

DATE: September 27, 2017
TO: All County Agricultural Commissioners
FROM: Plant Health and Pest Prevention Services
SUBJECT: **AQW Pest Report No. 35-2017**
Weekly AQW Report: For the week of August 24-30, 2017

Attached is the report for all A, Q and W pests intercepted or detected in California from August 24-30, 2017. Pests are identified by the California Department of Food and Agriculture's Plant Pest Diagnostics (PPD) Laboratory.

San Diego County Interception

PDRs: 370P06678366-8367

On August 28, 2017, San Diego County Inspector Gregory Terhall and USDA Compliance Officer Zachary Teachout conducted a trace back inspection at Dos Gringos Flower Company in Vista. Inspector Terhall and Officer Teachout inspected 32 boxes of *Gaultheria shallon* (salal) cut foliage shipped from Pacific Tradeworks, LLC, of Washington. The shipment was properly marked and certified.

Infested *Gaultheria shallon* cut foliage from Washington; photo courtesy of San Diego County

Upon inspection of the shipment, Inspector Terhall and Officer Teachout found a suspect pest on the cut foliage.

A pest sample was submitted to the PPD Laboratory for identification and identified as A-rated *Parmarion martensi* (semi-slug).

A notice of rejection was issued for the violation of California Food and Agricultural Code (FAC) [Section 6461.5](#) (live pests) and the shipment was destroyed.

Economic Impact ^{1/}: "*Parmarion martensi* is an efficient vector of the parasitic nematode that causes rat lungworm disease in humans. The semi-slug often feeds on green plants such as lettuce, contaminating the produce with nematodes that can be present in tiny immature semi-slugs or slime. This could have significant impacts on California's salad industry. Although the semi-slug is not known to be on any quarantine list, its presence in the state may affect markets for California produce if any of it were found to be contaminated with rat lungworm disease. This may lower crop yields if produce were unmarketable and increase crop production costs as growers ensure that fields are free from *Parmarion martensi*."

Los Angeles County Dog Team Interceptions

PDRs: 190P06620122-0124

On August 25, 2017, Los Angeles County Dog Team Handler/Inspector Lauren Eckert with dog Sedona and Inspector Rogelio Carranza intercepted unmarked and uncertified boxes of *Smilax* sp. cut foliage for decoration from Mississippi at the FedEx sort facility in Los Angeles.

Infested cut foliage from Mississippi; photo courtesy of Los Angeles County

Upon inspection of the boxes containing the cut foliage, Inspector Carranza found several suspect pests.

Pest samples were submitted to the PPD Laboratory for identification and identified as Q-rated *Phosphila turbulenta* (moth larvae) PDR: 190P06620122, 0123, and Q-rated *Darapsa* sp. (Virginia creeper sphinx) PDR: 190P06620124.

A notice of rejection was issued for the violation of California FAC [Section 6461.5](#) (live pests). The shipment of cut foliage was destroyed via freezing at South Gate office in Los Angeles County.

Balloon Plant Gets Stopped and Identified

PDR: BE0P06666758

On August 18, 2017, a private vehicle from Salt Lake City, Utah, entered the Benton Border Protection Station. Inspector Barbara Lane initiated an inspection and found one suspect weed plant in the vehicle.

This *Gomphocarpus physocarpus* plant was intercepted recently by Inspector Lane; photo courtesy of the Benton Station

Due to the suspicion, the driver was notified that the plant was quarantined and would not be admissible into California, due to California FAC [Section 6341](#) (seed pests). The driver complied and relinquished the plant over to Inspector Lane.

The plant was collected and submitted to the PPD Botany Lab and was identified as Q-rated *Gomphocarpus physocarpus* (balloon plant). As a procedure, the plant was destroyed and disposed of in an approved manner at the station.

Gomphocarpus physocarpus²: “(common names) Balloon plant, balloon cotton bush, balloon milkweed, cape cotton, cotton bush, swan plant, wild cotton; this invasive plant is native to South Africa. The risk of introduction of *Gomphocarpus physocarpus* is high because this species is often planted as an ornamental and medicinal plant and produces large numbers of seeds which can be easily dispersed by wind, its probability of escaping from cultivation and colonizing new habitats is high.”
