CARRIER OILS & OLEINS

Vegetable oils and Oleins of the highest purity and quality, from those parts of the planet where they are produce.

CARRIER OILS & OLEINS

Obtained from the extrusion of seeds and plants, they are highly appreciated in cosmetics and food.

100% Pure, natural and organic vegetable oils. Obtained from seeds and plants by cold pressing. Rich in polyunsaturated acids, they are the basis for a multitude of cosmetic, food, pharmaceutical and industrial applications.

They are 100% pure oils, of vegetable origin, obtained from seeds and other parts of plants in whose tissues they accumulate as a source of energy. With an oily texture, they are rich in vitamins A, B and E, minerals and polyunsaturated fatty acids. Vegetable oils are generally obtained by cold pressing by mechanical means.

We offer the cosmetic, food and pharmaceutical industry the experience **to innovate in their formulations by accessing new and exotic raw materials,** together with traditional ingredients.

Vegetable oils are highly valued in cosmetics for their nourishing and emollient properties that protect the skin, keeping it healthy and helping it to recover its elasticity and delay ageing. They are also used as carrier oils in the application of essential oils.

In food, vegetable oils are an essential part of many everyday food preparations and products. They contain essential nutrients found in natural foods. If consumed correctly and in moderation, they can contribute to cardiovascular health.

OLEINS

Oleins of the highest purity and quality, from those parts of the planet where they are produced.

With a fine and intense aroma, it is extracted by washing the plants in hexane or alcohol

The oleins are obtained from very fragile plants that cannot be subjected to the usual process of distillation with heat in an alembic from which the essential oil is obtained, so the ore is macerated in certain solvents that are subsequently eliminated through the distillation to finally obtain the absolute. This is a different method of obtaining the aromatic principle of the plant, which is known as "extraction".

We offer, to the cosmetic industry, the experience of **innovating in their formulations through access to new and exotic raw materials**, together with traditional ingredients.

This extraction is carried out by washing the aromatic material of the plant with hexane or alcohol, thus obtaining its aromatic principle. The result is an absolute with an extremely non-roma, intense and round, optimal for its application as a perfume or in essences diffusers. The differences with respect to essential oils subjected to the heat of distillation and biochemical transformation, are mainly that, in the absolute, their aroma is more intense and immediate than those of conventional essential oils and that their use is essentially odoriferous, as opposed to the nourishing and moisturizing properties in the areas of application of essential oils.

ESSENTIAL OILS

Obtained by steam distillation, easily absorbed by the skin and with a penetrating aroma.

Essential oils of vegetable origin 100% pure, natural and organic. Obtained by steam distillation. Volatile and light, they stand out for their aromatic intensity and are widely used in cosmetics, perfumery, pharmacy, food, liquor and confectionery.

The ease of absorption of these oils through the skin, as well as the penetrating aroma they give off, allows the active components to penetrate directly into the body, facilitating the beneficial effects on our organism. Some essential oils have calming and relaxing effects, while others are stimulating and invigorating.

Although their most notable properties are to moisturise and nourish the areas where they are applied, essential oils are highly appreciated for the beneficial effects they produce on the body and soul thanks to their pleasant fragrances, giving rise to a therapeutic trend of their own, aromatherapy.

Their uses can be diverse as well as their applications, since essential and pure oils have the versatility to be integrated with other ingredients that result in creams, balms or ointments without losing their natural properties.

In food they are widely used as flavourings and natural flavourings, given their intensity and variety.

We offer the cosmetic, food and pharmaceutical industries **the experience to innovate in their formulations through access to new and exotic raw materials,** together with traditional ingredients.

BUTTERS

Rich in vitamins, they provide deep hydration to skin and hair.

100% Pure, natural and organic vegetable butters. Made up of vegetable oils in solid texture, obtained raw by cold pressing and then refined by physical means. Commonly used in cosmetics and foodstuffs.

Vegetable butters are vegetable oils in solid texture, even at room temperature. They are obtained by pressure extraction through cold pressing or crushing of the fruit from which they come. They can be presented in crude or refined finish. The refined finish is carried out by purifying the raw butter, through physical processes, without the intervention of chemical bases. This system guarantees a high quality of the butter and a better preservation of the unsaponifiable active ingredients.

Vegetable butters are thick, creamy and consistent. Rich in vitamins and polyunsaturated fatty acids, they stand out for their nourishing and emollient properties.

We offer the cosmetic and food industry the experience **to innovate in their formulations by accessing new and exotic raw materials,** together with traditional ingredients.

They are widely used in cosmetics as a base for multiple applications due to their solidified texture and their intense moisturising properties for skin and hair. In food, they are commonly used as an ingredient in a multitude of industrial formulations of processed products.

FLORAL HYDROLATS & WATER EXTRACTS

Floral Hydrolats & Water Extracts of the highest purity and quality, from those parts of the planet where they are produce.

FLORAL HYDROLATS

Gentle on the skin and with a subtle aroma, they are the result of the distillation of essential oils.

