

## **Robot Motion Planning**

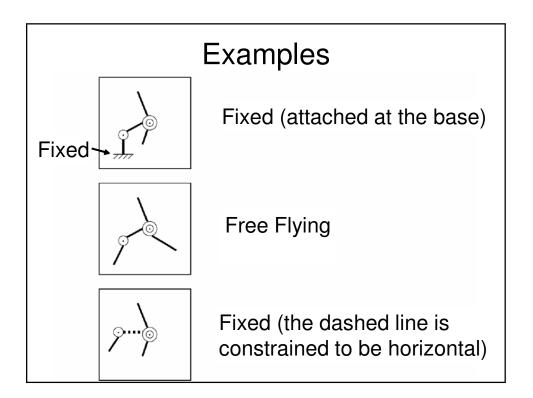

- Application of earlier search approaches (A\*, stochastic search, etc.)
- Search in geometric structures
- Spatial reasoning
- Challenges:
  - Continuous state space
  - Large dimensional space

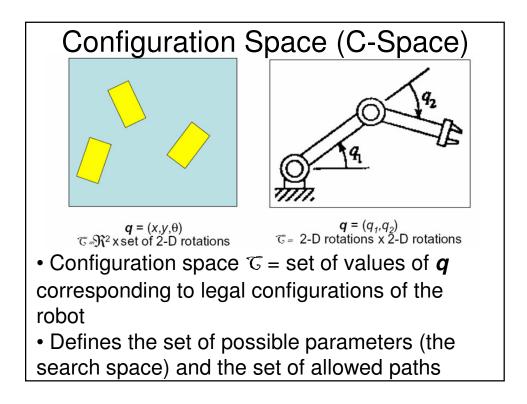

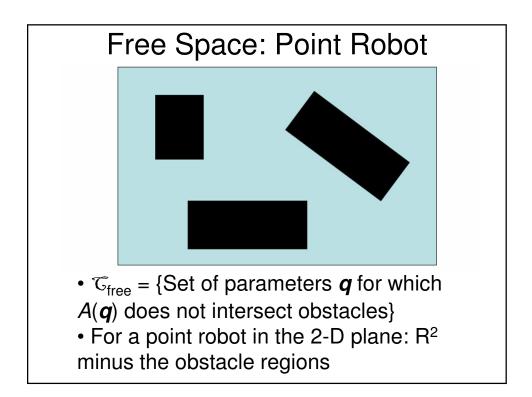

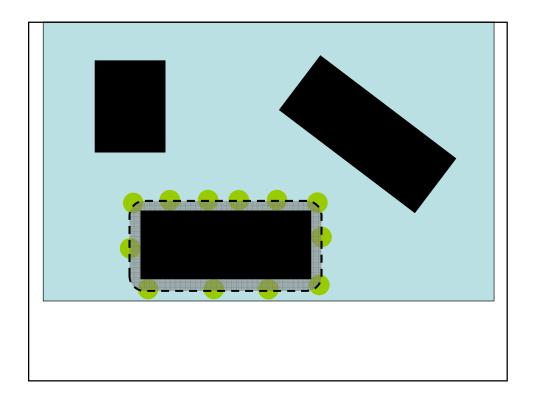

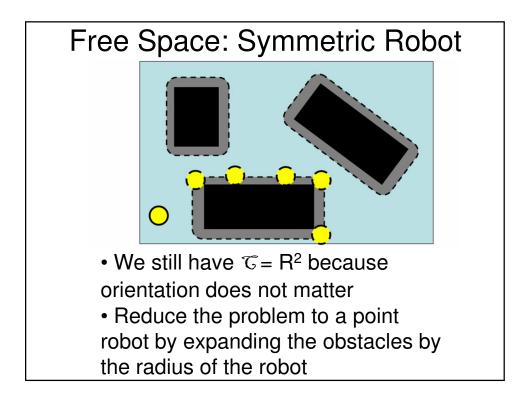

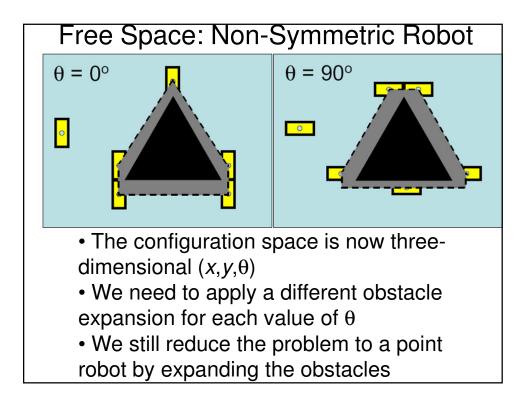

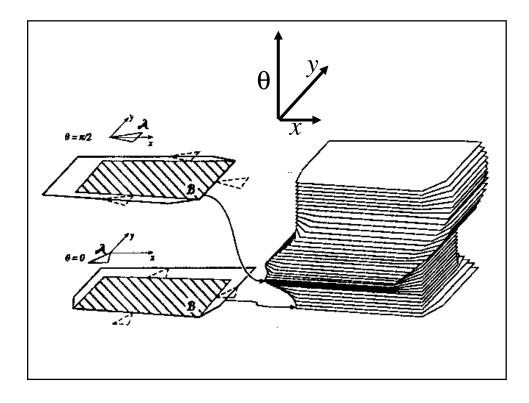

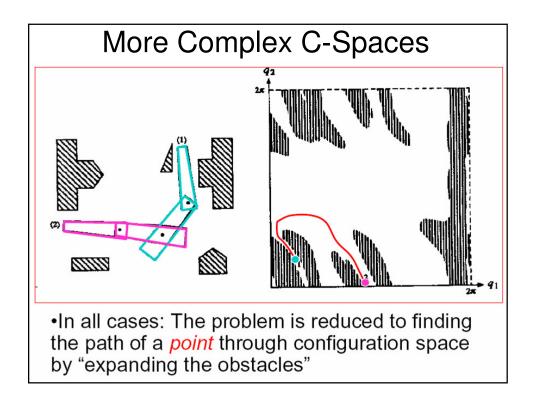

