Introduction

BioAustralis is a specialist manufacturer and supplier of microbial metabolites for *in vitro* laboratory use. Our expertise in early recognition profiling of metabolites from a broad diversity of fungi, actinomycetes and other bacterial genera places BioAustralis in a unique position to provide many rare and unusual microbial metabolites. For more than half our products, BioAustralis is first to market. We offer our products to other leading fine chemical retailers and direct to researchers, including via our global distributor network.

Our particular interest is producing rare metabolites. Some metabolites are reported only once in the literature and then are lost to science. Many offer promise of new pharmacology and modes of action. Today, in a world with rampant resistance across the chemotherapeutic spectrum, these "lost antibiotics" represent an unrealised avenue to sustain the need for genuinely novel antibacterials, antifungals, antitumor and antiprotozoan actives.

This December 2020 catalogue combines the May 2019 catalogue with the March 2020 supplement, now including over 1,000 individual metabolites, together with metabolite sets and analogue sets.

L-Homoserine Lactone Analogue Set

Product Description: L-Homoserine lactones comprise a family of mediators of cell to cell interactions between bacteria, notably in bacterial biofilms. When secreted by the producing bacteria, homoserine lactones modulate a diverse range of metabolic functions in surrounding species, regulating not only growth and motility but also the production of secondary metabolites such as antibiotics. The most significant variable defining the function of the homoserine lactones is the length of the acyl chain, with shorter chains displaying opposing actions to the longer chains. The L-Homoserine Lactone Analogue Set provides the full set of available homoserine lactones from acetyl (C2) to octadecanoyl (C18).

Tetracycline Degradation Set

Code No.: BIA-MS5011

Product Description: Tetracycline is a potent broad spectrum antibiotic that has played a pivotal role in human and animal health for over 60 years. Tetracycline is a linear tetracycline which can be degraded under various conditions, such as acidity, alkalinity, heat, oxidation, light and temperature. The degradation products are not biologically inert; rather, they are oxidative and isomeric analogues with unique physical and chemical properties that are not well characterised. The Tetracycline Degradation Set provides the major degradation products described in the literature as a tool for understanding and monitoring the fate of tetracycline on storage and in biological systems.
