VOCs	volatile organic compounds

## Introduction

This section describes the methodology and assumptions used to estimate criteria air pollutant, greenhouse gas (GHG) emissions and petroleum-based fuel use associated with the California Department of Food and Agriculture's (CDFA) Statewide Plant Pest Prevention and Management Program (Statewide Program) activities. Details for various data sources are also presented. The resulting estimates for air emissions and fuel use inventory are given for the baseline condition (i.e., average amounts generated by activities currently being conducted under the Statewide Program) and for the Proposed Program (i.e., anticipated amounts expected to be generated by future activities under the Statewide Program). Note that the emissions estimates include both activities conducted by CDFA and its contractors, as well as activities conducted by other parties (e.g., growers) in response to quarantines. Due to the methodology used, it was not possible to show these two categories of emissions separately.

These estimates have been used in making significance determinations in Section 6.2, Air Quality, and Section 6.4, Global Climate Change of the Final Program Environmental Impact Report (PEIR). Environmental settings for air quality and greenhouse gases also are discussed in those sections, respectively, and regulatory settings are provided in Appendix O, Regulatory Setting.

## Emissions Calculation Methodology

Air pollutant emissions from a given source or source category generally are calculated as the product of an emission rate, expressed as the amount of a pollutant emitted per some unit of source activity, and a measure of that source's activity. The following formula illustrates the basic relationship between the emissions rate (known as an emission factor) and source activity used to calculate emissions:

$$\text{Emissions} = \text{Emission Factor} \times \text{Source Activity}$$

This formula can be applied to calculate emissions from different source categories. For this analysis, emissions were calculated for activities that would use off-road equipment (e.g., tractors used for pesticide applications on farms), aircraft (infrequently used for activities such as sterile insect release), and on-road vehicles. A description of the methods, assumptions, and sources used to calculate the emissions for each of these source categories is provided below. The specific emission factors used for each source category are provided in Attachment G-1.

Emission factors were obtained for calendar years 2010, 2014, 2020, 2030 and 2035. To establish baseline conditions for CEQA analysis, 2010 represents the year in which the Notice of Preparation of the Draft PEIR was circulated, and 2014 represents the year that the Draft PEIR is to be publically circulated. Several future dates also were evaluated to represent regulatory effects on emissions in the future.

Baseline conditions were calculated by averaging readily available information from the period 2008 through 2010. Multiple years were chosen because activities have varied under

the Statewide Program in different years. Therefore, the average of these 3 years was considered to better represent a typical year under baseline conditions, as opposed to selecting one single year. It is possible that these particular years may have involved an unusually high or low amount of Statewide Program activities in a particular air basin. However, the location and intensity of Statewide Program activities is inherently highly variable from year to year, based on the locations of pest infestations and quarantines. For this reason, earlier years were considered for use in the analysis, but it was determined that they would not provide more representative data. In addition, the use of different years for the analysis would not change the overall impact conclusions for the Proposed Program.

If information was not readily available for 2008 and 2009, data from 2010 was used. Where information was not available for a given year, the average value between years that had activity was used since it was not always known if lack of information meant no activity or unavailable information.

Emissions have been estimated both for activities conducted by CDFA and its contractors, as well as activities conducted by other parties (e.g., growers) in response to quarantines. Off-road emissions are primarily related to quarantines.

## Off-Road Equipment Emissions

Off-road equipment is used in host removal activities and pesticide applications. Host removal primarily is conducted with hand tools and by other non-mechanized approaches. Several different types of equipment can be used to apply pesticides. This includes airblast sprayers, backpack sprayers, bait stations, fumigation sprayer, irrigation pumps, mechanically pressurized sprayers, STATIC, and tank sprayers. Equipment which uses manual mechanisms to operate (e.g., backpack sprayers, STATIC) does not have any off-road equipment emissions associated with it, and so has not been included in this analysis.

Emissions were estimated for the fuel-based off-road equipment used in different management activities that are listed in Table H-1. Emissions from tractor-mounted sprayers that are powered by a tractor engine were not calculated separately because these emissions were assumed to be included in tractor operation emissions. Additional sprayers and injectors, powered by electricity or compressed air tanks, also may be used during Statewide Program activities; however, emissions from such equipment likely are minor and thus were not considered in the emissions calculations.

**Table H-1. Fuel-Based Application Equipment Types for the Statewide Program**

Application Equipment	Horsepower	Load Factor
Agricultural Tractors	120	0.70
Off-Highway Trucks	372	0.38
Pumps	10	0.74
Sprayers	4	0.50
Aircraft	--	--

Note: Horsepower data were provided by CDFA; otherwise, they were assigned the default from OFFROAD2011. Load factors are from OFFROAD2011 defaults. Horsepower and load factor for aircraft is blank because this information is not required to calculate aircraft emissions.

### **Off-Road Equipment Emission Factors**

Off-road diesel equipment emission factors were calculated using emission factor and fuel consumption data from the California Air Resources Board's (CARB) In-Use Off-Road Equipment Inventory Model 2011 (commonly known as OFFROAD2011) and In-Use Off-Road Equipment Inventory Model 2007 (OFFROAD2007) models (CARB 2007, 2011). OFFROAD2007 was used for those equipment types that have not been updated by CARB in newer models, including agriculture equipment and small gasoline powered equipment.

### **Off-Road Equipment Activity**

The majority of off-road activity is associated with pesticide application. Various types of pesticide application methods exist for any given active ingredient. Many of the pesticide applications under the Statewide Program are conducted by individual growers; information is not available regarding the specific distribution of application methods used by these growers. Therefore, out of the range of application methods available for a given active ingredient contained in a pesticide, the application method with the highest emission intensity per pound of active ingredient was conservatively selected for each active ingredient. Furthermore, more than one type of pest may be controlled by a given active ingredient, and the application method with the highest emission intensity was used across pest control programs. The application rate of pounds of active ingredient per acre is consistent with the information used in Appendices A and B (Ecological Risk Assessment and Human Health Risk Assessment, respectively) and primarily is based on product labeling information.

Because most emission factors for off-road equipment are reported in units of grams per horsepower per hour, the amount of time off-road equipment would need to operate per acre treated was necessary to estimate emissions. Mobile off-road equipment was assumed to move at a rate of 3 miles per hour, at a width of 10 feet for sprayers and 20 feet for equipment moved with a tractor. From the equipment speed and width, the amount of time required to cover an acre was calculated. Drip irrigation pumps were assumed to operate for 7 hours per acre. Table H-2 shows the off-road equipment that was used to represent each active ingredient. In some instances, the application method with the highest emission intensity was aircraft. Aircraft emissions are detailed in the subsequent section. If the most intense application method varied by pollutant, the application method that had the most pollutants for a given active ingredient was selected.

**Table H-2. Applicant Equipment Assigned to Active Ingredients for the Statewide Program**

Active Ingredient	Equipment Type	Activity Rate	Units
1,2,4-Trimethylbenzene	Agricultural Tractors	16.67	hr/lb AI
1,2-propanediol	Sprayers	16.67	hr/lb AI
acetamiprid	Agricultural Tractors	2.38	hr/lb AI
Aliphatic hydrocarbons C9-C16	Agricultural Tractors	3.36	hr/lb AI
Alkyl biphenyl mixture	Agricultural Tractors	1.52	hr/lb AI

Active Ingredient	Equipment Type	Activity Rate	Units
carbaryl	Agricultural Tractors	0.20	hr/lb AI
Cumene	Sprayers	107.14	hr/lb AI
Cyclohexanone	Agricultural Tractors	5.00	hr/lb AI
cyfluthrin	Agricultural Tractors	8.00	hr/lb AI
Diatomaceous earth	Sprayers	2.45	hr/lb AI
diazinon	Sprayers	0.06	hr/lb AI
dinotefuran	Pumps	0.69	hr/lb AI
Fenpropathrin	Agricultural Tractors	0.50	hr/lb AI
Glycerin	Pumps	0.65	hr/lb AI
Glyphosate	Sprayers	0.96	hr/lb AI
Imidacloprid	Sprayers	11.28	hr/lb AI
kaolin clay	Agricultural Tractors	10.53	hr/lb AI
lambda-cyhalothrin	Sprayers	8.72	hr/lb AI
malathion	Aircraft-spray	5.71	Acres/lb AI
methoxyfenozide	Sprayers	2.01	hr/lb AI
Naphthalene	Agricultural Tractors	28.57	hr/lb AI
Naphthalene sulfonic acid polymer	Agricultural Tractors	3.55	hr/lb AI
permethrin	Agricultural Tractors	1.00	hr/lb AI
pyrethrins	Agricultural Tractors	4.08	hr/lb AI
Quartz	Agricultural Tractors	20.00	hr/lb AI
silica gel	Agricultural Tractors	20.00	hr/lb AI
Solvent naphtha	Agricultural Tractors	1.81	hr/lb AI
Spinosad	Aircraft-spray	3,205.13	Acres/lb AI
Starch	Sprayers	2.45	hr/lb AI
Thiamethoxam	Sprayers	2.45	hr/lb AI
Xylenes	Sprayers	107.14	hr/lb AI

Notes:

hr = hour; lb = pound; AI - Active Ingredient

1. Activity rate is based on the application rate as specified by product information and consistent with the human health risk assessment prepared for this Final PEIR. It was assumed that mobile off-road equipment moved at a rate of 3 miles per hour and width of 10 feet for sprayers, 20 feet for equipment moved with a tractor. From the equipment speed and width, the amount of time required to cover an acre was calculated. Drip irrigation pumps were assumed to operate for 7 hours per acre.

The emission intensity per pound of active ingredient was combined with the total active ingredient pounds reported per county by the California Department of Pesticide

Regulation (CDPR) in its 2010 annual pesticide use report (CDPR 2011). CDPR's annual reports do not distinguish between use of an active ingredient under the Statewide Program versus use of that same active ingredient for other purposes, and no other readily available source exists for such information. Therefore, CDPR reports may include use of an active ingredient to control pests that are not part of the Statewide Program, or other activities which were not conducted under the Statewide Program. To help address this issue, this evaluation was restricted to the total pounds of active ingredient used in counties where Statewide Program-focused pests and/or host plants were known to exist in 2010, and those areas that had active quarantines or eradication activities conducted under the Statewide Program in 2010. The total pounds of active ingredients used to estimate emissions are shown in Table H-3.

For Proposed Program activities using off-road equipment, a similar intensity of activity initially was assumed to occur. The differences in final emissions in future years is a reflection of anticipated equipment fleet emission reductions that is expected to occur based on existing federal and state regulations. Although the analysis used various conservative assumptions to estimate emissions when specific values were unknown, these do not affect the conclusions based on the incremental change between the future and the baseline conditions because the same methodologies were used in both the baseline and future conditions estimates. Thus, any over- or under-estimation of emissions of the baseline condition resulting from the activities assumptions would be the same order of magnitude in the future.

### ***Aircraft Emissions***

Emissions were calculated for aircraft that are used in aerial release of biological control agents (BCAs) and for aerial spraying in nursery and agricultural (not residential) settings. For release of BCAs, a Beechcraft King Air 90A aircraft was selected as representative of the type of aircraft that may be used. A Robinson R44 helicopter was evaluated as an alternative. Aerial spraying in compliance with quarantines is generally infrequent, but has occurred in the past on a periodic basis under the Statewide Program. In the event that a grower might opt to spray his commodity by air to meet quarantine requirements, he would use a licensed pest control business. For the purposes of this analysis, use of a Fletcher FU-24A was assumed for such activities.

### **Aircraft Emission Factors**

CARB has developed weighted average emission factors from several types of aircraft and helicopters typically used in agricultural settings. This analysis used these weighted values in pounds per gallon of fuel (CARB 1990). Hydrocarbon emissions were assumed to be equal to reactive organic gases (ROGs). In addition, it was conservatively assumed that particulate matter (PM) represented both particulate matter with aerodynamic radius of 10 micrometers or less ( $PM_{10}$ ) and particulate matter with aerodynamic radius of 2.5 micrometers or less ( $PM_{2.5}$ ). GHG emissions were estimated based on the jet fuel emission factor from the Local Governments Operation Protocol (CARB 2010). To convert from acres of land sprayed to fuel consumption, a factor of 0.1053 gallons of fuel per acre was used, as recommended by the Bay Area Air Quality Management District (BAAQMD) to reflect the average fuel consumption during aerial spraying (BAAQMD 1999). It was conservatively assumed that aircraft emission factors would not change over time.

This page left intentionally blank.

**Table H-3. Active Ingredients Estimated Usage for the Statewide Program (2010)**

County	Active Ingredients Pounds																				Total			
	Acetophate	Acetamiprid	<i>B. thuringiensis, Kurstaki</i>	Bifenthrin	Carbaryl	Chlorantraniliprole	Chlorpyrifos	Cyfluthrin	Diazinon	Dinotefuran	Fenpropathrin	Imidacloprid	Lambda-cyhalothrin	Malathion	Methoxyfenozide	Methyl Bromide	Neem Oil	Permethrin	Pyrethrins	Spinosad	Spirotetramat	Tau-Fluvalinate	Thiamethoxam

## Notes:

ACP = Asian Citrus Psyllid; CDFA = California Department of Food and Agriculture; EGVM = European Grape Vine Moth; FF = fruit fly; GWSS = Glassy Winged Sharp Shooter; LBAM = Light Brown Apple Moth

1. Values designated as 0 represent less than 1 pound of active ingredient reported. Empty cells indicate that no active ingredients were used under the Statewide Program in 2010.

2. Counties not shown had no Statewide Program activities in 2010.

3. Pesticide use by county was obtained from CDPR's Pesticide Use database for 2010.

4. CDFA had quarantines in 2010 as follows:

GWSS quarantines: Fresno, Imperial, Kern, Los Angeles, Orange, Riverside, Sacramento, San Bernardino, San Diego, Santa Barbara, Santa Clara, Solano, Tulare, Ventura

ACP quarantines: Imperial, Los Angeles, Orange, Riverside, San Bernardino, San Diego, Santa Barbara, Ventura

Melon FF)quarantines: Kern

LBAM quarantines: Alameda, Contra Costa, Marin, Monterey, Napa, San Benito, San Francisco, San Joaquin, San Mateo, Santa Clara, Santa Cruz, Solano, Sonoma

EGVM quarantines: Fresno, Lake, Mendocino, Merced, Napa, San Joaquin, Santa Clara, Solano, Sonoma

5. CDFA indicated the following host plants (listed in CDPR's pesticide use database) should be selected for each of the following pest programs:

ACP: greenhouse-grown flowers, greens and container plants; outdoor container and field grown plants; regulatory pest control; unspecified outdoor containers and greenhouses; soil application, preplant-outdoor; all citrus; all ornamentals; commodity fumigation (for ACP-16); flavoring and/or spice crops; and uncultivated agricultural areas.

GWSS: greenhouse-grown container plants; outdoor grown transplant/propagative material; regulatory pest control; unspecified outdoor containers/greenhouses; soil application, preplant-outdoor; all citrus; all ornamentals; apply; asparagus; avocado; flavoring and/or spice crops; grape; leafy vegetables; lettuce; mango; olive; orchards; pea; pepper; persimmon; pistachio; plum; potting soil; sage; sorghum; sunflower; vegetables; and walnut.

LBAM: greenhouse-grown flowers, greens and container plants; outdoor container and field grown plants; outdoor grown transplant propagative material; regulatory pest control; unspecified outdoor containers/greenhouses; soil application, preplant-outdoor; alfalfa; almond; apple; apricot; bean; blackberry; blueberry; broad bean; broccoli; cabbage; carrot; celery; Chinese cabbage; common bean; corn; cucumber; grapes; mustard; olive pea; peach; pear; pepper; plum; potato; pumpkin; radish; raspberry; sage; strawberry; tomato; and walnut.

Melon FF: greenhouse-grown cut flowers, greens and plants in containers; outdoor container/field grown plants; outdoor grown transplant/propagative material; regulatory pest control; unspecified outdoor containers/greenhouses; all melon; apple; cantaloupe; cauliflower; commodity fumigation; eggplant; fumigation; mustard; orange; peppers; pumpkin; tomato.

Mediterranean FF: greenhouse-grown cut flowers, greens and plants in containers; outdoor container/field grown plants; outdoor grown transplant/propagative material; regulatory pest control; unspecified outdoor containers/greenhouses; apple; apricot; avocado; bell pepper; carambola (starfruit); coffee; dates; fig; grape; grapefruit; guava; lemon; lime; loquat; lychee; mango; nectarine; orange; papaya; peach; pear; persimmon; plum; pomegranate; pummelo (pomelo); quince; sapote; tangerine; tomato; and walnut.

EGVM: greenhouse-grown cut flowers, greens and plants in containers; outdoor grown container/field grown plants; outdoor grown transplant/propagative material; regulatory pest control; unspecified outdoor containers/greenhouses; grape; olive; pomegranate; stone fruit.