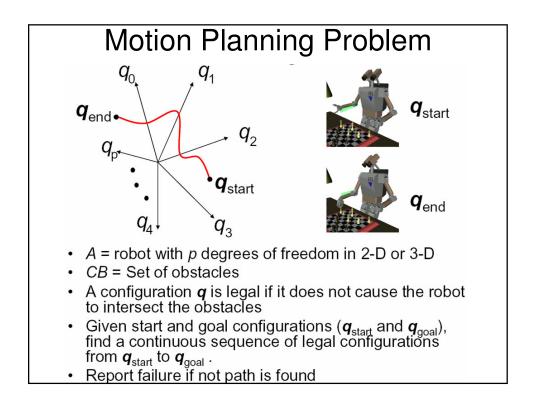

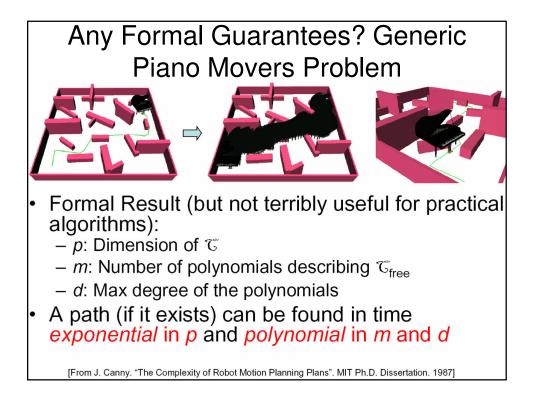

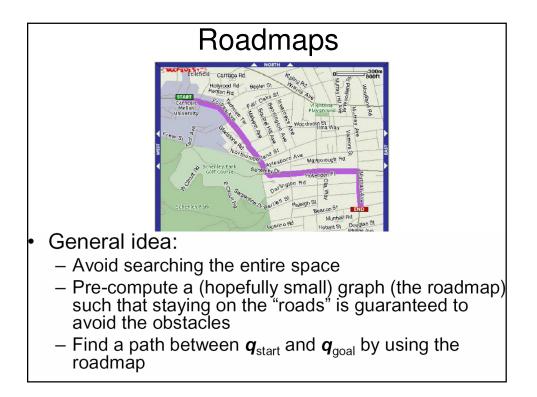

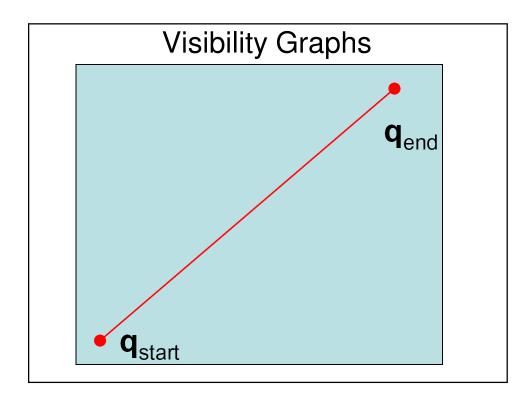

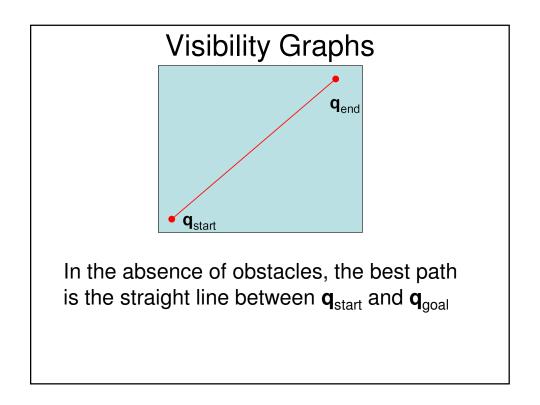

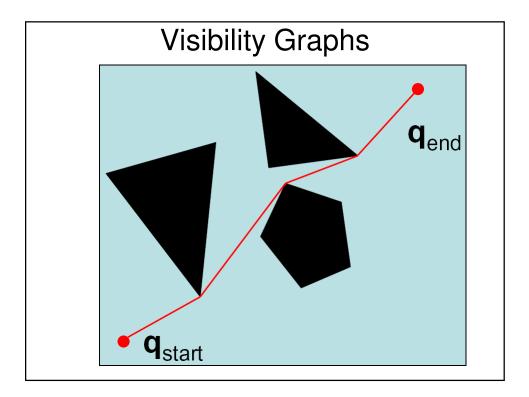

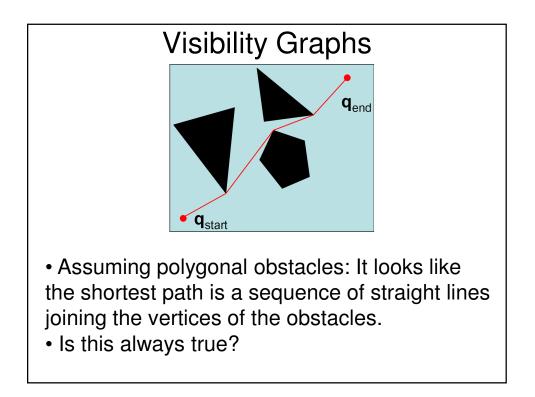

Approaches					
<ul> <li>Basic approaches:         <ul> <li>Roadmaps</li> <li>Visibility graphs</li> <li>Voronoi diagrams</li> <li>Cell decomposition</li> <li>Potential fields</li> </ul> </li> <li>Extensions         <ul> <li>Sampling Techniques</li> <li>On-line algorithms</li> </ul> </li> </ul>					

