Apoptosis

Apoptosis is the autonomous, orderly death of cells that are controlled by genes to maintain the homeostasis of internal environment. It's a "suicide" phenomenon, an active process. Apoptosis contains a series of gene activation, expression and regulation, such as the BCL-2 family, Caspase family, cancer genes such as C-myc, tumor suppressor gene such as p53 and Pten, ect.

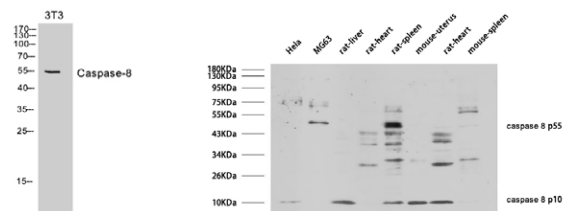

Overview: Regulation of Apoptosis

Caspase Family

Caspase is short for cysteine aspartic acid specific protease. It's an important effector component of the apoptotic mechanism and is involved in a variety of apoptosis related physiological and pathological processes. Caspase can be divided into three groups: apoptotic initiators, apoptotic executioners and inflammatory mediators which form a cascade amplification effect.

BCL-2 Family

There are many members in this family, such as Mcl-1, NR-B, A1, Bcl-w, Bcl-x, Bax, Bak, Bad, Bim, ect. All of them have function of anti-apoptotic and apoptosis promotion. Most members have two structural homologous regions, which can induce familial members to form dipolymers that is an important form for functional realization or functional regulation of proteins.

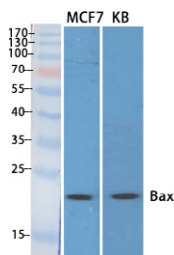

When there is no death signal, Bcl-2 anti-apoptotic proteins are generally isolated as integral membrane proteins of the organelle membrane, while pro-apoptotic proteins are distributed in the cytoplasm in an inactive form. When the cell is stimulated with death signal, pro-apoptotic protein conformational change results from some proteases leading to not only cell apoptosis which makes pro-apoptotic protein translocate to the membrane structure of organelles from cytosol, also the reduction of anti-apoptotic protein inhibitory activity especially in mitochondrial membrane interacting with anti-apoptosis protein.

Stem Cell

Stem cells are undifferentiated biological cells that can differentiate into specialized cells and can divide (through mitosis) to produce more stem cells. They are found in multicellular organisms. In mammals, there are two broad types of stem cells: embryonic stem cells, which are isolated from the inner cell mass of blastocysts, and adult stem cells that are found in various tissues. In adult organisms, stem cells and progenitor cells act as a repair system for the body, replenishing adult tissues. In a developing embryo, stem cells can differentiate into all the specialized cells—ectoderm, endoderm and mesoderm (see induced pluripotent stem cells)—but also maintain the normal turnover of regenerative organs, such as blood, skin or intestinal tissues.

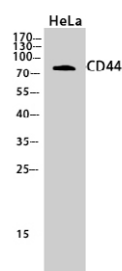

CHOP PAb(Cat. No.:E-AB-30923)

Western Blot analysis of VEC cells using CHOP Polyclonal Antibody

CHOP, also known as GADD153 or DDIT3, is a highly conserved gene in both the structural and regulatory regions to hamster gene. Imposed by unfolded and malformed proteins, CHOP is significantly induced by ER stress, deficiency of CHOP prevents cell from ER stress. CHOP is considered a proapoptotic marker of ER stress dependent cell death. CHOP acts as a dominant-negative inhibitor of the transcription factor C/EBP and LAP by forming a heterodimer. It may play an important role in the malignant transformation of nevus to melanoma.

CD44 PAb(Cat. No.:E-AB-30829)

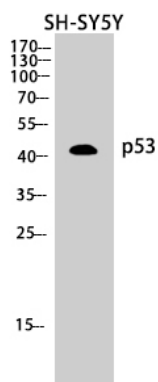

Western Blot analysis of HeLa cells using CD44 Polyclonal Antibody

CD44 is a receptor for hyaluronic acid (HA). Mediates cell-cell and cell-matrix interactions through its affinity for HA, and possibly also through its affinity for other ligands such as osteopontin, collagens, and matrix metalloproteinases (MMPs). Adhesion with HA plays an important role in cell migration, tumor growth and progression. Also involved in lymphocyte activation, recirculation and homing, and in hematopoiesis. Altered expression or dysfunction causes numerous pathogenic phenotypes. Great protein heterogeneity due to numerous alternative splicing and post-translational modification events.

