Your Bolton Surgical Instrument Catalogue

Thank you for choosing the Bolton Surgical Instrument Catalogue Edition 3. This edition has been updated to include many new products. We are confident our customers will find everything they need to meet their surgical instrument requirements.

The Bolton Surgical Instrument Catalogue showcases a comprehensive range of surgical instruments encompassing many disciplines of surgery. As a direct result of our ethos for innovation and continuous improvement, our product ranges are continuously reviewed and maintained to ensure we always offer customers the widest choice of products relevant to individual needs.

About this Catalogue

Design

We have designed this catalogue to enable customers to find the exact product they require quickly and simply. We have catalogued each product by discipline of surgery and then by the generic type of instrument. Each generic heading and the products listed within it are all in alphabetical order.

Indexing

We have created three indices, these can be found at the back of the catalogue. Customers can search by generic type of product (e.g Artery Forcep), product description or catalogue number.

Photography

We have used high quality photographs of the actual products in this catalogue and added a close-up image of working ends, jaws etc. to show more detail wherever possible. We have also added more detailed product descriptions and dimensions to help customers when choosing the correct product.

Useful Information

Customers will find conversion tables at the front of the catalogue together with a handy ruler and protractor to check lengths and angles. We have also included a guide to jaw types and Tungsten Carbide jaw serration specifications.

Latest Product Information

Customers can check all the very latest product listings, specifications and information by visiting our website at www.boltons.co.uk.

GUIDE TO TUNGSTEN CARBIDE (DIAMOND) JAW SELECTION AND SUTURE/NEEDLE SIZES

Tungsten Carbide Jaw Inserts are available in a range of types and styles, designed to sustain their edge and needle-holding ability.

A Bolton Surgical Tungsten Carbide Jaw will typically last 10 times longer than a standard stainless steel jaw, when used and processed correctly.

Bolton Surgical Tungsten Carbide Jaw inserts are milled, providing uniform serrations which improve stability when grasping needles and sutures.

Please use the guide below to select the correct Jaw Pitch for the Suture/Needle Size requirement.

				
2500 TEETH PER SQ"	3600 TEETH PER SQ"	7000 TEETH PER SQ"	MICRO FINE JAW	SMOOTH
Large diamond-cut serrations, for use with heavier needles and sutures	Medium diamond-cut serrations, for use with finer sutures	Extra Fine diamond-cut serrations, for use with delicate sutures	Tiny particles metallurgically bonded to the jaw to create a super fine textured surface for delicate sutures	Plain, smooth surface, reduces damage to delicate needles and sutures

GENERAL GUIDELINES FOR MAINTENANCE AND HANDLING OF BOLTON SURGICAL INSTRUMENTS

The correct care and maintenance of your Bolton Surgical Instruments is vital to ensure a long lasting instrument that maintains its effectiveness during use.

We pride ourselves on our workmanship and attention to detail. Our instruments will provide years of service to you, the customer, if they are treated correctly.

We have listed below our basic guidelines for Care and Maintenance. For a more comprehensive guide please refer to the Instructions for Use supplied with all products, these are also available by visiting our website at www.boltons.co.uk.

- All products are 100% checked for quality and functionality before despatch, nevertheless, new instruments should be carefully checked upon receipt. Actuate the instruments and visually check them before passing them for cleaning
- Follow manufacturer's instructions for cleaning and sterilization solutions and washer/dryer equipment, following local protocols where necessary
- Always handle instruments with great care. They are designed for a specific function (i.e Clamping, Cutting, Retracting etc.) and each instrument is given an exact and precise final set after manufacturing to ensure maximum fitness for purpose
- To minimise damage during processing, instruments should be laid gently into position, rough handling will result in damage
- Treat delicate and micro instruments with special care, use a hand cleaning method if appropriate
- Instruments should only be used for their intended purpose and by appropriately qualified clinicians
- Always perform a detailed inspection of each instrument after use. Look for staining, freedom of movement on all moving parts, damage and corrosion. Any instrument failing this inspection should be removed from circulation and sent for repair (visit our website for full details of our repair and maintenance services)
- All joints should be rinsed and dried thoroughly after cleaning and an approved soluble lubricant applied
- Soiling on used instruments should not be allowed to dry. Blood, saline and iodine are the most difficult to remove, if instruments are left in a dry prolonged state this could result in loss of passivation and rusting
- Avoid wherever possible processing instruments made from dissimilar materials together, to reduce the risk of galvanic corrosion
- Perform an immediate inspection after the initial cleaning process to identify and remove any residual particles
- Instruments with box and screw joints should be cleaned in the open position. Where possible suspend bowed instruments on an instrument pin or similar device
- Always ensure heavy equipment is placed at the bottom, beneath lighter, more delicate instruments
- Do not use abrasive material for cleaning as this can damage the steel surface and encourage pitting and corrosion
- Any instrument with a cannulated part should be thoroughly flushed out prior to the cleaning and sterilisation process

For care and maintenance of Fibre-optic products please ask your sales consultant, agent or distributor for our Care and Data Sheet for Fibre Optic Products, this is also available to download from our website at www.boltons.co.uk.

Designed and developed in conjunction with Professor Bill Heald OBE MChir FRCS, Heald Mesorectal Retractors are designed for optimum retraction, and uninterrupted views of the surgery site.

The Heald Retractor (pictured on the right) has a convex blade, as opposed to the usual concave blade of the St Marks Retractor, thus enabling easier dissection of the Mesorectum by encompassing it, allowing extended views of the Pelvic Floor.

The St Marks Heald Retractor (pictured on the left) has an angled lower blade, making it ideal for Bladder and sidewall retraction.

Designed to be used in pairs, use one of each retractor, from a choice of unique lengths and widths. All Heald retractors are fitted with a removable fibre light, providing illumination to the area of surgery.
