hunted to the verge of extinction. Today, even though it has long been a protected species, the population is still small.

Please note that you should be very careful while observing whales of this species. Remember that they are relatively slow-moving and avoid doing anything that might interfere with their activities or injure them.

In addition to the general guidelines listed above, the following special instruction should be observed when watching right whales:

— *never approach the animals at a speed exceeding 4 knots.*

## DISTINGUISHING WHALE GROUPS

**T**he numerous species of cetaceans that live in the oceans are divided into two main groups: baleen whales or Mysticeti, such as the blue whale, and toothed whales or Odontoceti, such as the beluga.

**Baleen whales** have paired blowholes and series of baleen plates instead of teeth. These are horny, triangular plates with fringed inner edges attached to the upper jaw. The plates act like a sieve, allowing water to filter through and trapping the tiny animals on which the whales feed. The rorquals (blue whale, fin whale, sei whale, minke whale and humpback whale) have expandable throat grooves, while the right whales (right whale and bowhead whale) have no throat grooves at all. The gray whale has deep folds instead of throat grooves.

**Toothed whales** have simple conical teeth used to catch fish and squid, which they swallow whole. Toothed whales have only one external blowhole whereas baleen whales have two.

## IDENTIFYING SPECIES FROM WHAT CAN BE SEEN OUT OF THE WATER

Whales are most often identified from the parts of their bodies that are visible out of the water when they come up to breathe. Features that can usually be observed include colouring; details of pigmentation; the presence or absence, shape, relative size of the dorsal fin; the po-

sition of the dorsal fin determined relatively of the time between its appearance and the time the head breaks the surface; and the shape of the caudal fin (flukes), if it is exposed in sounding dive.

Whales' other surface activities also make it possible to observe various parts of their bodies. These activities include **spyhopping** (raising the head up to view the aerial surroundings) by most species; **breaching** (jumping out of the water) by species such as the humpback whale, minke whale, gray whale and dolphins; **lobtailing** (beating the surface of the water with their flukes) by species such as the humpback whale and the

right whale; and **flippering** (slapping the surface of the water with their fins), often observed in species such as the humpback whale. While the reasons for these forms of behaviour are not all understood, proposed explanations include the need to make noise to announce their presence; play; movements associated with feeding or, in the case of dolphins, travelling, and removal of parasites from their bodies.

## COMPARISON OF VARIOUS WHALE SPECIES OBSERVED FROM THE SURFACE

The sketches show the portions of the body visible above the surface during a breathing sequence, generally viewed from the side. However, the sketches of the flukes may represent oblique or rear views. Remember that the shape of the dorsal fin and flukes, as well as markings, can vary considerably among individuals of the same species. You may also encounter specimens of the current year's young or juveniles as well as adults.

In calm weather, the height and shape of a whale's spout or blow can also help to identify some species or to spot distant whales. The blow results from the condensation of the warm, humid air exhaled by the whale.

Finally, it should be noted that respiration sequence characteristics are less useful for identifying toothed whales since their blow is seldom seen and body movement during respirations is more rapid. Colouring, and the shape and relative size of the dorsal fin are the key identification features for these animals, except when they jump from the water and display their entire bodies.

# BLUE WHALE

*(Balaenoptera musculus)*

## Canadian status

A rare whale (COSEWIC\*).

## World status

Protected since 1966 (IWC\*\*).

## Habitat

GENERAL: in offshore areas but sometimes in shallow waters.

SUMMER: arctic and subarctic waters, except for a local population in the Gulf of St. Lawrence.

WINTER: temperate waters.

## Feeding

Small crustacea (krill) exclusively; in summer, eats up to 4 metric tons of krill a day.

## Reproduction

Mating season: winter

Gestation period: 10-12 months

Calving season: around April

One young every 2-3 years

Lactation period: 7 to 8 months

## Behaviour or surface activity

Travels singly, in pairs or in small groups. Blows up to 15 times before sounding; submerges 5 to 20 minutes.

Before the dorsal fin can be seen, the head has submerged and moved underwater for a few seconds.

# RORQUALS

*Balaenopteridae*

## Swimming speed

Normal: 10-14 knots

Maximum: 18-20 knots

## Note

The blue whale is the largest of all animals living or extinct. The colour pattern seems to be useful in identifying individual whales. Pictures of the back with the dorsal fin are collected for that purpose.