Cancer

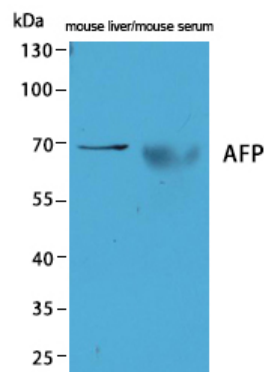

Cancer is a group of abnormal cells with the potential and uncontrolled ability of division and development to invade or spread to other parts of the body. Not all tumors are cancerous; benign tumors do not spread to other parts of the body. There are many kinds of cancers with possible signs and symptoms include a lump, abnormal bleeding, prolonged cough, unexplained weight loss and a change in bowel movements. Cancer has always been the first threat to human health.

Neuroscience

Neuroscience is the scientific study of the nervous system. The scope of neuroscience has broadened to include different approaches used to study the molecular, cellular, developmental, structural, functional, evolutionary, computational, and medical aspects of the nervous system. The techniques used by neuroscientists have also expanded enormously, from molecular and cellular studies of individual nerve cells to imaging of sensory and motor tasks in the brain. Recent theoretical advances in neuroscience have also been aided by the study of neural networks. The human brain remains a great mystery in science and current researchers strive to understand molecular and cellular processes of the nervous system. Prevention and effective treatment of neurological disorders has been a major medical challenge.

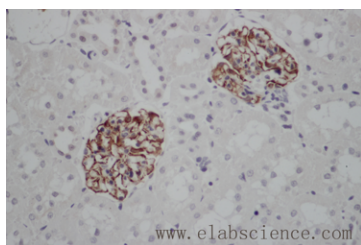

Vimentin PAb (Cat. No.:E-AB-33218)

Vimentin, also named as VIM, belongs to the intermediate filament family. Vimentin is class-III intermediate filaments found in various non-epithelial cells, especially mesenchymal cells. Vimentin is important for stabilizing the architecture of the cytoplasm. Monocyte-derived macrophages secrete vimentin into the extracellular space in vitro. Secretion of vimentin was enhanced by the proinflammatory cytokine tumor necrosis factor-alpha (TNFA; 191160) and inhibited by the anti-inflammatory cytokine IL10 (124092), suggesting that vimentin is involved in the immune response. Vimentin has specialized functions that contribute to specific dynamic cellular processes. As a phosphoprotein, 55-60 kDa of vimentin proteins can be observed due to the different phosphorylation level.

NES PAb (Cat. No.:E-AB-13002)

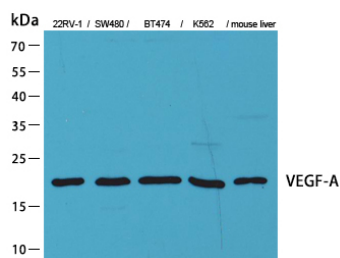

Immunohistochemistry of Rat kidney using NES Polyclonal Antibody at dilution of 1:100

Nestin is a type IV intermediate filament protein expressed by neuroepithelial stem cells and which has been proposed to represent a marker for putative islet stem cells. It is a high molecular weight protein with a terminus greater than 500 residues. Nestins are expressed by several types of cells during development, mostly in dividing cells of the Central Nervous System, Peripheral Nervous System and myogenic tissues. It also represents the progenitor population of neural stem cell origin. The role of nestin in dynamic cells, particularly structural organization of the cell, appears strictly regulated by phosphorylation, especially its integration into heterogeneous intermediate filaments together with vimentin or internexin. Nestin has recently received attention as a marker for detecting newly formed endothelial cells.

Cardiovascular

Cardiovascular system is an organ system that permits blood to circulate and transport nutrients (such as amino acids and electrolytes), oxygen, carbon dioxide, hormones, from blood cells to other cells in the body to provide nourishment and help to fight against diseases, stabilize temperature and pH, and maintain homeostasis. The study of the blood flow is called hemodynamics.

