- 103 Sample Characteristic(s): cover records for 1,794 vascular plant species in 7,738 (semi-)permanent
104 vegetation plots from Germany, resurveyed from 2 to 54 times, in total resulting in 23,641 vegetation
105 records and 458,311 species cover records, comprising the years from 1927 to 2020 and 97 EUNIS
106 habitat types
- 107

108 **Abstract**

109 Vegetation-plot resurvey data are a main source of information on terrestrial biodiversity change,
110 with records reaching back more than one century. Although more and more data from re-sampled
111 plots have been published, there is not yet a comprehensive open-access dataset available for

112 analysis. Here, we compiled and harmonised vegetation-plot resurvey data from Germany covering
113 almost 100 years. We show the distribution of the plot data in space, time and across habitat types
114 of the European Nature Information System (EUNIS). In addition, we include metadata on geographic
115 location, plot size and vegetation structure. The data allow calculating temporal biodiversity change
116 at the community scale and reach back further into the past than most comparable data yet
117 available. They also enable tracking changes in the incidence and distribution of individual species
118 across Germany. In summary, the data come at a level of detail that holds promise for broadening
119 our understanding of the mechanisms and drivers behind plant diversity change over the last
120 century.

121

122 **Background & Summary**

123 The current biodiversity crisis threatens an estimated one million species with extinction ¹. The
124 nature and rate of observed changes depend on the spatial scale at which they are observed ². At the
125 finest scale, i.e. the local scale of plant communities, vegetation-plot records have been found to
126 become sometimes richer, sometimes poorer in species ³, while a considerable temporal species
127 turnover is apparent in the majority of cases ⁴.

128 Vegetation-plot time series have mainly been collected for particular habitats, such as forests ⁵⁻¹⁷,
129 hedgerows¹⁸, wet grasslands¹⁹⁻²², mesic grasslands²³⁻²⁹, dry grasslands^{22,30-35}, acid grasslands and
130 heathlands³⁶⁻³⁸, alpine grasslands^{39,40}, rivers⁴¹, riverbanks⁴², peatlands⁴³⁻⁴⁶, roadsides⁴⁷ or arable
131 land⁴⁸⁻⁵⁰. Sometimes, they were recorded to assess the changes in species composition across all
132 communities that occur in a certain area⁵¹⁻⁵⁵. So far, vegetation-plot time series have not been
133 accessible without restrictions. In contrast, open access biodiversity time-series data such as
134 BioTIME⁵⁶, comprise all different types of taxonomic groups, ranging from plants, plankton and
135 terrestrial invertebrates to vertebrates, but include only a few vegetation-plot time series. Thus, our
136 database closes a gap for a particular region, which is Germany.

137 Vegetation-plot resurvey data have been extensively used to assess biodiversity changes by means of
138 monitoring certain vegetation types in local studies, such as managed grasslands ²⁴and rivers ⁴¹. More
139 recently, time series have been collected across regions, exploring the contribution of local
140 biodiversity change ³ to that observed at broader spatial scales ^{1,57,58}. While these analyses often
141 failed to detect changes in species richness ^{3,59,60}, they were able to relate the observed trends to
142 changes in land use and climate ^{61,62}. Although these studies have compiled databases on vegetation-
143 plot time series, they are currently not openly available. This is also the case for the current initiative
144 of ReSurveyEurope, which collates and mobilizes vegetation-plot data with repeated measurements
145 over time (<http://euroveg.org/eva-database-re-survey-europe>). Our aim is to provide a
146 comprehensive and taxonomically standardised database of vegetation-plot time series for Germany.
147 We confined the geographical extent to Germany because of a long tradition of German vegetation
148 scientists carrying out temporal observations on permanent plots (e.g.²⁸), the large amount of
149 available data, our familiarity with the regional literature, and of recent initiatives to mobilize
150 retrospective biodiversity data for trend analyses (www.idiv.de/smon).

151 Vegetation-plot time series differ in some fundamental ways from other biodiversity time series.
152 Since the advent of phytosociology in the early 20th century^{63,64}, vegetation surveys were carried out
153 in a standardised way. Plot sizes of vegetation relevés can vary considerably and depend on the
154 vegetation type considered (e.g. forest plots usually have plot sizes between 100 and 1000 m², while
155 non-forest plots mostly range from 4 to 100 m² ⁶⁵). In addition, sampling protocols might vary
156 between studies, but they all include complete lists of species occurring at the plot at the time of
157 sampling. In consequence, vegetation-plot records provide information on both presences and