## FIN WHALE (*Balaenoptera physalus*)

### Status

The North Pacific populations and some North Atlantic stocks are protected from any commercial exploitation (IWC\*). This species, as all others, has not been exploited in Canadian waters since 1972.

### Habitat

GENERAL: in arctic, subarctic and temperate seas with preference for temperate seas; inshore and offshore.

SUMMER: reaches Gulf of St. Lawrence and Vancouver Island areas around March-April.

### Feeding

Diversity of small fish and crustacea.

## RORQUALS *Balaenopteridae*

### Reproduction

Mating season: winter

Gestation period: 11-12 months

Calving season: winter

One young every 2-3 years

Lactation period: about 7 months

### Behaviour or surface activity

Travels singly or in pods of 2 to 12. Blows 5 to 8 times and submerges 4 to 20 minutes.

### Swimming speed

Normal: 10-15 knots

Maximum: 20-30 knots

### Note

The fin whale is among the fastest balaenopteridae.

\* International Whaling Commission

CAMPET 89

# HUMPBACK WHALE

(*Megaptera novaeangliae*)

## Canadian status

Considered threatened (COSEWIC\*).

## World status

Protected since 1966 (IWC\*\*).

## Habitat

GENERAL: all oceans, usually in inshore waters and continental shelf.

SUMMER: migrates to cold waters for feeding.

WINTER: migrates to warm waters for calving.

## Feeding

Diversity of small fish (capelin, herring, sand lance) and krill.

# RORQUALS

*Balaenopteridae*

## Reproduction

Mating season: winter

Gestation period: 11-12 months

Calving season: winter

One young every 2-3 years

Lactation period: 10 1/2 to 12 months

## Behaviour or surface activity

Travels singly or in herds of 2 to 8. Blows 5 to 10 times; submerges for 10 to 20 minutes. This whale is well known for its acrobatics. Breaches, spyhops, flukes and flipper can slap the water.

## Swimming speed

Normal: 3-5 knots

Maximum: 9-10 knots

## Note

The humpback whale, especially the male during reproductive season, has a complex vocal pattern that is changing from year to year. This is the so-called "singing whale" whose song has been compared to birds' songs. The colour pattern of the ventral side of the flukes is useful in identifying individual specimens and studying their local migrations and distribution. A catalogue has been published listing identified whales.

\* *Committee on the Status of Endangered Wildlife in Canada*

\*\* *International Whaling Commission*

## MINKE WHALE

*(Balaenoptera acutorostrata)*

### Status

Some north Pacific and some north Atlantic stocks are protected (IWC\*).

### Habitat

GENERAL: arctic, subarctic and temperate waters; more common inshore.

SUMMER: ventures into bays and estuaries.

### Feeding

Varied diet including a diversity of small fish (capelin, herring, sand lance), planktonic crustacea and squid.

## RORQUALS

*Balaenopteridae*

### Reproduction

Mating season: December to May

Gestation period: 10 months

Calving season: between October and March

One young every one to 2 years

Lactation period: 4 to 5 months

### Behaviour or surface activity

Usually travels singly. This whale is active at sea surface and it can be seen breaching. Sometimes curious and attracted to boats. Blows several times; head surfaces first and may come out of the water; dorsal fin is exposed almost simultaneously with the top of head.

### Swimming speed

Normal: 6-8 knots

Maximum: 20 knots

\* *International Whaling Commission*

# PACIFIC GRAY WHALE

## (*Eschrichtius robustus*)

### Status

Protected since 1946 (IWC\*) when believed near extinction. Has increased significantly since.

### Habitat

GENERAL: temperate waters; close to shore, continental shelf.

SPRING: migrates along Canada's west coast towards cold waters to feed.

FALL: migrates towards southern California and Mexico to calve. Travelling as many as 16,000 km annually, its migration is the longest undertaken by any mammal.

# GRAY WHALES

## *Eschrichtidae*

### Feeding

Diversity of bottom animals (amphipods, gasteropods, worms and small crabs) and some pelagic crustacea.

### Reproduction

Mating season: December to January

Gestation period: 12 months

Calving season: December or January, in lagoon's shallow water

One young every 2 years

Lactation period: 5 to 6 months

### Behaviour or surface activity

Usually travels singly but feeds in small pods. Blows 4 to 5 times, makes 4 or 5 quick shallow dives and submerges for about 5 minutes. The females actively protect their calves against enemies.