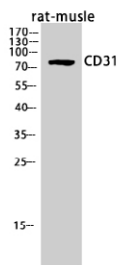

VEGF-A PAb(Cat. No.:E-AB-33378)

VEGFA is a member of the PDGF/VEGF growth factor family and encodes a protein that is often found as a disulfide linked homodimer. This protein is a glycosylated mitogen that specifically acts on endothelial cells and has various effects, including mediating increased vascular permeability, inducing angiogenesis, vasculogenesis and endothelial cell growth, promoting cell migration, and inhibiting apoptosis. Elevated levels of this protein is linked to POEMS syndrome, also known as Crow-Fukase syndrome. Mutations in this gene have been associated with proliferative and nonproliferative diabetic retinopathy. Alternatively spliced transcript variants, encoding either freely secreted or cell-associated isoforms, have been characterized. There is also evidence for the use of non-AUG (CUG) translation initiation sites upstream of, and in-frame with the first AUG, leading to additional isoforms.

CD31 PAb(Cat. No.:E-AB-30820)

Platelet endothelial cell adhesion molecule-1 (PECAM-1, CD31) is a member of the immunoglobulin gene superfamily of cell adhesion molecules. It is highly expressed on the surface of the endothelium, making up a large portion of its intracellular junctions. PECAM-1 is also present on the surface of hematopoietic cells and immune cells including platelets, monocytes, neutrophils, natural killer cells, megakaryocytes and some types of T-cell. As well as its role in cell-cell adhesion, PECAM-1 functions as a signaling receptor, and is involved in important physiological events such as nitric oxide production, regulation of T-cell immunity and tolerance, leukocyte transendothelial migration and inflammation and angiogenesis.

Polyclonal Antibody

Polyclonal antibody is a group of immunoglobulin secreted by plasma cells in the organism, which occurred during the immune reaction when the body is stimulated by heterologous antigens (macromolecular antigen, hapten conjugates). Polyclonal antibodies have been widely applied in science research and diagnosis due to the various advantages, such as recognizing multiple antigen epitopes, causing precipitation reaction, short preparation time and low cost.

The most important quality for polyclonal antibodies is high titer. Elabscience's polyclonal antibodies are prepared from the antiserum of immunized animal by affinity purification, and this preparation method leads to the production of interested antibodies with high-titer and high-affinity which are against the target antigen. We have collected a wide selection of high-quality polyclonal antibodies specific for various species and applications, and all of them are guaranteed to do great favor for your research.

Our polyclonal antibodies are available in 3 sizes: 60 uL, 120 uL and 200 uL. In addition, we also provide small package of 20 uL for customers to do the pre-experiment.

TNF, as also known as TNF-alpha, or cachectin, is a multifunctional proinflammatory cytokine that belongs to the tumor necrosis factor (TNF) superfamily. It is expressed as a 26 kDa membrane bound protein and is then cleaved by TNF-alpha converting enzyme (TACE) to release the soluble 17 kDa monomer, which forms homotrimers in circulation. It is produced chiefly by activated macrophages, although it can be produced by many other cell types such as CD4+ lymphocytes, NK cells, neutrophils, mast cells, eosinophils, and neurons. It can bind to, and thus functions through its receptors TNFRSF1A/TNFR1 and TNFRSF1B/TNFR2. This cytokine is involved in the regulation of a wide spectrum of biological processes including cell proliferation, differentiation, apoptosis, lipid metabolism, and coagulation. This cytokine has been implicated in a variety of diseases, including autoimmune diseases, insulin resistance, and cancer.