## Aircraft Activity

Aerial spraying is one potential application method for particular active ingredients in nursery and agricultural settings in response to quarantines under the Statewide Program. Similar to the estimation methods for activities involving off-road equipment, the emission intensity per pound of active ingredient was determined for the aircraft used in aerial spraying. If aircraft was the most intense emission application method, the application rate of pounds of active ingredient per acre, along with the pounds of active ingredient used based on the total active ingredient pounds reported in CDPR's 2010 annual pesticide use report (CDPR 2011), was used to estimate fuel consumption. This is likely to overestimate emissions, as typically less emission intense applicaton methods would be used, but was selected as a conservative (i.e., worst-case) estimate of emissions. See Table H-2 for active ingredients that assumed aerial spraying as the most intense emission application method.

Aerial release of sterile insects occurred for fruit flies and pink bollworm in the baseline. Data tracked by CDFA for Mediterranean fruit fly (Medfly) sterile insect releases included both fuel consumption and total flight hours. This was used to estimate the average fuel consumption per hour of flight—59.7 gallons of fuel per hour of flight. In contrast, CDFA only tracked the number of hours of flight for the pink bollworm, but this was assumed to have the same fuel consumption as the Medfly sterile insect release aircraft. When information was available for multiple years (2008 through 2010), a 3-year average was used to represent the baseline. In addition, various ground-based diesel support equipment (such as refridgerated trucks) was used for the Medfly sterile insect program. It was assumed that this was represented by the off-highway truck category in CARB's OFFROAD2011 model, discussed above. Table H-4 shows the aircraft activity information.

**Table H-4. Aircraft and Other Equipment Activity Usage for the Statewide Program Sterile Insect Release**

County	Fuel in Gallons	Equipment Type
Orange	472,637	Aircraft
Orange	5,902	Off-Highway Trucks
Imperial	2,515	Aircraft
Riverside	5,029	Aircraft

Notes:

IPC = Integrated Pest Control; Medfly = Mediterranean fruit fly; PBW = pink bollworm

1. Activity represents the average for 2008 through 2010, as provided by CDFA.
2. PBW data was provided in terms of hours of flight time. To convert to gallons of fuel, the average fuel consumption per hour from the Medfly program data was used: 59.7 gallons per hour.

For the purposes of developing an initial estimate of future Proposed Program emissions, a similar intensity of activity was assumed to occur. Although the analysis used various conservative assumptions to estimate emissions when specific values were unknown, these do not affect the conclusions based on the incremental change between the future and baseline conditions because the same methodologies were used in both the baseline and

future estimates. Thus, any over- or under-estimation of emissions of the baseline condition resulting from the activity assumptions would be the same order of magnitude in the future.

### ***On-Road Vehicle Emissions***

On-road vehicle emissions were estimated for survey, detection, and eradication activities and for other travel conducted by CDFA in administering the Statewide Program. This included CDFA staff or contractors traveling to residential areas to apply pesticides or set traps. Agricultural operations were assumed to generate no additional on-road vehicle miles beyond their normal activities in response to Statewide Program quarantines (off-road activity is addressed separately).

#### **On-Road Vehicle Emission Factors**

On-road vehicle emission factors were calculated using emission factor and fuel consumption data from the CARB EMFAC 2011 model (CARB 2013). Emission factors were obtained for calendar years 2010, 2014, 2020, 2030 and 2035. Emission factors were estimated on a statewide basis only and aggregated over all models and speeds for a given calendar year. Emission factors were used based on specific vehicle classes listed in EMFAC 2011, such as light-duty auto (LDA), light-duty trucks type 1 and 2 (LDT1 and LDT2), medium-duty vehicles (MDV), and light-heavy-duty trucks type 1 and 2 (LHDT1 and LHDT2).

#### **On-Road Vehicle Activity**

CDFA has estimates of vehicle miles traveled (VMT) for Statewide Program activities. For counties where multiple years were estimated by CDFA, an average of non-zero values was used for each county to represent the baseline condition. Multiple years were chosen because different activities occur under the Statewide Program in any given year. Therefore, the average of these 3 years was considered to better represent a typical year under baseline conditions, as opposed to selecting one single year. If information was given for combined counties, the VMT were allocated based on the ratio of total county acreage.

The vehicle classes associated with the VMT estimates for Statewide Program activities were provided in some cases, but not all. Table H-5 shows the VMT estimated for each county. In general, non-chemical spraying activities (e.g., detection surveys and use of traps) tended to use smaller vehicles, such as LDA, LDT1, LDT2, and MDVs. In general, chemical spraying activities used in residential eradication programs tended to use larger vehicles, such as MDV, LHDT1, and LHDT2. If a specific percentage breakdown of vehicle classes was available, this was used. If no specific breakdown was provided, the vehicle mix it was assumed to be 47.5 percent LDT1, 47.5 percent LDT2, and 5 percent MDV, with the exception of chemical spraying activities, for which the vehicle mix was assumed to be 33.3 percent MDV, 33.3 percent LHDT1, and 33.3 percent LHDT2 based on CDFA recommendations. The percentage of diesel versus gasoline vehicles was assumed to be the same as the EMFAC 2011 statewide distribution of fuel types for a specific vehicle class based on total VMT. Table H-6 shows the vehicle class assignments.

1. Ratios are based on information provided by CDFA. If no specific breakdown was provided, the vehicle mix was assumed to be 47.5% LDT1, 47.5% LDT2, and 5% MDV, with the exception of chemical spraying activities, for which the vehicle mix was assumed to be 33.3% MDV, 33.3% LHDT1, and 33.3% LHDT2.

Because information was generated in terms of total VMT rather than a specific number of trips and trip length, no value was available for the number of vehicle starts or number of vehicles. For the purposes of estimating starting and evaporative emissions, two starts per vehicle per day and a vehicle travel of 40 miles per day were assumed. This is a typical default value used for trips by workers or hauling equipment in rural areas (i.e., similar to highest value in CalEEMod (CAPCOA 2013)). A larger VMT traveled per vehicle per day would result in lower emissions since less starting emissions would occur.

For Proposed Program activities that use on-road vehicles, a similar intensity of activity initially was assumed to occur. The differences in final emissions in future years is a reflection of anticipated vehicle fleet emission reductions that would occur based on existing federal and state regulations.

### ***Fugitive Emissions***

Fugitive dust emissions from travel on roads and generated by other equipment used in the Statewide Program has not been estimated because it is indistinguishable from normal operations on roads and in agricultural areas. In addition, many thresholds used in CEQA significance determinations only consider exhaust emissions from vehicles and not fugitive dust. Pesticides can contain a large quantity of volatile organic compounds (VOCs), some of which are ROGs. ROGs in the atmosphere can react and form ozone. The amount of VOCs released into the atmosphere depends on the specific pesticide and the specific application method. CDPR has developed sophisticated methods to estimate the ROGs from pesticide use at the statewide level, based on CDPR's annual pesticide use data. The emission potential for each pesticide is not readily available from this data, and the specific application methods used for the majority of applications (including applications conducted under both the Statewide Program and otherwise) are not known. Therefore, it would be difficult and speculative to estimate the ROGs associated with pesticide use under the Statewide Program only. Furthermore, these emissions already are included in CDPR's emission estimates, and CDPR has implemented several emission reduction programs and policies to reduce VOCs from pesticides. CDPR is responsible for ensuring that VOCs from pesticide use is consistent with the State Implementation Plan for Pesticide Use.

## CEQA Significance Comparison

Because Statewide Program activities could increase in the future, an upper bound limit to future increases in activity and related emissions was developed. First, a baseline emission and future emission inventory was developed using the same activity assumptions if no specific change in activity was anticipated. This involved combining county-level information into air basin-specific emission totals. If a county was in multiple air basins, the county emissions were allocated based on the total area within a specific air basin, as shown in Table H-7.

Note:

1. Acreage is based on GIS shapefiles, available at State of California Geoportal

County	Air Basin	Ratio
( <a href="http://portal.gis.ca.gov/geoportal/catalog/main/home.page">http://portal.gis.ca.gov/geoportal/catalog/main/home.page</a> ).		

Next, a mass emission significance threshold was developed for each pollutant that was based on the most conservative values used by any air district. Significance thresholds are most important for those criteria pollutants and their precursors (ROGs and nitrogen oxides [ $\text{NO}_x$ ]) that have areas of non-attainment. Non-attainment areas in California occur most commonly for  $\text{PM}_{10}$ ,  $\text{PM}_{2.5}$ , and ozone precursors (ROGs and  $\text{NO}_x$ ). Several air districts in California have established significance threshold for operational emissions for CEQA projects (i.e., SJVAPCD 2012, BAAQMD 2010, SMAQMD 2009, and SCAQMD 2011). If the incremental increase in emissions for an activity compared to the baseline was below these annual thresholds, the impact of the activity would be less than significant. For this Final PEIR, the lowest annual emission threshold from several air districts was selected to apply to all air basins, as shown in Table H-8.

**Table H-8. CEQA Mass Emission Significance Thresholds**

Pollutant	Annual Operational Threshold	Units
CO	100	tons/year
$\text{NO}_x$	10	tons/year
ROGs	10	tons/year
$\text{PM}_{10}$	15	tons/year
$\text{PM}_{2.5}$	10	tons/year
$\text{SO}_x$	27	tons/year

This formed the basis for the significance conclusions and, if applicable, the mitigation measures.

No mass emission threshold was developed for GHG emissions. The GHG emissions thresholds was based on best performance standards.

## Program Activity Emissions

Tables H-9 through H-11 show the results of the emissions inventory by county for application equipment, aircraft and equipment used for sterile insect release, and on-road vehicles used to conduct the Statewide Program. Table H-12 shows the total gallons of fuel used statewide for each emission category. Table H-13 shows the emissions by air basin. This likely is an overestimation of the GHG emissions because no change occurs in GHG emission factors for off-road equipment and aircraft accounted at this time that make up the majority of the GHG emissions. The emissions in general decrease in future years if activity remains the same. This is due to existing regulations on vehicle equipment emission improvements and general equipment fleet turnover.

As previously described, future estimates are based on data from 2008 through 2010. It is possible that these particular years may have involved an unusually high or low amount of Statewide Program activities in a particular air basin. The location and intensity of Statewide Program activities is inherently highly variable from year to year, based on the locations of pest infestations and quarantines. For this reason, earlier years were considered for use in the analysis, but it was determined that they would not provide more representative data. In addition, the extent to which Proposed Program activities may result in increased emissions in the future compared to baseline Statewide Program activities is unknown. New pest infestations may occur in air basins where few infestations and related management activities have occurred in the past, or may occur in areas which have traditionally been the location of more pest infestations. In addition, shifts in the types of activities within an air basin could lead to shifts in emissions, where the activities have different emissions intensities (e.g., use of aircraft as opposed to trucks).

**Table H-9. Application Equipment Emissions by County**

Calendar Year	County	Tons of Pollutants						Metric Tons of Emissions			
		CO	NO <sub>x</sub>	ROGs	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>x</sub>	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	CO <sub>2</sub> e

**Notes:**

CH<sub>4</sub> = methane; CO = carbon monoxide; CO<sub>2</sub> = carbon dioxide; CO<sub>2</sub>e = carbon dioxide equivalent; NO<sub>x</sub> = nitrogen oxides;

N<sub>2</sub>O = nitrous oxide; PM<sub>10</sub> = particulate matter with aerodynamic radius 10 micrometers or less;

PM<sub>2.5</sub> = particulate matter with aerodynamic radius 2.5 micrometers or less; ROGs = reactive organic gases; SO<sub>x</sub> = sulfur oxides

1. To convert individual greenhouse gases to the carbon dioxide equivalent, the global warming potential from Table A-1 of 40 CFR Part 98 was used. For methane this is 25 and for nitrous oxide this is 298.

2. A zero with no decimal places means there were no emissions calculated for this county/pollutant. Counties not shown did not have CDFA Statewide Program quarantine or eradication activities in the baseline year.

**Table H-10. Sterile Insect Release Emissions by County**

## Notes:

CO = carbon monoxide; CO<sub>2</sub> = carbon dioxide; NO<sub>x</sub> = nitrogen oxides; N<sub>2</sub>O = nitrous oxide;PM<sub>10</sub> = particulate matter with aerodynamic radius 10 micrometers or less;PM<sub>2.5</sub> = particulate matter with aerodynamic radius 2.5 micrometers or less;ROGs = reactive organic gases; SO<sub>x</sub> = sulfur oxides

- Emissions are based on activity data provided by CDFA and emission factors from CARB EMFAC2011.

# Appendix I

---

List of Special Status Species in California

# Animals

---

State of California  
The Natural Resources Agency  
DEPARTMENT OF FISH AND GAME  
Biogeographic Data Branch  
California Natural Diversity Database

**SPECIAL ANIMALS (898 taxa)**  
January 2011

The California Natural Diversity Database (CNDDB) is a continually refined and updated, computerized inventory of location information on the most rare animals, plants, and natural communities in California. The blueprint used to set up the CNDDB was developed by The Nature Conservancy (TNC) in the early 1970's. The California program was started in 1979. TNC has helped to set up similar programs in all 50 states and a number of foreign countries. Collectively these programs are known as the Natural Heritage Network. The "Heritage Methodology" used by all of these programs sets the standards for the information we gather and the procedures we use. In 1999 TNC and the Natural Heritage Network jointly established an independent organization, the Association for Biodiversity Information (ABI), to achieve their mutual goal of using the wealth of biodiversity information in the Heritage Network to support conservation efforts. In November 2001 ABI changed its name to NatureServe. More information the Natural Heritage Network is available on the NatureServe web site: <http://www.natureserve.org>.

"Special Animals" is a general term that refers to all of the taxa the CNDDB is interested in tracking, regardless of their legal or protection status. This list is also referred to as the list of "species at risk" or "special status species". The Department of Fish and Game considers the taxa on this list to be those of greatest conservation need. The species on this list in 2005 were used in the development of California's Wildlife Action Plan (available at: <http://www.dfg.ca.gov/wildlife/WAP> )

The species on this list generally fall into one or more of the following categories:

- Officially listed or proposed for listing under the State and/or Federal Endangered Species Acts.
- State or Federal candidate for possible listing.
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the California Environmental Quality Act Guidelines. (More information on CEQA is available at [http://ceres.ca.gov/topic/env\\_law/ceqa/guidelines/](http://ceres.ca.gov/topic/env_law/ceqa/guidelines/))
- Taxa considered by the Department to be a Species of Special Concern (SSC)
- Taxa that are biologically rare, very restricted in distribution, declining throughout their range, or have a critical, vulnerable stage in their life cycle that warrants monitoring. There may be taxa that fall into this category but are not included on this list because their status has not been called to our attention.
- Populations in California that may be on the periphery of a taxon's range, but are threatened with extirpation in California.

- Taxa closely associated with a habitat that is declining in California at an alarming rate (e.g., wetlands, riparian, old growth forests, desert aquatic systems, native grasslands, vernal pools, etc.)
- Taxa designated as a special status, sensitive, or declining species by other state or federal agencies, or non-governmental organization (NGO).

Taxa marked with a “+” to the left of the scientific name are those for which there is location information in the CNDDB Geographic Information System (GIS), as of the date of this list.

Taxa with a “Yes” in the “Notes” column have more information in an end note at the back of the list.

Additional information on the CNDDB is available on the Department of Fish and Game web site at: <http://www.dfg.ca.gov/biogeodata/cnddb> .

Additional information on other Department resource management programs is available at: <http://www.dfg.ca.gov/about/resource-mgmt.html> . The Species Conservation & Recovery Program page at: <http://www.dfg.ca.gov/wildlife/nongame> is a particularly rich source of information including such topics as “Survey Standards and Guidelines”, “Threats to Wildlife”, “Habitats”, and “Plant and Animal Pictures”.

### **What is an Element Occurrence?**

An element Occurrence (EO) is a location where the element (species) has been documented to occur. **An EO is not a population**, but it may indicate that a population is present in that area; and a single population may be represented by more than one EO. An EO is based upon the source documents available to us at the time it was mapped. Both the mapped feature and the text portion of EO's are updated as new information becomes available.

### **Element Occurrence (EO) Definition:**

The EO definition refers to the types of information we map. For most animal taxa, the CNDDB is interested in information that indicates the presence of a resident population. For many birds, however, the CNDDB tracks only nesting locations, (those species are so indicated on the list). Detailed information about avian detections is available at: <http://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=25731> . For other taxa where we track only a certain part of their range or life history, the area or life stage is indicated on the list.

### **Mapping Conventions:**

Our information is mapped as precisely as possible, based upon the source materials used to map the element occurrence (EO). More vague location information is mapped with the larger circular features and more precise location information is mapped with 80m radius circles or polygon features. Generally, observations/collections within  $\frac{1}{4}$  mile, within continuous habitat, are combined into a single element occurrence (EO). However, there are exceptions such as nest trees for Swainson's hawk, where each known nest tree is mapped.

**Taxonomic References and Sources of Additional Information:**

We follow the most current published taxonomy.

For butterflies we followed the taxonomy used by NatureServe:

<http://www.natureserve.org/explorer/>

For fish we used:

Moyle, P. B. 2002. Inland Fishes of California. University of California Press.