158 absences of species in a community. As sampling is usually done by professionals, absences of a
159 previously occurring species in a time series strongly indicates local extinction, or vice versa, the
160 presence of a species that had not been recorded previously is a robust indication of colonization.
161 However, even with experts carrying out the survey, it is possible that some species may remain
162 undetected in the record because of their phenology or taxonomic uncertainties⁶⁵. Yet, such
163 vegetation-plot data are much more reliable than vegetation surveys at larger scales, such as floristic
164 grid mapping, where false absence data are the rule^{66,67}. In contrast to time series at broader spatial
165 scales, vegetation-plot time series contain information on species co-occurrence at scales relevant
166 for direct biotic interactions among individuals⁶⁸. An additional advantage of vegetation-plot records
167 is that they report the relative abundance of species, in the case of vegetation records from
168 Germany, typically assessed as cover values^{69,65}. Thus, vegetation-plot records allow testing key
169 theories of biogeography, such as the abundance–range size relationship⁷⁰ or the relationship
170 between local abundance and niche breadth^{71,72}. Most importantly, several vegetation-plot time
171 series precede the onset of any other systematic plant species monitoring programme, such as for
172 example the monitoring of Natura 2000 sites in Europe, which only started in 2001⁷³. This is
173 particularly important because severe biodiversity loss may have already happened in the second
174 half of the 20th century, mainly brought about by shifts in the type and intensity of landuse as the
175 consequence of technical progress and societal changes⁷⁴. Finally, species-abundance data in plots
176 can be linked to functional information on species⁶⁵, which allows the interpretation of the
177 underlying ecological drivers of the changes observed and the consequences for ecosystem
178 functioning⁷⁵.

179 Based on the data described here we analysed for the first time the dynamics of losses and gains of
180 plant species⁷⁶. We showed that the difference in cover changes between decreasing and increasing
181 species results in biodiversity change even if species richness at the plot scale remains unchanged.
182 Two mechanisms are responsible for these changes. First, losses at the plot scale were more evenly
183 distributed among losing species than gains among winning species. Second, gains and losses in cover
184 were concentrated in different species, resulting in a higher number of losers than winners at the
185 spatial scale of Germany. The temporal extent of the data allowed us to demonstrate that most
186 species losses occurred already in the 1960s, affecting mostly species from mires and spring fens,
187 grasslands and arable land. Thus, these data already helped to shed light on the most important
188 mechanisms underlying biodiversity change in the second half of the 20th century.

189

190 **Data Records**

191 ReSurveyGermany is the most comprehensive compilation of repeated long-term vegetation plot
192 records from Germany to date, including published studies as well as surveys from grey literature
193 and nature conservation assessments. A list of all 92 projects included in the study is provided in
194 Table 1. A project might comprise one or several studies and focus on one or several vegetation
195 types, but typically carried out the surveys at the same times and with the same methodology. In
196 total, the projects comprise 1,794 vascular plant species recorded in 7,738 vegetation plots. The plots
197 were either marked with poles or magnets (permanent) or recovered from exact descriptions (semi-
198 permanent). In addition, there were also studies where plots were not matched in time but a set of
199 plots at a site was compared within another set of plots at the same site in the resurvey (community
200 comparison, Fig. 1). We only considered records with complete lists of vascular plants and
201 information on their relative abundance, which was mostly expressed as percentage cover⁷⁷. A
202 further important criterion for including a study was the existence of vegetation data for at least two
203 points in time, although the number of visits (i.e. vegetation records) per site ranged between two
204 and 54. The time span covered by each project is shown in Fig. 1. All records were made between

205 1927 and 2020. In total, ReSurvey Germany comprises 23,641 vegetation-plot records and 458,311
206 species cover records.

207 Plot locations are not evenly spread across Germany (Fig. 2). We assigned the individual plot
208 locations to the grid cells of the quadrants of German ordnance maps (“MTBQ,” 0°10′ × 0°6′,
209 approximately 5.6 km × 5.9 km in the centre of Germany), and tested whether the grid cells with
210 vegetation-plot time-series records differed from those without observations with respect to
211 population density, road density, urban cover, cropland cover and protected areas. This revealed that
212 the sampled grid cells were not representative for the whole area of Germany. Surprisingly, the
213 sampled grid cells showed significantly higher human population densities, road densities and urban
214 cover, while cover of cropland and the amount of protected area was lower (Table 2), which
215 indicates that the majority of time series was made in regions with higher human pressures. The lack
216 of spatial representativeness also becomes obvious when plotting maps of plot locations by the
217 decade of the times when they were visited (Fig. 3).

218 While we did not deliberately exclude certain habitat types, the data mainly consist of semi-natural
219 to intensively managed grasslands and forests. Thus, the time series in ReSurveyGermany are biased
220 with respect to habitat types. We assigned EUNIS habitat types to each plot record. This was
221 accomplished by using the expert system EUNIS-ESy⁷⁸ and the corresponding R code⁷⁹. Plot records
222 covered a total of 92 EUNIS habitat types out of the 150 ones distinguished for Germany. About 63%
223 of the 23,641 plot records came from grasslands (level 1 EUNIS habitat R, n=14,849), followed by
224 forests and other wooded lands (T, n= 5,440, 23%). In contrast, arable land (V, vegetated man-made
225 habitats), which makes up more than 36% of the land cover in Germany, was only represented by 3%
226 (816 plot records).