VASP (Ab-157) Polyclonal Antibody

Catalog number: E-AB-12094

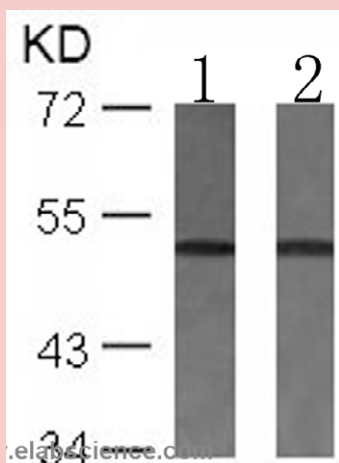

Host: Rabbit

Reactivity: H, M, R

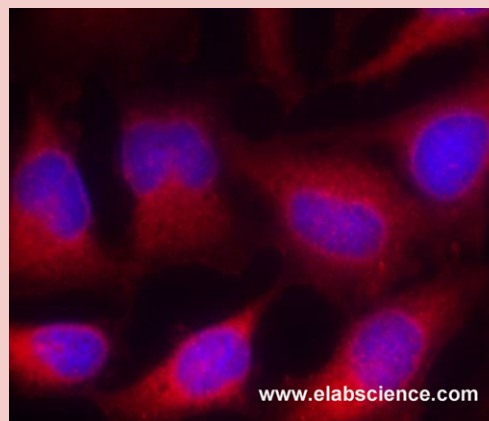

Applications: WB, IF

Recommended dilution: WB 1:500-1:1000, IF/ICC 1:100-1:200

Ena/VASP proteins are actin-associated proteins involved in a range of processes dependent on cytoskeleton remodeling and cell polarity such as axon guidance, lamellipodial and filopodial dynamics, platelet activation and cell migration. VASP promotes actin filament elongation. It protects the barbed end of growing actin filaments against capping and increases the rate of actin polymerization in the presence of capping protein. VASP stimulates actin filament elongation by promoting the transfer of profilin-bound actin monomers onto the barbed end of growing actin filaments. It plays a role in actin-based mobility of listeria monocytogenes in host cells. It regulates actin dynamics in platelets and plays an important role in regulating platelet aggregation.

Monoclonal Antibody

A monoclonal antibody specifically recognizes a single epitope within an antigen, thus having following advantages compared with polyclonal antibodies, low cross-reactivity, high specificity, excellent lot-to-lot stability.

Elabscience offers mouse, rat, rabbit and other species derived recombinant monoclonal antibody, all of which are strictly verified, so the quality could be guaranteed.

Elabscience also provides custom monoclonal antibody service, designing and producing high quality antibodies according to your project requirements, to benefit your research at the greatest extent.

EGFR Monoclonal Antibody

Catalog number: E-AB-22007

Synonyms: EGFR, ERBB, ERBB1, HER1, Epidermal growth factor receptor, Proto-oncogene c-ErbB-1, Receptor tyrosine-protein kinase erbB-1

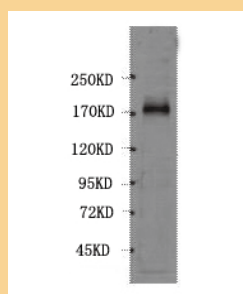

Host: Mouse

Reactivity: H

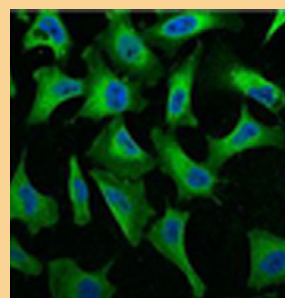

Applications: WB, IF

Recommended dilution: WB 1:500-1:2000, IF 1:50-1:100

Receptor tyrosine kinase binding ligands of the EGF family and activating several signaling cascades to convert extracellular cues into appropriate cellular responses. Known ligands include EGF, TGFA/TGF-alpha, amphiregulin, epigen/EPGN, BTC/betacellulin, epiregulin/EREG and HBEGF/heparin-binding EGF. Ligand binding triggers receptor homo- and/or heterodimerization and autophosphorylation on key cytoplasmic residues. The phosphorylated receptor recruits adapter proteins like GRB2 which in turn activates complex downstream signaling cascades. It activates at least 4 major downstream signaling cascades including the RAS-RAF-MEK-ERK, PI3 kinase-AKT, PL Cgamma-PKC and STATs modules. It may also activate the NF-kappa-B signaling cascade. It also directly phosphorylates other proteins like RGS16, activating its GTPase activity and probably coupling the EGF receptor signaling to the G protein-coupled receptor signaling. It also phosphorylates MUC1 and increases its interaction with SRC and CTNNB1/beta-catenin.

p53 Monoclonal Antibody

Catalog number: E-AB-22015

Synonyms: TP53, P53, Cellular tumor antigen p53, Antigen NY-CO-13, Phosphoprotein p53, Tumor suppressor p53