Nelson, J.S., E.J. Crossman, H. Espinosa-Perea, L.T. Findley, C.R. Gilbert, R. N. Lea, and J. D. Williams. 2004. Common and scientific names of fishes from the United States, Canada, and Mexico. American Fisheries Society, Special Publication 29, Bethesda, Maryland. 386 pp.

Jelks, H.L., S.J. Walsh, N.M. Burkhead, S. Contreras-Balderas, E. Díaz-Pardo, D.A. Hendrickson, J. Lyons, N.E. Mandrak, F. McCormick, J.S. Nelson, S.P. Platania, B.A. Porter, C.B. Renaud, J. J. Schmitter-Soto, E.B. Taylor, and M.L. Warren, Jr. 2008. Conservation status of imperiled North American freshwater and diadromous fishes. *Fisheries* 33(8):372-407. Available at:

#### **CNDDB CONSERVATION STATUS RANKS:**

The CNDDB ranking codes are part of the "Heritage Methodology". It is a shorthand formula that provides information about the status of a taxon, both throughout its entire range and within California. We use the best information available to assign these ranks and they are changed and refined as new information becomes available. More detailed information about the conservation status ranking system can be found at:

[http://www.natureserve.org/publications/ConsStatusAssess\\_StatusFactors.pdf](http://www.natureserve.org/publications/ConsStatusAssess_StatusFactors.pdf)

**CALIFORNIA ENDANGERED SPECIES ACT (CESA) LISTING CODES:** The listing status of each species is current as of the date of this list. The most current changes in listing status will be found in the list of "Endangered and Threatened Animals of California", which the CNDDB updates and issues quarterly (January, April, July, & October).

SE	State-listed as Endangered
ST	State-listed as Threatened
SCE	State candidate for listing as Endangered
SCT	State candidate for listing as Threatened
SCD	State candidate for delisting

**FEDERAL ENDANGERED SPECIES ACT (ESA) LISTING CODES:** The listing status is current as of the date of this list. The most current changes in listing status will be found in the list of "Endangered and Threatened Animals of California", which the CNDDB updates and issues quarterly (January, April, July, & October). Federal listing actions contained in the Federal Register are also available at:

<http://www.regulations.gov/search/Regs/home.html#home>.

FE	Federally listed as Endangered
FT	Federally listed as Threatened
FPE	Federally proposed for listing as Endangered
FPT	Federally proposed for listing as Threatened
FPD	Federally proposed for delisting
FC	Federal candidate species (former Category 1 candidates)

Section 4(c)(2)(A) of the Act requires that we conduct a review of listed species at least once every five years. Five year reviews for the Pacific Southwest Region are available at:

[http://www.fws.gov/cno/es/five\\_year\\_review\\_lists.html](http://www.fws.gov/cno/es/five_year_review_lists.html)

#### **OTHER STATUS CODES:**

**IUCN - The World Conservation Union**, through its Species Survival Commission (SSC) assess, on a global scale, the conservation status of species, subspecies, varieties and even selected subpopulations in order to highlight taxa threatened with extinction, and therefore promote their conservation. The SSC is firmly committed to providing the world with the most objective, scientifically-based information on the current status of globally threatened biodiversity. The taxa assessed for the IUCN Red List have been evaluated using the IUCN Red List Categories and Criteria <http://www.iucnredlist.org/technical-documents/categories-and-criteria>. Detailed information on the IUCN and the Red List is available at: <http://www.redlist.org/>.

#### **American Bird Conservancy: United States WatchList of Birds of Conservation Concern:**

The United States WatchList is a joint project between the American Bird Conservancy and the National Audubon Society. It reflects a comprehensive analysis of all the bird species in the United States. It reveals those in greatest need of immediate conservation

attention to survive a convergence of environmental challenges, including habitat loss, invasive species, and global warming. The list builds on the species assessments conducted for many years by Partners in Flight (PIF) for land birds. It uses those same PIF standards but it is expanded to cover all bird species, not just land birds. The list is based on the latest available research and assessments from the bird conservation community, along with data from the Christmas Bird Count and Breeding Bird Survey. More information is available at:

<http://www.abcbirds.org/abcprograms/science/watchlist/index.html>

**AFS:** Designations for freshwater and diadromous species were taken from the paper: Jelks, H.L., S.J. Walsh, N.M. Burkhead, S. Contreras-Balderas, E. Díaz-Pardo, D.A. Hendrickson, J. Lyons, N.E. Mandrak, F. McCormick, J.S. Nelson, S.P. Platania, B.A. Porter, C.B. Renaud, J. J. Schmitter-Soto, E.B. Taylor, and M.L. Warren, Jr. 2008. Conservation status of imperiled North American freshwater and diadromous fishes. *Fisheries* 33(8):372-407. Available at: [http://www.fisheries.org/afs/docs/fisheries/fisheries\\_3308.pdf](http://www.fisheries.org/afs/docs/fisheries/fisheries_3308.pdf). Designations for marine and estuarine species were taken from the paper: Musick, J.T. et al. 2000. "Marine, Estuarine, and Diadromous Fish Stocks at Risk of Extinction in North America (Exclusive of Pacific Salmonids). *Fisheries* 25(11):6-30. Available at: <http://www.flmnh.ufl.edu/fish/sharks/sawfish/Reprint1390.pdf>

**Audubon: WatchList:** The Audubon WatchList has been incorporated into the **American Bird Conservancy United States WatchList of Birds of Conservation Concern** and no longer has a separate designation.

**BLM: Sensitive:** Bureau of Land Management. BLM Manual §6840 defines sensitive species as "...those species that are (1) under status review by the FWS/NMFS; or (2) whose numbers are declining so rapidly that Federal listing may become necessary, or (3) with typically small and widely dispersed populations; or (4) those inhabiting ecological refugia or other specialized or unique habitats." Existing California-BLM policy concerning the designation of sensitive species identifies two conditions that must be met before a species may be considered as BLM sensitive: (1) a significant population of the species must occur on BLM-administered lands, and (2) the potential must exist for improvement of the species' condition through BLM management. The "Sensitive Species" designation is not meant to include federally listed species, proposed species, candidate species or State-listed species. It is BLM policy to provide sensitive species with the same level of protection that is given federal candidate species. The list is available at:

[http://www.blm.gov/ca/pdfs/pa\\_pdfs/biology\\_pdfs/SensitiveAnimals.pdf](http://www.blm.gov/ca/pdfs/pa_pdfs/biology_pdfs/SensitiveAnimals.pdf)

**CDF: Sensitive:** California Department of Forestry and Fire Protection. The Board of Forestry classifies as "sensitive species" those species that warrant special protection during timber operations. The list of "sensitive species" is given in §895.1 (Definitions) of the California Forest Practice Rules. The 2010 Forest Practice Rules are available at:

[http://www.fire.ca.gov/resource\\_mgt/downloads/2010\\_FP\\_Rulebook\\_w-Diagrams\\_wo-TechRule\\_No1.pdf](http://www.fire.ca.gov/resource_mgt/downloads/2010_FP_Rulebook_w-Diagrams_wo-TechRule_No1.pdf)

**DFG: SSC:** California Species of Special Concern. It is the goal and responsibility of the Department of Fish and Game to maintain viable populations of all native species. To this end, the Department has designated certain vertebrate species as "Species of Special Concern" because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. The goal of designating species as "Species of Special Concern" is to halt or reverse their decline by calling attention to their plight and addressing the issues of concern early enough to secure their long term viability. Not all "Species of Special Concern" have declined equally; some species may be just starting to decline, while others may have already reached the point where they meet the criteria for listing as a "Threatened" or "Endangered" species under the State and/or Federal Endangered Species Acts. More information is available at:

<http://www.nrm.dfg.ca.gov/fileHandler.ashx?DocumentID=3778>

The 1995 report for fish, the 1994 report for amphibians and reptiles and the 1986 & 1998 reports for mammals are available on-line.

Fish: [http://www.dfg.ca.gov/wildlife/nongame/publications/docs/fish\\_ssc.pdf](http://www.dfg.ca.gov/wildlife/nongame/publications/docs/fish_ssc.pdf)

Amphibians & Reptiles:

[http://www.dfg.ca.gov/wildlife/nongame/publications/docs/herp\\_ssc.pdf](http://www.dfg.ca.gov/wildlife/nongame/publications/docs/herp_ssc.pdf)

Mammals:

[http://www.dfg.ca.gov/wildlife/nongame/publications/bm\\_research/docs/86\\_27.pdf](http://www.dfg.ca.gov/wildlife/nongame/publications/bm_research/docs/86_27.pdf)

<http://www.dfg.ca.gov/wildlife/nongame/ssc/1998mssc.html>

Updates of all three reports are in preparation. Information on the Amphibian and Reptile Species of Special Concern report is available at: <http://arssc.ucdavis.edu>. Information on the mammal report is available at:

<http://www.dfg.ca.gov/wildlife/nongame/ssc/mammals.html> and

<http://www.dfg.ca.gov/wildlife/nongame/ssc/docs/mammal/MSSCProjectTimeline.pdf>

A new *California Bird Species of Special Concern* report was completed in 2008. More information is available at: <http://www.dfg.ca.gov/wildlife/species/ssc/birds.html>. A new category of "**Taxa to Watch**" was created in the new *California Bird Species of Special Concern* report. The birds on this **Watch List** are 1) not on the current Special Concern list but were on previous lists and they have not been state listed under CESA; 2) were previously state or federally listed and now are on neither list; or 3) are on the list of "Fully Protected" species. More information and brief accounts for each species is available in the report.

**DFG: Fully Protected:** The classification of Fully Protected was the State's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds and mammals. Most of the species on these lists have subsequently been listed under the state and/or federal endangered species acts; white-tailed kite, golden eagle, trumpeter swan, northern elephant seal and ring-tailed cat are the exceptions. The white-tailed kite and the golden eagle are tracked in the CNDB; the trumpeter swan, northern elephant seal and ring-tailed cat are not.

The Fish and Game Code sections dealing with Fully Protected species state that these species "....may not be taken or possessed at any time and no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected" species, although take may be authorized for necessary scientific research. This language arguably makes the "Fully Protected" designation the strongest and most restrictive regarding the "take" of these species. In 2003 the code sections dealing with fully protected species were amended to allow the Department to authorize take resulting from recovery activities for state-listed species.

More information on Fully Protected species and the take provisions can be found in the Fish and Game Code, (birds at §3511, mammals at §4700, reptiles and amphibians at §5050, and fish at §5515). Additional information on Fully Protected fish can be found in the California Code of Regulations, Title 14, Division 1, Subdivision 1, Chapter 2, Article 4, §5.93. The category of Protected Amphibians and Reptiles in Title 14 has been repealed. The Fish and Game Code is available online at: <http://www.leginfo.ca.gov/cgi-bin/calawquery?codesection=fgc&codebody=&hits=20>. Title 14 of the California Code of Regulations is available at: <http://ccr.oal.ca.gov/linkedslice/default.asp?SP=CCR-1000&Action=Welcome>

**FS: Sensitive:** USDA Forest Service defines sensitive species as those plant and animal species identified by a regional forester that are not listed or proposed for listing under the federal Endangered Species Act for which population viability is a concern, as evidenced by significant current or predicted downward trends in population numbers or density, or significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution. Regional Foresters shall identify sensitive species occurring within the region. California is the Pacific Southwest Region (Region 5).The list of sensitive animals for Region 5 is undergoing revision. The anticipated completion date was spring 2009, however it still has not been updated in spring 2010. The sensitive designation on this list is based on the previous list. More information is available at:

<http://www.fs.fed.us/r5/projects/sensitive-species/>

**FWS: BCC:** Fish and Wildlife Service: Birds of Conservation Concern: The goal of the *Birds of Conservation Concern 2008* report is to accurately identify the migratory and nonmigratory bird species (beyond those already designated as Federally threatened or endangered) that represent our highest conservation priorities and draw attention to species in need of conservation action. We hope that by focusing attention on these highest priority species, this report will promote greater study and protection of the habitats and ecological communities upon which these species depend, thereby ensuring the future of healthy avian populations and communities. This report is available at:

[http://library.fws.gov/Bird\\_Publications/BCC2008.pdf](http://library.fws.gov/Bird_Publications/BCC2008.pdf)

**Marine Mammal Commission: Marine Mammal Species of Special Concern:** Section 202 of the Marine Mammal Protection Act directs the Marine Mammal Commission, in consultation with its Committee of Scientific Advisors, to make recommendations to the Department of Commerce, the Department of the Interior, and other federal agencies on research and management actions needed to conserve species of marine mammals. To meet this charge,

the Commission devotes special attention to particular species and populations that are vulnerable to various types of human-related activities, impacts, and contaminants. Such species may include marine mammals listed as endangered or threatened under the Endangered Species Act or as depleted under the Marine Mammal Protection Act. In addition, the Commission often directs special attention to other species or populations of marine mammals not so listed whenever special conservation challenges arise that may affect them. More information on the Marine Mammal Protection Act and the Species of Special Concern list is available at: <http://www.mmc.gov/species>

**National Oceanic and Atmospheric Administration (NOAA):** The Office of Protected Resources (OPR) is a headquarters program office of NOAA's National Marine Fisheries Service (NOAA Fisheries Service, or NMFS), under the U.S. Department of Commerce, with responsibility for protecting marine mammals and endangered marine life.

NOAA's Office of Protected Resources works to conserve, protect, and recover species under the Endangered Species Act (ESA) and the Marine Mammal Protection Act (MMPA) in conjunction with our Regional offices, Science Centers, and various partners. The category **Species of Concern** was established by the National Marine Fisheries Service (NMFS) effective 15 April 2004. **Species of Concern** are those species about which NOAA's National Marine Fisheries Service (NMFS) has some concerns regarding status and threats, but for which insufficient information is available to indicate a need to list the species under the Endangered Species Act (ESA). We wish to draw proactive attention and conservation action to these species. "Species of concern" status does not carry any procedural or substantive protections under the ESA. More information is available at:

<http://www.nmfs.noaa.gov/pr/species/concern>

**WBWG: High Priority:** The Western Bat Working Group is comprised of agencies, organizations and individuals interested in bat research, management and conservation from the 13 western states and provinces. The goals are (1) to facilitate communication among interested parties and reduce risks of species decline or extinction; (2) to provide a mechanism by which current information on bat ecology, distribution and research techniques can be readily accessed; and (3) to develop a forum to discuss conservation strategies, provide technical assistance and encourage education programs. Species designated as "High Priority" are imperiled or are at high risk of imperilment based on available information on distribution, status, ecology and known threats. More information is available at: <http://www.wbwg.org>.

**Xerces Society: Red list:** The Xerces Society is an international non-profit organization dedicated to protecting biological diversity through invertebrate conservation. The Society advocates for invertebrates and their habitats by working with scientists, land managers, educators, and citizens on conservation and education projects. Their core programs focus on endangered species, native pollinators, and watershed health. More information on the Red list is available at: <http://www.xerces.org/>

## Special Animals List - January 2011

**End Notes****Invertebrates****INSECTA, Order Coleoptera (beetles)***Trigonoscuta sp.*

Doyen's trigonoscuta dune weevil

- 1) Sometimes referred to as "Trigonoscuta doyenii" which is an unpublished manuscript name.

**Fishes****ACIPENSERIDAE (sturgeon)***Acipenser medirostris*

green sturgeon

- 1) Federal listing includes all spawning populations south of the Eel River.
- 2) The NMFS "Special Concern" designation refers to the northern DPS which includes spawning populations north of the Eel River (inclusive).

**SALMONIDAE (trout & salmon)***Oncorhynchus kisutch*

coho salmon - central California coast ESU

- 1) The federal listing is limited to naturally spawning populations in streams between Punta Gorda, Humboldt Co. and the San Lorenzo River, Santa Cruz Co.
- 2) The state listing is limited to Coho south of Punta Gorda, Humboldt Co.

coho salmon - southern Oregon / northern California ESU

- 1) Federal listing refers to populations between Cape Blanco, Oregon & Punta Gorda, Humboldt Co. California.
- 2) State listing refers to populations between the Oregon border & Punta Gorda, Humboldt Co. California.

*Oncorhynchus mykiss irideus*

southern steelhead - southern California DPS

- 1) The federal designation refers to fish in the coastal basins from the Santa Maria River (inclusive), south to the U.S. - Mexico Border.
- 2) The DFG "Species of Special Concern" designation refers to southern steelhead trout.

steelhead - central California coast DPS

- 1) Federal listing includes all runs in coastal basins from the Russian River in Sonoma County, south to Soquel Creek in Santa Cruz County, inclusive. It includes the San Francisco and San Pablo Bay basins, but excludes the Sacramento-San Joaquin River basins.

steelhead - Central Valley DPS

- 1) Federal listing includes all runs in the Sacramento & San Joaquin Rivers and their tributaries.

steelhead - Klamath Mountains Province DPS

- 1) This ESU includes all naturally spawned populations residing in streams between the Elk River in Oregon and the Klamath River in California, inclusive.
- 2) The SSC designation refers only to the California portion of the ESU and refers only to the summer-run.

steelhead - northern California DPS

- 1) The federal designation refers to naturally spawned populations residing below impassable barriers in coastal basins from Redwood Creek in Humboldt Co. to, and including, the Gualala River in Mendocino Co.
- 2) The DFG "Species of Special Concern" designation refers only to the summer-run.

steelhead - south/central California coast DPS

- 1) Federal listing includes all runs in coastal basins from the Pajaro River south to, but not including, the Santa Maria River.
- 2) The DFG "Species of Special Concern" designation refers to southern steelhead trout.

summer-run steelhead trout

- 1) Summer-run steelhead are part of both the Klamath Mountains Province DPS and the Northern California DPS.