227

228 **Database organisation**

229 A separate database was created for each project that contributed data, using the data-management
230 software Turboveg 2⁸⁰. The database is composed of two main tables, following the structure of
231 Turboveg and common practice in vegetation science. The plot-species-abundance table contains six
232 fields as described in Table 3. It is linked to the plot metadata (header file) through
233 PROJECT_ID_RELEVE_NR, which is a unique Plot observation ID of a combination of PROJECT_ID (see
234 Table 1) and the plot observation ID (called RELEVE_NR), the name of the observed taxon
235 (TaxonName), the vertical layer (tree layer, shrub layer, herb layer, moss layer) in which the species
236 was observed (LAYER) and the taxon’s cover in the plot (Cover_Perc). The latter was obtained by
237 transforming the original cover classes in per cent cover. For example, the seven cover classes of
238 the Braun-Blanquet scale, r, +, 1, 2, 3, 4, 5 were transformed to 1%, 2%, 3%, 13%, 38%, 63%, 88%,
239 respectively. The other table is the so-called header file, which holds all important plot-level
240 information, such as plot sizes, geographic location and vegetation structure for each plot
241 observation ID (Table 4).

242 The taxon names in the plot-species-abundance table were standardised using German SL 1.3⁸¹. The
243 nomenclature for vascular plants followed Wisskirchen et al.⁸², with additional aggregations to higher
244 taxonomic levels according to German SL 1.3. As some authors recorded subspecies and other
245 infraspecific taxa, species were aggregated at the species level, using vegdata⁸³. Some closely related
246 species that, from our experience, are often mistaken in the field were merged at the aggregate or
247 genus level. Species aggregates were also used when different taxon names of the same aggregate
248 occurred in different projects, to prevent that the same taxon might appear under different taxon
249 names. We used our own R code to merge taxon names and the notation of the ESy expert system⁷⁸
250 to protocol all steps. The species harmonisation forms the first section of the ESy system and shows

251 which taxon names were aggregated under the name of a broader taxonomic concept (Table 5). In
252 addition, within single projects, we used customised aggregations and segregations when the same
253 taxa were reported with different taxonomic levels at different points in time in the same plot
254 resurvey IDs (Table 6). For example, in all years of a time series of a specific plot *Orchis militaris* was
255 reported but in one year *Orchis spec.* was recorded at the genus level. Unaccounted for, such a leap
256 between taxonomic levels within a time series would result in incorrect species change observations.
257 To avoid losing the predominating information at the species level by aggregating all records to
258 *Orchis*, we assumed that the taxon was also *Orchis militaris* in the particular year when only the
259 genus level was reported. If more than one taxon occurred in previous years, we equally distributed
260 the cover values among those taxa. This happened for example when a record was taken late in
261 spring when the two species *Anemone nemorosa* and *A. ranunculoides* could no longer be
262 distinguished.

263 The percentage cover values of the same aggregated taxon name of the same plot were merged,
264 assuming a random overlap of their cover values and making sure that the combined cover values
265 cannot exceed 100%⁷⁸. As not all projects had recorded cryptogams, we removed bryophytes and
266 lichens in all projects, using the vegdata package in R⁸³. As a result, the original list of 3,280 taxon
267 names that included bryophytes and lichens was reduced to 1,794 taxon names of vascular plants.
268 However, if data on lichens and bryophytes are required, they are available on request from the
269 respective dataset custodians (see Table 1).

270 The data structure of the header file of ReSurveyGermany follows the Turboveg 2 standard⁸⁰ and in
271 addition holds the fields of ReSurveyEurope (<http://euroveg.org/eva-database-re-survey-europe>)
272 (Table 4). The fields relevant for the resurvey are RS_PROJECT, which refers to the resurvey project in
273 Table 1. The header field RS_SITE holds the location name of plots and allows for a local geographical
274 scale aggregation of resurvey plots within projects. LOCALITY provides more details on the locality in
275 German

276 Within each project, the field RS_PLOT holds a plot resurvey ID that connects plot observations from
277 different times made on the same plot. In resurveys, there are also cases, where the previously
278 provided location was not precise enough. In these cases, resurveys often used several plots to
279 match one previous plot, resulting in a one-to-many relationship. If a set of plots at the same site was
280 compared with plot records from another point in time, this field is empty and the unique identifier
281 indicating which plots have to be matched is found in the field RS_SITE. We still keep the original
282 observation ID that a plot received when it was surveyed (RS_OBSERV). We report the exact DATE
283 when a record was made (if available). In addition, the field YEAR lists the year in which the plot was
284 (re)surveyed. If available, we also report the year of the underlying publication (YEAR_PUBL).

285 Plot area (SURF_AREA) ranges from 0.5 to 2500 m², with 25, 100 and 400 m² being the most
286 frequently used plot sizes (Fig. 4). Plot sizes larger than 100 m² were typical of forest sites (with a
287 very few exceptions).

