

**Application of the Residence Concept to the
Bashful Bulrush/Few Flowered Clubrush (*Trichophorum planifolium*) in
Canada**

Does the concept of residence under SARA apply to this species? **NO**

Detailed Rationale:

(1) Does the ecology of the species include the use of a dwelling place—which is a specific location (or locations) or discrete spatial area that contains features similar to a den or nest, or performs functions similar to a den or nest?

No - the specific location occupied by an individual Bashful Bulrush / Few Flowered Clubrush plant is plainly a part of the general habitat of the species; there is no inherent feature of this area similar to a den or nest.

(2) Are these locations occupied or habitually occupied during all or part of the species' life cycle?

NA

(3) Are these locations essential to the successful performance of a specific, crucial function of the species' life-cycle?

NA

Summary of Rationale:

Individual Bashful Bulrush / Few Flowered Clubrush plants do not appear to use a dwelling place similar to a nest or den, and therefore do not qualify for having a residence. There would be no additional legal protection not already afforded by protection of the individual and its critical habitat.