*Oncorhynchus tshawytscha*

chinook salmon - California coastal ESU

- 1) Originally proposed as part of a larger Southern Oregon & California Coastal ESU. This new ESU was revised to include only naturally spawned coastal spring & fall-run chinook salmon between Redwood Creek in Humboldt Co & the Russian River in Sonoma Co.

chinook salmon - Central Valley fall / late fall-run ESU

- 1) The Central Valley fall/late fall-run ESU refers to populations spawning in the Sacramento & San Joaquin Rivers and their tributaries.
- 2) The DFG "Species of Special Concern" designation refers only to the fall-run.

## Special Animals List - January 2011

**Fishes****SALMONIDAE (trout & salmon)***Oncorhynchus tshawytscha*

chinook salmon - Central Valley spring-run ESU

- 1) Federal listing refers to the Central Valley Spring-run ESU. It includes populations spawning in the Sacramento River & its tributaries.

**OSMERIDAE (smelt)***Spirinchus thaleichthys*

longfin smelt

- 1) AFS Threatened designation take from: Musick, J.T. et al. 2000. "Marine, Estuarine, and Diadromous Fish Stocks at Risk of Extinction in North America (Exclusive of Pacific Salmonids). Fisheries 25(11):6-30.

**CYPRINIDAE (minnows and carp)***Lavinia symmetricus ssp. 1*

San Joaquin roach

- 1) Current taxonomy considers this taxon to be a population of *Lavinia symmetricus symmetricus*, the Sacramento-San Joaquin roach.

*Rhinichthys osculus ssp. 1*

Amargosa Canyon speckled dace

- 1) Current taxonomy considers this taxon to be a distinct population of *Rhinichthys osculus nevadensis*.

*Rhinichthys osculus ssp. 2*

Owens speckled dace

- 1) Current taxonomy includes the Benton Valley speckled dace (formerly ssp 4) with the Owens speckled dace.

**GASTEROSTEIDAE (sticklebacks)***Gasterosteus aculeatus microcephalus*

resident threespine stickleback

- 1) The U.S. Forest Service "Sensitive" designation refers to the full species.

*Gasterosteus aculeatus santaannae*

Santa Ana (=Shay Creek) threespine stickleback

- 1) The U.S. Forest Service "Sensitive" designation refers to the full species.

*Gasterosteus aculeatus williamsoni*

unarmored threespine stickleback

- 1) The U.S. Forest Service "Sensitive" designation refer to the full species.

**POLYPRIONIDAE (wreckfishes)***Stereolepis gigas*

giant sea bass

- 1) AFS Vulnerable designation taken from: Musick, J.T. et al. 2000. "Marine, Estuarine, and Diadromous Fish Stocks at Risk of Extinction in North America (Exclusive of Pacific Salmonids). Fisheries 25(11):6-30.

**Amphibians****PLETHODONTIDAE (lungless salamanders)***Plethodon asupak*

Scott Bar salamander

- 1) Newly described species from what was part of the range of *Plethodon stormi*.
- 2) Since this newly described species was formerly considered to be a subpopulation of *Plethodon stormi*, and since *Plethodon stormi* is listed as Threatened under the California Endangered Species Act (CESA), *Plethodon asupak* retains the designation as a Threatened species under CESA.

**BUFONIDAE (true toads)***Anaxyrus californicus*

arroyo toad

- 1) Formerly *Bufo microscaphus californicus*, now considered a full species.
- 2) Formerly *Bufo californicus*; Frost, Grant, Faivovich, Bain, Haas, Haddad, De Sá, Channing, Wilkinson, Donnellan, Raxworthy, Campbell, Blotto, Moler, Drewes, Nussbaum, Lynch, Green & Wheeler (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Anaxyrus* (Tschudi, 1845). The standard common name remains arroyo toad.

## Special Animals List - January 2011

**Amphibians****BUFONIDAE (true toads)***Anaxyrus canorus*

## Yosemite toad

- 1) Formerly *Bufo canorus*; Frost, Grant, Faivovich, Bain, Haas, Haddad, De Sá, Channing, Wilkinson, Donnellan, Raxworthy, Campbell, Blotto, Moler, Drewes, Nussbaum, Lynch, Green & Wheeler (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Anaxyrus* (Tschudi, 1845). The standard common name remains Yosemite toad.

*Anaxyrus exsul*

## black toad

- 1) Formerly *Bufo exsul*; Frost, Grant, Faivovich, Bain, Haas, Haddad, De Sá, Channing, Wilkinson, Donnellan, Raxworthy, Campbell, Blotto, Moler, Drewes, Nussbaum, Lynch, Green & Wheeler (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Anaxyrus* (Tschudi, 1845). The standard common name remains black toad.

*Incilius alvarius*

## Sonoran desert toad

- 1) Formerly *Bufo alvarius*. Between 2006 & 2009 the scientific name has been changed to *Cranopsis alvaria*, to *Ollotis alvaria*, to *Incilius alvarius*, back to *Ollotis alvarius* and then back to *Incilius alvarius*. The common name has changed from Colorado River toad to Sonoran desert toad.

**RANIDAE***Lithobates pipiens*

## northern leopard frog

- 1) Formerly *Rana pipiens*; Frost, Grant, Faivovich, Bain, Haas, Haddad, De Sá, Channing, Wilkinson, Donnellan, Raxworthy, Campbell, Blotto, Moler, Drewes, Nussbaum, Lynch, Green & Wheeler (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Lithobates* (Fitzinger, 1843). The standard common name remains northern leopard frog.

*Lithobates yavapaiensis*

## lowland (=Yavapai, San Sebastian &amp; San Felipe) leopard frog

- 1) Formerly *Rana yavapaiensis*; Frost, Grant, Faivovich, Bain, Haas, Haddad, De Sá, Channing, Wilkinson, Donnellan, Raxworthy, Campbell, Blotto, Moler, Drewes, Nussbaum, Lynch, Green & Wheeler (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Lithobates* (Fitzinger, 1843). The standard common name remains lowland leopard frog.

*Rana aurora*

## northern red-legged frog

- 1) A recent mtDNA study concludes that *Rana aurora aurora* and *Rana aurora draytonii* should be recognized as separate species with a narrow zone of overlap.

*Rana draytonii*

## California red-legged frog

- 1) A recent mtDNA study concludes that *Rana aurora aurora* and *Rana aurora draytonii* should be recognized as separate species with a narrow zone of overlap, and that the range of *draytonii* extends about 100 km further north in coastal California than previously thought.

*Rana muscosa*

## Sierra Madre yellow-legged frog

- 1) Federal listing refers to populations in the San Gabriel, San Jacinto, & San Bernardino Mountains only.
- 2) Federal Candidate status refers to all populations that occur north of the Tehachapi Mountains in the Sierra Nevada.
- 3) *Rana muscosa* has been split into *Rana sierrae*, the Sierra Nevada yellow-legged frog, found in the northern and central Sierra Nevada and *Rana muscosa*, the Sierra Madre yellow-legged frog, found in the southern Sierra Nevada and southern California.
- 4) *Rana muscosa* was petitioned to be listed as endangered. It is now a state candidate species for listing as threatened or endangered.

*Rana sierrae*

## Sierra Nevada yellow-legged frog

- 1) Federal candidate status refers to all populations that occur north of the Tehachapi Mountains in the Sierra Nevada.
- 2) Formerly *Rana muscosa*. *Rana muscosa* has been split into *Rana sierrae*, the Sierra Nevada yellow-legged frog, found in the northern and central Sierra Nevada and *Rana muscosa*, the Sierra Madre yellow-legged frog, found in the southern Sierra Nevada and southern California.
- 3) *Rana sierrae* was petitioned to be listed as endangered. It is now a state candidate for listing as threatened or endangered.

## Special Animals List - January 2011

**Reptiles****EMYDIDAE (box and water turtles)***Emys marmorata*

western pond turtle

- 1) The paper: Spinks, Phillip Q. & H. Bradley Shaffer. 2005. Range-wide molecular analysis of the western pond turtle (*Emys marmorata*): cryptic variation, isolation by distance, and their conservation implications. *Molecular Ecology* (2005) 14, 2047-2064. determined that the current subspecies split was not warranted. Therefore, we are now tracking the western pond turtle only at the full species level.
- 2) The paper: Spinks, Phillip Q., & H. Bradley Shaffer. 2009. Conflicting Mitochondrial and Nuclear Phylogenies for the Widely Disjunct *Emys* (Testudines: Emydidae) Species Complex, and What They Tell Us about Biogeography and Hybridization. *Systematic Biology*. 58(1): pp. 1-20 determined that the correct genus name is *Emys*.

**HELODERMATIDAE (venomous lizards)***Heloderma suspectum cinctum*

banded gila monster

- 1) The BLM "Sensitive Species" designation refers to the full species.

**BOIDAE (boas)***Charina trivirgata*

rosy boa

- 1) The Forest Service "Sensitive" designation refers only to the subspecies *roseofusca*.
- 2) The taxonomy of this species is in flux. The name *Lichanura trivirgata* is a synonym. Some sources list several subspecies while others don't recognize any subspecies.

**Birds****PHASIANIDAE (grouse and ptarmigan)***Dendragapus fuliginosus howardi*

Mount Pinos sooty grouse

- 1) Formerly merged with *D. obscurus* as blue grouse, but separated on the basis of genetic evidence and differences in voice, behavior, & plumage.
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

**RALLIDAE (rails, coots, and gallinules)***Laterallus jamaicensis coturniculus*

California black rail

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.
- 2) The IUCN designation of "Near Threatened" refers to the full species.

*Rallus longirostris levipes*

light-footed clapper rail

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

*Rallus longirostris obsoletus*

California clapper rail

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

*Rallus longirostris yumanensis*

Yuma clapper rail

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

**CHARADRIIDAE (plovers and relatives)***Charadrius alexandrinus nivosus*

western snowy plover

- 1) Federal listing applies only to the Pacific coastal population
- 2) DFG "Species of Special Concern" designation refers to both the coastal & interior populations.
- 3) USFWS - Birds of Conservation Concern designation refers to non-listed subspecies or populations of Threatened or Endangered species.

## Special Animals List - January 2011

**Birds****CHARADRIIDAE (plovers and relatives)***Charadrius montanus*

mountain plover

- 1) The June 29, 2010 proposed rule reinstates that portion of the December 5, 2002 proposed rule concerning the listing of the mountain plover as threatened. It does not reinstate the portion of that proposed rule regarding a special rule under section 4(d) of the Endangered Species Act.

**LARIDAE (gulls and terns)***Gelochelidon nilotica*

gull-billed tern

- 1) Taxonomy recently changed from *Sterna nilotica*

*Hydroprogne caspia*

Caspian tern

- 1) Taxonomy recently changed from *Sterna caspia*

*Sternula antillarum browni*

California least tern

- 1) Taxonomy recently changed from *Sterna antillarum browni*.
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

*Thalasseus elegans*

elegant tern

- 1) Taxonomy recently changed from *Sterna elegans*

**STRIGIDAE (owls)***Athene cunicularia*

burrowing owl

- 1) A burrow site = an observation of one or more owls at a burrow or evidence of recent occupation such as whitewash and feathers. Winter observations at a burrow are mapped. Winter observations with or without a burrow in San Francisco, Ventura, Sonoma, Marin, Napa & Santa Cruz Counties are mapped.

*Strix occidentalis caurina*

northern spotted owl

- 1) There are no northern spotted owl EO's in the CNDB. All northern spotted owl location information is maintained in a separate data layer. This layer is packaged with the CNDB layer in BIOS. All RareFind subscribers have access to this information through BIOS (<http://BIOS.dfg.ca.gov>)
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

*Strix occidentalis occidentalis*

California spotted owl

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

**TYRANNIDAE (tyrant flycatchers)***Empidonax traillii*

willow flycatcher

- 1) State listing of the full species includes all subspecies
- 2) USFWS: Birds of Conservation Concern designation refers to non-listed subspecies or populations of Threatened or Endangered species.

*Empidonax traillii brewsteri*

little willow flycatcher

- 1) State listing of the full species includes all subspecies
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.
- 3) USFWS - Birds of Conservation Concern designation refers to non-listed subspecies or populations for Threatened or Endangered species.

*Empidonax traillii extimus*

southwestern willow flycatcher

- 1) State listing of the full species includes all subspecies
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

## Special Animals List - January 2011

**Birds****LANIIDAE (shrikes)***Lanius ludovicianus mearnsi*

San Clemente loggerhead shrike

- 1) Subspecific identity of shrikes currently on San Clemente is uncertain. Mundy et al. (1997a, b) provided evidence *L. l. mearnsi* is genetically distinct from *L. l. gambeli* and *L. l. anthonyi*, whereas Patten and Campbell (2000) concluded, based on morphology, that the birds now on San Clemente are intergrades between *L. l. mearnsi* and *L. l. anthonyi*.

**VIREONIDAE (vireos)***Vireo bellii arizonae*

Arizona bell's vireo

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.
- 2) The IUCN designation of "Near Threatened" refers to the full species.

*Vireo bellii pusillus*

least Bell's vireo

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.
- 2) The IUCN designation of "Near Threatened" refers to the full species.

**TROGLODYTIIDAE (wrens)***Campylorhynchus brunneicapillus sandiegensis*

coastal cactus wren

- 1) Nomenclature follows the draft DFG Bird Species of Special Concern report.

**SYLVIIDAE (gnatcatchers)***Polioptila californica californica*

coastal California gnatcatcher

- 1) AKA Alta California gnatcatcher
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

**MIMIDAE (mockingbirds and thrashers)***Toxostoma lecontei*

Le Conte's thrasher

- 1) The BLM "Sensitive Species" designation refers to the subspecies *Toxostoma lecontei macmillanorum*.
- 2) DFG "Species of Special Concern" designation refers only to the San Joaquin population, AKA *T. l. macmillanorum*.

**PARULIDAE (wood-warblers)***Geothlypis trichas sinuosa*

saltmarsh common yellowthroat

- 1) AKA San Francisco common yellowthroat

**EMBERIZIDAE (sparrows, buntings, warblers, & relatives)***Amphispiza belli belli*

Bell's sage sparrow

- 1) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

*Amphispiza belli clementae*

San Clemente sage sparrow

- 1) Subspecific validity uncertain. Recognized by AOU (1957), but not by Patten and Unitt (2002).
- 2) The American Bird Conservancy "WatchList of Birds of Conservation Concern" designation refers to the full species.

*Melospiza melodia graminea*

Channel Island song sparrow

- 1) Subspecific validity is uncertain. This subspecies when referred to as Santa Barbara song sparrow is extinct. However, the subspecies was merged by Patten (2001) with the San Miguel (*M. m. micronyx*), and San Clemente (*M. m. clementae*) song sparrows as the Channel Island song sparrow with the subspecific name *M. m. graminea*.

*Piranga flava*

hepatic tanager

- 1) According to The A.O.U. Check-list of North American Birds, Seventh Edition, this species is probably misplaced in the current phylogenetic listing but for which data indicating proper placement are not yet available.

## Special Animals List - January 2011

**Birds****EMBERIZIDAE (sparrows, buntings, warblers, & relatives)***Piranga rubra*

summer tanager

- 1) According to The A.O.U. Check-list of North American Birds, Seventh Edition, this species is probably misplaced in the current phylogenetic listing but for which data indicating proper placement are not yet available.

**Mammals****PHYLLOSTOMIDAE (leaf-nosed bats)***Leptonycteris yerbabuenae*

lesser long-nosed bat

- 1) Listed by the U.S. Fish & Wildlife Service as *Leptonycteris curasoae yerbabuenae*.

**VESPERTILIONIDAE (evening bats)***Lasiurus blossevillii*

western red bat

- 1) The DFG "Species of Special Concern" designation is based on the draft updated Mammalian Species of Special Concern report.

*Lasiurus xanthinus*

western yellow bat

- 1) The DFG "Species of Special Concern" designation is based on the draft updated Mammalian Species of Special Concern report.

**OCHOTONIDAE (pikas)***Ochotona princeps schisticeps*

gray-headed pika

- 1) All of the subspecies of pika in California have been synonymized under *Ochotona princeps schisticeps*.

**APLODONTIDAE (mountain beavers)***Aplodontia rufa californica*

Sierra Nevada mountain beaver

- 1) The IUCN "Least Concern" designation refers to the full species.

*Aplodontia rufa nigra*

Point Arena mountain beaver

- 1) The IUCN "Least Concern" designation refers to the full species.

*Aplodontia rufa phaea*

Point Reyes mountain beaver

- 1) The IUCN "Least Concern" designation refers to the full species.

