

**Research note**

## Taxonomic Revision of *Lindernia* All. (Scrophulariaceae sensu lato) In Taiwan

Yi-Shuo Liang,<sup>1)</sup> Chih-Hsiung Chen,<sup>2,3)</sup> Jenn-Che Wang<sup>1)</sup>

### [ Summary ]

The genus *Lindernia* (Scrophulariaceae) in Taiwan was taxonomically revised based on morphological and ecological studies. Thirteen species and 2 varieties of this genus, including a newly recorded species, *L. nummularifolia* (D. Don) Wettst. and a newly naturalized species, *L. rotundifolia* (L.) Alston are treated. Three species: *L. hyssopoides* (L.) Haines, *L. mollis* (Benth.) Wettst., and *L. viatica* (Kerr ex Barnett) Philcox are excluded from the flora of Taiwan. A key to sections and species is presented.

**Key words:** *Lindernia*, revision, Scrophulariaceae, new records, Taiwan.

## 摘要

本文處理台灣產母草屬(*Lindernia*)植物分類，共包含13種、2變種，其中包含1新紀錄種寬葉母草(*L. nummularifolia* (D. Don) Wetst.)以及1新歸化種(*L. rotundifolia* (L.) Alston)。而尖果母草(*L. hyssopioides* (L.) Haines)、見風黃(*L. mollis* (Benth.) Wetst.)與擬泥花草(*L. viatica* (Kerr ex Barnett) Philcox)則為排除種，並不分布於台灣。本文提供台灣產本屬下節與種類檢索表。

**關鍵詞：**母草屬、分類訂正、玄參科、新紀錄、台灣。

The genus *Lindernia* All. traditionally belonged to the Scrophulariaceae. Rahmanzadeh et al. (2005) treated this genus as a member of the new family Linderniaceae which was accepted by APG III (2009). This genus contains about 100 species throughout most of the Old and New World tropics. They fall in 3 main geographical groups, the largest in Asia followed by those in Africa and the Americas (Philcox 1968). *Lindernia* currently contains 12 or more different genera, of which 3 other genera: *Vandellia* L., *Bonnaya* Link & Otto, and *Ilysianthes* Rafin are most commonly used (Pennell 1935, Philcox 1968). In the past, these 4 genera were distinguished by the androecium, capsule, leaf, and calyx: *Vandellia* and *Lindernia* have 2 pairs of fertile stamens but are distinguished by the pinnately nerved and 3~5 veins arising from the base of the lamina; *Bonnaya* and *Ilysianthes* have 1 pair of fertile androecium and 1 pair of staminodes, but in *Ilysianthes*, the anterior staminodes have large appendages, while in *Bonnaya*, these staminodes are only simple (Bentham 1846, Philcox 1968). Haines (1922) reduced *Bonnaya* to *Vandellia* and *Ilysianthes* to *Lindernia*, as did Yamazaki

(1954, 1955a) and Li (1978). On the other hand, Pennell (1935) reduced *Vandellia*, *Bonnaya*, and *Ilysianthes* to *Lindernia* because these genera have uniform corolla and similar curiously recurved anterior filaments and similar septicidal dehiscence capsules. The circumscription of *Lindernia* sensu Pennell was accepted by subsequent authors such as Hara (1943), Li (1950, 1961), Yamazaki (1977), and Tsoong and Ku (1979).

Taiwanese *Lindernia* species were recorded by Japanese taxonomists, such as Hayata (1908, 1920), Mori (1936), and Yamazaki (1952) who published some new taxa in Taiwan. The first revision was made by Li (1950), who recorded 9 species in Taiwan. Yamazaki (1955a, 1955b) reviewed the genera *Lindernia*, *Vandellia*, and *Torenia* in eastern Asia including 10 species listed in Taiwan, which was followed by Li (1978) in the *Flora of Taiwan*. Yamazaki (1977) reviewed the genus *Lindernia* sensu Pennell (1935) in Taiwan and Japan, and reported 14 species in 6 sections. In the *Flora of Taiwan* 2<sup>nd</sup> edition (Liu 1998), 15 species were recorded in Taiwan, 3 of which (*L. hyssopioides*, *L. mollis*, and *L. viatica*) were not included in previous studies.

After consulting all relevant literature and examining herbarium collections from BM, C, HAST, K, L, KYO, PPI, TAI, TAIF, TI, and TNM, we recognized 13 species and 2 varieties in Taiwan. In addition, we also examined 10~20 seeds to determine the length and width. The seed length is from the hilum to the other apex, and the width is the widest length perpendicular to the hilum-apex line. The length and width ratio (L/W) was also determined. The sectional treatment follows Philcox (1968). The nomenclature citation, synonyms, key to taxa, taxonomic descriptions, and notes are presented below.

### Taxonomic Treatment

*Lindernia* Allioni, Misc. Taur. 3: 178, 1762-1765; Li, Q. J. Taiwan Mus. 3: 66. 1950; Li, Q. J. Taiwan Mus. 14: 10. 1961; Yamazaki, J. Jap. Bot. 52(8): 255. 1977; Tsoong and Ku, Fl. Reipubl. Popularis Sin. 68: 126. 1979; Yamazaki, J. Fac. Sci. Univ. Tokyo, Sect. 3, Bot. 13: 32. 1981; Liu, Fl. Taiwan. 2nd Ed. 4: 603. 1998.

*Vandellia* L., Mant. Pl. 1: 12, 1767; Matsumura & Hayata, J. Coll. Sci. Univ. Tokyo 22: 281. 1906 (Enum. Pl. Form.); Hayata, Icon. Pl. Form. 9: 79. 1920; Li, Fl. Taiwan 4: 601. 1978.

*Bonnaya* Link et Otto, Ic. Pl. Select. 25. 1820; Matsumura & Hayata, J. Coll. Sci. Univ. Tokyo 22: 281. 1906; Hayata, Icon. Pl. Form. 9: 79. 1920.

*Ilysanthes* Rafin., Ann. Nat. 13. 1820; Mori in Masamune, Short Fl. Form. 191. 1936.

Annuals or perennials. Stem erect to prostrate, usually quadrangular. Leaves opposite, simple, pinnately or palmately nerved, entire or serrate. Flowers in terminal or axillary racemes or in subumbellate clusters. Calyx deeply to shallowly 5-lobed, 5-nerved, each nerve with an obscure or distinct rib. Co-

rolla tubular, bilabiate; posterior lip 2-lobed, entire or emarginate; anterior lip 3-lobed. Stamens 2 or 4; posterior pair fertile; anterior pair sterile, reduced to simple staminodes; anterior filaments usually each with a distinct appendage or geniculum arising near base; anthers touching in pairs under posterior lip, anther cells divaricate. Style filiform; stigma 2-parted. Ovary obliquely or symmetrically ovate, oblong or cylindric, glabrous. Capsule septicidally 2-valved, valves separated from placentiferous septum. Seeds small, numerous, ellipsoid, shortly cylindric or triangle-like to polygonal, reticulate or scrobiculate.

About 100 species ranging from South Asia to tropical Africa, and the Americas. There are 13 species and 2 varieties in Taiwan.

