

FACT SHEET

THE ASPEN TRIAL (NCT03053440) — A PIVOTAL PHASE 3 HEAD-TO-HEAD TRIAL OF THE BTK INHIBITORS ZANUBRUTINIB AND IBRUTINIB IN WALDENSTRÖM'S MACROGLOBULINEMIA (WM)

ABOUT THE TRIAL^{i,ii}

The ASPEN trial is a pivotal Phase 3 randomized, open-label, multicenter study evaluating zanubrutinib compared to ibrutinib in patients with relapsed/refractory or treatment-naïve patients with Waldenström's macroglobulinemia (WM). It was the first randomized Phase 3 study comparing two Bruton's tyrosine kinase (BTK) inhibitors in any indication and is the largest prospective randomized Phase 3 study in WM.

TRIAL DESIGN®

COHORT 1 201 PATIENTS WITH MYD88 MUTATION				COHORT 2 28 PATIENTS WITH MYD88 WILD-TYPE OR MUTATION UNKNOWN
ARM A: 102 patients, randomized to receive zanubrutinib 160 mg twice daily		ARM B: 99 patients, randomized to receive ibrutinib 420 mg once daily		ARM C: non-randomized, all patients to receive zanubrutinib 160 mg twice daily; previous trials
83 relapsed/ refractory patients	19 treatment naïve patients	81 relapsed/ refractory patients	18 treatment naïve patients	showed poor responses to ibrutinib therapy for patients with these mutations

- Randomized, open-label, Phase 3 trial comparing the highly selective next generation BTK inhibitor zanubrutinib and first-generation BTK inhibitor ibrutinib in patients with WM who required treatment according to consensus criteria.ⁱ
- 1:1 assignment of patients with MYD88^{L265P} disease to receive either ibrutinib at the approved dose of 420 mg once daily or zanubrutinib 160 mg twice daily in 28-day cycles until progression or intolerance (cohort 1).
- Stratified randomization by CXCR4^{WHIM} (CXCR = chemokine receptor type 4; WHIM = Warts, Hypogammaglobulinemia, Immunodeficiency and Myelokathexis syndrome) mutation status and number of prior lines of therapy.¹
- Exploratory cohort 2 included patients with MYD88 wild-type (MYD88WT) or with undetermined MYD88 mutation status. They received zanubrutinib in a third nonrandomized arm.ⁱ
- Allowed treatment interruption for ≤ 2 consecutive cycles and ≤ 2 dose reductions to treat recurrent grade 3/4 treatment-related toxicities.ⁱ
- No crossover was allowed for progression or due to intolerance in cohort 1.ⁱ

 A total of 211 patients were enrolled from research sites in Australia, Europe and the United States.ⁱ

Primary Efficacy Endpoint: Proportion of participants achieving either a complete response (CR) or a very good partial response (VGPR) in Cohort 1 per response criteria updated at the 6th International Workshop on WM (IWWM-6) as assessed by an independent review committee.ⁱ

Key secondary endpoints: major response rate (MRR), progression-free survival (PFS), duration of response (DOR), disease burden and safety, overall survival (OS) and quality of life (QoL).ⁱ