288 Geographic information is given by LONGITUDE, LATITUDE and ALTITUDE. Current monitoring
289 programs and data protection of land owners do not allow us to provide location information at the
290 highest available precision. In addition, some records contain occurrence data of rare and protected
291 species. Thus, information on longitude and latitude was rounded to two decimal digits. Compared to
292 the coordinates at highest available precision, rounding resulted in a mean uncertainty of 371 m (\pm
293 138 m standard deviation), and thus, is within the somewhat limited range of accuracy provided by
294 many custodians in the first place (see field PRECISION). If more precise coordinates are required for
295 certain analysis we recommend to contact the respective data owners (as shown in Table 1).

296 Vegetation-plot time series differ with respect to the accuracy of the plot relocation during the

297 resurvey. In the ideal case, plots are permanently marked, using poles, metal tent pegs or magnets
298 and metal detectors to retrieve their position (shown as “01” in the LOC_METHOD field, Table 4). In
299 other cases, plots only have exact coordinates (using GPS coordinates, “03” or “04”) or other ways of
300 descriptions of the exact locality (such as from maps, “05”), but are not marked on the ground, which
301 we refer to as semi-permanent plots. In addition, there is information on the cover scale used for the
302 record, a reference to the data source (or, if published, the publication ID), including the table and
303 column from which the data were taken.

304

305 The orientation of the plot can be taken from SLOPE (inclination) and slope ASPECT (compass
306 directions). Vegetation structure is described by the height and cover of the different layers, ranging
307 from tree layer to moss layer and including information on cover of litter and bare soil (if available).

308

309 Some of our projects included experimental treatments with different management of habitats (e.g.
310 abandonment or establishment of grazing, succession and disturbance). Plots with experimental
311 manipulation contain “Y” in the MANIPULATE) field. The type of manipulation can be taken from
312 MANIPTYPE. When projects involved treatments that are not representative for biodiversity change
313 in the study, we included only the control plots⁴⁴, plots that reflected the predominant land use at
314 the site (e.g. mowing for a grassland to counteract natural succession)²⁰, that were unfenced⁸⁴ or
315 were subjected to continuous grazing⁸⁵.

316

317 **Usage notes**

318 The data of the ReSurveyGermany dataset as described above is available
319 <https://doi.org/10.25829/ivid.3508-c17blk> under the terms specified by CC BY 4.0.

320 [Please note that the link is not yet activated, which will happen around May 25th, 2022. In the
321 meantime you can already access the metadata via

322 <https://idata.idiv.de/ddm/Data/ShowData/3508?version=0> and the full dataset here:

323 <https://cloud.uni-halle.de/s/wei1ljqnq2Wet0A>

324 [This part marked in yellow will then be deleted from the paper]

325 Users are urged to cite the original sources when using ReSurveyGermany in addition to the present
326 paper (see Table 1). As some of the time series will be continued, it might be useful to contact the
327 respective data owners. As described above, the dataset cannot be considered representative of
328 Germany’s vegetation, neither spatially, nor temporally, which is typical of vegetation-plot time
329 series⁸⁶. As plots were established with different objectives in different habitats at different points in
330 time, analysis of vegetation-plot resurveys faces various methodological challenges⁶⁰. Yet, we note
331 that ReSurveyGermany covers about 60% of the 2,988 vascular plant species that occur in Germany
332 (without subspecies and segregates⁸²) and includes rare habitats which often harbour rare plant
333 species. This means that even if our sites are not fully representative of the vegetation of Germany
334 and its change over the last century, the data nevertheless give important insights into biodiversity
335 change at the level of local communities and individual species.

336

337 **Code availability**

338 The R code to read the plot-species-abundance file (ReSurveyGermany.csv) and combine it with the
339 header data (Header_ReSurveyGermany.csv) is provided on [https://github.com/idiv-](https://github.com/idiv-biodiversity/Read_ReSurveyGermany)
340 [biodiversity/Read_ReSurveyGermany](https://github.com/idiv-biodiversity/Read_ReSurveyGermany).

341

342 **Acknowledgments**

343 We are grateful to surveyors who recorded vegetation in the field and provided these data. We
344 acknowledge those data contributors who made their data available to us or helped in recording
345 these data: Thea Dittmann, Alexandra Erfmeier, Bernd Gerken, Kerstin Günther, Sabine Heinz,
346 Wilfried Hakes, Heike Heklau, Alfons Henrichfreise, Elisabeth Hüllbusch, Andreas Huwer, Anneke
347 Immoor, Sophie Luise Kühn, Benjamin Krause, Sebastian Leonhardt, Thomas Meineke, Jutta Rach,
348 Jennifer Reinecke, Ulrich Scheidel and Immo Vollmer. We thank Diana Bowler for her analysis of
349 spatial representativeness. The assistance of the iDiv Data & Code Unit (Anahita Kazem, Ludmilla
350 Figueiredo) for archiving the dataset is greatly acknowledged. We very much appreciate the support
351 for the strategic project sMon by the German Centre for Integrative Biodiversity Research (iDiv)
352 Halle-Jena-Leipzig, funded by the German Research Foundation (DFG-FZT 118, 202548816).