### Swimming speed

Normal: 2-4 knots

Maximum: 10 knots

KAMPET 85

# RIGHT WHALE

(*Eubalaena glacialis*)

## Canadian status

Endangered (COSEWIC\*)

## World status

Extremely uncommon, protected since 1930 (IWC\*\*).

## Habitat

Temperate seas, often inshore in shallow waters.

## Feeding

Pelagic crustacea.

# RIGHT WHALES

*Balaenidae*

## Reproduction (not well known)

Gestation period: 11-12 months

One young every 3 years or more

Lactation period: 6 to 12 months

## Behaviour or surface activity

Travels singly, in pairs or in small pods. Blows 5 to 6 times, submerges 3 to 12 minutes.

## Swimming speed

Normal: 2 knots

Maximum: 5 knots

## Note

The head callosities are useful in identifying individual whales.

\* Committee on the Status of Endangered Wildlife in Canada

\*\* International Whaling Commission

# BOWHEAD WHALE

(*Balaena mysticetus*)

## Canadian status

Endangered species (COSEWIC\*)

## World status

Protected from commercial whaling (IWC\*\*).

## Habitat

Arctic and subarctic waters in association with pack ice often in shallow areas.

## Feeding

Small crustacea or bottom animals.

# RIGHT WHALES

*Balaenidae*

## Reproduction (not well known)

Mating season: spring

Gestation period: 10-12 months

Calving season: March to August

One young every 2-3 years

Lactation period: about one year

## Behaviour or surface activity

Travels singly, in pairs or in pods of up to 50.

Blows 7 to 9 times, submerges 5 to 20 minutes.

Slow-moving and easily alarmed.

## Swimming speed

Normal: 6 knots

CAMPET 85

# SPERM WHALE

## *(Physeter macrocephalus)*

### **Status**

All southern hemisphere, North Pacific, North Atlantic and Northern Indian Ocean stocks are protected (zero quotas) from commercial exploitation (IWC\*).

### **Habitat**

GENERAL: all oceans of the world but more common in temperate and tropical waters. Usually offshore.

SUMMER: bulls travel northward in loose groups.

### **Feeding**

Mostly squid but may also eat a variety of fish.

### **Reproduction**

Mating season: January to July;  
peak in April and May

Gestation period: 16-17 months

Calving season: May to November

One young every 3-4 years

Lactation period: 2 years

### **Behaviour or surface activity**

Lies still on surface after deep dive for about 10 minutes, makes 50 short and regular blows; submerges up to 70 minutes.

### **Swimming speed**

Normal: 3-4 knots

Maximum: 12 knots

# SPERM WHALES

## *Physeteridae*

# KILLER WHALE

(*Orcinus orca*)

## Habitat

Lives in all oceans. Comes close to shore in pursuit of its prey.

## Feeding

Has a diversified diet of fish, seals, dolphins, porpoises, whales and even aquatic birds.

## Reproduction

Gestation period: about 12 months or more

Lactation period: one year or more

## Behaviour or surface activity

Travels in pods of up to 50. Makes 3 to 5 relatively inconspicuous blows, submerges 1 to 4 minutes. Breaches.

## Swimming speed

Normal: 3-6 knots

Maximum: 25 knots

## Note

Named for its ferocious feeding habits. Develops permanent group associations made up of males, females and young, in which communication evolves in a characteristic dialect. Many small pods often travel together. The shape of the grey saddle behind the dorsal fin, with particular scars or shape of that fin, helps in differentiating individuals. Inshore resident animals in British Columbia provide a unique opportunity to study these populations.

CAMPETAS

# LONG FINNED PILOT WHALE

(*Globicephala melaena*)

## Habitat

GENERAL: subarctic or temperate waters; usually offshore

SUMMER: comes close to shore and bays.

## Feeding

Squid, fish (cod, plaice), amphipods.

## Reproduction

Mating season: April-May

Gestation period: Around 15 1/2 months

Calving season: all year but mostly from May to November

One young every 2-3 years

Lactation period: 21-22 months

## Behaviour or surface activity

Travel sometimes in pods of 5 to 300 but inshore pods of 20 to 50 are more common. Makes several frequent blows, submerges for several minutes.