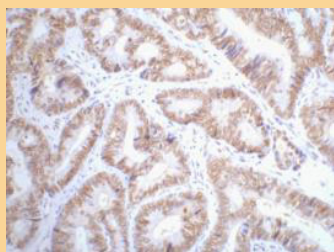

Host: Mouse

Reactivity: H

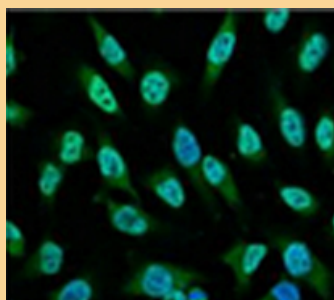

Applications: WB, IHC, IF

Recommended dilution: WB 1:500-1:2000, IHC 1:50-1:200, IF 1:50-1:100

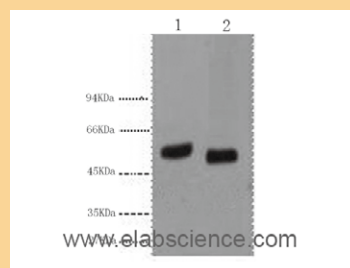

P53 acts as a tumor suppressor in many tumor types, induces growth arrest or apoptosis depending on the physiological circumstances and cell type, involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2 expression. Implicated in Notch signaling cross-over. Isoform 2 enhances the transactivation activity of isoform 1 from some but not all TP53-inducible promoters. Isoform 4 suppresses transactivation activity and impairs growth suppression mediated by isoform 1. Isoform 7 inhibits isoform 1-mediated apoptosis.

Acetyl/Phospho/Methyl Antibody

Acetylation is related with protein activity, therefore the activity of target protein can be reflected through the specific identification of acetylated target protein by acetylation antibodies, and to study the function and regulation of protein.

Phosphorylation antibodies can identify the phosphorylation or non-phosphorylation of protein, and can be applied in qualitative and quantitative analysis of phosphorylated protein under the condition of avoiding radiation pollution. Elabscience's specific phosphorylation antibodies can be widely used in applications such as Western blot, Immunohistochemistry, ELISA, etc.

Methylation is an important modification of proteins and nucleic acids, which can regulate the expression and silence of gene and is closely associated with cancer, aging, Alzheimer's disease and other diseases, it is one of the most important research content of epigenetics. The most common methylation modification includes DNA methylation and histone methylation.

Protein methylation is a form of post-translational modification, which generally refers to the methylation of arginine or lysine in protein sequence. It includes Mono Methyl, Di Methyl, and Tri methyl. Among histones, the protein methylation is the content that has been studies most. Some histone residues can inhibit or activate the gene expression by methylation, so as to form an epigenetic phenomena.

Applications: WB, IHC, ELISA

MAPK14(mitogen-activated protein kinase 14) is also named as SAPK2A, p38MAPK, CSBP1, RK, p38, EXIP, Mxi2, CSBP2, PRKM14, PRKM15, CSPB1, p38ALPHA and belongs to the MAP kinase subfamily. MAPK14-signaling is a central pathway for the integration of instructive signals in dendritic cells for T (H) 17 differentiation and inflammation. It plays an important role in the regulation of hematopoietic stem cellself-renewal in vitro and inhibition of MAPK14 activation with a small molecule inhibitor may represent a novel approach to promote ex vivo expansion of hematopoietic stem cell. This protein has 4 isoforms produced by alternative splicing.

This gene encodes tumor protein p53, which responds to diverse cellular stresses to regulate target genes that induce cell cycle arrest, apoptosis, senescence, DNA repair, or changes in metabolism. p53 protein is expressed at low level in normal cells and at a high level in a variety of transformed cell lines, where it's believed to contribute to transformation and malignancy. p53 is a DNA-binding protein containing transcription activation, DNA-binding, and oligomerization domains. It is postulated to bind to a p53-binding site and activate expression of downstream genes that inhibit growth and/or invasion, and thus function as a tumor suppressor. Mutants of p53 that frequently occur in a number of different human cancers fail to bind the consensus DNA binding site, and hence cause the loss of tumor suppressor activity. Alterations of this gene occur not only as somatic mutations in human malignancies, but also as germline mutations in some cancer-prone families with Li-Fraumeni syndrome. Multiple p53 variants due to alternative promoters and multiple alternative splicing have been found. These variants encode distinct isoforms, which can regulate p53 transcriptional activity.

Tags & Controls Antibody

With the development of recombinant DNA technology, scientific researchers can construct recombinant fusion proteins which express target genes and have epitope tags. Therefore, epitope tags are frequently used for identification and purification of recombinant proteins. Epitope tag antibodies are highly specific monoclonal/polyclonal antibodies with commonly used dye and enzyme conjugates and can serve as a universal detection method in Western blot.