566

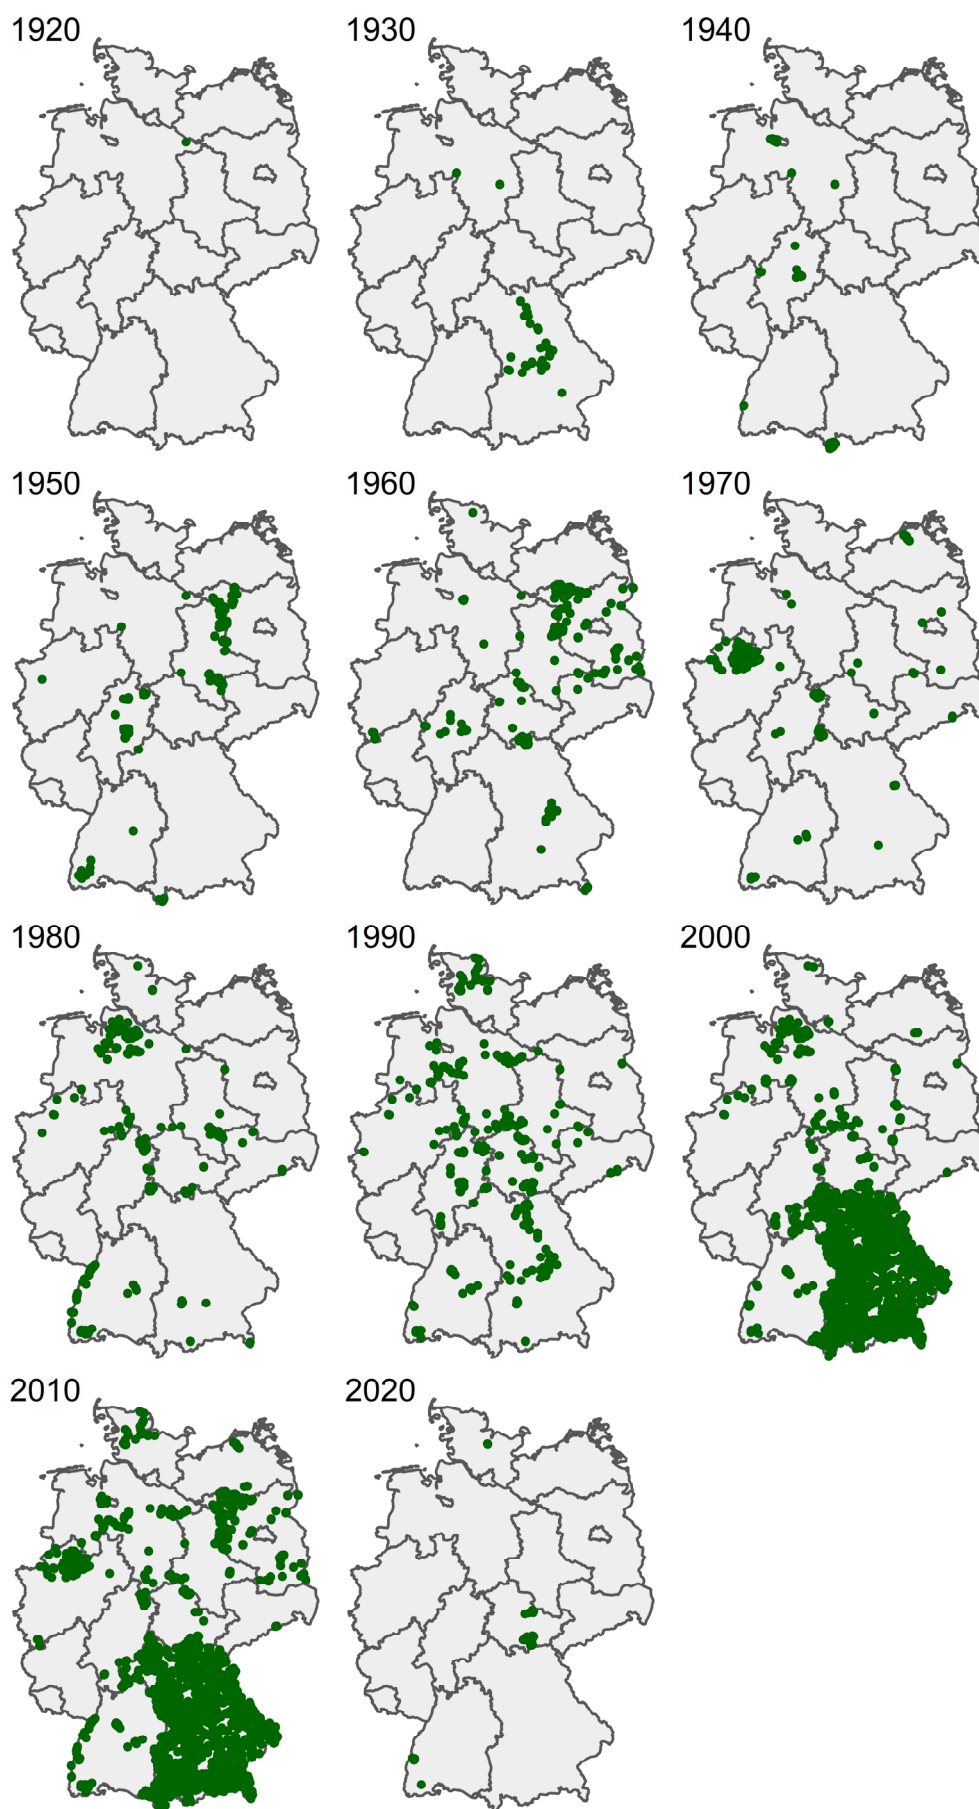

567 Fig. 1: Temporal coverage of the 92 projects included in the study. The coloured lines indicate the
 568 start and the end of a project, black diamonds show in which years surveys were made. Resurvey
 569 type refers to either studies that were repeated within a particular community across a site without
 570 attempts to match plots (community comparison), or were carried out on matched plots, which were
 571 either permanently marked or retrieved from exact descriptions (semi-permanent). The lower graph
 572 shows the number of times a particular year was included in the covered time span of any of the
 573 projects. For a list of projects see Table 1.

574

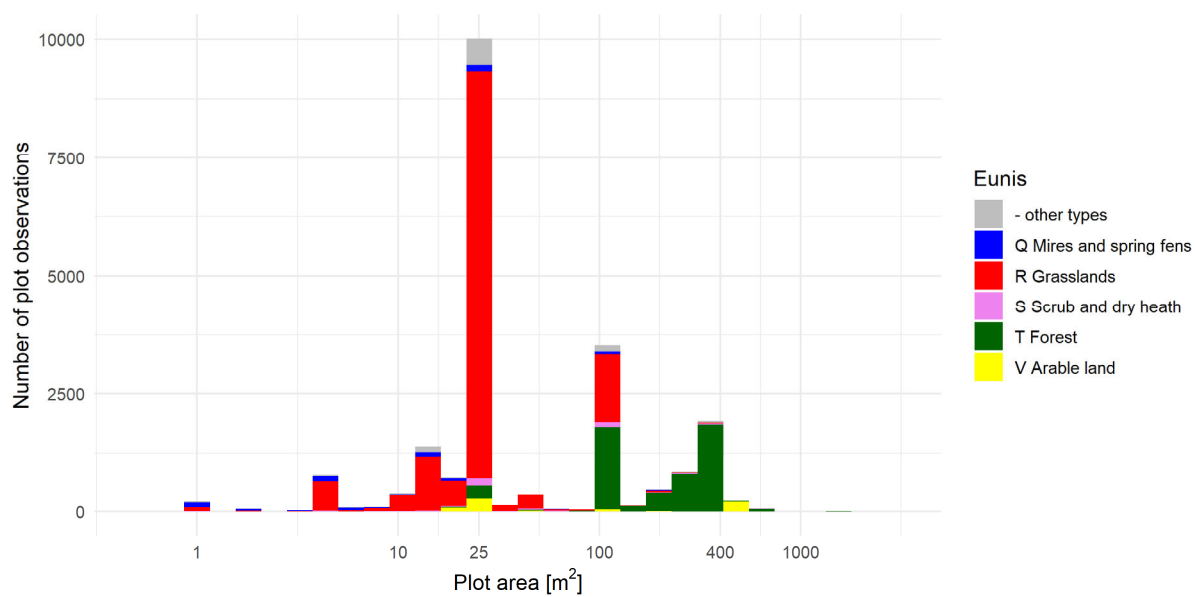

575

576 Fig. 2: Map of all plots of all projects (n=23,641). Note that green dots may represent one or several
577 plots which were summarised under the same plot resurvey ID (n=7,738). The more complete
578 coverage of Bavaria resulted from including the grassland monitoring Bavaria which started in 2002
579 ²⁴.

580

581 Fig. 3: Map of plot visits by decade, with the year showing the begin of the decade.

582

583 Fig. 4: Histogram of plot size across all records (n=23,641). Colours show Eunis level 1 habitat types.

584

585 Table 1: List of all projects included in this study. PROJECT_ID: internal reference number.
 586 EUNIS habitat types of time series were assigned to the habitat type by using the earliest
 587 plot record that resulted in level 3 EUNIS classification. The classification was based on the
 588 EUNIS-ESy expert system⁷⁸ using the R code implementation⁷⁹. If a project included several
 589 habitat types, they are shown in decreasing numbers of plot records. Code for habitat types
 590 are ?: plots not assigned to any level 3 EUNIS habitat type, +: assigned to more than one
 591 level 3 EUNIS habitat type, A: Marine habitats, C: Inland surface waters, H: Inland sparsely
 592 vegetated habitats or devoid of vegetation, N: Coastal habitats, Q: Wetlands, R: Grasslands
 593 and lands dominated by forbs, mosses or lichens, S: Heathlands, scrub and tundra, T: Forests
 594 and other wooded land, V: Vegetated man-made habitats, including arable land.

