

Jasper Ridge Biological Preserve Serpentine Flora

LA=locally abundant/dominant at x scale; C=common; O=occasional; U=uncommon; Ex=usually excluded from serpentine. Gr=grassland; Ch=chaparral; W=broadleaf evergreen woodland; S=seep, drainage, vernally wet areas; E=ecotonal. X=observed 2007-2015. N.B. The main ridge-top road, Road F, was surfaced in 1983 with fractured greenstone from the cliffs by Searsville Lake. Aerial photographs indicate the road earlier ran further to the south. Species abundance can vary dramatically year to year; see charts in RJ Hobbs, S Yates, HA Mooney (2007) Long-term data reveal complex dynamics in grassland in relation to climate and disturbance, Ecological Monographs. See the Preserve Plant List for photo-links <<http://www.stanford.edu/dept/JRBP/plants/PlantList.htm>>.

Notes

[1] yes=record or specimen of plant on serpentinite soils; yesx=observed growing on serpentinite 2007-; R=restricted to serpentine or serpentine-influenced

[2] SPEC=vouchered, present; LRV=vouchered, not seen in the field in 10 years

[3] Affinity: After Safford, HD.; Viers, JH.; Harrison, SP. 2005. Serpentine Endemism in the California Flora: A Database of Serpentine Affinity. *Madroño* 52:222-257. SE=Serp endemic, i.e., strict endemic with >95% of occurrences on ultramafics BE=Broad endemic, i.e., 85-94% of their occurrences on ultramafics BE/SI Transition, i.e., 75-84% of their occurrences on ultramafics SI=Strong indicators, 65-74% of their occurrences on ultramafics WI=Weak Indicator, 55-64% WI/IN=Indifferent transition, 50-54%

[4] *L. caruifolium*: In contrast to *L. utriculatum*, stem leaves of *L. caruifolium* are absent or only 1-2 near base, and these lack prominent sheathing petiole bases of *L. u.*

[5] *L. dasycarpum* petals gen hairy; fruit ovate-elliptic; bractlets free or fused. Hybridizes with *L. m.*

[6] *L. macrocarpum* petals glabrous; fruit narrowly elliptic-oblong; bractlets fused, 1-sided

[7] *L. utriculatum* variable in lf dissection but fls always bright yellow and petioles of stem lvs with distinctive sheathing bases. In contrast to *L. utriculatum*, stem leaves of *L. caruifolium* are absent or only 1-2 near base, and these lack prominent sheathing petiole bases of *L. u.*

[8] Asclepias: with Verbena l., Carex s., Stachys p.

[9] Coyote brush, which is spreading on the preserve, avoids serpentine but a few plants are on tr 5 (Rocky Road) in an area of possible non-serp soil influence.

[10] Centaurea: usually excluded from serpentine. Adventive in transition soil zones in annual grassland, disturbed areas, e.g., little b

[11] Blue oak woodland, near serpentine contact

[12] *L. californica* are the edaphic Race A plants in Rajakaruna, N (1999) The edaphic factor and patterns of variation in *Lasthenia californica* (Asteraceae). *AMERICAN JOURNAL OF BOTANY* 86: 1576-1596. Also <http://nrajakaruna.wordpress.com/research/>

[13] *L. gracilis* are the edaphic Race C plants in Rajakaruna, N (1999) The edaphic factor and patterns of variation in *Lasthenia californica* (Asteraceae). *AMERICAN JOURNAL OF BOTANY* 86: 1576-1596.

[14] one station at serp contact at first seasonal drainage on little b

[15] Tidy tips: declining

Notes

- [16] JHT listed as common in 1974
- [17] *Stellaria media*: light green form common in open grassland, mostly disturbed areas along road F near Escobar Gate; little b extension in bloom 3/15/10
- [18] Brewer's onion site Area C
- [19] usually excluded from serpentine but individual trees are sometimes found, usually scrubby individuals in transition zone as found along Tr. 15
- [20] Q. b. x: this entity forms short scrub eventually grading into Q. durata
- [21] Blue oak woodland is usu replaced by chaparral on serpentine.
- [22] in trail blooming 4/24/2010 near small drainage
- [23] near serpentine contact along Rd F in blue oak woodland; not located in recent years
- [24] Chamise: codominant with leather oak.
- [25] COLspa: little A; lost serpentine
- [26] Brewer's onion site Area C
- [27] one occurrence on Tr 6 under leather oak
- [28] differs from *J. xiphiooides* by having anthers longer than filaments; tepals with green center and dark brown margins, 4 mm l.; capsule tapering.
- [29] Tepals white w pinkish midveins, papery when dry, 6 prominent ovary crests. Wet areas in serpentine.)
- [30] *A. lacunosum*: perianth < 1 cm long, whitish; ovary w 3 low crests, each 2-lobed; tepals often with rose midvein.
- [31] RANK 1B.2. Flrs bright red-purple on long pedicels in open heads.
- [32] Plants have 2-3 channelled lvs.)
- [33] *C. argillosus*: in the Bay Area can be separated from *C. venustus* by its petals lacking an upper splotch.
- [34] *D. capitatum*: anthers 6 in 2 dissimilar series; perianth not narrowed above ovary; bloom early spring.
- [35] see note for *Gastridium*, with which it can be confused.

Notes

[36] noticed a small clump along trail 15 and also Rd F in April 2010

[37] *Danthonia californica*: largest stands in non-serpentine grassland

[38] *Gastridium* can be confused w. *A. microphyllus*. *Gastridium* spikelets are swollen at base; 2nd glume much longer than first; lemmas hairy throughout with bristly rachilla extension.

[39] JRBPs plants usu one spikelet/node; lemma awn barely exceeding glumes. In bloom West Serpentine 3/15/10

[40] usu. depauperate forms that are hard to distinguish from *V. microstachys*.

[41] *V. m. pauciflora*: lemmas and glumes glabrous.

[42] *Festuca* (*Vulpia*) *microstachys*: easily spotted after *Lolium* dies back where they grow together.