### Key to the sections, species, and varieties in Taiwan

1. Leaves palmately 3~5-nerved ..... 2
1. Leaves pinnate nerved, serrate or crenate, or rarely entire ..... 5
2. Stamens 4, all fertile. Upper leaves entire (Sect. 1. *Lindernia*) ..... 1. *L. procumbens*
2. Stamens 2, staminodes 2. Leaves more or less with 3~5 pairs of serrate teeth (Sect. 2. *Brachycarpae*) ..... 3
3. Staminodes without spur-like appendage. Seeds falcate-oblong. Corolla white or light-blue ..... 2. *L. rotundifolia*
3. Staminodes with spur-like appendage. Seeds oblong to ovate. Corolla pink or very pale-purple ..... 4
4. Pedicle typically shorter than subtending leaves, 0.6~1 mm in diameter ..... 3a. *L. dubia* var. *dubia*
4. Pedicle typically 1.2~3-times longer than subtending leaves, 0.1~0.5 mm in diameter ..... 3b. *L. dubia* var. *anagallidea*
5. Stamens 4, anterior filament geniculate,

- usually with appendages..... 6
5. Stamens 2, anterior pair of staminodes 2, filiform, simple (Sect. 8. *Bonnaya*) ..... 11
  6. Anterior pair of filaments geniculate with blunt clavate appendages ..... 7
  6. Anterior pair of filaments geniculate with thick geniculum or subglobose appendages at base ..... 9
  7. Calyx shorter 5-lobed, lobes shorter than calyx tube (Sect. 3. *Torenioides*) ....
    - ..... 4. *L. crustacea*
  7. Calyx deeply 5-lobed almost to base, lobes longer than calyx tube ..... 8
  8. Capsule linear-cylindric, 2~3-times longer than calyx (Sect. 4. *Angustifolia*) ....
    - ..... 5. *L. anagallis*
  8. Capsule oblong, equal or subequal to calyx (Sect. 5. *Setulosae*) ....
    - ..... 6. *L. scutellariiformis*
  9. Calyx shallowly 5-lobed, lobes subequal to calyx tube, ridged when flowering. Capsule linear-cylindric (Sect. 6. *Numularia*) ..... 7. *L. nummularifolia*
  9. Calyx deeply 5-lobed almost to base, lobes much longer than calyx tube, not ridged when flowering. Capsule subglobose, ovate (Sect. 7. *Tittmannia*) ..... 10
  10. Flowers solitary and axillary. Calyx densely hirsute and glandular hairy. Capsule subglobose ..... 8. *L. pusilla*
  10. Flowers in racemes. Calyx with glandular hairs only. Capsule ovate ..... 9. *L. viscosa*
  11. Plant stoloniferous or creeping ....
    - ..... 10. *L. ruellioides*
  11. Plant erect to ascending ..... 12
  12. Leaf margin sharply serrate with fine aristate teeth ..... 11. *L. ciliata*
  12. Leaf margin serrate with acute teeth ..... 13
  13. Leaves linear. Flowers in racemes. Staminodes pale-blue ..... 12. *L. tenuifolia*
  13. Leaves oblanceolate to obovate-oblong. Flower solitary, axillary or in racemes. Staminodes yellow ..... 13. *L. antipoda*

### Sect. 1. *Lindernia*

1. *Lindernia procumbens* (Krock.) Borbas, Bekesm Fl. 80. 1881; Tsoong and Ku, Fl. Reipubl. Popularis Sin. 68: 131. 1979; Yamazaki, J. Fac. Sci. Univ. Tokyo, Sect. 3, Bot. 13: 3. 1981; Liu, Fl. Taiwan 2nd Ed. 4: 606. 1998.....陌上草  
*Anagaloides procumbens* Krock., Fl. Siles. 2: 398. 1790.

*Lindernia pyxidaria* L. Mant. Pl. 2: 252, 1771, nom. illeg.; Yamazaki, J. Jap. Bot. 30: 171. 1955; Li, Q. J. Taiwan Mus. 14: 2. 1961.

*Lindernia pyxidaria* Allioni, Misc. Tourin. 3: 178. 1776; Mori in Masamune, Short Fl. Form. 191. 1936; Li, Q. J. Taiwan Mus. 3: 65. 1950.

*Vandellia erecta* Benth., Scroph. Ind. 36. 1835 (Lectotype: K!, Wallich, 3947C); Matsumura and Hayata, J. Coll. Sci. Univ. Tokyo 22: 280. 1906 (Enum. Pl. Form.).

*Lindernia procumbens* (Krock.) Philcox, Taxon 14: 30. 1965; Philcox, Kew Bull. 22(1): 29. 1968; Yamazaki, J. Jap. Bot. 52(8): 254. 1977; Li, Fl. Taiwan 4: 571. 1978.

Annual herb 5~20 cm tall. Stem erect or ascendant, obscurely quadrangular, glabrous. Leaves palmately 3~5-nerved, sessile, elliptic or ovate-elliptic, obtuse at apex, 6~25(~30) mm long, 4~12 mm wide, entire, rarely obscurely crenate, glabrous. Flowers solitary-axillary; pedicels usually opposite, 5~20(~25) mm long, obscurely quadrangular, glabrous. Calyx deeply 5-lobed almost to base, 2.5~3 mm long, lobes linear-lanceolate, glabrous. Corolla pale-pink, 3~5 mm long; posterior lip ovate, emarginated; anterior lip with 3 rounded lobes. Stamens 4, all fertile; anterior filaments each with a clavate to linear spur 0.4~1 mm long arising near base. Ovary ellipsoid; disk small, at ovary bottom, yellow. Capsule ellipsoid, 2.5~4 mm long, 2~3 mm wide, acute, subequal or slightly longer than persistent calyx. Seeds oblong or oval, 0.29~0.41

mm long, 0.14~0.19 mm wide, length/width (L/W) ratio ca. 1.93, seed-coat smooth or reticulate. Flowering and fruiting Apr.~Nov.

Widely spread over tropical to warm-temperate regions from Eastern Europe to Asia. Taiwan in rice fields, marshy ground, river sides below 1000 m in elevation.

Specimens examined: TAIWAN: New Taipei City: Tanshui Dist., elev. 50 m, May 28, 2006, Y. S. Liang 838 (TNM); Shihmen Dist.: near Laomei Elementary School, elev. 50 m, May 28, 2006, Y. H. Liang 860 (TNM); Sanchih Dist.: Shanchuchueh, elev. 50 m, May 28, 2006, Y. S. Liang 853 (TNM); Tanshui Dist., July 25, 1909, Kawakami, Takiya et al. s.n. (TAIF 23323); National Taiwan Univ. (NTU) campus, elev. ca. 0~50 m, W. C. Leong 1099 (HAST). Miaoli Co.: Shihtan Township: Peiwo, May 8, 2003, C. H. Chen 4770 (TNM). Taichung City: Taya Dist., May 30, 2000, C. M. Wang 4231 (TNM); Hsinshe Dist., July 6, 2000, C. M. Wang 4439 (TNM); Shenkang Dist.: Peichuang, elev. 176 m, Oct. 24, 1995, C. M. Wang 1820 (TNM). Nantou Co.: Puli Town: Liyutan, June 22, 1998, C. M. Wang 3384 (TNM). Yunlin Co.: Dounan, Sept. 28, 1986, C. H. Ou 9883 (TCF). Chiayi Co.: Minhsitung Township, Sept. 26, 1987, H. F. Yen 1671 (TNM); Hukou Township, May 21, 1987, H. F. Yen 914 (TNM); Yichu Township: Yichu to Lutsao, elev. 10 m, Nov. 3, 1986, H. F. Yen 121 (TNM). Tainan City: Liuying Dist.: Kuoyihou, Oct. 23, 2000, C. M. Wang 4528 (TNM); Madou Dist.: Anle, Sep. 7, 1993, H. F. Yen 8158A (TNM). Pingtung Co.: Wukoushui, Apr. 5, 2001, C. C. Lin 189 (TAIF). Ilan Co.: Chuangwei, July 18, 1984, C. I Peng 7105 (HAST); Ilan, June 4, 2006, G. H. Chen 102 (TCF). Taitung Co.: Chengkung, Jan. 20, 1995, T. C. Huang 16725 (TAI).

Sect. 2. *Brachycarpae* (Benth.) Philcox, Kew Bull. 22(1): 50. 1968.

*Ilysanthes* sect. *Eulyisanthes* Urban, Ber. Deut. Bot. Ges. 2: 434. 1884. *Lindernia* sect. *Eulyisanthes* (Urban) Yamazaki, J. Jap. Bot. 52: 254. 1977; Yamazaki, J. Fac. Sci. Univ. Tokyo, Sect. 3, Bot. 13: 4. 1981. *syn. nov.*

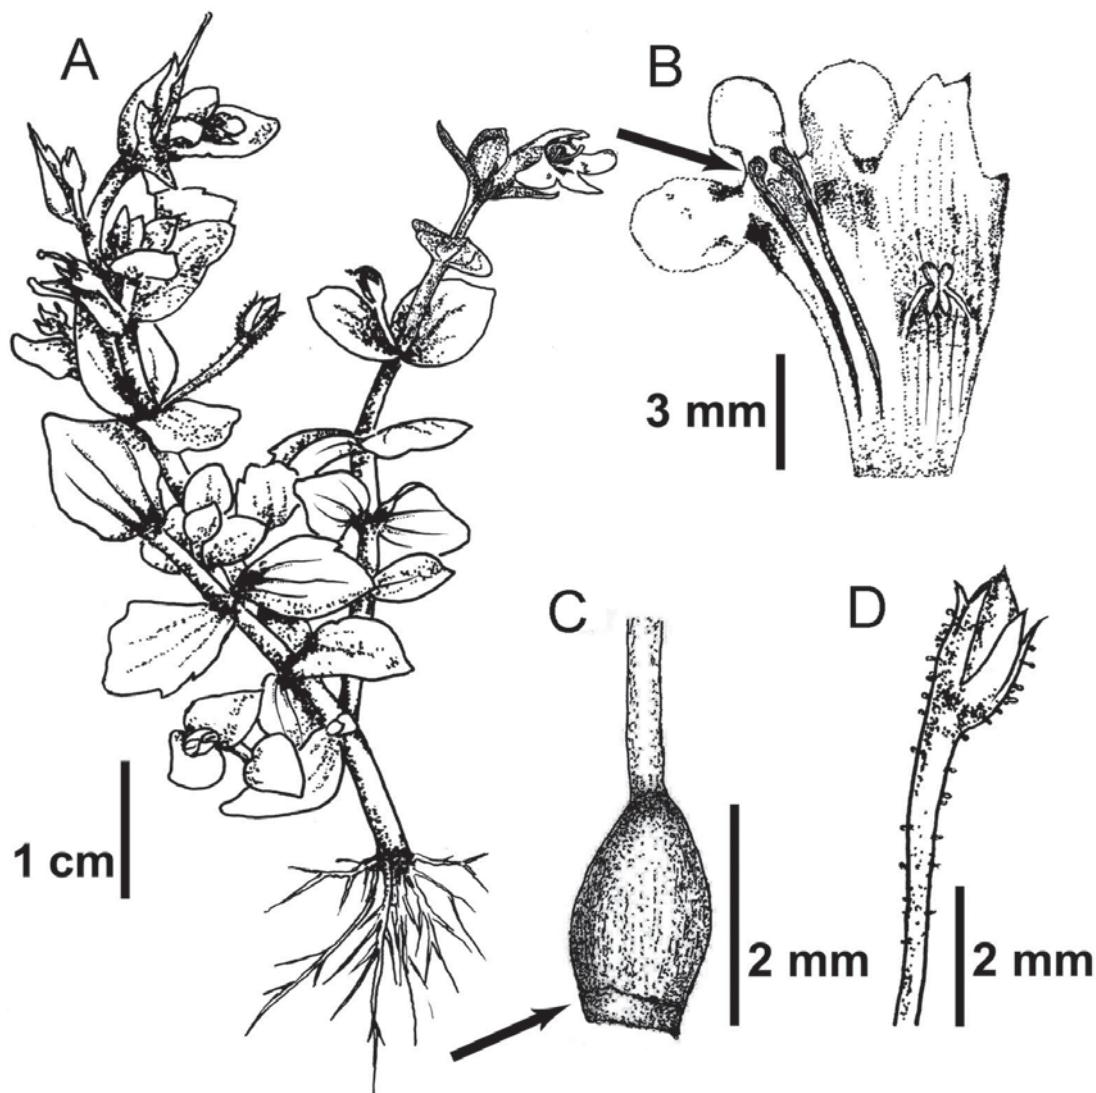

In Philcox's treatment (1968), characteristics of the section *Brachycarpae* are 1 pair of stamens, 1 pair of stamenoides, and the broadly ovoid capsule. The type species is *L. hyssopioides* (L.) Haine. On the other hand, Yamazaki (1977) transferred section *Eulyisanthes* from *Ilysanthes* to *Lindernia*. In Yamazaki's treatment, the section *Eulyisanthes* was characterized by having fertile posterior stamens and anterior stamenoides. The type species of section *Eulyisanthes* is *L. dubia* (L.) Pennell. In Yamazaki's treatment (1981), *L. hyssopioides* was under section *Eulyisanthes*. We found that all species under these 2 sections had palmate leaf veins, 1 pair of stamens, 1 pair of stamenoides, and a broadly ovate capsule. In addition, section *Brachycarpae* was published earlier than section *Eulyisanthes*. We concluded that section *Eulyisanthes* should be treated as a synonym of section *Brachycarpae*.

2. *Lindernia rotundifolia* (L.) Alston in Trimen, Hand-Book Fl. Ceylon 6. Suppl.: 214. 1931. (Fig. 1) ..... 圓葉母草  
*Gratiola rotundifolia* L., Mant. 174. 1771 (Lectotype: LINN, photo!, Herb. Linn. No. 30.4).

Annual trailing herb. Stems green, 2.5~18 cm long, rooting at lower, most, or all nodes, glabrous; branching from base of stem. Leaves palmately 3~5-nerved, sessile, minutely glandular-punctate on both surfaces; lamina elliptic, ovate, obovate, or orbicular, 2~16 mm long, 1~12 mm wide; base cuneate to rounded; margin 2 or 3(4) pairs serrate or remotely toothed, occasionally entire; apex acute or obtuse. Flowers solitary in axils; pedicels alternate or occasionally opposite,

2~18 mm long, about 1/2 length of subtending leaf, stipitate-glandular, especially near base of pedicel; erect to spreading, often reflexed in fruit. Calyx deeply 5-lobed, zygomorphic or irregular, occasionally nearly actinomorphic, 1.4~2.5 mm long, lanceolate, acuminate, glandular. Corolla white or light-blue with purple blotches on throat and purple spots on lower lobes, tufts of trichomes at base of anterior lobes; tube 9~12.2 mm long. Androecium of 2 fertile stamens and 2 staminodes; free part of staminodial filament

2~3.2 mm long, staminodes slightly exserted from corolla tube, incurvate, with yellow glands; fertile anthers coherent, filaments 1.4~1.7 mm long, glabrous. Ovary ellipsoid, ca. 2 mm long; disk small, at ovary bottom, yellow; style 3~5.5 mm long, often persisting until capsule dehisces; stigma 2-parted. Capsule 1.5~3 mm long, approximately equaling and infrequently exceeding length of calyx, ovate to ellipsoid, apex acute, glabrous. Seeds yellow, falcate-oblong, rugate, 0.34~0.36 mm long, 0.15~0.16 mm wide, L/W ratio ca. 2.3.

**Fig. 1.** *Lindernia rotundifolia* (L.) Alston. (A): Habit; (B): corolla and a pair each of stamens and anterior staminodes (arrow); (C): ovary and disk (arrow); (D): capsule.

Flowering and fruiting throughout year.

Widespread form Central and South America, Africa, India, Sri Lanka, and Vietnam. Naturalized in northern Taiwan (Ilan and Taipei counties), in wet meadows.

Specimens examined: TAIWAN: Ilan Co.: Ilan City, June 23, 2006, Y. S. Liang 943 (TNM). New Taipei City: Shuangxi Dist., Feb. 20, 2008, Y. S. Liang 1551A (TNU).

This newly naturalized species is widespread in the Neotropics and Old World tropics. It is a widely used aquarium plant. In Taiwan, it is usually found in the northern and northeastern parts, in rice fields, wet meadows, and along streams.

3a. *Lindernia dubia* (L.) Pennell, Acad. Nat. Sci. Phil. Monogr. 1: 141. 1935; Ou, Bull. Exp. Forest. Natl. Chung Hsing Univ. 8: 19. 1987; Liu, Fl. Taiwan. 2nd ed. 4:605. 1998.

.....*Gratiola dubia* L., Sp. Pl. 17. 1753 (Lectotype: BM, photo!, Clayton 164).

Annual glabrous herb, erect to ascending, stem green, section quadrate, 5~20 cm long, much-branched near base, often rooting at lower nodes. Leaves sessile, elliptical, subspatulate, occasionally lanceolate, 5~25(~30) mm long, 7~14 mm wide, largest leaves near base, middle of stem, palmately 3~5-nerved, apex acute, base cuneate to attenuate, occasionally obtuse, margin 3 or 4 (5) pairs crenate, occasionally 3 or 4 (5) pairs sub-serrate, glabrous. Flowers solitary, axillary. Pedicel typically shorter than subtending leaves, occasionally approximately equaling or slightly longer, 0.6~1 mm in diameter, 4~25(~30) mm long, section quadrate. Calyx actinomorphic, 3~6 mm long, sepals basally connate, lobes lanceolate, linear, surface asperate or gibbous. Corolla pink or pale-purple, occasionally very pale-purple to white, anterior lobes rarely with purple markings or spots, 6.5~11.9 mm long. Androecium 4; anterior pair of

staminodes, linear, ca. 8 mm long, apex free, 0.46~1.1 mm long, with spur-like appendages near apex, 1~1.6 mm long, posterior pair fertile, anthers 2-locule, coherent, included, posterior filament 1.1~1.9 mm long. Style 2.6~4 mm long, often presenting until fruit dehisces; stigma 2-parted. Disk small, at ovary bottom, yellow. Capsule ovate to oblong, apex acute, equaling or slightly longer than persistent calyx, at most 1.4-times longer than calyx, 3~4.3 mm long. Seeds numerous, oblong, 0.37~0.5 mm long, 0.12~0.22 mm wide, L/W ratio 2.26~2.84, seed-coat smooth. Flowering and fruiting May~Oct.

Native to the Americas. Taiwan, naturalized in paddy-fields, and marshy areas in the northern and central parts of the island, occasionally found in the south.

Specimens examined: TAIWAN: New Taipei City: Shuangshi Dist., elev. 100 m, Aug. 8, 2000, P. F. Lu 1222 (TAIF); Tanshui Dist., elev. 50 m, May 28, 2006, Y. S. Liang 844 (TNM); Shihmen Dist.: near Laomei Elementary School, elev. 50 m, May 28. 2006, Y. H. Liang 859 (TNM). Taoyuan Co.: Lujhu Township: Fujhu, elev. 0~20 m, Oct. 12, 2002, S. C. *Y. C. Kao* 576 (HAST); Yuanshan Township, elev. 50 m, June 23 2006, *Y. S. Liang* 937 (TNM).

3b. *Lindernia dubia* (L.) Pennell var. *anagallidea* (Michx.) Cooperrider, *Castanea* 41(3): 224. 1976; Chaw and Kao, *J. Taiwan Mus.* 42: 97. 1989.....擬櫻草

*Gratiola anagallidea* Michx., *Fl. Bor. Am.* 1: 6. 1803.

*Lindernia anagallidea* (Michx.) Pennell, *Acad. Nat. Sci. Phil. Monogr.* 1: 141. 1935; Liu, *Fl. Taiwan*. 2nd ed. 4: 603. 1998.

Annual glabrous herb, erect to ascending, stem green, basal stem usually red to dark-red, section quadrate, 3~25(~36) cm long, much-branched near base, often rooting at lower nodes. Leaves sessile, lanceolate, ovate, slightly 3 or 4 pairs serrate or entire, apex acute, base rounded to truncate, margins subentire, glabrous, 5~20(~24) mm long, 3~13 mm wide, largest leaves near base, middle of stem palmately 3~5-nerved. Flowers solitary, axillary; stem terminal ones more or less subumbel-like (terminal leafy racemes). Pedicel occasionally approximately equaling to more typically 1.2~3-times longer than subtending leaves, 0.1~0.5 mm in diameter, 3~30 mm long, section quadrate. Calyx actinomorphic, 3~5 mm long, sepals basally connate, lobes lanceolate, linear, surface asperate or gibbous. Corolla white or very pale-purple with purple markings or spots at base of anterior lobes, 5~7.6 mm long. Androecium 4; anterior pair of staminodes linear, 4~6 mm long, apex free, 1~1.3 mm long, with spur-like appendages near apex, 0.5~0.8 mm long, posterior pair fertile, anthers 2-locule, coherent, included, posterior filament 1.2~1.4 mm long. Style 3~6 mm long, often presenting until fruit dehisces; stigma 2-parted. Disk small, at ovary bottom, yellow. Capsule ovate to oblong, apex acute, equaling or slightly longer than persistent calyx, 2.5~4.6 mm long.

Seeds numerous, oblong to oval, 0.28~0.36 mm long, 0.13~0.14 mm wide, L/W ratio ca. 2.3, seed-coat smooth. Flowering and fruiting Apr.~Oct.

Native to the Americas. Taiwan, naturalized in paddy fields, and marshy areas in the north, rarely in the south.

Specimens examined: TAIWAN: Taoyuan Co.: Yangmei Town: Pushi, elev. ca. 200 m, Mar. 19, 2002, *W. C. Leong* 2732 (HAST); Longtan, Aug. 31, 1988, *M. T. Kao* 10746 (TAI, HAST); Jhongli: Shuangzunkou, elev. 0~100 m, Sept. 9, 2002, *C. C. Chen* 396 (HAST); Hsinwu: Dajhuangpu, elev. ca. 40~60 m, Sept. 11, 2002, *S. C. Liu* 804 (TNU, HAST). Hsinchu Co.: Hsinfeng Township: road mark ca. 65 km on Prov. Hwy. 61 elev. ca. 0 m, Aug. 23, 1999, *C. I Peng* 17677 (HAST); Hsinfeng Township: Lienhwa Temple, Sept. 5, 1984, *C. I. Peng* 7239 (HAST). Pingtung Co.: Tungkang, elev. 30 m, Dec. 30, 1999, *Y. P. Cheng* 2881 (TAIF).

*Lindernia dubia* var. *anagallidea* was recorded in the *Flora of Taiwan* 2nd ed. (Liu 1998) as *L. anagallidea*. In a revision of New World *Lindernia* (Lewis 2000), *L. dubia* was treated as having 4 varieties of which var. *anagallidea* was included, and the author pointed out the difficulty in distinguishing var. *anagallidea* and var. *dubia* in some areas. Var. *anagallidea* may be distinct from var. *dubia* by the shorter leaves, darker-gold seeds, pedicels longer than the leaf, and a greater number of filiform pedicels (Pennell 1935, Diaz-Miranda 1977, Lewis 2000). In Taiwan, these 2 taxa also could be distinguished by the leaf shape: var. *dubia* is elliptical or subspatulate, and var. *anagallidea* is lanceolate to ovate. Var. *dubia* with lanceolate leaves was only recorded in Kaohsiung (Mei-Nung Dist.) and Ilan (Wu-Wei Gang). It is commonly naturalized in Japan according to herbarium records (KYO, TI). In a handbook of wetland

plants, var. *dubia* with lanceolate leaves was claimed to be an un-approved new species (Lin 2009). We confirmed it as *L. dubia* var. *dubia*.

*Capraria crustacea* L., Mant. Pl. 87. 1767 (Lectotype: LINN, photo!, Herb. Linn. no. 785.3).

*Vandellia crustacea* (L.) Benth., Scroph. Ind.: 25. 1835; Matsumura and Hayata, J. Coll. Sci. Univ. Tokyo 22: 279. 1906 (Enum. Pl. Form.); Yamazaki, J. Jap. Bot. 30: 178. 1955; Li, Fl. Taiwan 4: 603. 1978.

Annual herb. Stems ascendant or diffused, 5~25(~40) cm long, occasionally rooting at nodes, quadrangular, sparsely pubescent on angles and nodes. Leaves ovate-oblong, ovate or broadly ovate; acute, acuminate or occasionally obtuse at apex, rounded or subtruncate at base, subacute-serrate, 8~16.5 mm long, 5~11.3 mm wide, glabrous on both surfaces, shortly hirsute on margin and veins; veins pinnately nerved; petioles 2~5(~7) mm long, glabrous or sparsely pubescent. Flowers solitary, axillary, or stem terminal ones more or less subumbel-like; pedicels (4~)7.5~17.5(~20.5) mm long when flowering, 12~25.9 mm long when fruiting, quadrangular, glabrous or sparsely pubescent at angle. Calyx tubular, 4~5.5 mm long when

flowering, 4~6 mm long when fruiting, shortly 5-lobed, slightly pubescent on the main nerves giving rise to pronounced ridges. Corolla purple or blue, 7~8.5 mm long, posterior lip ovate, shallowly bilobed, anterior lip with 3 rounded lobes, with darker-blue marker at basal central lobe; outer surface of tube glabrous-like, sparsely glandular and clavellate at margin, internally yellow on basal ventral side. Stamens 4, all fertile; posterior anthers each with connective of lower cell produced into a short projection; posterior filaments 1.2~1.5 mm long; anterior filaments geniculate, 2.5~3.2 mm long, finely glandular between basal filament, each with a blunt linear appendage, 0.4~1.2 mm long. Ovary ovoid, ca. 2.2 mm long, 1.3 mm wide; disk yellow, entirely surrounding ovary, a little concave on dorsal side, ca. 0.4 mm long. Capsule ovate to elliptical, apex obtuse, rotundate, 3.7~5.15 mm long, 2~2.6 mm wide, enclosed with persistent calyx. Seeds oval to orbicular, 0.34~0.41 mm long, 0.28~0.33 mm wide, L/W ratio ca. 1.35, scrobiculate, with many projections. Flowering and fruiting throughout year.

India, Nepal, Sir Lanka, Malaysia, Indo-China, China, Japan, the Philippines, Australia, and New Guinea, Polynesia, Madagascar. Taiwan in meadows, roadsides, rice fields, dry ground, sandy ground, and semi-open forests below 1000 m in elevation.

Annual herb. Stems erect or creeping and rooting at nodes, 20~40(~60) cm long, glabrous, quadrangular. Leaves very shortly petiolate or sessile; lamina pinnately nerved, broadly deltoid-ovate to ovate, obtuse or acute at apex, rounded to subcordate at base, adpressedly crenate, 5~25 mm long, 3~12 mm wide, glabrous on both surfaces. Flowers solitary, axillary, or stem terminal ones more or less subumbel-like (leafy racemes); pedicels slender, 1~4 cm long, glabrous, quadrangular. Calyx deeply 5-lobed almost to base, 3.5~5.5 mm long, lobes narrowly lanceolate, acute, glabrous. Corolla purple or pink, 8.3~12 mm long, posterior lip ovate, shallowly bilobed, anterior lip with 3 rounded lobes, central one slightly larger than laterals, with yellow spot on central lobe, tube glandular on outer surface, internal surface glabrous. Stamens 4, all fertile; posterior filament 1.5~1.95 mm long, anterior filiment geniculate, 2.9~4.5 mm long, with appendages arising near base, ca.

0.4~1.5 mm long; posterior anthers ca. 2 mm long, each with a connective of lower cells, terminal cells produced into a long tail of ca. 1 mm. Ovary elliptical, ca. 2.5 mm long; style ca. 4 mm long; disk yellow, surrounding basal ovary with cleft on dorsal side, ca. 0.9 mm long. Capsule cylindric, acute, 8~13 mm long, ca. 1.5 mm wide, much longer than persistent calyx. Seeds oval or a short cylinder, 0.3~0.34 mm long, 0.18~0.20 mm wide, L/W ratio 1.65, scrobiculate, with many projections. Flowering and fruiting throughout year.

India, Malaysia, Indochina, S. China, the Ryukyus (Japan), the Philippines, Australia, and New Guinea. Taiwan in marshy ground, riversides, rice fields, and meadows below 1000 m in elevation.

*Vandellia scutellariiformis* (Yamazaki) Yamazaki, J. Jap. Bot. 30: 174. 1955; Li, Fl. Taiwan 4: 605. 1978.

Annual herb, repent to procumbent, branched stem usually ascending, stem green, section quadrate, setulose at angle and nodes, 20~48 cm long, often rooting at procumbent stem nodes, branched at procumbent stems. Leaves petiolate, petiole ca. 2.5 mm long, leaves ovate, 13~30 mm long, 10~22 mm wide, pinnately nerved, apex acute to obtuse, base truncate to cordate, margin serrate, 4~6

pairs, sub-glabrous to slightly scarious above, rarely slightly setulose, sparsely setulose below, more on veins. Flowers in 3~10-flowered racemes. Inflorescence 3.3~13 cm long, basal flower (first flower) usually leaf-opposite or bract-opposite. Pedicel 11~27 mm long, opposite, section quadrate, with subtending bract, 3.1~3.3 mm long, lanceolate. Calyx actinomorphic, 5.7~9.8 mm long, sepals basally connate, lobes lanceolate, linear, thinly puberulous. Corolla white, upper outer surface red to dark-red, upper inner surface yellow, anterior lobes occasionally with purple marks, outer surface of corolla tube densely glandular, 10~14.5 mm long. Androecium 4, all fertile; anterior pair of stamens ca. 8 mm long, filament geniculate, 2.8~4 mm long, with clavate appendages, 1.7~3.1 mm long, yellow, anthers 2-locule, ca. 2 mm long, posterior pair of filaments 1.7~2.9 mm long, anthers 2-locule, 0.8~1.3 mm long, coherent, included, posterior anthers longer than anterior ones. Style ca. 8 mm long; stigma 2-parted. Disk yellow, slender, glandular. Capsule oval to elliptical-oblong, apex acute, equaling or slightly shorter than persistent calyx, 7.5~8 mm long. Seeds numerous, orbicular, scrobiculate, 0.30~0.34 mm long, 0.29~0.30 mm wide, L/W ratio ca. 1.08, seed-coat with many projections. Flowering and fruiting May~Dec.

Endemic to Taiwan. In wet semi-open forests in southern of Taiwan at 300~1500 m in elevation.

Specimens examined: TAIWAN: New Taipei City: Urai, Aug. 17, 1914, S. Kawagoe s.n. (L). Yunlin Co.: Kukeng Township, elev. 500 m, July 20, 1990, H. F. Yen 3957 (TNM). *Lindernia scutellariiformis* is the only endemic species of the genus in Taiwan. Based on our field surveys and herbarium records, the main distribution is at several restricted low-elevation mountain areas in southwestern Taiwan. Only 1 specimen in the northern part of Taiwan was recorded by Kawagoe (in the L herbarium) in 1914.

Sect. 6. *Numularia* (Benth.) Philcox, Kew Bull. 22: 10. 1968.

#### 7. *Lindernia nummularifolia* (D. Don)

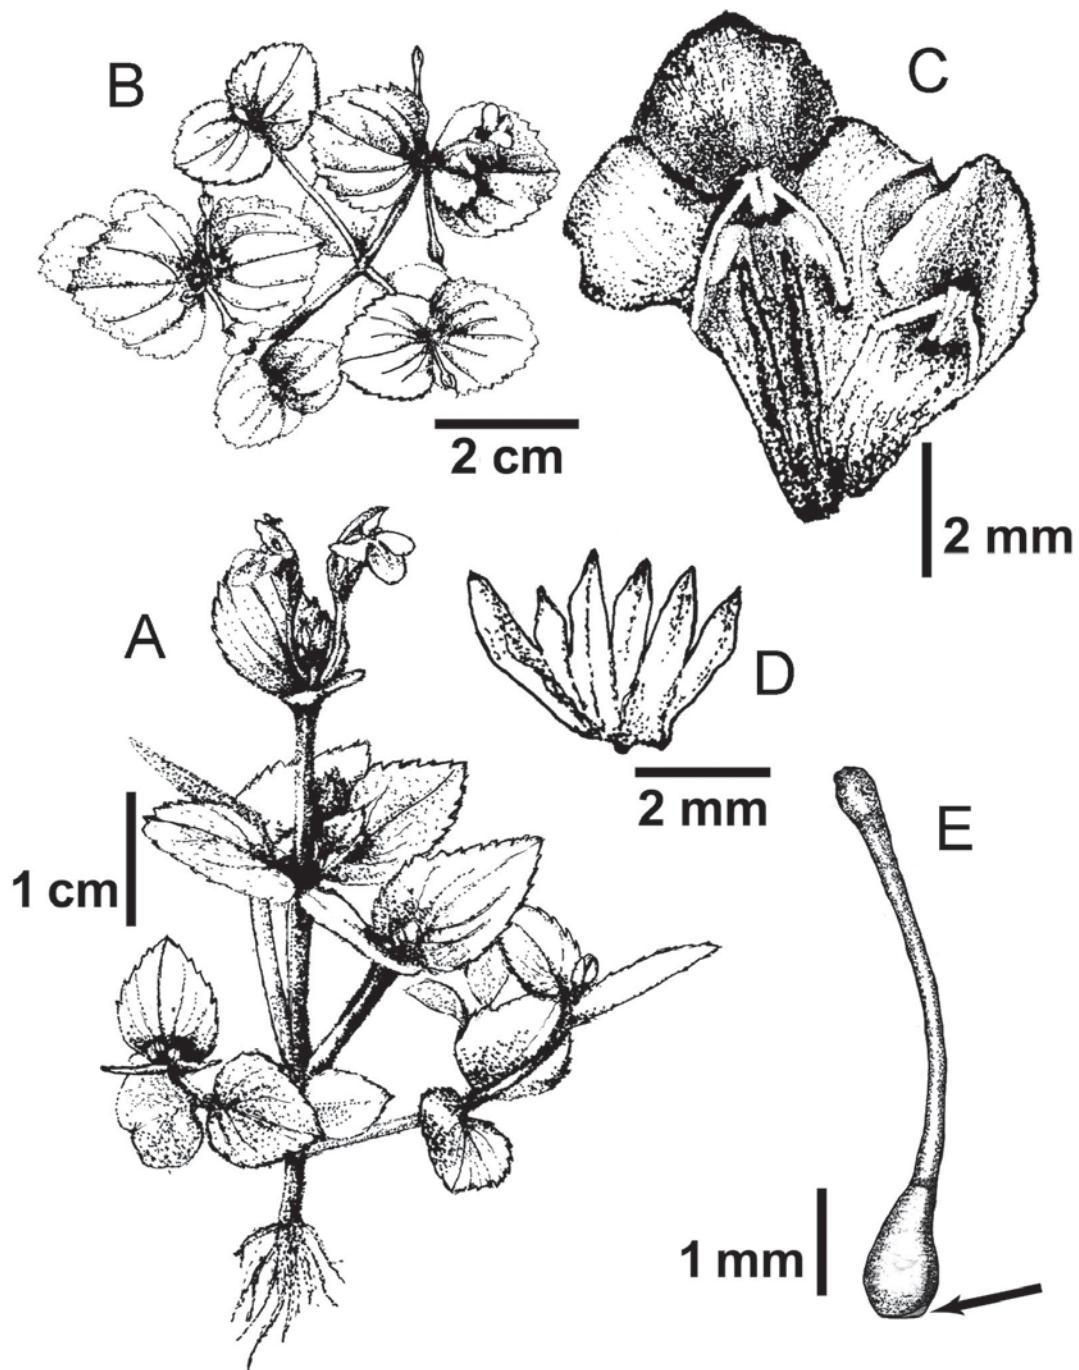

Wettst. in Engler and Prant, Nat. Pflanzenfam. IV, 3B: 79. 1891. (Fig. 2).....寬葉母草

*Vandellia nummularifolia* D. Don, Prodr. Fl. Nep. 86. 1825.

Annual herb 4~10 cm tall. Stems simple or slightly branched, erect, more or less quadrangular, with short hispid hairs on angles. Leaves subsessile, pinnately nerved but appearing palmately nerved, suborbicular or ovate-orbicular, acute-serrate, 3~25 mm long

and wide, glabrous above, sparsely hirsute beneath only on nerves, shortly pubescent at margin. Flowers solitary-axillary, or in racemes with few flowers; pedicels slender, 3~15 mm long, glabrous except sparsely his-

pid on upper parts. Bracts setaceous, 0.7~1 mm long. Calyx 1.5 mm long, 5-lobed near middle, lobes ovate, subacute, about as long as calyx-tube. Corolla violet to white, ca. 7 mm long, tube externally sparsely glandular,

**Fig. 2.** *Lindernia nummularifolia* (D. Don) Wettst. (A, B): Habit; (C): corolla and stamens; (D): calyx; (E): ovary and disk (arrow).

internally densely lanate on ventral side, posterior lip broadly ovate, ca. 3 mm long, 2.5 mm wide, emarginated, anterior lip with 3 rounded lobes. Stamens 4, all fertile; anterior filaments each with a thick geniculum at base. Capsule linear-cylindric, acute at apex, 5~6 mm long, 2 mm wide, 1.5~2-times as long as persistent calyx. Seeds oval to ellipsoidal, 0.45~0.48 mm long, 0.26~0.32 mm wide, scrobiculate, with many projections. Flowering July~Sept. and fruiting Aug.~Nov.

India, Nepal, Burma, Thailand, Vietnam, Malaysia, W. and C. China, Madagascar, Taiwan in wet meadows in south (Pingtung County).

Specimens examined: TAIWAN: Pingtung Co.: Ma-Kua, Sept. 11, 1973, *T. C. Huang* 7476 (TAI).

This newly recorded species was collected from Ma-Kua, Pingtung. It is an Old World species widespread in Africa, India, Nepal, Burma, Thailand, Vietnam, to W. and C. China. This species belongs to section *Numularia* which contain 2 taxa (the other is *L. sessiliflora* Wettst.). The venation of section *Numularia* is pinnate, but appears palmate because the secondary veins are elongated toward the leaf apex. In Asian *Lindernia*, this kind of venation was observed only in plants of this section and a very similar genus, *Craterostigma*, in the tribe Linderniae.

*Lindernia stellarifolia* Hayata, Icon. Pl. Form. 9: 77. 1920 (Type: TI!, Aug. 5, 1917, Matsuda s.n.); Mori in Masamune, Short Fl. Form. 191. 1936; Li, Q. J. Taiwan Mus. 3: 67. 1950; Li, Q. J. Taiwan Mus. 14: 13. 1961.

*Lindernia hirta* (Cham. & Schlecht.) Pennell, J. Arnold. Arbor. 24: 250. 1943; Li, Q. J. Taiwan Mus. 3: 67. 1950; Li, Q. J. Taiwan Mus. 14: 5. 1961.

*Vandellia hirta* (Cham. & Schlecht.) Yamazaki, J. Jap. Bot. 30: 174. 1955; Li, Fl. Taiwan 4: 605. 1978.

Annual herb 5~15 cm tall. Stems simple and erect, or slightly branched and diffused, sparsely to densely pubescent mixed with spreading long hairs. Leaves broadly ovate to suborbicular, obscurely crenate, 4~11(~15) mm long, 4~10 mm wide, pubescent above, hirsute beneath, veins pinnately nerved; leaves subsessile or sessile. Flowers solitary-axillary, or in pairs or clusters at each axil; pedicels slender, 5~13 mm long, longer than subtending leaf, sparsely hispid mixed with glandular hairs. Calyx deeply 5-lobed almost to base, actinomorphic, lower lobes slightly longer than upper, 3.1~4 mm long, lobes lanceolate, acuminate, hispid, mixed with glandular hairs. Corolla 5.5~8.8(~9.8) mm long, usually white, outer surface glabrous, posterior lip broadly ovate-emarginate, anterior lip with 3 rounded lobes, basal central lobe with yellow marks. Stamens 4, all fertile; posterior filaments 1.2~1.9 mm long, anterior filaments in 2 parts, 2.5~3 mm long at incurvate part, 1.5~1.7 mm long at straight part, each with a broad geniculum arising near base, ca. 0.2 mm long, sparsely villose between basal anterior stamens; anthers without tail at terminal.

Ovary globose, glabrous, ca. 2 mm long; style 4.5~5.8 mm long; disk yellow, adhhereing to ovary on ventral side, about 1/3 length of ovary, ca. 0.7 mm long. Capsule subglobose, 2~2.5 mm long and wide, slightly shorter than persistent calyx, caudate at apex. Seeds sub-oblong, 0.36~0.40 mm long, 0.25~0.29 mm wide, lophate. Flowering and fruiting throughout year.

India, Burma, Sri Lanka, Malaysia, Indo-China, S. China, the Philippines, and New Guinea. In Taiwan, usually found in rice fields, wet meadows, and marshy fields below 1000 m in elevation.

Annual herb 4~20 cm tall. Stems slightly branched, erect or ascendently diffused, quadrangular, sparsely to densely hispid mixed with spreading gland. Leaves pinnately nerved; lower leaves petiolate, petioles 3~8 mm long, hirsute to sub-hirsute; lamina ovate, oblong-ovate, or obovate, obtuse at apex, base gradually narrowing to petiole, 2~3.5 cm long, 1~2 cm wide, undulate or crenate-dentate; upper leaves subsessile to sessile, ovate-lanceolate to broadly ovate, 10~20 mm long, 4~12 mm wide; both upper and lower leaves hirsute or slightly glandular on both surfaces, particularly on nerves on underside. Inflorescences racemose at ends of stems, glandular, slightly flowered; pedicels slender,

4~8 mm long, opposite, glandular-pubescent; bracts lanceolate to subulate, 1~2 mm long. Calyx deeply 5-lobed almost to base, 2~3.1 mm long, lobes linear-lanceolate, acuminate to acute, hairs glandular. Corolla white, 3.7~5 mm long, upper exterior surface of tube pale-brown, glabrous, posterior lip broadly ovate, emarginated or undulate at margin, anterior lip with 3 suborbicular lobes, central lobe with small yellow mark at base. Stamens 4, all fertile; posterior filaments 0.8~1 mm long, anterior filaments in 2 parts, 1.2~2 mm long at incurvate part, 0.7~1 mm long at straight part, each with a broad geniculum arising near base, ca. 0.15 mm long, sparsely villose between basal anterior stamens and geniculum; anthers without tail at terminal. Ovary ovate, glabrous, ca. 1.5 mm long; style ca. 4 mm long; disk yellow, adhhereing to ovary on ventral side, ca. 0.4 mm long. Capsule ovate to globose, 2.5~3.6 mm long and wide, equaling or slightly shorter than persistent calyx. Seeds oval, 0.27~0.32 mm long, 0.20~0.23 mm wide, L/W ratio ca. 1.37, scrobiculate, seed-coat with many projections. Flowering and fruiting June~Nov.

India, Nepal, Burma, Malaysia, Indo-China, S. China, the Philippines. In Taiwan, in forest edges or roadsides in the south below 500 m in elevation.

Specimens examined: TAIWAN: Tainan City: Hsikang Dist., elev. ca. 15 m, Oct. 14, 1987, H. F. Yen 1764 (TNM). Kaohsiung City: Kangshan, Shimada 140 (TAI). Pingtung Co.: Pingtung, 1915, Matuda s.n. (TAI).

In the *Flora of Japan* (1993), Yamazaki listed a new variety, *L. viscosa* var. *glabra*, which was distributed in southern Taiwan and Luzon (the Philippines). The diagnosis of the variety was very sketchy ('*planta glabra*'), and only 1 type specimen was listed. In the present study, the type specimen of the variety in TI and other specimens of *L. viscosa*

in TI, KYO, PNH, TAI, IBSC, TNM, and KUN were examined and compared. The glandular and hirsute hairs of this species in Luzon, Thailand, Taiwan, and China are the same in most specimens. Additionally, in our field survey, the young plant of *L. viscosa* is somewhat nearly glabrous on the leaf upper surface, and the stem has somewhat glandular hairs which may disappear in dried specimens. Thus, we consider *L. viscosa* var. *glabra* a synonym of the typical variety.

*Vandellia antipoda* auct. non L.: Yamazaki, J. Jap. Bot. 30: 177. 1955.

Perennial herb. Stems slightly branched, stoloniferous, obscurely quadrangular, rooting at the nodes, 10~45 cm long, sparsely pubescent. Leaves pinnately nerved, elliptic to orbicular-elliptic, rounded at apex; 1~5 cm long, 0.8~2.5 cm wide, serrulate to dentate with teeth inwardly curved and acute at apex, viens on both surfaces sparsely scabrid; petioles 4~1.5 mm long, sparsely pubescent. Inflorescence racemose, slightly flowered; bracts linear-lanceolate, ca. 5 mm long; pedicels opposite, ca. 5 mm long when flowering, 5~10 mm long when fruiting, glabrous. Calyx deeply 5-lobed almost to base, glabrous, 7~9 mm long, lobes linear-lanceolate, acuminate, scarious-margined. Corolla pale-purple or pale-blue, 10~15 mm long, outer surface

sparsely glandular, internally densely yellow clavellate between basal staminodes, posterior lip oblong, rounded at apex, anterior lip ca. 4 mm long, with 3 rounded lobes. Stamens 2, posterior, fertile, posterior filament 1.3~2.4 mm long. Staminodes 2, anterior, filiform, 2~3 mm long, yellow, uncinately curved at apex. Ovary elliptical, ca. 1.5 mm long; style ca. 7 mm long; disk pale-yellow, adhering to ovary on ventral side, about 2/3 length of ovary, ca. 1 mm long. Capsule cylindric, acute, 1~2 cm long, 1.2~2 mm wide, 2~2.5-times as long as persistent calyx. Seeds triangular to polygonal, 0.41~0.46 mm long, 0.33~0.35 mm wide, L/W ratio ca. 1.29, scrobiculate, seed-coat with many projections. Flowering and fruiting June~Nov.

India, Nepal, Burma, Malaysia, Indo-China, S. China, the Ryukyus (Japan), the Philippines, and New Guinea. In Taiwan, in wet semi-open forests or semi-open meadows below 1300 m in elevation.

Annual herb, 5~20 cm tall. Stem slightly branched, erect or ascendant, quadrangular, glabrous but with sparse hirsute hairs at nodes. Leaves pinnately nerved, sessile, oblong or elliptic, rounded at apex, cuneate at base, amplexicaul-like, 1~2.5(~3.3) cm long, 0.5~1.1 cm wide, sharply serrate with triangular aristate teeth, glabrous on both surfaces, occasionally with scattered hispid hairs beneath. Racemes of flowering shoots with small linear-lanceolate bracts, 3.1~7(~9.5) cm long, slightly flowered; pedicels opposite, 1.5~3.5 mm long when flowering, 3~7.5 mm long when fruiting, glabrous. Calyx cylindric, glabrous, ca. 3.7 mm long, deeply 5-lobed almost to base, lobes subulate acuminate, scarious-margined, sparsely ciliate at margin. Corolla white, 5.5~7 mm long, outer surface of tube glandular, internally glabrous, posterior lip oblong, slightly bilobed at apex, anterior lip with 3 rounded lobes, central lobe larger than lateral ones, with pink marks at central lobe. Stamens 2, posterior, fertile, filament ca. 0.9 mm long; anthers ca. 0.4 mm long. Staminodes 2, anterior, filiform, ca. 1.5 mm long, uncinately outcurving at apex, pale pink at apex, base glandular and pilose. Ovary elliptical, ca. 0.8 mm long; style ca. 4 mm long; disk pale-yellow, adhering to ovary on ventral side, about 1/2 length of ovary, ca. 0.4 mm long. Capsule cylindric, acuminate, 7~14 mm

long, 0.8~1.2 mm wide, 2~3-times as long as persistent calyx. Seeds triangular to polygonal, 0.39~0.48 mm long, 0.30~0.37 mm wide, L/W ratio ca. 1.35, scrobiculate, with many projections. Flowering and fruiting July~Nov.

India, Nepal, Burma, Malaysia, Indo-China, S. China, the Ryukyus (Japan), the Philippines, Australia, and New Guinea. In Taiwan, in open meadows, moist fields, and dry fields below 1000 m in elevation in southern and central parts.

#### Species excluded from the Flora of Taiwan

1. *Lindernia hyssopoides* (L.) Haines, Bot. Bihar Orissa 4: 635. 1922; Liu, Fl. Taiwan. 2nd ed. 4: 606. 1998.

*Gratiola hyssopoides* L. (Lectotype: LINN, photo!, Herb. Linn. no. 30.6).

*Lindernia hyssopioides* was first recorded in the *Flora of Taiwan*, 2nd edition (Liu 1998). We examined the cited specimen (Taoyuan: Tachuang, Huang & Huang 13527) which has a many-branched stem, elliptic, sessile leaves, and an ovate to oblong capsule. We conclude that this specimen is actually *L. dubia*.

*Lindernia dubia* and *L. hyssopioides* belong to the section *Brachycarpeae* which is characterized by having palmately 3~5-nerved leaves and 2 anterior staminodes. *Lindernia hyssopioides* and *L. dubia* differ in stem branching, calyx, capsule, and distribution. Stem branching in *L. hyssopioides* is few but *L. dubia* is many; the capsule is 1.5-times longer than the calyx in *L. hyssopioides* but are equal length in *L. dubia*. The distribution of *L. hyssopioides* is native to Southeast Asia and S. China (Hainan Island and Yunnan Province). *Lindernia dubia* is native to North and South America, but is now naturalized in East Asia (Taiwan, Japan, and Korea).

2. *Lindernia mollis* (Benth.) Wettst., Engler & Prantl, Nat. Pflanzenfam. IV. 3B. 79. 1891; Liu, Fl. Taiwan. 2nd ed. 4: 606. 1998.

*Vandellia mollis* Benth., Scroph. Ind. 37. 1835 (Holotype: K!, E. Bengal, Sylhet, Wallich 3948B); Li, Fl. Taiwan 4: 605. 1978.

*Lindernia cruciformis* was published by Hayata (1920) with no specimens cited, and its distribution was just described as Ako. Only 1 specimen (Matuda s.n., 1915. TAI 099062) was identified as *L. mollis* (Benth.) Wettst. by H.-L. Li who annotated on the label "as Hayata's type of *L. cruciformis*". That specimen was also cited in the *Flora of Taiwan*, 2nd edition (Liu, 1998). We examined that specimen and found that it was not comparable to specimens of *L. mollis* (Benth.) Wettst. collected from SW China and deposited in KUN, PE, and TNM. We identified it as *L. viscosa* (Hornem.) Boldingh.

### 3. *Lindernia viatica* (Kerr ex Barnett)

Philcox, Taxon 19: 649. 1970; Yamazaki, J. Fac. Sci. Univ. Tokyo, Sect. 3, Bot. 13: 53. 1981. Liu, Fl. Taiwan. 2nd ed. 4: 608. 1998.

*Ilysianthes viatica* Kerr ex Barnett, Kew Bull. 16: 489. 1963 (Holotype: BM!, Thailand, Aran Pralet. Aug. 9, 1930, Kerr 19604).

*Lindernia oppositifolia* auct. non (Willd.) Mukerjee: Yamazaki, J. Jap. Bot. 52: 256. 1977.

The species in Taiwan was first reported by Yamazaki (1977) as *L. oppositifolia* (Willd.) Mukerjee without citing any specimens. Later, Yamazaki (1981) reported the presence *L. viatica* (Kerr ex Barnett) Philcox distributed in Taiwan but without vouchers. *Lindernia viatica* was misspelled as "*L. vitacea*" in Yamazaki (1981) and also misspelled in the *Flora of Taiwan* 2nd edition. In the *Flora of Taiwan* 2nd edition (Liu 1998), the specimen Simada 878C was cited under *L. viatica*, but the same collection number Simada 878B was cited as *L. tenuifolia* (Colsm.) Alston. Both specimens were collected from Hsinchu on the same day. We compared these 2 specimens and examined the types of *L. tenuifolia* and *L. viatica*. We identified both as *L. tenuifolia* (Colsm.) Alston.