**HETEROMYIDAE (kangaroo rats, pockets mice, & kangaroo mice)***Chaetodipus fallax fallax*

northwestern San Diego pocket mouse

- 1) The DFG "Species of Special Concern" designation refers to the full species.

*Chaetodipus fallax pallidus*

pallid San Diego pocket mouse

- 1) The DFG "Species of Special Concern" designation refers to the full species.

*Perognathus alticolus alticolus*

white-eared pocket mouse

- 1) The DFG "Species of Special Concern" and the BLM "Sensitive Species" designations refer to the full species.

- 2) The IUCN "Endangered" designation is at the species level.

*Perognathus alticolus inexpectatus*

Tehachapi pocket mouse

- 1) The DFG "Species of Special Concern" designation refers to the full species.

- 2) The IUCN "Endangered" designation is at the species level.

## Special Animals List - January 2011

**Mammals****MURIDAE (mice, rats, and voles)***Neotoma fuscipes riparia*

riparian (=San Joaquin Valley) woodrat

- 1) This species is currently undergoing taxonomic revision

*Reithrodontomys megalotis santacruzae*

Santa Cruz harvest mouse

- 1) Synonomous with *Reithrodontomys megalotus longicaudus*, Santa Cruz Island Population.

**CANIDAE (foxes, wolves, and coyotes)***Urocyon littoralis*

island fox

- 1) State listing is at the full species level and includes all subspecies on all islands. Federal listing does not include San Nicolas & San Clemente island subspecies.

*Urocyon littoralis catalinae*

Santa Catalina Island fox

- 1) The IUCN "Critically Endangered" designation refers to the full species.

*Urocyon littoralis clementae*

San Clemente Island fox

- 1) The IUCN "Critically Endangered" designation refers to the full species.

*Urocyon littoralis dickeyi*

San Nicolas Island fox

- 1) The IUCN "Critically Endangered" designation refers to the full species.

*Urocyon littoralis littoralis*

San Miguel Island fox

- 1) The IUCN "Critically Endangered" designation refers to the full species.

*Urocyon littoralis santacruzae*

Santa Cruz Island fox

- 1) The IUCN "Critically Endangered" designation refers to the full species.

*Urocyon littoralis santarosae*

Santa Rosa Island fox

- 1) The IUCN "Critically Endangered" designation refers to the full species.

**MUSTELIDAE (weasels and relatives)***Enhydra lutris nereis*

southern sea otter

- 1) The IUCN "Endangered" designation refers to the full species.

*Martes pennanti (pacific)* DPS

Pacific fisher

- 1) The subspecies *pacifica* is no longer considered a valid subspecies. The Pacific fisher is now considered to be a distinct population segment (DPS).
- 2) Federal candidate status refers to the distinct population segment in Washington, Oregon & California.
- 3) Was a candidate for state listing as an endangered or threatened species. The Fish and Game Commission at its Jun3 23, 2010 meeting determined that listing was not warranted.

**BOVIDAE (sheep and relatives)***Ovis canadensis nelsoni* DPS

peninsular bighorn sheep

- 1) The subspecies *O. c. cremnobates* has been synonymized with *O. c. nelsoni*. Peninsular bighorn sheep are now considered to be a Distinct Population Segment (DPS).

# Plants

Natural Diversity Database***

***SPECIAL VASCULAR PLANTS,  
BRYOPHYTES, AND LICHENS  
LIST***

***April 2014***

**Citation:** California Department of Fish and Wildlife, Natural Diversity Database. April 2014. Special Vascular Plants, Bryophytes, and Lichens List. Quarterly publication. 73 pp.

## **SPECIAL PLANTS**

Last updated July, 2013

“Special Plants” is a broad term used to refer to all the plant taxa inventoried by the Department of Fish and Wildlife’s California Natural Diversity Database (CNDDB), regardless of their legal or protection status. Special Plants include vascular plants and high priority bryophytes (mosses, liverworts, and hornworts). A few lichens are also tracked. Special Plant taxa are species, subspecies, or varieties that fall into one or more of the following categories:

- Officially listed by California or the Federal Government as Endangered, Threatened, or Rare;
- A candidate for state or federal listing as Endangered, Threatened, or Rare;
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the California Environmental Quality Act (CEQA) Guidelines; these taxa may indicate “None” under listing status, but note that all CNPS Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA.
- A Bureau of Land Management, U.S. Fish and Wildlife Service, or U.S. Forest Service Sensitive Species;
- Taxa listed in the California Native Plant Society’s *Inventory of Rare and Endangered Plants of California*;
- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation;
- Population(s) in California that may be peripheral to the major portion of a taxon’s range but are threatened with extirpation in California; and
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g. wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats, etc.).

**This list contains taxa that are actively inventoried by the CNDDB (Note: Taxa mapped in the GIS have a “yes” in the right column of the list) as well as an almost equal number of taxa (mostly Rare Plant Rank 3 and 4) which we track but for which we only currently have quad and county level geographic information.** For the latter taxa, we maintain site and other information in manual files along with Internet access to the quad and county level information via our “**CNDDB Quick Viewer**.” These plants will be mapped as time permits or when we have enough information to determine that they fulfill our rarity and/or endangerment criteria. For more copies of this list or other CNDDB information, call (916) 324-3812 or email CNDDB Information Services, at [BDB@wildlife.ca.gov](mailto:BDB@wildlife.ca.gov).

**California Heritage (CNDDDB) Element Ranking  
For Plants**  
Last updated July, 2013

All Heritage Programs, such as the California Natural Diversity Database (CNDDDB) use the same ranking methodology, originally developed by The Nature Conservancy and now maintained and recently revised by NatureServe. It includes a **Global rank** (G rank), describing the rank for a given taxon over its entire distribution and a **State rank** (S rank), describing the rank for the taxon over its state distribution. For subspecies and varieties, there is also a "T" rank describing the global rank for the subspecies. The second page of this document details the criteria used to assign element ranks, from G1 to G5 for the Global rank and from S1 to S5 for the State rank. Procedurally, state programs such as the CNDDDB develop the State ranks and the Global ranks collaboratively among states/provinces containing the species. NatureServe then checks for consistency and logical errors at the national level.

An element rank is assigned using standard criteria and rank definitions. This standardization makes the ranks comparable across organism and political boundaries. NatureServe has developed a "rank calculator" to help increase repeatability and transparency of the ranking process. The three main categories that are taken into consideration when assigning an element rank are rarity, threats, and trends. Within these three categories, various factors are taken into consideration including:

- Range extent, area of occupancy, population size, number of occurrences and number of good occurrences (ranked A or B). Environmental specificity can also be used if other information is lacking.
- Overall threat impact as well as intrinsic vulnerability (if threats are unknown).
- Long-term and short-term trends.

Detailed information on the newest element ranking methodology can be found here:  
<http://natureserve.org/publications/library.jsp>

With the above considerations in mind, refer below for the numerical definitions for G1-5 and S1-5. An element's ranking status may be adjusted up or down depending upon the considerations above.

## ELEMENT RANKING

### **GLOBAL RANKING**

The *global rank* (G-rank) is a reflection of the overall status of an element throughout its global range. **Both Global and State ranks represent a letter+number score that reflects a combination of Rarity, Threat and Trend factors, with weighting being heavier on Rarity than the other two.**

### **SPECIES OR NATURAL COMMUNITY LEVEL**

- G1** = **Critically Imperiled**—At very high risk of extinction due to extreme rarity (often 5 or fewer populations), very steep declines, or other factors.
- G2** = **Imperiled**—At high risk of extinction due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.
- G3** = **Vulnerable**—At moderate risk of extinction due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.
- G4** = **Apparently Secure**—Uncommon but not rare; some cause for long-term concern due to declines or other factors.
- G5** = **Secure**—Common; widespread and abundant.

### **SUBSPECIES LEVEL**

Subspecies receive a **T-rank** attached to the G-rank. With the subspecies, the G-rank reflects the condition of the entire *species*, whereas the T-rank reflects the global situation of just the *subspecies* or *variety*. For example: *Chorizanthe robusta* var. *hartwegii*. This plant is ranked G2T1. The G-rank refers to the whole species range i.e., *Chorizanthe robusta*. The T-rank refers only to the global condition of var. *hartwegii*.

---

## STATE RANKING

The *state rank* (S-rank) is assigned much the same way as the global rank, but state ranks refer to the imperilment status only within California's state boundaries.

- S1** = **Critically Imperiled**—Critically imperiled in the state because of extreme rarity (often 5 or fewer populations) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.
  - S2** = **Imperiled**—Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the state.
  - S3** = **Vulnerable**—Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the state.
  - S4** = **Apparently Secure**—Uncommon but not rare in the state; some cause for long-term concern due to declines or other factors.
  - S5** = **Secure**—Common, widespread, and abundant in the state.
- 

### **Notes:**

1.	Other considerations used when ranking a species or natural community include the pattern of distribution of the element on the landscape, fragmentation of the population/stands, and historical extent as compared to its modern range. It is important to take a <b>bird's eye or aerial view</b> when ranking sensitive elements rather than simply counting element occurrences.	3.	Other symbols:  GH All sites are <b>historical</b> ; the element has not been seen for at least 20 years, but suitable habitat still exists (SH = All California sites are historical).  GX All sites are <b>extirpated</b> ; this element is extinct in the wild (SX = All California sites are extirpated).  GXC Extinct in the wild; exists in cultivation.  G1Q The element is very rare, but there are <b>taxonomic questions</b> associated with it.  T Rank applies to a subspecies or variety.
2.	Uncertainty about the rank of an element is expressed in two major ways:  By expressing the ranks as a <b>range</b> of values: e.g., S2S3 means the rank is somewhere between S2 and S3.  By adding a ? to the rank: e.g., S2?. This represents more certainty than S2S3, but less certainty than S2.		

**SPECIAL LICHENS**  
Last updated March 23, 2007

There are a few lichens in California for which we have adequate information to place them on the list of Special taxa. They appear after the bryophytes at the beginning of the list. We are not including lichens for which little is known, even if they are only known from a few sites in California because the level of information is not developed enough. As information on individual taxa becomes better developed, more lichens may be added. Lichen statuses are developed in coordination with the California Lichen Society (CALS) and relevant experts.

Note that lichens are not plants, but a symbiotic relationship between a fungus and either green algae or cyanobacteria (aka bluegreen algae).

### **The California Rare Plant Ranks<sup>1</sup>**

- 1A. Presumed extirpated in California and either rare or extinct elsewhere
- 1B. Rare or Endangered in California and elsewhere
- 2A. Presumed extirpated in California, but more common elsewhere
- 2B. Rare or Endangered in California, but more common elsewhere
- 3. Plants for which we need more information - Review list
- 4. Plants of limited distribution - Watch list

**| 1A: Plants Presumed Extirpated in California and either rare or extinct elsewhere**

The plants of Rank 1A are presumed extirpated because they have not been seen or collected in the wild in California for many years. This rank includes those plant taxa that are both presumed extinct, as well as those plants which are presumed extirpated in California and rare elsewhere. A plant is extinct if it no longer occurs anywhere. A plant that is extirpated from California has been eliminated from California, but may still occur elsewhere in its range.

**1B: Plants Rare, Threatened, or Endangered in California and Elsewhere  
(Includes Rare Plant Ranks 1B.1, 1B.2, 1B.3)**

The plants of Rank 1B are rare throughout their range with the majority of them endemic to California. Most of the plants that are ranked 1B have declined significantly over the last century. California Rare Plant Rank 1B plants constitute the majority of plant taxa tracked by the CNDDB, with more than 1,000 plants assigned to this category of rarity.

**2A: Plants Presumed Extirpated in California, but more common elsewhere**

The plants of Rank 2A are presumed extirpated because they have not been seen or collected in the wild in California for many years. This rank includes only those plant taxa that are presumed extirpated in California, but that are more common elsewhere in their range. Note: Plants of both Rank 1A and 2A are presumed extirpated in California; the only difference is the status of the plants outside of the state.

**2B: Plants Rare, Threatened, or Endangered in California, but More Common Elsewhere  
(Includes Rare Plant Ranks 2B.1, 2B.2, 2B.3)**

The plants of Rank 2B are rare, threatened or endangered in California, but more common elsewhere. Plants common in other states or countries are not eligible for consideration under the provisions of the **Federal** Endangered Species Act; however they are eligible for consideration under the **California** Endangered Species Act. This rank is meant to highlight the importance of protecting the geographic range and genetic diversity of more widespread species by protecting those species whose ranges just extend into California. Note: Plants of both Rank 1B and 2B are rare, threatened or endangered in California; the only difference is the status of the plants outside of the state.

**3: Plants About Which We Need More Information - A Review list  
(Includes Rare Plant Ranks 3, 3.1, 3.2, 3.3)**

The plants that comprise Rank 3 are united by one common theme--we lack the necessary information to assign them to one of the other lists or to reject them. Nearly all of the plants remaining on Rank 3 are taxonomically problematic.

**4: Plants of Limited Distribution - A Watch list  
(Includes Rare Plant Ranks 4.1, 4.2, 4.3)**

The plants in this category are of limited distribution or infrequent throughout a broader area in California, and their vulnerability or susceptibility to threat appears low at this time. While we cannot call these plants "rare" from a statewide perspective, they are uncommon enough that their status should be monitored regularly. Should the degree of endangerment or rarity of a Rank 4 plant change, we will transfer it to a more appropriate rank or delete it from consideration.

**Threat Ranks:**

The California Rare Plant Ranks (CRPR) use a decimal-style threat rank. The threat rank is an extension added onto the CRPR and designates the level of threats by a 1 to 3 ranking with 1 being the most threatened and 3 being the least threatened. So most CRPRs read as 1B.1, 1B.2, 1B.3, etc. Note that some Rank 3 plants do not have a threat code extension due to difficulty in ascertaining threats for these species. Rank 1A and 2A plants also do not have threat code extensions since there are no known extant populations of the plants in California.

**Threat Code extensions and their meanings:**

- .1 - Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
- .2 - Moderately threatened in California (20-80% of occurrences threatened / moderate degree and immediacy of threat)
- .3 - Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

<sup>1</sup> In March, 2010, DFG changed the name of "CNPS List" or "CNPS Ranks" to "California Rare Plant Rank" (or CRPR). This was done to reduce confusion over the fact that CNPS and DFG jointly manage the Rare Plant Status Review groups (300+ botanical experts from government, academia, NGOs and the private sector) and that the rank assignments are the product of a collaborative effort and not solely a CNPS assignment.

In July 2013, CNPS revised the Rare Plant Ranks in order to better define and categorize rarity in California's flora. In essence, Rank 2 was split into Rank 2A and Rank 2B to be complementary to the already existing 1A and 1B ranks. This split in Rank 2 plants resulted in five Rank 2 plants moving to Rank 2A (Presumed extirpated in California, but more common elsewhere) and the remaining Rank 2 plants being reclassified as Rank 2B (Rare, Threatened or Endangered in California, but more common elsewhere).

## Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities

State of California  
CALIFORNIA NATURAL RESOURCES AGENCY  
Department of Fish and Game  
November 24, 2009<sup>2</sup>

### INTRODUCTION AND PURPOSE

The conservation of special status native plants and their habitats, as well as natural communities, is integral to maintaining biological diversity. The purpose of these protocols is to facilitate a consistent and systematic approach to the survey and assessment of special status native plants and natural communities so that reliable information is produced and the potential of locating a special status plant species or natural community is maximized. They may also help those who prepare and review environmental documents determine when a botanical survey is needed, how field surveys may be conducted, what information to include in a survey report, and what qualifications to consider for surveyors. The protocols may help avoid delays caused when inadequate biological information is provided during the environmental review process; assist lead, trustee and responsible reviewing agencies to make an informed decision regarding the direct, indirect, and cumulative effects of a proposed development, activity, or action on special status native plants and natural communities; meet California Environmental Quality Act (CEQA)<sup>3</sup> requirements for adequate disclosure of potential impacts; and conserve public trust resources.

### DEPARTMENT OF FISH AND GAME TRUSTEE AND RESPONSIBLE AGENCY MISSION

The mission of the Department of Fish and Game (DFG) is to manage California's diverse wildlife and native plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. DFG has jurisdiction over the conservation, protection, and management of wildlife, native plants, and habitat necessary to maintain biologically sustainable populations (Fish and Game Code §1802). DFG, as trustee agency under CEQA §15386, provides expertise in reviewing and commenting on environmental documents and makes protocols regarding potential negative impacts to those resources held in trust for the people of California.

Certain species are in danger of extinction because their habitats have been severely reduced in acreage, are threatened with destruction or adverse modification, or because of a combination of these and other factors. The California Endangered Species Act (CESA) provides additional protections for such species, including take prohibitions (Fish and Game Code §2050 *et seq.*). As a responsible agency, DFG has the authority to issue permits for the take of species listed under CESA if the take is incidental to an otherwise lawful activity; DFG has determined that the impacts of the take have been minimized and fully mitigated; and, the take would not jeopardize the continued existence of the species (Fish and Game Code §2081). Surveys are one of the preliminary steps to detect a listed or special status plant species or natural community that may be impacted significantly by a project.