PROJECT_ID	Project Name	Reference	EUNIS habitat type

Table 2: Representativeness of grid cells (“MTBQ,” 0°10′ × 0°6′) with time series. The estimates were obtained from linear models comparing samples with unsampled MTBQs with respect to population density, road density, urban cover, cropland cover and protected area.

Predictors	Population density			Road density			Urban cover			Cropland cover			Protected area		
	Estimates	CI	p	Estimates	CI	p	Estimates	CI	p	Estimates	CI	p	Estimates	CI	p
(Intercept)	30547	30128 – 309645	<0.001	1.59	1.55 – 1.63	<0.001	0.07	0.06 – 0.07	<0.001	0.45	0.44 – 0.45	<0.001	0.01	0.01 – 0.01	<0.001
type [unsampled]	-6686	-7447 – -5925	<0.001	-0.52	-0.59 – -0.45	<0.001	-0.03	-0.03 – -0.03	<0.001	0.01	0.00 – 0.02	0.029	0.01	0.01 – 0.01	<0.001
Observations	11226			25303			12024			12024			29535		
R ² /R ² adjusted	0.026 / 0.026			0.008 / 0.008			0.019 / 0.019			0.000 / 0.000			0.038 / 0.038		

Table 3: Data structure of the Plot-species-abundance file of ReSurveyGermany. For Type: C = character, N = numeric, I = integer (n=23,641)

Field name	Type	Description
PROJECT_ID	I	Number of the resurvey project in ReSurveyGermany; see Table 1
RELEVE_NR	I	Plot observation ID, only unique within a RS_PROJECT, usually the original plot observation ID from the underlying Turboveg 2 database
PROJECT_ID _RELEVE_NR	C	Unique Plot observation ID, by which the project's plot-species-abundance file is linked to the header file, combination of PROJECT_ID and RELEVE_NR
LAYER	I	0: No layer, 1: Tree layer (uppermost), 2: Tree layer (middle), 3: Tree layer (lowest), 4: Shrub layer (uppermost), 5: Shrub layer (low), 6: Herb layer, 7: Juveniles, 8: Seedling (< 1 year), 9: Moss layer.
TaxonName	C	Harmonized taxon name
Cover_Perc	C	Cover of the taxon in per cent

Table 4: Data structure of the header file of ReSurveyGermany. For Type: C = character, N = numeric, I = integer. Per cent of NA values is given by dividing the number of NAs by (n=23,641)

Field name	Type	Description	Number of NAs
RS_PROJECT	C	Unique name of the resurvey project; for the list of the 92 projects and the underlying references see Table 1	0
PROJECT_ID	I	Number of the resurvey project in ReSurveyGermany; see Table 1	0
RS_PLOT	C	Unique (within the site) code of the resurveyed plot; it is used to pair observations from different times recorded in the same plot; gives a unique identifier for the resurveyed plot or set of plots in time if combined with RS_PROJECT. Several plots in the same year might have the same RS_PLOT code if they have to be summarised for temporal comparisons. In these cases, they might also contain the community name.	0
RS_SITE	C	Name of the resurveyed site. For further details see LOCALITY.	0
LOCALITY	C	More detailed description of the locality of the resurveyed site (in German and if available)	8,499
RS_OBSERV	C	Unique code of the one-time observation; combination of RS_SITE, RS_PLOT, YEAR	0
RELEVE_NR	I	Plot observation ID, only unique within a RS_PROJECT, usually the original plot observation ID from the underlying Turboveg 2 database	0
PROJECT_ID _RELEVE_NR	C	Unique Plot observation ID, by which the project's plot-species-abundance file is linked to the header file, combination of PROJECT_ID and RELEVE_NR	0
DATE	C	Date of the record (YYYYMMDD); the exact date if provided by the author, otherwise only the year and month or only year; if the year was not provided by the author, we took the year of the publication	0
YEAR	I	Year of the record (YYYY), extracted from DATE	0
SURF_AREA	N	Plot size [m ²] (only stated if available)	2064