A housekeeping gene is usually used as control in WB. The common used cytoplasm housekeeping genes includes GAPDH, β -actin, α -tubulin, β -tubulin. Elabscience offers you the variety high quality monoclonal and polyclonal housekeeping genes to meet your specific research demands.

An isotype control is the negative control in Flow cytometry and Immunohistochemistry, which is used to differentiate the non-specific background signal from specific antibody signal. The choice of isotype control antibody should consider the factor of the host species, isotype and conjugation in your antibody experiment for Flow Cytometry purpose. Elabscience have collected our Tags & Control Antibodies in one page, enjoy the diverse good-performance and high-specificity antibodies and learn how Elabscience's products can benefit you.

This technology has been widely used in immunology, hematology, oncology, cell biology, cytogenetics, biochemistry, clinical medicine and basic medical research fields, which plays a vital role in evaluation of immunologic function, diagnosis and treatment of various blood diseases and tumor.

Elabscience have collected our best flow cytometry antibodies and technical protocols. Our various flow cytometry validated antibodies offer multiple dye choices and a wide range of both intracellular and extracellular targets.

Anti-Human CD3 (OKT-3) Monoclonal Antibody (APC Conjugated)

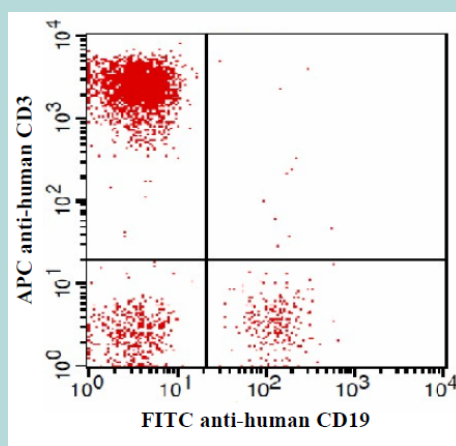

Catalog number: E-AB-1504

Host: Mouse

Reactivity: H

Applications: Flow Cyt

CD3 ϵ is a 20 kDa chain of the CD3/T-cell receptor (TCR) complex which is composed of two CD3 ϵ , one CD3 γ , one CD3 δ , one CD3 ζ (CD247), and a T-cell receptor (α/β or γ/δ) heterodimer. It is found on all mature T lymphocytes, NK-T cells, and some thymocytes. CD3, also known as T3, is a member of the immunoglobulin superfamily that plays a role in antigen recognition, signal transduction, and T cell activation. The CD3 antibody is able to induce T cell activation.

Anti-Mouse CD4 (GK1.5) Monoclonal Antibody (FITC conjugated)

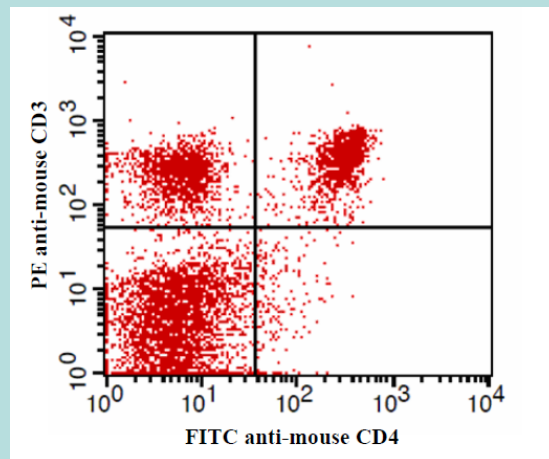

Catalog number: E-AB-2021

Host: Rat

Reactivity: M

Applications: Flow Cyt

CD4 is a 55 kDa protein also known as L3T4 or T4. It is a member of the Ig superfamily, primarily expressed on most thymocytes, a subset of T cells, and weakly on macrophages and dendritic cells. It acts as a coreceptor with the TCR during T cell activation and thymic differentiation by binding MHC class II and associating with the protein tyrosin kinase, lck.

Secondary Antibody

Secondary antibodies can bind to antibodies, namely 'anti-antibody'. Secondary antibodies can be used for indirect detection of the target antigens, and it can improve the sensitivity by amplifying signal and provide more flexibility for labeling and detection.

Elabscience offers various high-quality conjugated/unconjugated secondary antibodies which can be applied in fluorescence detection of the primary antibody, and they are suitable for conventional applications such as IF, IHC, WB and Flow cytometry, etc.