### DEFINITIONS

Botanical surveys provide information used to determine the potential environmental effects of proposed projects on all special status plants and natural communities as required by law (i.e., CEQA, CESA, and Federal Endangered Species Act (ESA)). Some key terms in this document appear in **bold font** for assistance in use of the document.

For the purposes of this document, **special status plants** include all plant species that meet one or more of the following criteria<sup>4</sup>:

---

<sup>2</sup> This document replaces the DFG document entitled "Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened and Endangered Plants and Natural Communities."

<sup>3</sup> <http://ceres.ca.gov/ceqa/>

<sup>4</sup> Adapted from the East Alameda County Conservation Strategy available at [http://www.fws.gov/sacramento/EACCS/Documents/080228\\_Species\\_Evaluation\\_EACCS.pdf](http://www.fws.gov/sacramento/EACCS/Documents/080228_Species_Evaluation_EACCS.pdf)

- Listed or proposed for listing as threatened or endangered under ESA or candidates for possible future listing as threatened or endangered under the ESA (50 CFR §17.12).
- Listed<sup>5</sup> or candidates for listing by the State of California as threatened or endangered under CESA (Fish and Game Code §2050 *et seq.*). A species, subspecies, or variety of plant is **endangered** when the prospects of its survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, over-exploitation, predation, competition, disease, or other factors (Fish and Game Code §2062). A plant is **threatened** when it is likely to become endangered in the foreseeable future in the absence of special protection and management measures (Fish and Game Code §2067).
- Listed as rare under the California Native Plant Protection Act (Fish and Game Code §1900 *et seq.*). A plant is **rare** when, although not presently threatened with extinction, the species, subspecies, or variety is found in such small numbers throughout its range that it may be endangered if its environment worsens (Fish and Game Code §1901).
- Meet the definition of rare or endangered under CEQA §15380(b) and (d). Species that may meet the definition of rare or endangered include the following:
  - ◆ Species considered by the California Native Plant Society (CNPS) to be “rare, threatened or endangered in California” (Lists 1A, 1B and 2);
  - ◆ Species that may warrant consideration on the basis of local significance or recent biological information<sup>6</sup>;
  - ◆ Some species included on the California Natural Diversity Database’s (CNDDB) *Special Plants, Bryophytes, and Lichens List* (California Department of Fish and Game 2008)<sup>7</sup>.
- Considered a **locally significant species**, that is, a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region (CEQA §15125 (c)) or is so designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include a species at the outer limits of its known range or a species occurring on an uncommon soil type.

**Special status natural communities** are communities that are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects. These communities may or may not contain special status species or their habitat. The most current version of the Department’s *List of California Terrestrial Natural Communities*<sup>8</sup> indicates which natural communities are of special status given the current state of the California classification.

Most types of wetlands and riparian communities are considered special status natural communities due to their limited distribution in California. These natural communities often contain special status plants such as those described above. These protocols may be used in conjunction with protocols formulated by other agencies, for example, those developed by the U.S. Army Corps of Engineers to delineate jurisdictional wetlands<sup>9</sup> or by the U.S. Fish and Wildlife Service to survey for the presence of special status plants<sup>10</sup>.

## BOTANICAL SURVEYS

<sup>5</sup> Refer to current online published lists available at: <http://www.dfg.ca.gov/biogeodata>.

<sup>6</sup> In general, CNPS List 3 plants (plants about which more information is needed) and List 4 plants (plants of limited distribution) may not warrant consideration under CEQA §15380. These plants may be included on special status plant lists such as those developed by counties where they would be addressed under CEQA §15380. List 3 plants may be analyzed under CEQA §15380 if sufficient information is available to assess potential impacts to such plants. Factors such as regional rarity vs. statewide rarity should be considered in determining whether cumulative impacts to a List 4 plant are significant even if individual project impacts are not. List 3 and 4 plants are also included in the California Natural Diversity Database’s (CNDDB) *Special Plants, Bryophytes, and Lichens List*. [Refer to the current online published list available at: <http://www.dfg.ca.gov/biogeodata>.] Data on Lists 3 and 4 plants should be submitted to CNDDB. Such data aids in determining or revising priority ranking.

<sup>7</sup> Refer to current online published lists available at: <http://www.dfg.ca.gov/biogeodata>.

<sup>8</sup> <http://www.dfg.ca.gov/biogeodata/vegcamp/pdfs/natcomlist.pdf>. The rare natural communities are asterisked on this list.

<sup>9</sup> <http://www.wetlands.com/regs/tlpge02e.htm>

<sup>10</sup> U.S. Fish and Wildlife Service Survey Guidelines available at <http://www.fws.gov/sacramento/es/protocol.htm>

Conduct botanical surveys prior to the commencement of any activities that may modify vegetation, such as clearing, mowing, or ground-breaking activities. It is appropriate to conduct a botanical field survey when:

- Natural (or naturalized) vegetation occurs on the site, and it is unknown if special status plant species or natural communities occur on the site, and the project has the potential for direct or indirect effects on vegetation; or
- Special status plants or natural communities have historically been identified on the project site; or
- Special status plants or natural communities occur on sites with similar physical and biological properties as the project site.

### SURVEY OBJECTIVES

Conduct field surveys in a manner which maximizes the likelihood of locating special status plant species or special status natural communities that may be present. Surveys should be **floristic in nature**, meaning that every plant taxon that occurs on site is identified to the taxonomic level necessary to determine rarity and listing status. “Focused surveys” that are limited to habitats known to support special status species or are restricted to lists of likely potential species are not considered floristic in nature and are not adequate to identify all plant taxa on site to the level necessary to determine rarity and listing status. Include a list of plants and natural communities detected on the site for each botanical survey conducted. More than one field visit may be necessary to adequately capture the floristic diversity of a site. An indication of the prevalence (estimated total numbers, percent cover, density, etc.) of the species and communities on the site is also useful to assess the significance of a particular population.

### SURVEY PREPARATION

Before field surveys are conducted, compile relevant botanical information in the general project area to provide a regional context for the investigators. Consult the CNDDB<sup>11</sup> and BIOS<sup>12</sup> for known occurrences of special status plants and natural communities in the project area prior to field surveys. Generally, identify vegetation and habitat types potentially occurring in the project area based on biological and physical properties of the site and surrounding ecoregion<sup>13</sup>, unless a larger assessment area is appropriate. Then, develop a list of special status plants with the potential to occur within these vegetation types. This list can serve as a tool for the investigators and facilitate the use of reference sites; however, special status plants on site might not be limited to those on the list. Field surveys and subsequent reporting should be comprehensive and floristic in nature and not restricted to or focused only on this list. Include in the survey report the list of potential special status species and natural communities, and the list of references used to compile the background botanical information for the site.

### SURVEY EXTENT

Surveys should be comprehensive over the entire site, including areas that will be directly or indirectly impacted by the project. Adjoining properties should also be surveyed where direct or indirect project effects, such as those from fuel modification or herbicide application, could potentially extend offsite. Pre-project surveys restricted to known CNDDB rare plant locations may not identify all special status plants and communities present and do not provide a sufficient level of information to determine potential impacts.

### FIELD SURVEY METHOD

Conduct surveys using **systematic field techniques** in all habitats of the site to ensure thorough coverage of potential impact areas. The level of effort required per given area and habitat is dependent upon the vegetation and its overall diversity and structural complexity, which determines the distance at which plants can be identified. Conduct surveys by walking over the entire site to ensure thorough coverage, noting all plant taxa observed. The level of effort should be sufficient to provide comprehensive reporting. For example, one person-hour per eight acres per survey date is needed for a comprehensive field survey in grassland with medium diversity and moderate terrain<sup>14</sup>, with additional time allocated for species identification.

<sup>11</sup> Available at <http://www.dfg.ca.gov/biogeodata/cnddb>

<sup>12</sup> <http://www.bios.dfg.ca.gov/>

<sup>13</sup> [Ecological Subregions of California](http://www.fs.fed.us/r5/projects/ecoregions/toc.htm), available at <http://www.fs.fed.us/r5/projects/ecoregions/toc.htm>

<sup>14</sup> Adapted from U.S. Fish and Wildlife Service kit fox survey guidelines available at [www.fws.gov/sacramento/es/documents/kitfox\\_no\\_protocol.pdf](http://www.fws.gov/sacramento/es/documents/kitfox_no_protocol.pdf)

### **TIMING AND NUMBER OF VISITS**

Conduct surveys in the field at the time of year when species are both evident and identifiable. Usually this is during flowering or fruiting. Space visits throughout the growing season to accurately determine what plants exist on site. Many times this may involve multiple visits to the same site (e.g. in early, mid, and late-season for flowering plants) to capture the floristic diversity at a level necessary to determine if special status plants are present<sup>15</sup>. The timing and number of visits are determined by geographic location, the natural communities present, and the weather patterns of the year(s) in which the surveys are conducted.

### **REFERENCE SITES**

When special status plants are known to occur in the type(s) of habitat present in the project area, observe reference sites (nearby accessible occurrences of the plants) to determine whether those species are identifiable at the time of the survey and to obtain a visual image of the target species, associated habitat, and associated natural community.

### **USE OF EXISTING SURVEYS**

For some sites, floristic inventories or special status plant surveys may already exist. Additional surveys may be necessary for the following reasons:

- Surveys are not current<sup>16</sup>; or
- Surveys were conducted in natural systems that commonly experience year to year fluctuations such as periods of drought or flooding (e.g. vernal pool habitats or riverine systems); or
- Surveys are not comprehensive in nature; or fire history, land use, physical conditions of the site, or climatic conditions have changed since the last survey was conducted<sup>17</sup>; or
- Surveys were conducted in natural systems where special status plants may not be observed if an annual above ground phase is not visible (e.g. flowers from a bulb); or
- Changes in vegetation or species distribution may have occurred since the last survey was conducted, due to habitat alteration, fluctuations in species abundance and/or seed bank dynamics.

### **NEGATIVE SURVEYS**

Adverse conditions may prevent investigators from determining the presence of, or accurately identifying, some species in potential habitat of target species. Disease, drought, predation, or herbivory may preclude the presence or identification of target species in any given year. Discuss such conditions in the report.

The failure to locate a known special status plant occurrence during one field season does not constitute evidence that this plant occurrence no longer exists at this location, particularly if adverse conditions are present. For example, surveys over a number of years may be necessary if the species is an annual plant having a persistent, long-lived seed bank and is known not to germinate every year. Visits to the site in more than one year increase the likelihood of detection of a special status plant especially if conditions change. To further substantiate negative findings for a known occurrence, a visit to a nearby reference site may ensure that the timing of the survey was appropriate.

### **REPORTING AND DATA COLLECTION**

Adequate information about special status plants and natural communities present in a project area will enable reviewing agencies and the public to effectively assess potential impacts to special status plants or natural communities<sup>18</sup> and will guide

<sup>15</sup> U.S. Fish and Wildlife Service Survey Guidelines available at <http://www.fws.gov/sacramento/es/protocol.htm>

<sup>16</sup> Habitats, such as grasslands or desert plant communities that have annual and short-lived perennial plants as major floristic components may require yearly surveys to accurately document baseline conditions for purposes of impact assessment. In forested areas, however, surveys at intervals of five years may adequately represent current conditions. For forested areas, refer to "Guidelines for Conservation of Sensitive Plant Resources Within the Timber Harvest Review Process and During Timber Harvesting Operations", available at <https://r1.dfg.ca.gov/portal/Portals/12/THPBotanicalGuidelinesJuly2005.pdf>

<sup>17</sup> U.S. Fish and Wildlife Service Survey Guidelines available at [http://www.fws.gov/ventura/speciesinfo/protocols\\_guidelines/docs/botanicalinventories.pdf](http://www.fws.gov/ventura/speciesinfo/protocols_guidelines/docs/botanicalinventories.pdf)

<sup>18</sup> Refer to current online published lists available at: <http://www.dfg.ca.gov/biogeodata>. For Timber Harvest Plans (THPs) please refer to the "Guidelines for Conservation of Sensitive Plant Resources Within the Timber Harvest Review Process and During Timber Harvesting Operations", available at <https://r1.dfg.ca.gov/portal/Portals/12/THPBotanicalGuidelinesJuly2005.pdf>

the development of minimization and mitigation measures. The next section describes necessary information to assess impacts. For comprehensive, systematic surveys where no special status species or natural communities were found, reporting and data collection responsibilities for investigators remain as described below, excluding specific occurrence information.

### SPECIAL STATUS PLANT OR NATURAL COMMUNITY OBSERVATIONS

Record the following information for locations of each special status plant or natural community detected during a field survey of a project site.

- A detailed map (1:24,000 or larger) showing locations and boundaries of each special status species occurrence or natural community found as related to the proposed project. Mark occurrences and boundaries as accurately as possible. Locations documented by use of global positioning system (GPS) coordinates must include the datum<sup>19</sup> in which they were collected;
- The site-specific characteristics of occurrences, such as associated species, habitat and microhabitat, structure of vegetation, topographic features, soil type, texture, and soil parent material. If the species is associated with a wetland, provide a description of the direction of flow and integrity of surface or subsurface hydrology and adjacent off-site hydrological influences as appropriate;
- The number of individuals in each special status plant population as counted (if population is small) or estimated (if population is large);
- If applicable, information about the percentage of individuals in each life stage such as seedlings vs. reproductive individuals;
- The number of individuals of the species per unit area, identifying areas of relatively high, medium and low density of the species over the project site; and
- Digital images of the target species and representative habitats to support information and descriptions.

### FIELD SURVEY FORMS

When a special status plant or natural community is located, complete and submit to the CNDB a California Native Species (or Community) Field Survey Form<sup>20</sup> or equivalent written report, accompanied by a copy of the relevant portion of a 7.5 minute topographic map with the occurrence mapped. Present locations documented by use of GPS coordinates in map and digital form. Data submitted in digital form must include the datum<sup>21</sup> in which it was collected. If a potentially undescribed special status natural community is found on the site, document it with a Rapid Assessment or Relevé form<sup>22</sup> and submit it with the CNDB form.

### VOUCHER COLLECTION

Voucher specimens provide verifiable documentation of species presence and identification as well as a public record of conditions. This information is vital to all conservation efforts. Collection of voucher specimens should be conducted in a manner that is consistent with conservation ethics, and is in accordance with applicable state and federal permit requirements (e.g. incidental take permit, scientific collection permit). Voucher collections of special status species (or suspected special status species) should be made only when such actions would not jeopardize the continued existence of the population or species.

Deposit voucher specimens with an indexed regional herbarium<sup>23</sup> no later than 60 days after the collections have been made. Digital imagery can be used to supplement plant identification and document habitat. Record all relevant permittee names and permit numbers on specimen labels. A collecting permit is required prior to the collection of State-listed plant species<sup>24</sup>.

## BOTANICAL SURVEY REPORTS

Include reports of botanical field surveys containing the following information with project environmental documents:

- **Project and site description**
  - ◆ A description of the proposed project;
  - ◆ A detailed map of the project location and study area that identifies topographic and landscape features and includes a north arrow and bar scale; and,
  - ◆ A written description of the biological setting, including vegetation<sup>25</sup> and structure of the vegetation; geological and hydrological characteristics; and land use or management history.
- **Detailed description of survey methodology and results**
  - ◆ Dates of field surveys (indicating which areas were surveyed on which dates), name of field investigator(s), and total person-hours spent on field surveys;
  - ◆ A discussion of how the timing of the surveys affects the comprehensiveness of the survey;
  - ◆ A list of potential special status species or natural communities;
  - ◆ A description of the area surveyed relative to the project area;
  - ◆ References cited, persons contacted, and herbaria visited;
  - ◆ Description of reference site(s), if visited, and phenological development of special status plant(s);
  - ◆ A list of all taxa occurring on the project site. Identify plants to the taxonomic level necessary to determine whether or not they are a special status species;
  - ◆ Any use of existing surveys and a discussion of applicability to this project;
  - ◆ A discussion of the potential for a false negative survey;
  - ◆ Provide detailed data and maps for all special plants detected. Information specified above under the headings “Special Status Plant or Natural Community Observations,” and “Field Survey Forms,” should be provided for locations of each special status plant detected;
  - ◆ Copies of all California Native Species Field Survey Forms or Natural Community Field Survey Forms should be sent to the CNDDB and included in the environmental document as an Appendix. It is not necessary to submit entire environmental documents to the CNDDB; and,
  - ◆ The location of voucher specimens, if collected.
- **Assessment of potential impacts**
  - ◆ A discussion of the significance of special status plant populations in the project area considering nearby populations and total species distribution;
  - ◆ A discussion of the significance of special status natural communities in the project area considering nearby occurrences and natural community distribution;
  - ◆ A discussion of direct, indirect, and cumulative impacts to the plants and natural communities;
  - ◆ A discussion of threats, including those from invasive species, to the plants and natural communities;
  - ◆ A discussion of the degree of impact, if any, of the proposed project on unoccupied, potential habitat of the species;
  - ◆ A discussion of the immediacy of potential impacts; and,
  - ◆ Recommended measures to avoid, minimize, or mitigate impacts.