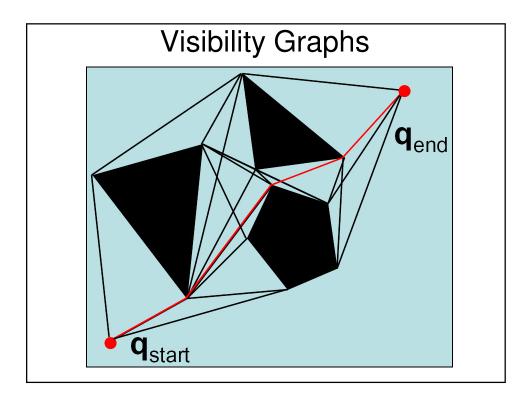

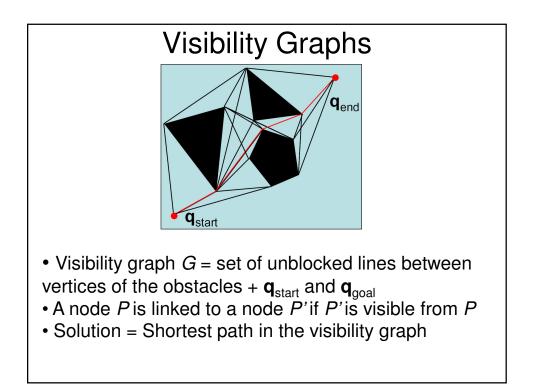

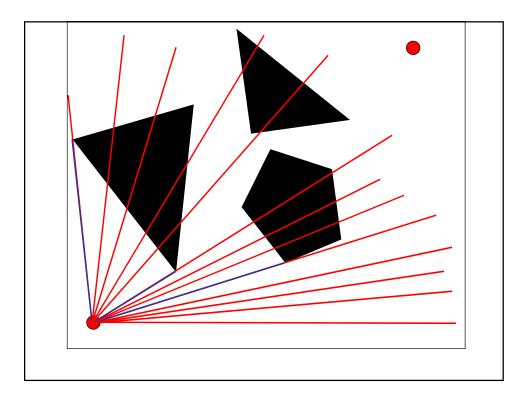

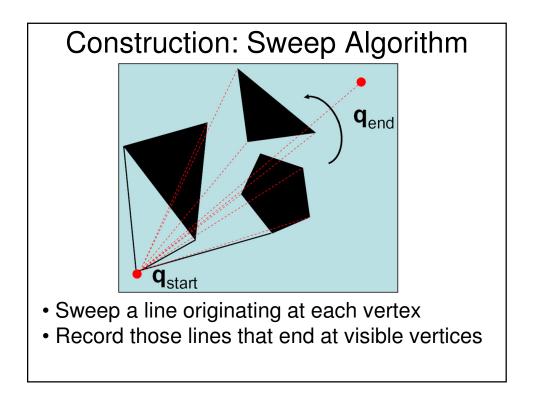

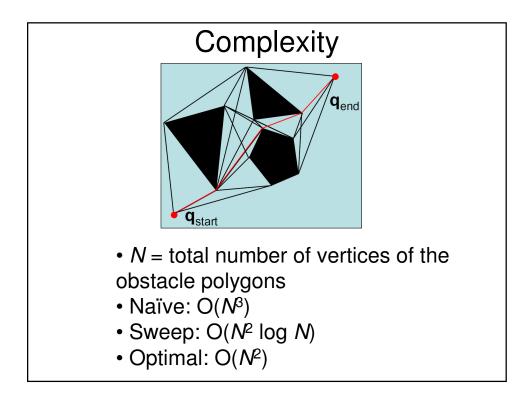

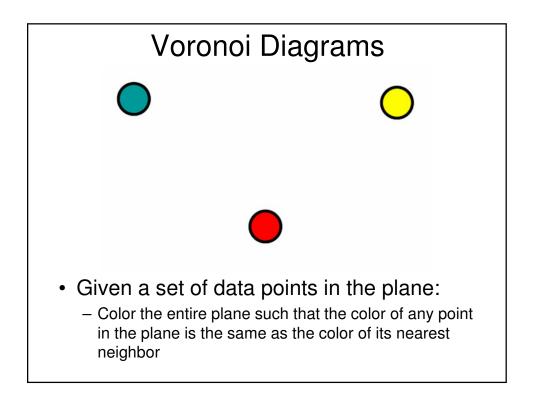

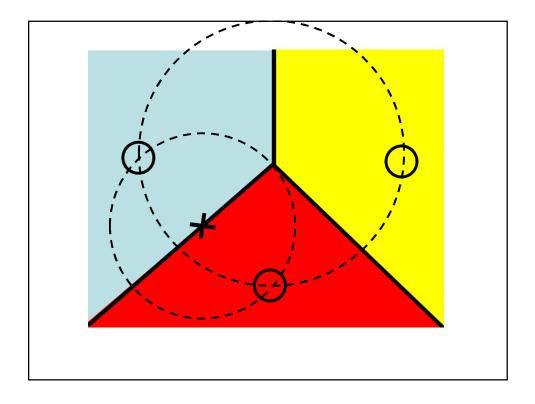

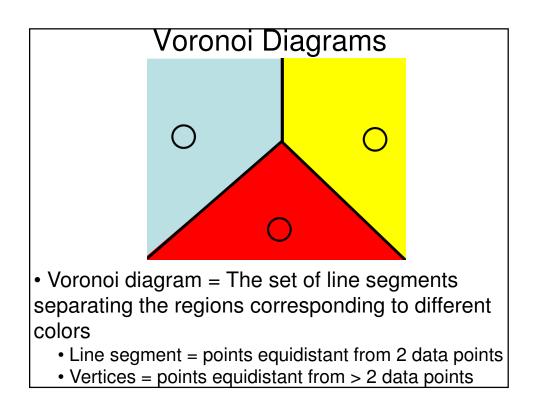

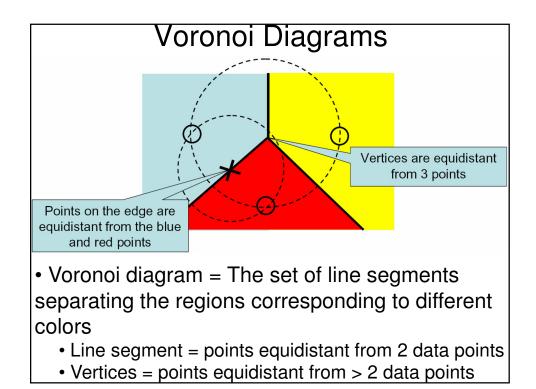

### Visibility Graphs: Weaknesses

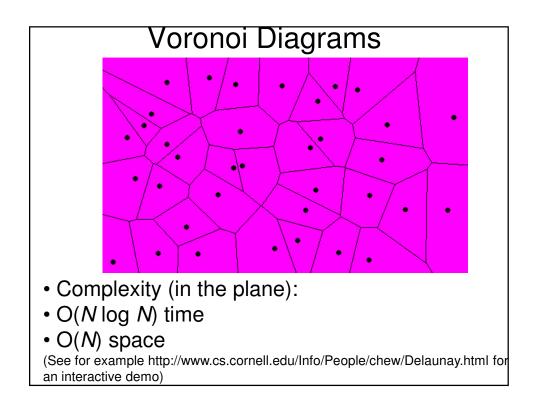

- Shortest path but:
  - Tries to stay as close as possible to obstacles
  - Any execution error will lead to a collision
  - Complicated in >> 2 dimensions
- We may not care about strict optimality so long as we find a safe path. Staying away from obstacles is more important than finding the shortest path
- Need to define other types of "roadmaps"