MANIPULAT E	C	Binary information (Y/N) about whether the plot was part of a manipulative experiment (“Y”) or not (“N”). If “Y”, we chose the treatments representing the ambient land use. Observations with NA were to our knowledge not part of an experiment, and thus, can be treated as “N”.	15,020
MANIPTYPE	C	Shows the type of treatment in the plot manipulation (partly in German and only if available).	20,255
LAND_USE	C	Land use, often identical with MANIPTYPE (mostly in German, also using the abbreviations used in the particular study, and only if available)	18,149
LOC_METHO D	C	Method of plot (re-)location, 1: Permanently marked plot isolated (i.e. somewhere within the site), 2: Marked plot in a grid (i.e. with regularly spaced neighbor plots), 3: Location with differential GPS, 4: Location with GPS, 5: Location from accurate map, 6; Location from a description, 7: Other	12,607
LOC_METH_ COMMENT	C	Detailed description of the location method (if available)	20,163
LONGITUDE	N	Longitude of the plot in decimal degrees, coordinate system WGS-84; this coordinate should refer to the centre of the plot; coordinates were rounded to 2 digits of decimal degrees.	0
LATITUDE	N	Latitude of the plot in decimal degrees, rounded to 2 digits as LONGITUDE	0
PRECISION	I	Uncertainty in m, of coordinates for geographic position of plots, provided by the author or estimated if coordinates were taken from a topographic map. PRECISION refers to the true coordinates, not to those rounded to two digits.	13,034
GEO_LEV	C	Method of how the geographic location was obtained: GPS = Geographical positioning system, MTB = center of the German ordnance map, MTB_4 = center of a quadrant of the German ordnance map, POINT = all other	0
ALTITUDE	I	Elevation [m] (if available)	14,723
ASPECT	N	Compass direction of the slope in degrees [°], 0° = N, 90°=E etc. NA shows plot records either without aspect information or with aspect information when SLOPE is 0.	16,572
SLOPE	I	Inclination of the slope in degrees [°]	18,962

COUNTRY	C	DE for Germany	0
EUNIS		EUNIS level 3 code of the habitat, as obtained by applying the expert system EUNIS-ESy ⁷⁸ and the corresponding R code ⁷⁹ .	0
COVERSCALE	C	Cover scale used for the plot record. 00 = no scale, cover estimated in per cent (%), 01 = Braun/Blanquet (old), 02 = Braun/Blanquet (new), 03 = Londo, 04 = Presence/Absence, 10 = Reichelt & Wilmanns 1973 (short), 26 = Londo (short), 29 = Londo per cent classes, 30 = Londo (modified, in project 9, Sperle et al. unpublished), 31 = Maas & Kohler 1983 (in project 86, Poschlod et al. 2010), 50 = Londo (modified, in project 89, Bruelheide & Luginbühl 2009)	0
REFERENCE	C	Reference number in GVRD, 6 digits referring to the bibliographic reference, found in ReSurveyGermanyReference.csv	51
YEAR_PUBL	I	Year of the publication (if available)	18,057
TABLE_NR	C	Number of the table in the original publication	12,659
TABNAME		Name of the table in the original publication	8,402
NR_IN_TAB	C	Column name in the TABLE_NR	3,789
ORIG_NR		Name of the plot given by the author in the original publication	10,172
ORIG_DB		Name of original Turboveg file, to be used internally for backtracking changes	19,700
COV_TOTAL	I	Total cover of all layers [%] (if available)	18,704
COV_TREES	I	Cover of the tree layer [%] (if available)	20,554

COV_SHRUB S	I	Cover of the shrub layer [%] (if available)	20,520
COV_HERBS	I	Cover of the herb layer [%] (if available)	11,964
COV_MOSSE S	I	Cover of the moss layer (bryophytes and lichens) [%] (if available)	17,512
COV_LITTER	I	Cover of the litter layer on the ground [%] (if available)	20,786
COV_ROCK	I	Cover of the rocks on the plot surface [%] (if available)	21,697
TREE_HIGH	I	Height of the upper tree layer [m] (if available)	22,317
TREE_LOW	I	Height of the lower tree layer [m] (if available)	23,107
SHRUB_HIG H	N	Height of the upper shrub layer [m] (if available)	22,848
SHRUB_LOW	N	Height of the lower shrub layer [m] (if available)	23,478
HERB_HIGH		Mean height of the upper herb layer [cm] (if available)	20,311
HERB_LOW		Mean height of the lower herb layer [cm] (if available)	22,317
HERB_MAX		Maximum height of the herb layer [cm] (if available)	22,627

Table 5: List of all taxa that were harmonised across all projects. The format of the list follows the rules of the ESy system⁷⁸. The taxon names that were aggregated below a broader concept name are indented using five blanks. The number to the right shows the German SL 1.3⁸¹ number for each taxon.

Table 6: List of all taxon names that were adapted within projects, in addition to the harmonisation across all projects, as shown in Table 4. PROJECT_ID and Project_Name refer to the project in Table 1, RS_PLOT is the plot resurvey ID, which identifies the groups of plots compared in time, RELEVE_NR is the plot observation ID in the Turboveg 2 database (Table 4). Taxon_name_old is the name given by the original author, while Taxon_name_new_1 and Taxon_name_new_2 refer to newly assigned taxon names. In case of two new names the cover values of the old taxon were equally divided among the two new taxa.

PROJECT_ID	Project_Name	RS_Plot	RELEVE_NR	Taxon_name_old	Taxon_name_new_1	Taxon_name_new_2