Dives and blows as a group when herded. Does not often breach but frequently spyhops and lobtails.

# OCEAN DOLPHINS

*Delphinidae*

3m

2m

1m

0m

CAMPET 85

# ATLANTIC WHITE-SIDED DOLPHIN

*(Lagenorhynchus acutus)*

## Habitat

GENERAL: subarctic and temperate waters; usually offshore.

SUMMER: comes in coastal areas.

## Feeding

Diversity of fish (herring, capelin, sand lance, salmonids, mackerel) shrimp and small squid.

## Reproduction

Mating season: summer and early fall

Gestation period: 10-11 months

Calving season: May to August

One young every 2-3 years

Lactation period: more than one year

## Behaviour or surface activity

Sometimes seen in very large herds.

Frequent breaching.

## Swimming speed

Normal: 15 knots

Maximum: 30-32 knots

## Note

Of all Canadian cetaceans, this is the only species with a yellow or brownish patch.

# OCEAN DOLPHINS

*Delphinidae*

# PACIFIC WHITE-SIDED DOLPHIN

*(Lagenorhynchus obliquidens)*

## Habitat

GENERAL: subarctic and temperate waters

SUMMER AND FALL: offshore

WINTER AND SPRING: comes closer to shore

## Feeding

Diversity of small fish and small squid.

## Reproduction

Gestation period: 10-12 months

Calving season: summer — early fall

## Behaviour or surface activity

Gregarious, gather sometimes in very large herds of more than 1,000. Fast swimmers, breach frequently.

## Swimming speed

Normal: 15 knots

# WHITE-BEAKED DOLPHIN

*(Lagenorhynchus albirostris)*

## Habitat

Arctic, subarctic and temperate waters; usually offshore in deep waters, but gets inshore in northern waters. Seen in the Maritimes in spring and fall.

## Feeding

Diversity of fish (cod, herring, capelin) squid and octopus and bottom crustacea.

## Reproduction

Mating season: fall

Gestation period: about one year

Calving season: summer

# OCEAN DOLPHINS

*Delphinidae*

AMST 45

# HARBOUR PORPOISE

*(Phocoena phocoena)*

## Habitat

Subarctic and temperate; usually inshore, often in bays and estuaries.

## Feeding

Diversity of fish (herring, pollock, mackerel, hake), squid and bottom crustacea.

## Reproduction

Mating season: June to August

Gestation period: 11 months

Calving season: March to July

One young each year

Lactation period: about 8 months

## Behaviour or surface activity

Often swims quietly at the surface. Keeps away from vessels. Hard to see, difficult to study.

## Swimming speed

Maximum: 12 knots

# PORPOISES

*Phocoenidae*

CAMPET B5

# DALL'S PORPOISE

*(Phocoenoides dalli)*

## Habitat

North Pacific; seasonal offshore-inshore and north-south movements.

## Feeding

Squid, crustaceans and diversity of fish.