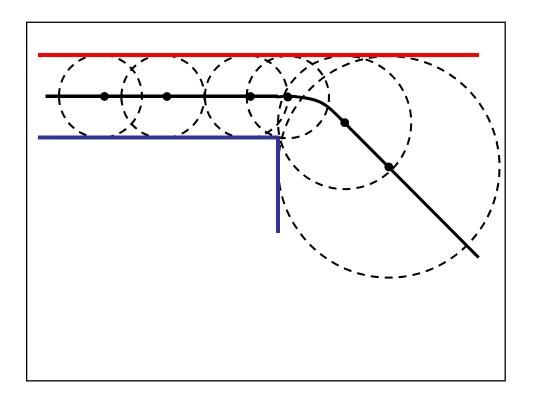

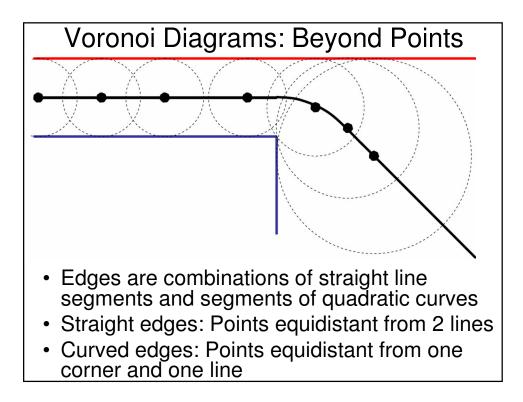

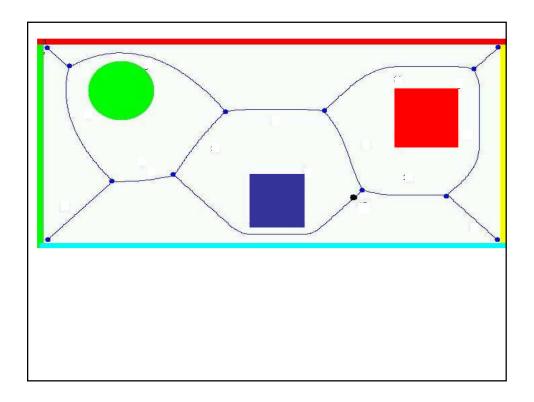

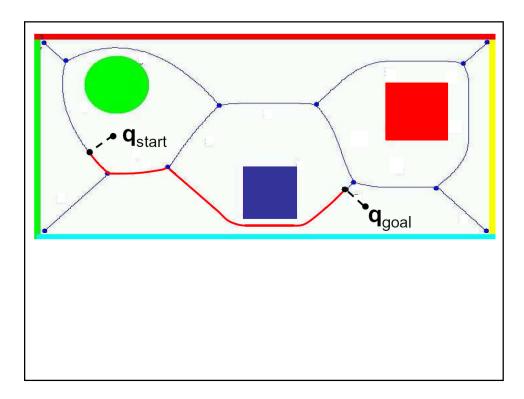

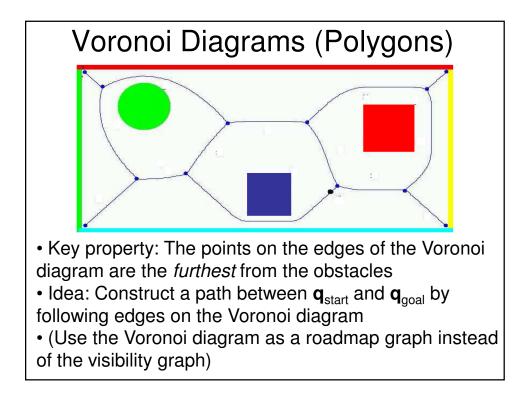

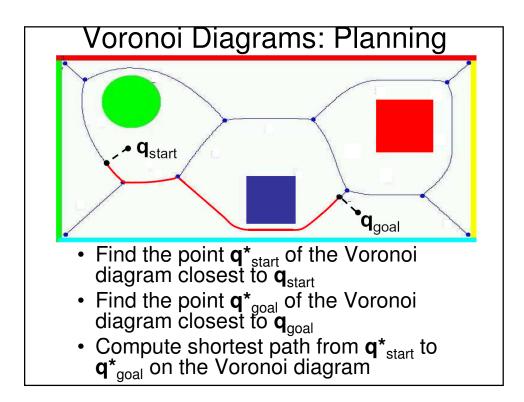

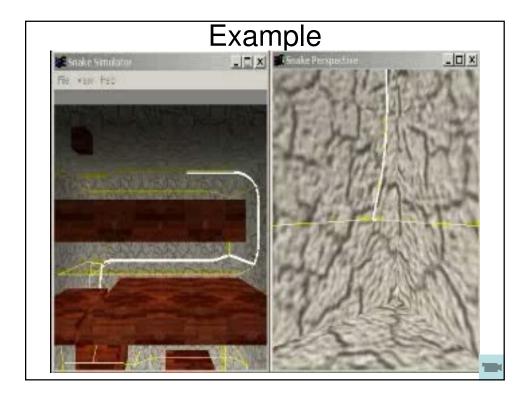

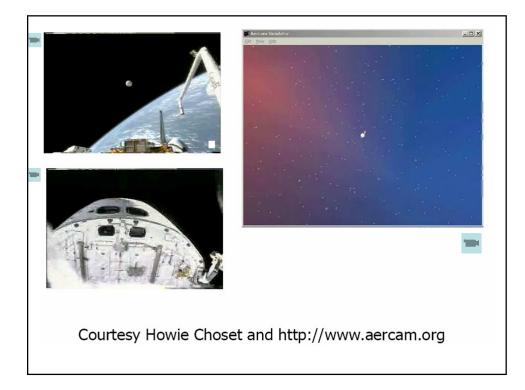

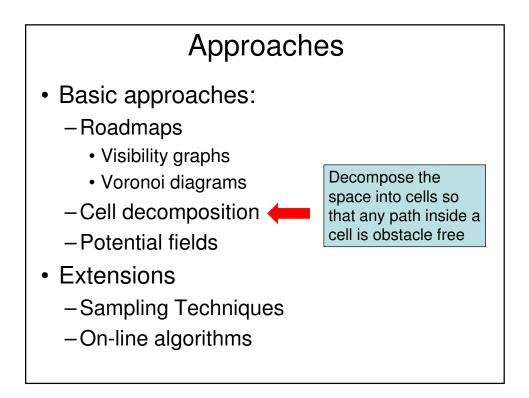

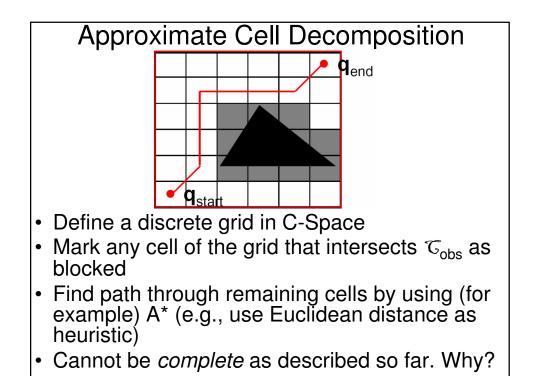

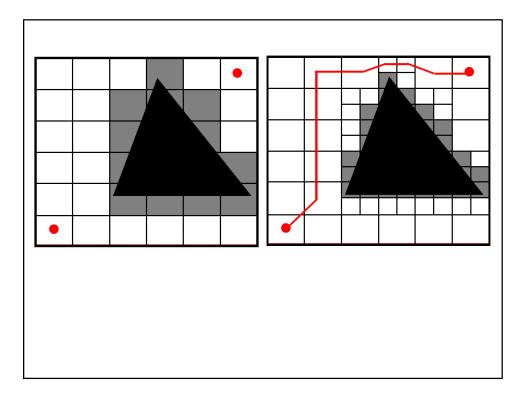

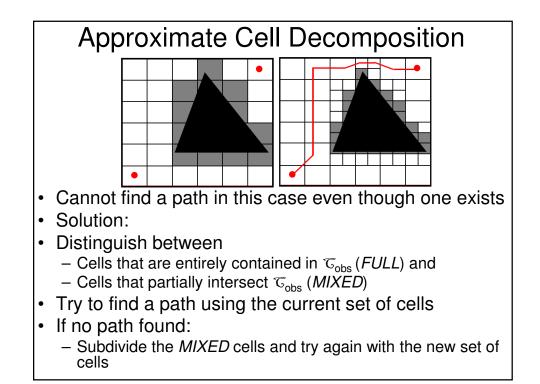

## Voronoi: Weaknesses

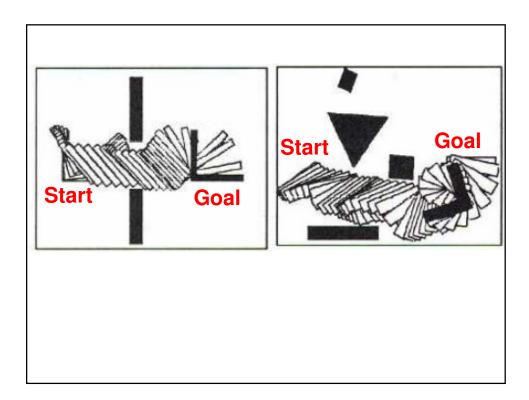

- Difficult to compute in higher dimensions or nonpolygonal worlds
- Approximate algorithms exist
- Use of Voronoi is not necessarily the best heuristic ("stay away from obstacles") Can lead to paths that are much too conservative, or lead to "ranging sensor deprivation"
- Can be unstable → Small changes in obstacle configuration can lead to large changes in the diagram
- Localization is hard (e.g. museums) if you stay away from known surfaces