100% Pure, natural and organic floral hydrolats.

Obtained by the entrainment of water vapour during the distillation of essential oils. Preserves the properties of the distilled plant. Mainly used in cosmetics but also in food.

We offer the cosmetic, food and pharmaceutical we offer the cosmetic, food and pharmaceutical industries the experience **to innovate in their formulations by accessing new and exotic raw materials, together with traditional ingredients.**

Floral Hydrolats or Flower Waters are obtained during the distillation of plants and flowers to obtain the essential oil. To do this, the part of the plant from which the essential oil is obtained is placed in a still together with water so that, when heated, the water vapour carries away the essential oils from the plant. Once they are carried away by the vapour, when it cools down, the difference in molecular weight between the water and the oil causes the essential oil to remain on top and the water underneath. This water left over from the distillation process is known as hydrolat or floral water and has the same properties as the essential oil, but in a much less concentrated form.

Hydrolats increase the moisture content of the skin. They are gentle to the dermis and discreetly scented. Their pH is similar to that of the skin, between 5 and 6, making them ideal for sensitive skin, including babies' skin.

They require special preservation as they are very sensitive to light and extreme temperatures. They should be kept away from direct light in dark jars at room temperature.

WATER EXTRACTS

They are mainly used in natural cosmetics
and pharmaceutical applications.

Water extracts are natural preparations obtained by
maceration of a plant, using water as a solvent.

Rich in vitamins, mineral salts and active ingredients,
they acquire the therapeutic action of the plant they
come from during the maceration process.

**100% Pure, natural
and organic water
extracts.** Obtained by
macerating a plant in
water.

We offer the
cosmetic, food and
pharmaceutical we offer the
cosmetic, food and
pharmaceutical industries the
experience **to innovate in their
formulations by accessing new
and exotic raw materials,**
together with traditional
ingredients.

PLANT EXTRACTS

Macerated in different solvents, they acquire the therapeutic action of the plant they come from.

Plant extracts are natural preparations obtained by macerating a plant in a solvent. Through this process, the active principles, which are beneficial to the organism, are transferred to the solvent, giving rise to a natural compound suitable for cosmetic, pharmaceutical and industrial uses.

There are different plant extracts depending on the solvent used.

Some of them are:

Macerated or oily extract:

When a vegetable oil is used as a solvent.

Hydroglycerinated extract:

When the solvent used in the maceration is glycerine.

Hydroglycolic extract:

When the solvent used is propylene glycol.

Rich in vitamins, mineral salts and active ingredients, they acquire the therapeutic action of the plant they come from during the maceration process. Mainly used in natural cosmetics, pharmaceutical applications and various industrial productions.

100% Pure, natural and organic plant extracts.

Obtained by macerating a vegetable in water.

We offer the cosmetic and pharmaceutical industry **the experience to innovate in their formulations through access to new and exotic raw materials**, together with traditional ingredients.

SEEDS, SCRUBS, DRIED PLANTS & SEAWEED

Seeds, scrubs, dried plants and seaweed of the highest purity and quality, from those parts of the planet where they occur.

SEEDS & SCRUBS

Of
**the highest
purity and quality,**
from those parts of
the world where
they are
produced.

They conserve their properties and therapeutic and nutritional qualities in a dehydrated state.

SEEDS

Grain contained inside the fruit of a plant that germinates and gives rise to a new plant of the same species, under the appropriate conditions.

The seeds stand out in their cosmetic use due to their high fatty acid content, which allows natural oils to be obtained whose properties are used in a multitude of personal care solutions.

SCRUBS

Natural exfoliants are 100% pure and natural preparations, of vegetable origin, derived from plants and fruits that, once dried, are subjected to a mechanical process of crushing and sieving giving rise to a granulitic solid product of different thicknesses that serve as a base for the elaboration of multiple cosmetic products for personal care and cellular regeneration of the dermis.

We offer
the cosmetic,
pharmaceutical and food
industries the experience to
**innovate in their formulations
by accessing new and
exotic raw materials,**
together with traditional
ingredients.

DRIED PLANTS & SEAWEED

They conserve their properties and therapeutic and nutritional qualities in a dehydrated state.

Of the **highest purity and quality**, from those parts of the world where they are produced.

We offer the cosmetic, pharmaceutical and food industries the experience to **innovate in their formulations by accessing new and exotic raw materials**, junto a los ingredientes tradicionales.

DRIED PLANTS

Dried plants are obtained through the natural drying process of the different plants and fruits, preserving their properties and therapeutic qualities in a dehydrated state. They are the basis for a multitude of cosmetic and food applications such as absolutes, extracts and oleoresins.

SEAWEEDS

Seaweeds are aquatic plants that live on the seabed. They grow wild and have multiple properties and are used in a wide range of applications, from cosmetic applications to gastronomic and dietary products and the production of clean energy and biodiesel. Seaweeds are very varied and versatile natural resources, appreciated in sectors such as cosmetics, pharmaceuticals, food and gastronomy, and industries such as green energy.