## Reproduction

Gestation period: about 11 months

Calving season: possibly year-round

One young every 3 years

Lactation period: about 2 years

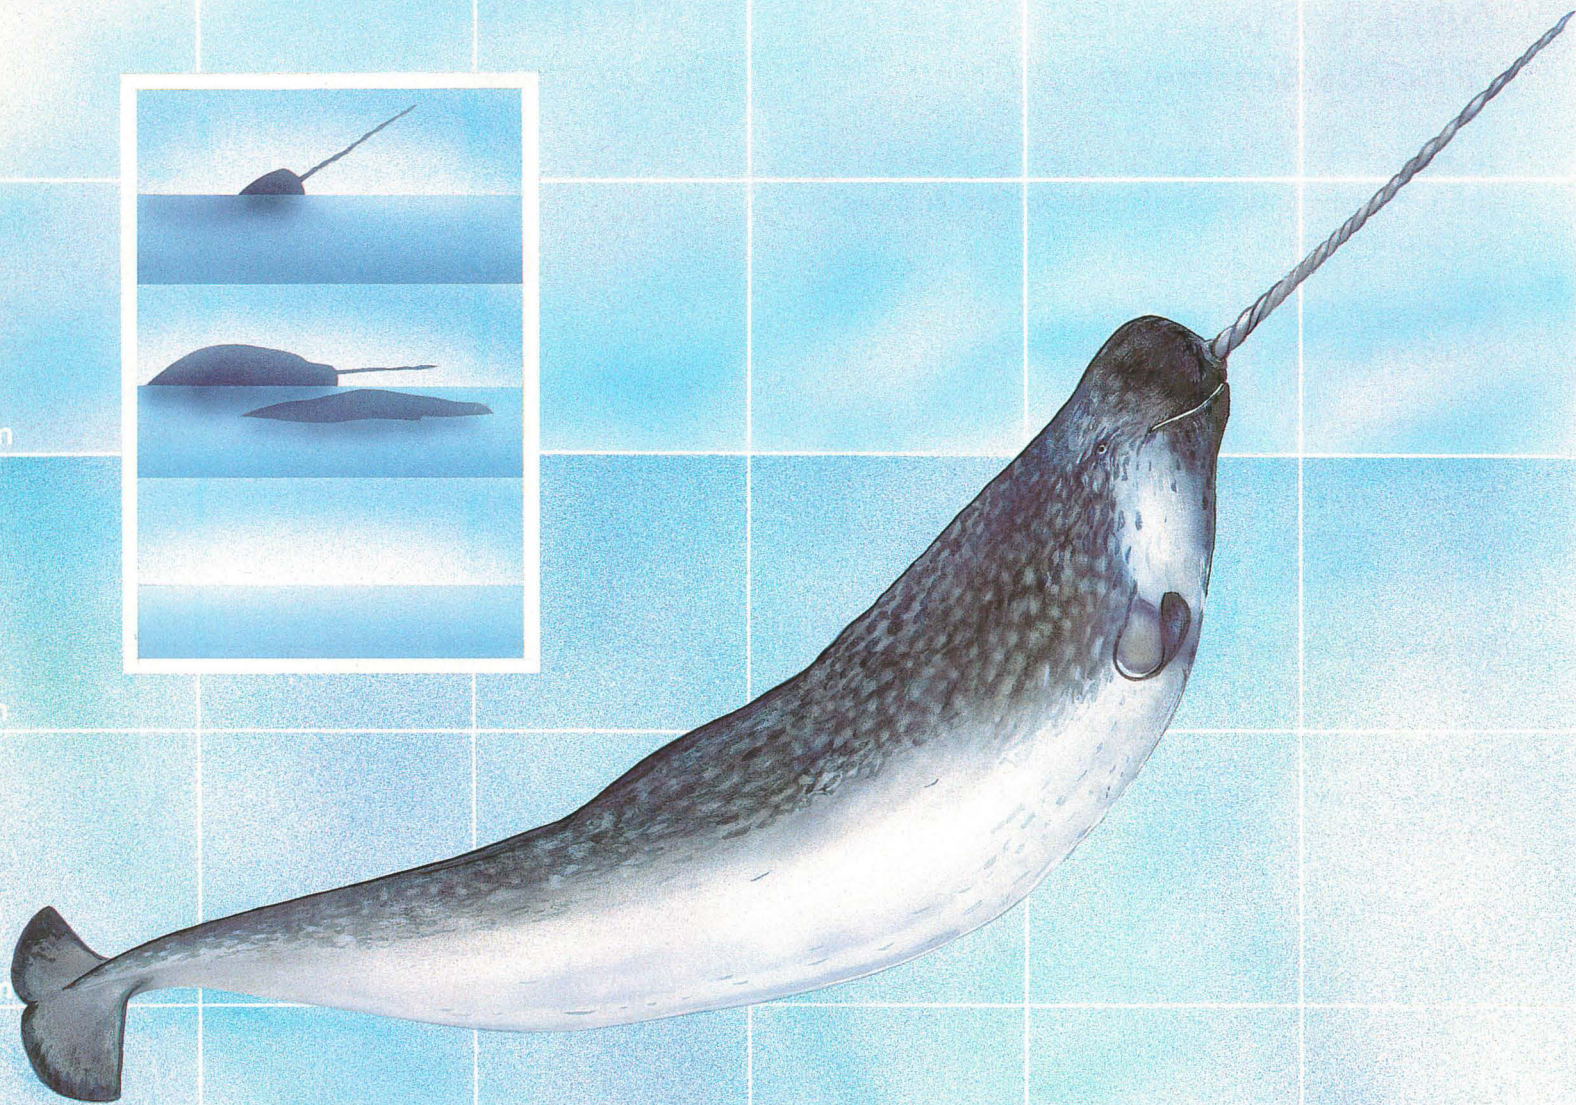

## Behaviour or surface activity

Travels in groups of 10 to 20. Frequently seen in association with Pacific white-sided dolphins or pilot whales. Has a way to break the surface, making a splash or cone of water called "rooster tail"; almost never leaps out of the water but swims in bow waves of moving vessels. Fast swimmer.