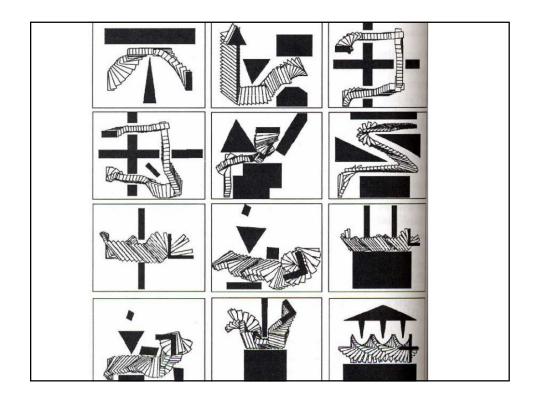

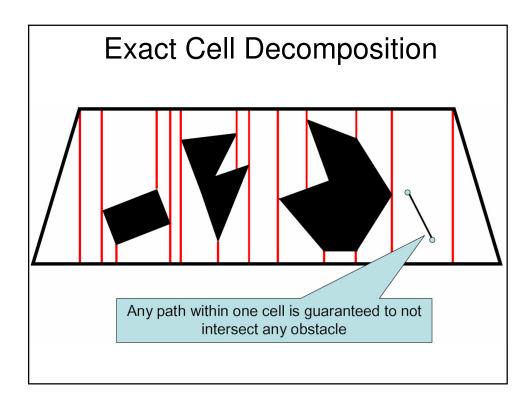

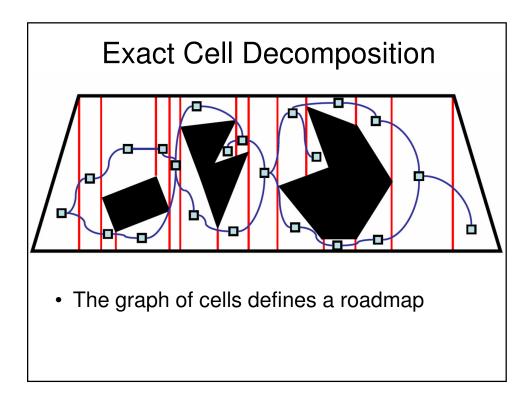

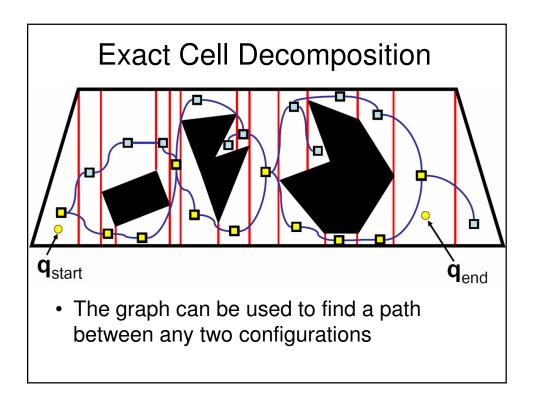

#### Approximate Cell Decomposition: Limitations

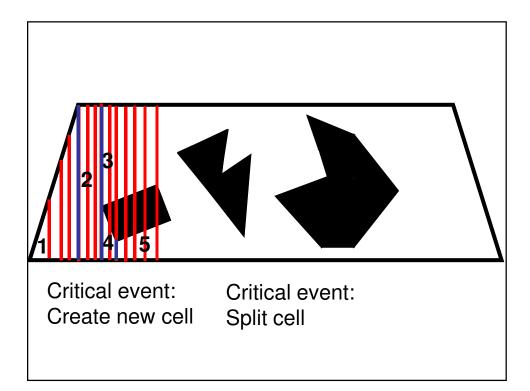

• Good:

- Limited assumptions on obstacle configuration
- Approach used in practice
- Find obvious solutions quickly
- Bad:
  - No clear notion of optimality ("best" path)
  - Trade-off completeness/computation
  - Still difficult to use in high dimensions

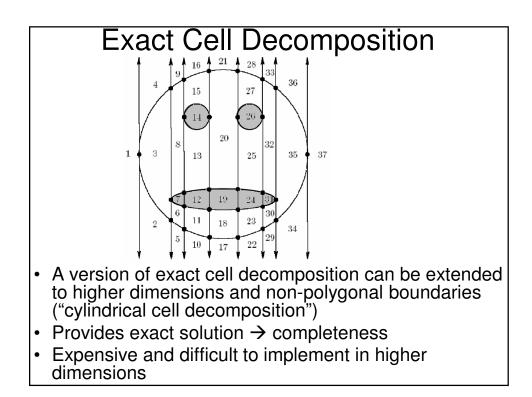

## Plane Sweep algorithm

- · Initialize current list of cells to empty
- Order the vertices of  $\mathcal{T}_{obs}$  along the *x* direction
- · For every vertex:
  - Construct the plane at the corresponding x location
  - Depending on the type of event:
    - Split a current cell into 2 new cells OR
    - Merge two of the current cells
  - Create a new cell
- Complexity (in 2-D):
  - Time: O( $N \log N$ )
  - Space: O(N)

# Humans?

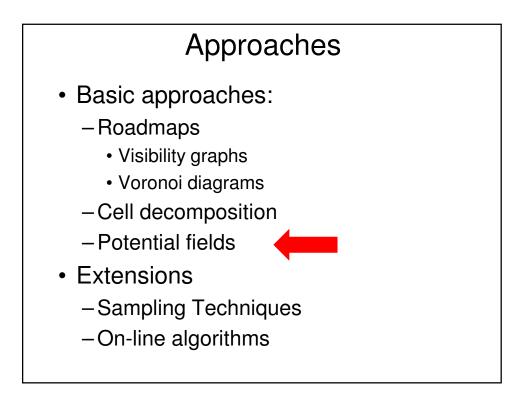

What do you think humans do?

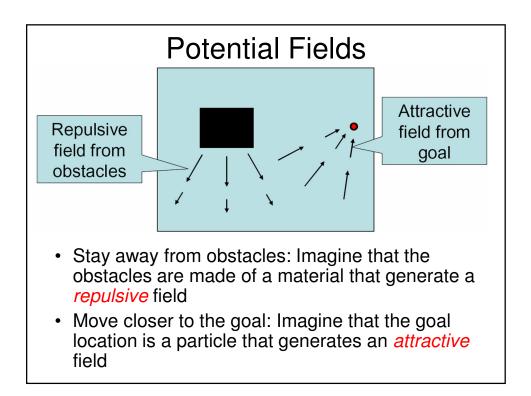

## Humans?

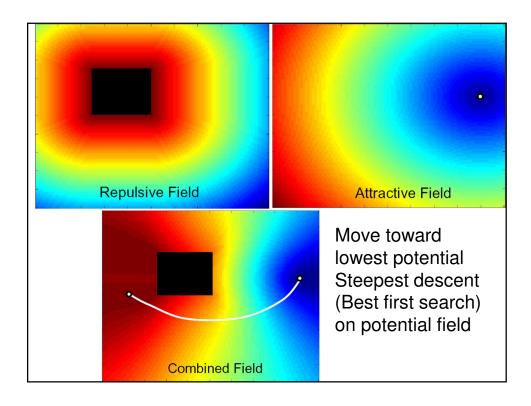

What do you think humans do?

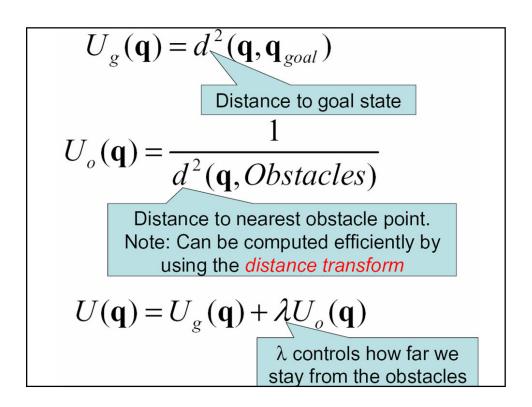

"Volume-based reasoning" "Boundary detection"

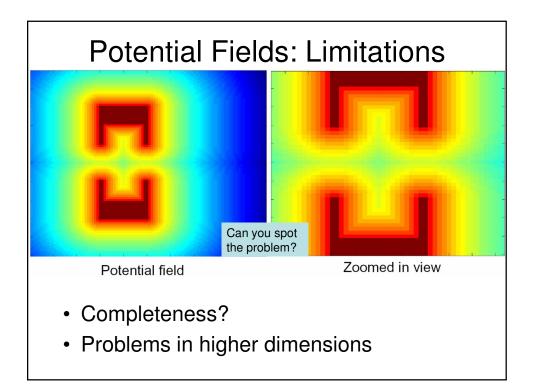

"Relevance reasoning"

	Sampling	Potential Fields	Approx. Cell Decomposition	Voronoi	Visibility			
Practical in ~2-D or 3-D	Y	Y	Y	Y	Y			
Practical in >> 2-D or 3-D	Y	(using randomized version)	??	N	N			
Fast	Y	Y	Y	In low dim.	In 2-D			
Online Extensions	Y	Y	??	??	N			
Complete?	Probabilis tically complete	Probabilis tically- resolution complete	Resolution- Complete	Y	Y