<sup>25</sup> A vegetation map that uses the National Vegetation Classification System (<http://biology.usgs.gov/npsveg/nvcs.html>), for example *A Manual of California Vegetation*, and highlights any special status natural communities. If another vegetation classification system is used, the report should reference the system, provide the reason for its use, and provide a crosswalk to the National Vegetation Classification System.

## QUALIFICATIONS

Botanical consultants should possess the following qualifications:

- Knowledge of plant taxonomy and natural community ecology;
- Familiarity with the plants of the area, including special status species;
- Familiarity with natural communities of the area, including special status natural communities;
- Experience conducting floristic field surveys or experience with floristic surveys conducted under the direction of an experienced surveyor;
- Familiarity with the appropriate state and federal statutes related to plants and plant collecting; and,
- Experience with analyzing impacts of development on native plant species and natural communities.

List of Sensitive Natural Communities in California

September 2010 [http://www.dfg.ca.gov/biogeodata/vegcamp/natural\\_communities.asp](http://www.dfg.ca.gov/biogeodata/vegcamp/natural_communities.asp)

<b>Forest and Woodlands Alliances and Stands</b>		<b>Global &amp; State Rank</b>
*88.800.00	<b><i>Abies amabilis</i> (Pacific silver fir forest) Alliance</b>	G5 S1
*88.800.01	<i>Abies amabilis</i>	
*88.300.00	<b><i>Abies bracteata</i> (Santa Lucia fir groves) Alliance</b>	G3 S3
*88.300.01	<i>Abies bracteata / Galium clementis</i>	
*88.300.02	<i>Abies bracteata / Polystichum munitum</i>	
88.500.00	<b><i>Abies concolor</i> (White fir forest) Alliance</b>	G5 S4 (some associations are of high priority for inventory)
88.500.40	<i>Abies concolor - Calocedrus decurrens - Pinus jeffreyi</i>	
88.510.10	<i>Abies concolor - Calocedrus decurrens - Pseudotsuga macrocarpa - Pinus coulteri</i>	
88.500.29	<i>Abies concolor - Calocedrus decurrens - Quercus kelloggii</i>	
88.500.31	<i>Abies concolor - Calocedrus decurrens / Pyrola picta</i>	
88.500.30	<i>Abies concolor - Calocedrus decurrens / Symphoricarpos mollis</i>	
*88.500.37	<i>Abies concolor - Chrysolepis chrysophylla</i>	
88.500.35	<i>Abies concolor / (Rosa gymnocarpa) - Symphoricarpos mollis</i>	
88.500.60	<i>Abies concolor / Acer glabrum</i>	
88.500.12	<i>Abies concolor / Achlys triphylla</i>	
88.500.33	<i>Abies concolor / Amelanchier alnifolia</i>	
88.500.10	<i>Abies concolor / Arctostaphylos nevadensis</i>	
88.500.17	<i>Abies concolor / Arnica cordifolia</i>	
88.500.32	<i>Abies concolor / Chimaphila menziesii - Pyrola picta</i>	
88.500.11	<i>Abies concolor / Chimaphila umbellata</i>	
88.500.59	<i>Abies concolor / Goodyera oblongifolia</i>	
88.500.54	<i>Abies concolor / Mahonia nervosa</i>	
88.500.58	<i>Abies concolor / Prunus emarginata</i>	
88.500.61	<i>Abies concolor / Pseudostellaria jamesiana</i>	
88.500.57	<i>Abies concolor / Trillium ovatum</i>	
88.500.53	<i>Abies concolor / Vicia americana</i>	
88.510.00	<b><i>Abies concolor - Pinus lambertiana</i> (White fir - sugar pine forest) Alliance</b>	G4 S4
88.510.01	<i>Abies concolor - Pinus lambertiana</i>	
88.510.09	<i>Abies concolor - Pinus lambertiana - Calocedrus decurrens - Quercus chrysolepis</i>	
88.510.06	<i>Abies concolor - Pinus lambertiana - Calocedrus decurrens / Adenocaulon bicolor</i>	
88.510.07	<i>Abies concolor - Pinus lambertiana - Calocedrus decurrens / Chrysolepis sempervirens</i>	
88.510.05	<i>Abies concolor - Pinus lambertiana - Calocedrus decurrens / Cornus nuttallii / Corylus cornuta</i>	
88.510.08	<i>Abies concolor - Pinus lambertiana - Calocedrus decurrens / Symphoricarpos mollis / Kelloggia galioidea</i>	
88.510.04	<i>Abies concolor - Pinus lambertiana - Pinus jeffreyi</i>	
88.510.17	<i>Abies concolor - Pinus lambertiana - Pinus ponderosa / Lithocarpus densiflorus var. echinoides</i>	
88.510.14	<i>Abies concolor - Pinus lambertiana - Pseudotsuga menziesii / Carex rossii</i>	
88.510.13	<i>Abies concolor - Pinus lambertiana / Ceanothus cordulatus</i>	
88.510.03	<i>Abies concolor - Pinus lambertiana / Maianthemum canadense - Prosartes hookeri</i>	
88.510.16	<i>Abies concolor - Pinus ponderosa / Lithocarpus densiflorus var. echinoides</i>	
88.510.15	<i>Pinus ponderosa - Pinus lambertiana / Lithocarpus densiflorus var. echinoides</i>	
88.530.00	<b><i>Abies concolor - Pseudotsuga menziesii</i> (White fir - Douglas fir forest) Alliance</b>	G5 S4 (some associations are of high priority for inventory)
88.530.34	<i>Abies concolor - Pseudotsuga menziesii - (mixed conifer) / Acer circinatum - Chrysolepis sempervirens</i>	
*88.530.06	<i>Abies concolor - Pseudotsuga menziesii - (Quercus chryssolepis)</i>	
88.530.30	<i>Abies concolor - Pseudotsuga menziesii - Calocedrus decurrens</i>	
88.530.35	<i>Abies concolor - Pseudotsuga menziesii / Amelanchier utahensis</i>	
88.530.14	<i>Abies concolor - Pseudotsuga menziesii / Arnica cordifolia</i>	
88.530.36	<i>Abies concolor - Pseudotsuga menziesii / Cornus nuttallii</i>	
88.530.37	<i>Abies concolor - Pseudotsuga menziesii / Cornus nuttallii / Corylus cornuta</i>	

*88.530.15	<i>Abies concolor - Pseudotsuga menziesii / Corylus cornuta</i>	
88.530.32	<i>Abies concolor - Pseudotsuga menziesii / Corylus cornuta / Adenocaulon bicolor</i>	
88.530.16	<i>Abies concolor - Pseudotsuga menziesii / Melica subulata</i>	
88.530.29	<i>Abies concolor - Pseudotsuga menziesii / Pteridium aquilinum</i>	
88.530.17	<i>Abies concolor - Pseudotsuga menziesii / Quercus sadleriana</i>	
88.530.18	<i>Abies concolor - Pseudotsuga menziesii / Quercus sadleriana - Arctostaphylos nevadensis</i>	
88.530.19	<i>Abies concolor - Pseudotsuga menziesii / Quercus sadleriana - Quercus vacciniifolia</i>	
88.530.38	<i>Abies concolor - Pseudotsuga menziesii / Quercus sadleriana - Rhododendron macrophyllum</i>	
88.530.20	<i>Abies concolor - Pseudotsuga menziesii / Quercus vacciniifolia</i>	
*88.530.21	<i>Abies concolor - Pseudotsuga menziesii / Rhododendron macrophyllum - Quercus</i>	
88.530.23	<i>Abies concolor - Pseudotsuga menziesii / Rosa gymnocarpa - Linnaea borealis - Symphoricarpos mollis</i>	
88.530.24	<i>Abies concolor - Pseudotsuga menziesii / Rosa gymnocarpa - Symphoricarpos mollis</i>	
*88.530.25	<i>Abies concolor - Pseudotsuga menziesii / Rosa gymnocarpa / Linnaea borealis</i>	
88.530.31	<i>Abies concolor - Pseudotsuga menziesii / Rubus ameniacus</i>	
*88.530.26	<i>Abies concolor - Pseudotsuga menziesii / Rubus parviflorus</i>	
88.530.33	<i>Abies concolor - Pseudotsuga menziesii / Trientalis latifolia</i>	
88.530.28	<i>Abies concolor - Pseudotsuga menziesii / Xerophyllum tenax</i>	
*88.100.00	<b><i>Abies grandis (Grand fir forest) Alliance</i></b>	G4 S2
*88.400.00	<b><i>Abies lasiocarpa (Subalpine fir forest) Alliance</i></b>	G5 S2
*88.400.01	<i>Abies lasiocarpa</i>	
88.200.00	<b><i>Abies magnifica (Red fir forest) Alliance</i></b>	G5 S4 (some associations are of high priority for inventory)
88.200.23	<i>Abies magnifica</i>	
88.200.30	<i>Abies magnifica - Pinus monticola</i>	
88.200.15	<i>Abies magnifica - Tsuga mertensiana / Orthilia secunda</i>	
88.200.14	<i>Abies magnifica - Picea breweriana / Quercus sadleriana - Vaccinium membranaceum</i>	
88.200.16	<i>Abies magnifica - Pinus contorta / Sphenosciadium capitellatum</i>	
88.200.24	<i>Abies magnifica - Pinus contorta ssp. murrayana / Hieracium albiflorum</i>	
88.200.29	<i>Abies magnifica - Pinus monticola - Pinus contorta ssp. murrayana</i>	
88.200.43	<i>Abies magnifica - Pinus monticola / Quercus vacciniifolia</i>	
*88.200.10	<i>Abies magnifica - (Calocedrus decurrens)</i>	
88.200.03	<i>Abies magnifica / Achlys triphylla</i>	
88.200.27	<i>Abies magnifica / Arctostaphylos nevadensis</i>	
88.200.05	<i>Abies magnifica / Chimaphila umbellata</i>	
88.200.35	<i>Abies magnifica / Leucothoe davisiae</i>	
88.200.37	<i>Abies magnifica / Linnaea borealis</i>	
88.200.41	<i>Abies magnifica / Lupinus albifrons</i>	
88.200.11	<i>Abies magnifica / Orthilia secunda</i>	
88.200.06	<i>Abies magnifica / Penstemon gracilentus</i>	
88.200.25	<i>Abies magnifica / Pinus contorta ssp. murrayana</i>	
88.200.28	<i>Abies magnifica / Pinus monticola / Arctostaphylos nevadensis</i>	
88.200.31	<i>Abies magnifica / Pinus monticola / Chrysolepis sempervirens</i>	
88.200.13	<i>Abies magnifica / Pyrola picta</i>	
88.200.01	<i>Abies magnifica / Quercus sadleriana</i>	
88.200.09	<i>Abies magnifica / Quercus sadleriana - Arctostaphylos nevadensis</i>	
88.200.36	<i>Abies magnifica / Quercus vacciniifolia</i>	
*88.200.12	<i>Abies magnifica / Rhododendron macrophyllum</i>	
*88.200.02	<i>Abies magnifica / Vaccinium membranaceum</i>	
88.200.26	<i>Abies magnifica / Wyethia mollis</i>	
88.520.00	<b><i>Abies magnifica - Abies concolor (Red fir - white fir forest) Alliance</i></b>	G5 S4
88.520.01	<i>Abies magnifica - Abies concolor</i>	
88.520.09	<i>Abies magnifica - Abies concolor - Pinus jeffreyi</i>	
88.520.11	<i>Abies magnifica - Abies concolor / Acer glabrum</i>	
88.520.08	<i>Abies magnifica - Abies concolor / Achlys triphylla</i>	
88.520.16	<i>Abies magnifica - Abies concolor / Anemone deltoidea</i>	

88.520.07	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Arctostaphylos nevadensis</i>	
88.520.12	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Arctostaphylos nevadensis</i>	
88.520.03	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Arnica cordifolia</i>	
88.520.13	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Penstemon anguineus</i> - <i>Monardella odoratissima</i>	
88.520.10	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Pinus lambertiana</i>	
88.520.02	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Pteridium aquilinum</i>	
88.520.15	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Pyrola picta</i>	
88.520.06	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Quercus sadleriana</i>	
88.520.14	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Quercus sadleriana</i>	
88.520.05	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Symphoricarpos mollis</i> - <i>Rosa gymnocarpa</i>	
88.520.04	<i>Abies magnifica</i> - <i>Abies concolor</i> / <i>Symphoricarpos mollis</i> / <i>Pyrola picta</i>	
*61.450.00	<b><i>Acer macrophyllum</i> (Bigleaf maple forest) Alliance</b>	G4 S3
*61.450.01	<i>Acer macrophyllum</i>	
*61.450.02	<i>Acer macrophyllum</i> - <i>Pseudotsuga menziesii</i> / <i>Adenocaulon bicolor</i>	
*61.450.04	<i>Acer macrophyllum</i> - <i>Pseudotsuga menziesii</i> / <i>Corylus cornuta</i>	
*61.450.03	<i>Acer macrophyllum</i> - <i>Pseudotsuga menziesii</i> / <i>Dryopteris arguta</i>	
*61.450.05	<i>Acer macrophyllum</i> - <i>Pseudotsuga menziesii</i> / <i>Philadelphus lewisii</i>	
*61.450.06	<i>Acer macrophyllum</i> - <i>Pseudotsuga menziesii</i> / <i>Polystichum munitum</i>	
*61.440.00	<b><i>Acer negundo</i> (Box-elder forest) Alliance</b>	G5 S2
*61.440.01	<i>Acer negundo</i> - <i>Salix gooddingii</i>	
*75.100.00	<b><i>Aesculus californica</i> (California buckeye groves) Alliance</b>	G3 S3
*75.100.03	<i>Aesculus californica</i>	
*75.100.02	<i>Aesculus californica</i> - <i>Umbellularia californica</i> / <i>Diplacus aurantiacus</i>	
*75.100.06	<i>Aesculus californica</i> - <i>Umbellularia californica</i> / <i>Holodiscus discolor</i>	
*75.100.04	<i>Aesculus californica</i> / <i>Datisca glomerata</i>	
*75.100.05	<i>Aesculus californica</i> / <i>Lupinus albifrons</i>	
*75.100.01	<i>Aesculus californica</i> / <i>Toxicodendron diversilobum</i> / moss	
61.420.00	<b><i>Alnus rhombifolia</i> (White alder groves) Alliance</b>	G4 S4 (some associations are of high priority for inventory)
61.420.10	<i>Alnus rhombifolia</i>	
61.420.03	<i>Alnus rhombifolia</i> - <i>Acer macrophyllum</i>	
*61.420.11	<i>Alnus rhombifolia</i> - <i>Platanus racemosa</i>	
61.420.12	<i>Alnus rhombifolia</i> - <i>Platanus racemosa</i> - <i>Quercus chryssolepis</i>	
*61.420.15	<i>Alnus rhombifolia</i> - <i>Platanus racemosa</i> - <i>Salix laevigata</i>	
61.420.29	<i>Alnus rhombifolia</i> - <i>Pseudotsuga menziesii</i>	
61.420.31	<i>Alnus rhombifolia</i> - <i>Pseudotsuga menziesii</i> - <i>Calocedrus decurrens</i>	
61.420.30	<i>Alnus rhombifolia</i> - <i>Pseudotsuga menziesii</i> / <i>Darmera peltata</i>	
61.420.04	<i>Alnus rhombifolia</i> - <i>Pseudotsuga menziesii</i> / <i>Rubus armeniacus</i>	
61.420.22	<i>Alnus rhombifolia</i> - <i>Quercus chryssolepis</i>	
*61.420.13	<i>Alnus rhombifolia</i> - <i>Salix laevigata</i>	
61.420.02	<i>Alnus rhombifolia</i> / <i>Aruncus dioicus</i>	
61.420.09	<i>Alnus rhombifolia</i> / <i>Baccharis salicifolia</i>	
61.420.24	<i>Alnus rhombifolia</i> / <i>Carex nudata</i>	
61.420.23	<i>Alnus rhombifolia</i> / <i>Carex spp</i>	
*61.420.07	<i>Alnus rhombifolia</i> / <i>Cornus sericea</i>	
61.420.06	<i>Alnus rhombifolia</i> / <i>Cornus sessilis</i>	
*61.420.05	<i>Alnus rhombifolia</i> / <i>Darmera peltata</i>	
61.420.08	<i>Alnus rhombifolia</i> / <i>Galium trifolium</i>	
61.420.26	<i>Alnus rhombifolia</i> / <i>Galium trifolium</i> - <i>Stachys ajugoides</i>	
61.420.21	<i>Alnus rhombifolia</i> / <i>Leucothoe davisiae</i>	
*61.420.01	<i>Alnus rhombifolia</i> / <i>Polypodium californicum</i>	
61.420.27	<i>Alnus rhombifolia</i> / <i>Pteridium aquilinum</i>	
*61.420.17	<i>Alnus rhombifolia</i> / <i>Rhododendron occidentale</i>	
*61.420.18	<i>Alnus rhombifolia</i> / <i>Salix exigua</i> - ( <i>Rosa californica</i> )	