WAXES, RESINS & CLAYS

Waxes, resins and clays of the highest purity and quality, from those parts of the planet where they are produced.

WAXES

Of
the highest
purity and quality,
from those parts of
the planet where
they are
produced.

We offer the
cosmetic and
pharmaceutical industry
the experience to **innovate
in their formulations through
access to new and exotic raw
materials**, together
with traditional
ingredients.

Of natural origin, they are the basis of
cosmetic applications for personal care.

WAXES

Waxes are molecules obtained by esterification.

They are insoluble in water but soluble in
non-polar, organic solvents.

All waxes are organic compounds.

They have traditionally been used in cosmetics,
in the form of creams or ointments, due to the
anti-inflammatory and healing properties of many
of their components. Another cosmetic application
is as a depilatory, as the hair adheres to it
and is easier to remove.

RESINS & CLAYS

Of the highest purity and quality, from those parts of the planet where they are produced.

Of natural origin, they are the basis of cosmetic applications for personal care.

RESINS

Natural resins are sticky exudates from trees or shrubs that harden on contact with air. They play a fundamental role in the metabolism and ecology of plants. Natural resins are mixtures of compounds with a wide variety and multiple properties. The extraction, transformation and uses of these resins have been described since ancient times. Thanks to their properties, resins are used for the production of perfumes, adhesives, varnishes and food additives, among other products.

We offer the cosmetic and pharmaceutical industry the experience to **innovate in their formulations through access to new and exotic raw materials,** together with traditional ingredients.

CLAYS

Clay is a natural material of mineral origin. From the most remote antiquity the earth (the mud, the clay) has been one of the most accessible, useful and appreciated therapies by men and animals to treat many illnesses. Its uses in cosmetics are very varied and appreciated.

ABSOLUTES & OLEORESINS

Absolutes and Oleoresins of the highest purity and quality,
from those parts of the planet where produce.

ABSOLUTES

With a fine and intense aroma, the absolute is extracted by washing the plants in hexane or alcohol.

**100% Pure
and natural absolutes.**

Obtained by washing the plants in hexane or alcohol. Commonly used in perfumery and cosmetics.

We offer the cosmetic and pharmaceutical industry the experience to **innovate in their formulations through access to new and exotic raw materials**, together with traditional ingredients.

Absolutes are obtained from very fragile plants that cannot undergo the usual process of distillation, with heat in an alembic, from which the essential oil is obtained, so the flower is macerated in certain solvents that are later eliminated through distillation to finally obtain the absolute. This is another different method to obtain the aromatic principle of the plant, which is known as "extraction".

This extraction is done by washing the aromatic material of the plant with hexane or alcohol to obtain its aromatic principle.

Absolutes are obtained from very fragile plants that cannot undergo the usual process of distillation, with heat in an alembic, from which the essential oil is obtained, so the flower is macerated in certain solvents that are later eliminated through distillation to finally obtain the absolute. OLEORESINS

100% Pure and natural oleoresins.

Generated by maceration of a plant in a volatile solvent. Highly valued in food.

With a fine and intense aroma, the absolute is extracted by washing the plants in hexane or alcohol.

Oleoresins are semi-solid natural compounds obtained from the maceration of a resin in volatile oils; usually essential oils. The oleoresin is the result of this process, once the oil used as a solvent has evaporated.

The most commonly used vegetable base for oleoresin generation is spices as they intensely transfer aroma and flavour, preserving oleoresins the natural flavourings in a concentrated form.

Oleoresins are mainly used in food and in the flavouring of industrial products produced for different consumer sectors.

We offer the cosmetic and pharmaceutical industry the experience to **innovate in their formulations through access to new and exotic raw materials**, together with traditional ingredients.

OTHERS

Pure and natural ingredients are produced and obtained through environmentally friendly processes.

Of the **highest purity and quality**, from those parts of the planet where they are produced.

We offer the cosmetic, pharmaceutical, food and industrial sectors **the experience to innovate in their formulations through access to new and exotic raw materials**, together with traditional ingredients.

Nature is an inexhaustible source of active ingredients and beneficial natural principles used in countless industrial developments, which help us to take care of our health and our environment in a sustainable way.

Today's society is increasingly aware of the need to seek and find a balance between the wellbeing offered by the advances of our time and the care of our organism and our world.

That is why sectors such as cosmetics, perfumery and pharmaceuticals, together with the food, human and animal industries, and others such as detergent and phytosanitary manufacturers, are increasingly looking to Nature for sustainable and respectful solutions for their formulations.

Here, these sectors will find a wide selection of products of natural origin to meet their needs for natural ingredients for their eco-responsible and sustainable formulations.

Among them you can find activated charcoal, organic alcohol, organic vegetable glycerine for food and cosmetic grade, organic aloe vera in different presentations, organic menthol and a wide range of salts and antioxidants, among many others.