# PORPOISES

*Phocoenidae*

# NARWHAL

(*Monodon monoceros*)

## Habitat

GENERAL: arctic waters

SUMMER: in fiords and bays or around pack ice.

WINTER: in deep waters; pack ice of Davis Strait and Hudson Strait.

## Feeding

Squid, fish and crabs

## Reproduction

Mating season: around April

Gestation period: about 15 months

Calving season: summer (July-August)

One young every 2 years

## Behaviour or surface activity

Travels in pods of 10 or more. When surfacing to blow, the head, then the back emerges. The tusk sometimes comes out of the water.

## Note

The tusk that the male and occasionally the female have, is 2 to 3 metres long and spirals counter clockwise; this tusk is the only one of the two teeth of the upper jaw that protudes.

## **BELUGA**

***(Delphinapterus leucas)***

### **Status**

The St. Lawrence Estuary population (350-750 animals) is endangered and fully protected (COSEWIC\*). There are many other populations in the Canadian Arctic; some of them are in very low numbers and others are in the order of 5,000 to 10,000 animals.

### **Habitat**

**GENERAL:** arctic and subarctic; one population is resident of the St. Lawrence Estuary.

**SUMMER:** shallow waters of estuaries and bays

**WINTER:** migrates in areas of loose pack or open water.

### **Feeding**

Diversified, including fish, bottom invertebrates and squid.

### **Reproduction**

Sexual maturity: female, 4-5 years; male, 5-8 years

Mating season: spring

Gestation period: 14 1/2 months

Calving season: June and August

One young every 3 years

Lactation period: 2 years

### **Behaviour or surface activity**

Travels in pods of 2 to 10 although groups of up to several hundreds are common. Surfaces 2 to 3 times per minute to breathe, submerges 10 to 15 minutes.

## **BELUGA-NARWHAL**

***Monodontidae***

### **Swimming speed**

Normal: 5-6 knots

Maximum: 9-10 knots

### **Note**

Adults are white, juveniles are grey, newborns are brown or dark blue. In summer, groups of females and young are separate from the males. The longevity is thought to be up to 30 years.

# COLLECTION OF WHALE OBSERVATION DATA

Each whale-watching excursion is an opportunity to obtain data on whales' ranges and numbers; the recurring presence in an area of individuals recognized by their distinctive features (colouring, injuries, fins, and so on); and behaviour.

The following form provides examples of data which would be useful to record during whale-watching excursions. Such data can be forwarded to the nearest Department of Fisheries and Oceans office listed on the following page of this brochure.

Pictures of the whales' colouration patterns and other distinctive features are used for the identification of individual animals, particularly for the blue, the humpback, the right and the killer whales. Pictures of certain distinctively marked animals (particular colourations, scars, etc) are useful for all species. Such pictures with information on the date, time, place where they were taken and the author's name and address should be sent to the researchers that have asked for them, either directly or through the nearest Fisheries and Oceans office.

On Canada's west coast, a team of experienced veterinarians, biologists and researchers have established a program for stranded marine mammals to provide assistance to live marine mammals in distress and to make the best use possible of diseased or dead animals, by making tissues samples and test results readily accessible to qualified scientific investigators. Sightings of stranded marine mammals should be reported immediately to the

Vancouver Public Aquarium **(604) 685-3364** and/or to the Pacific Biological Station of the Department of Fisheries and Oceans in Nanaimo B.C. **(604) 756-7000**.

Research on mortality causes is in progress for the whales, dolphins and seals of the St. Lawrence Gulf and Estuary. Strandings should be reported at **(418) 775-6500** or **(514) 457-3660**.

There is a rescue program for whales accidentally entangled in fishing nets in the Newfoundland and Labrador waters. Net entanglements can be reported 24 hours a day, at **(709) 753-5495** (collect).

For additional information on whales, please contact any of the Department of Fisheries and Oceans (Government of Canada) offices listed below:
