Abstract. Type specimens from the collection of beetles (Coleoptera) deposited in the Department of Entomology, National Museum, Prague, are currently being catalogued. In this fourth part of the catalogue dealing with the Scarabaeoidea, we present precise information for types of 47 taxa of the tribe Ateuchini and 62 taxa of the tribe Canthonini. Nomenclature and current status of the taxon originally described as *Canthon latipes* ab. *viridans* Balthasar, 1939 is discussed.

Introduction

This work represents the fourth part of the catalogue of type specimens of beetles (Coleoptera) deposited in the collection of the National Museum, Prague, Czech Republic (NMP; NMPC when referring to the collection); the first three parts were published by BEZDĚK & HÁJEK (2009, 2010a,b). This part deals with the tribes Ateuchini and Canthonini belonging to the subfamily Scarabaeinae. Along with the paper, a database of all types including photos of most types and a copy of their original description is available on request.

As in the previous parts, we begin by presenting brief information about the most important collections mentioned in the catalogue:

Collection of Vladimír Balthasar (1897–1978) represents the most important specialised collection of the scarabaeoid families in NMP. It contains ca. 40,000 specimens including types of more than 500 species, most of them described by V. Balthasar himself.

* Catalogue of type specimens in NMPC, part 4

Types from the collection of David Král (born 1959) comprise the complete type material (70 holotypes and 445 paratypes) from the collection of this contemporary Czech specialist on Scarabaeoidea. Beside the species he described himself, it includes also specimens exchanged with other specialists, e.g., R. Paulian.

Most recently, the Czech specialist Václav Křivan (born 1976) donated the types, described by J. F. Josso and P. Prévost from his collection, to NMP.

For additional information, see also BEZDĚK & HÁJEK (2009, 2010a,b).

Material and methods

Recent concepts of higher classification in the Scarabaeoidea are largely inconsistent. The classification used in this catalogue follows SCHOLTZ & GREBENNICKOV (2005). Tribal classification of the subfamily Scarabaeinae is adopted from HANSKI & CAMBEFORT (1991) and partially modified according to MONTREUIL (1998) and VAZ-DE-MELLO (2008): Ateuchini, Canthonini, Coprini, Eucraniini, Eurysternini, Gymnopleurini, Oniticellini, Onthophagini, Onitini, Phanaeini, Scarabaeini and Sisyphini. Because the subfamily Scarabaeinae is speciose, it will be catalogued in three parts and particular tribes will be listed in alphabetical order.

Within each subfamily/tribe, the genera and species are arranged alphabetically. Each entry includes:

- the name of the taxon in original combination.
- the name of the taxon in original combination and spelling, with the author and year of description. Pagination, figures and plates are also given.
- the name-bearing type, number of specimens (including their sex if known) and exact label data. Our remarks are found in square brackets: [p] – preceding data are printed, [hw] – preceding data are handwritten. Separate labels are indicated by a double slash ‘//’ and lines within each label are separated by a slash ‘/’.
- the current taxonomic status.
- the type condition is mentioned for considerably damaged specimens.
- any taxonomic problems and inconsistencies are mentioned under Remarks.

Full reference to each publication can be found in References.

Missing types

Subfamily Scarabaeinae: Ateuchini

Frankenbergerius mirabilis Balthasar, 1938: 213, Fig. on p. 211.

Current status. Junior subjective synonym of *Frankebergerius armatus* (Boheman, 1857), see FROLOV & SCHOLTZ (2005).

Remark. The species was described on the basis of two male specimens from the collection of V. Balthasar (BALTHASAR 1938). However, there is no mention of this species in Balthasar's collection, and we were not able to trace the type specimens in NMPC.

Subfamily Scarabaeinae: Canthonini

Panelus quadridentatus Balthasar, 1952

Panelus quadridentatus Balthasar, 1952: 223.

Current status. Valid species.

Remark. The species was probably described on the basis of a single specimen from the collection of V. Balthasar (BALTHASAR 1952). However, there is no mention of this species in Balthasar's collection, and we were not able to trace the type specimen in NMPC.

Ponerotrogus krali Utsunomiya & Masumoto, 2000

Remark. This species was described on the basis of a single female. Although NMPC is reported as the depository of the holotype, it is in fact housed in the National Science Museum (Natural History) in Tokyo, Japan (MASUMOTO, pers. comm.).

Acknowledgements

We are very grateful to Josef Jelínek, Vladimír Švihla (both National Museum, Prague, Czech Republic) and David S. Boukal (Biology Centre ASCR, Institute of Entomology, České Budějovice, Czech Republic) for their help and valuable comments on the manuscript.

Fernando Vaz-de-Mello (Federal University of Mato Grosso, Cuiaba, Brazil) and François Génier (Québec, Canada) kindly consulted the tribal classification of Scarabaeinae and current status of several species-group names. Paul Schoolmeesters (Herent, Belgium) supported us with numerous hardly obtainable literature. The present study was supported by the Ministry of Culture of the Czech Republic (grant DC08P02OUK004).