61.410.00	<b><i>Alnus rubra</i> (Red alder forest) Alliance</b>	G5 S4 (some associations are of high priority for inventory)
*61.410.01	<i>Alnus rubra</i> - <i>Pseudotsuga menziesii</i> / <i>Acer circinatum</i> / <i>Claytonia sibirica</i>	
*61.410.02	<i>Alnus rubra</i> / <i>Gaultheria shallon</i>	
61.410.07	<i>Alnus rubra</i> / <i>Rubus spectabilis</i>	
*61.410.06	<i>Alnus rubra</i> / <i>Rubus spectabilis</i> - <i>Sambucus racemosa</i>	
*61.410.05	<i>Alnus rubra</i> / <i>Salix lasiolepis</i>	
*73.200.00	<b><i>Arbutus menziesii</i> (Madrone forest) Alliance</b>	G4 S3
*73.200.03	<i>Arbutus menziesii</i> - <i>Quercus agrifolia</i>	
*73.200.01	<i>Arbutus menziesii</i> - <i>Umbellularia californica</i> - ( <i>Lithocarpus densiflorus</i> )	
*73.200.02	<i>Arbutus menziesii</i> - <i>Umbellularia californica</i> - <i>Quercus kelloggii</i>	
*33.120.00	<b><i>Bursera microphylla</i> (Elephant tree stands) Special Stands</b>	G4 S1
*81.606.00	<b><i>Callitropsis abramsiana</i> (Santa Cruz cypress groves) Special Stands</b>	G1 S1
*81.601.00	<b><i>Callitropsis bakeri</i> (Baker cypress stands) Alliance</b>	G2 S2
*81.601.01	<i>Callitropsis bakeri</i> / <i>Arctostaphylos patula</i>	
*81.607.00	<b><i>Callitropsis forbesii</i> (Tecate cypress stands) Alliance</b>	G2 S2
*81.603.00	<b><i>Callitropsis goveniana</i> (Monterey pygmy cypress stands) Special Stands</b>	G1 S1
*81.300.00	<b><i>Callitropsis macnabiana</i> (McNab cypress woodland) Alliance</b>	G3 S3
*81.300.02	<i>Callitropsis macnabiana</i> / <i>Arctostaphylos viscida</i>	
*81.604.00	<b><i>Callitropsis macrocarpa</i> (Monterey cypress stands) Special Stands</b>	G1 S1
*81.605.00	<b><i>Callitropsis nevadensis</i> (Piute cypress woodland) Alliance</b>	G2 S2
*81.605.01	<i>Callitropsis nevadensis</i>	
*81.200.00	<b><i>Callitropsis nootkatensis</i> (Alaska yellow-cedar stands) Alliance</b>	G4 S1
*81.400.00	<b><i>Callitropsis pigmaea</i> (Mendocino pygmy cypress woodland) Alliance</b>	G2 S2
*81.400.01	<i>Callitropsis pigmaea</i> / <i>Cladonia bellidiflora</i>	
*81.400.03	<i>Callitropsis pigmaea</i> / <i>Ramalina tharusta</i>	
*81.400.04	<i>Callitropsis pigmaea</i> / <i>Usnea subfloridana</i>	
*81.400.02	<i>Callitropsis pimaea</i> / <i>Cladina impexa</i>	
*81.500.00	<b><i>Callitropsis sargentii</i> (Sargent cypress woodland) Alliance</b>	G3 S3
*81.500.01	<i>Callitropsis sargentii</i>	
*81.500.03	<i>Callitropsis sargentii</i> / <i>Arctostaphylos montana</i>	
*81.500.02	<i>Callitropsis sargentii</i> / <i>riparian</i>	
*81.610.00	<b><i>Callitropsis stephensonii</i> (Cuyamaca cypress stands) Special Stands</b>	G1 S1
*85.100.00	<b><i>Calocedrus decurrens</i> (Incense cedar forest) Alliance</b>	G4 S3
*85.100.05	<i>Calocedrus decurrens</i> - <i>Abies concolor</i> / <i>Senecio triangularis</i>	
*85.100.03	<i>Calocedrus decurrens</i> - <i>Alnus rhombifolia</i>	
*85.100.04	<i>Calocedrus decurrens</i> - <i>Quercus chrysolepis</i> - <i>Quercus kelloggii</i>	
*85.100.01	<i>Calocedrus decurrens</i> / <i>Listera convallarioides</i>	
*81.100.00	<b><i>Chamaecyparis lawsoniana</i> (Port Orford cedar forest) Alliance</b>	G3 S3
*81.100.31	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>Acer circinatum</i>	
*81.100.30	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>Alnus viridis</i>	
*81.100.14	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>Chrysolepis sempervirens</i> (- <i>Rhododendron occidentale</i> - <i>Leucothoe davisiae</i> )	
*81.100.08	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>herb</i>	
*81.100.07	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>Quercus sadleriana</i>	
*81.100.09	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>Quercus vacciniifolia</i>	

*81.100.06	<i>Chamaecyparis lawsoniana</i> - <i>Abies concolor</i> / <i>Rhododendron occidentale</i>
*81.100.32	<i>Chamaecyparis lawsoniana</i> - <i>Abies x shastensis</i> - <i>Picea breweri</i> / <i>Quercus sadleriana</i> - <i>Quercus vacciniiifolia</i>
*81.100.33	<i>Chamaecyparis lawsoniana</i> - <i>Abies x shastensis</i> / <i>Alnus viridis</i> - <i>Quercus sadleriana</i>
*81.100.34	<i>Chamaecyparis lawsoniana</i> - <i>Abies x shastensis</i> / <i>Alnus viridis</i> / <i>Darlingtonia californica</i>
*81.100.03	<i>Chamaecyparis lawsoniana</i> - <i>Abies x shastensis</i> / <i>Quercus sadleriana</i> - <i>Vaccinium membranaceum</i>
*81.100.39	<i>Chamaecyparis lawsoniana</i> - <i>Calocedrus decurrens</i> - <i>Alnus rhombifolia</i>
*81.100.40	<i>Chamaecyparis lawsoniana</i> - <i>Calocedrus decurrens</i> / <i>Quercus vacciniiifolia</i>
*81.100.16	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / <i>Alnus viridis</i>
*81.100.19	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / dry herb complex
*81.100.10	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / <i>Quercus vacciniiifolia</i>
*81.100.15	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / <i>Rhododendron neoglandulosum</i> / <i>Darlingtonia californica</i>
*81.100.38	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / <i>Rhododendron neoglandulosum</i> / <i>Darlingtonia californica</i>
*81.100.37	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / <i>Rhododendron occidentale</i> - <i>Lithocarpus densiflorus</i> var. <i>echinoides</i> - <i>Rhododendron neoglandulosum</i>
*81.100.17	<i>Chamaecyparis lawsoniana</i> - <i>Pinus monticola</i> / <i>Vaccinium membranaceum</i>

## Introduction

Declines in populations of pollinator species have become a global concern. The California Department of Food and Agriculture (CDFA) recognizes that healthy pollinator populations are critical to protecting the environmental quality and agricultural resources of the state. CDFA engages in a number of activities to help protect the health of pollinator populations and minimize the potential for CDFA's activities to contribute to their decline. For further discussion of CDFA's activities, see Attachment 1 to this Appendix.

This Appendix reviews the available literature that evaluates the relationship between various stressors and pollinator declines. The activities that may be conducted under the Proposed Program, in particular chemical management approaches, are evaluated in relationship to pollinators, special-status species, and the natural environment.

## Background

Pollinators include honey bees (*Apis mellifera*), native bees, birds, and other insects or small mammals, some of which are listed under the federal Endangered Species Act. Scientists in the U.S. Environmental Protection Agency (EPA 2013), U.S. Department of Agriculture (USDA 2012), National Research Council (NRC 2006), and global scientific and regulatory communities have observed a general decline in populations of many pollinators, including a decline in the general health of honey bees. These declines may be related to complex interactions among multiple stressors, including:

- Pests (e.g., varroa mite), pathogens (e.g., the bacterial disease American foulbrood), and viruses;
- Poor nutrition (e.g., loss of foraging habitat, increased reliance on supplemental diets);
- Pesticide (e.g., insecticides, fungicides) exposure;
- Bee management practices (e.g., long migratory routes to support pollination services);
- Lack of genetic diversity;
- Habitat loss; and
- Drought.

The interactions between these stressors are complex, and many of the stressors reduce resilience and health, making the bees more susceptible to pests, pathogens, and disease (Pettis et al. 2012, USDA 2010, and Vanbergen and Insect Pollinators Initiative 2013). One manifestation of the honey bee decline is a phenomenon known as Colony Collapse Disorder (CCD).

Honey bee populations have been adversely affected by CCD over the past 10 years. CCD is only a problem for managed honey bee hives and not native bees (USGS 2013). CCD occurs when most of the worker bees in a colony disappear and leave behind a queen, food stores, and only a few nurse bees to care for the remaining immature bees and the queen. Reported cases of CCD have declined over the last 6 years. The number of winter losses attributed to CCD dropped from approximately 60 percent of total hives lost in 2008, to 26 percent in 2012 (EPA 2013). During this period, losses of honey bee colonies in the United States from all causes have averaged approximately 30 percent (USDA 2014), posing a threat to meeting the pollination service demands for several commercial crops (USDA 2012).

## Pollinator Biology and Role in the Ecosystem

Pollinators include species of invertebrates, bats, birds, and some mammals. This discussion focuses on invertebrate pollinators, because this group of pollinators has the greatest potential to be affected by the Proposed Program's chemical management activities (for evaluation of potential effects, please refer to PEIR Appendix A, Ecological Risk Assessment). Non-native honey bees are the most abundant pollinators in California, but 1,600 native bee species and other pollinators are also found in the state. This includes 18 species listed as threatened and endangered under the federal and/or state Endangered Species Acts (Frankie et al. 2009). Native bees in California include leafcutting bees, sweat bees, digger bees, mining bees, mason bees, carpenter bees, and cuckoo bees (Frankie et al. 2009).

Pollinators play a critical role in the life cycle of most plants, including pollinator-dependent agricultural crops and special-status flowering plants (SSFP). Plants can either reproduce vegetatively, where an exact clone is reproduced from a cutting or underground shoot, or sexually, where a seed is produced from an ovary being pollinated. For most flowering plants, sexual reproduction is the primary mode of reproduction; therefore, a flower must be pollinated either by wind or by an animal for the plant to reproduce. However, not all flowering plants are pollinator-dependent. For example, most grass species are self-pollinated or wind pollinated, and do not rely on pollinators.

Over 75 percent of flowering plants are pollinated by animals (ESA 2008; Pesticide Environmental Stewardship 2014; USFWS 2014). Approximately 90 percent of some crop pollination is estimated to be done by invertebrate species (Classen et al. 2014; Roubik 1995). Many natural communities are dominated by pollinator-dependent plant species (including populations of SSFP). Examples include Joshua tree woodlands (Baker 1986; Pellmyr and Segraves 2003), California poppy fields (Smith 2010), and vernal pools (USFWS 2014).

The pollinator-plant relationships usually are mutually beneficial to both parties: flowering plants produce nectar, a highly nutritious, sugar-based substance that has no direct benefit for the plant but is a critical source of energy for pollinators, and the pollinators facilitate the reproduction of plants by transporting pollen from flower to flower. In addition, pollinated plants produce fruits and seeds that are an important food source for wildlife.

The geographic range and active periods of pollinators are variable. Honey bees are active during daylight hours, traveling as far as 8 miles while foraging for food, with a median travel distance of around 3.5 miles. Foraging distance is correlated with body size and

varies greatly depending on the type of pollinator, the type of resource that the pollinator visits, and its availability (Beekman and Ratnieks 2000; Greenleaf et al. 2007; Hagler et al. 2011).

## Potential Effects of Pesticide Use on Pollinators and Pollinator-Dependent Plants

Two broad categories of pesticides exist: contact chemicals that are only toxic while active on the surface of the plant, and systemic chemicals that are absorbed into the plant tissue. Both categories can have extended residual toxicity (ERT) for hours after being applied, but systemic pesticide toxicity typically is longer because the chemical is designed to remain active in the plant tissue. The extent to which a pesticide may result in an adverse effect on a pollinator depends on a variety of factors, including the type of chemical, transport mechanism, ERT of the chemical formulation, and the size of the pollinator.

Bees can be poisoned by pesticides, either by absorption of the pesticide through contact or by consuming contaminated nectar, pollen, or water. Absorption can occur if bees are foraging as the spray is applied or if they walk across plants that have spray residues (NRC 2006). Consumption of contaminated nectar or pollen is associated with a class of pesticides called systemic chemicals, including neonicotinoids, which are absorbed in the plant and transferred through the vascular system, making the plant poisonous long after pesticide application (Hopwood et al. 2012). Neonicotinoids, a pesticide toxic to bees, remain persistent in soil for months and can be detected in woody plant tissue for up to 6 years (Hopwood et al. 2012). The relationship between concentrations in soil or woody plant tissue and the concentration in pollen has not been well studied, however systemic chemicals and their metabolites are known to translocate throughout a plant. One study has been conducted linking seed treatments with pollen contamination. The study tested for imidacloprid (a systemic neonicotinoid) throughout a plant after it was used to treat the seed. Once the plant matured and flowered, the pollen tested positive for imidacloprid. The concentration in the pollen was lower than the starting seed concentration; the study does not test the longevity of this translocation. (Laurent and Rathahao 2003)

Poisoning is more likely to occur if pesticides are applied to crops when they are blooming because the bees are more likely to make contact while foraging. Other factors that can increase potential pollinator-pesticide contact include (Hooven et al. 2013; Pesticide Environmental Stewardship 2014):

1. If the chemical was sprayed during the day and has an ERT of more than 8 hours;
2. Pesticide drift outside of the spray site, increasing the area with potential pesticide-pollinator contact;
3. If flowering ground cover or hedgerows are sprayed; and
4. When contaminated particles and pollen make it back to the hive.

Depending on the species, native bees may nest in underground tunnels, hollow plant stems, and tunnels in wood. Many ground-nesting species, such as squash bees, long-horned bees, mining bees, and sweat bees, construct their nests in the midst of annual and

perennial crop fields (Hooven et al. 2013). Unlike honey bees, whose hives can be moved, these native pollinators cannot be moved from the locations where pesticides are used.

Bee kill incidents from pesticides have been observed, such as the Wilsonville bee kill in 2013 (Grossman 2013). However, detrimental sublethal impacts are more likely; for example, pesticide contact can reduce foraging success of bees, disrupt navigation, reduce lifespan and disrupt the population biology of pollinators (i.e., lowering pollinator abundance even if not causing mortality) (Hopwood et al. 2012; Sandrock et al. 2014; Vanbergen and the Insect Pollinators Initiative 2013). Most native bees are substantially smaller than honey bees, in some cases only a fraction of the size, which makes them more susceptible to adverse effects (Johansen et al. 1983).

## Potential Impacts of Pesticide Use on Special-Status Pollinator Species

In California, 18 invertebrate special-status pollinators (SSP) exist, all of which are butterfly, moth, fly, and beetle species (Table K-1) (CDFW 2014). None of the native bee species in California are special-status species. Although little research has been done specifically about the effects of pesticides on SSP species, they may be susceptible to similar toxic effects from the four broad-spectrum systemic pesticides that may be used under the Proposed Program which affect honey bees and native bees. Because the SSPs are less abundant, a decrease in their numbers resulting from pesticide contact would have a more substantial effect on the population's ability to survive. SSPs typically have very limited ranges; therefore, potential impacts are best addressed through species-specific measures.

**Table K-1. Pollinator Species Listed as Threatened or Endangered**

Common Name	Scientific Name	Listing Status*
Bay checkerspot butterfly	<i>Euphydryas editha bayensis</i>	FT
Behren's silverspot butterfly	<i>Speyeria zerene behrensi</i>	FE

Smith's blue butterfly	<i>Euphilotes enoptes smithi</i>	FE
Valley elderberry longhorn beetle	<i>Desmocerus californicus dimorphus</i>	FT

\*FE = Federally Endangered, FT = Federally Threatened

## Potential Effects of Pollinator Reductions on Agricultural Outputs

As described earlier, many types of plants, including fruit and vegetable crops, depend on insects and other species (e.g., certain bird species) for pollination. The economic contribution of pollinators and the potential impact of pollinators on agriculture production have been estimated in many ways.

Honey bees are California's most important pollinators, resulting in an estimated ecosystem service value of \$4.4 billion a year.<sup>1</sup> Harm to honey bees, other pollinators, and other beneficial organisms from pesticide use could contribute to declines in pollinator or other ecosystem services, affecting the specialty crop industry in California.

Pollination is estimated to contribute "to crop production worth \$20-30 billion in agricultural production annually," (USDA 2012). Honey bees migrate by truck all over the country and pollinate 30 percent of the food we consume (ESA 2008). Pollinators are responsible for the reproduction of approximately 75 percent of all crops, including 150 crops in the U.S. (Kearns et al. 1998; USFWS 2014). Regardless of the specific statistics, clearly much of our food is dependent on the existence of pollinators, and agricultural production will decline as a result of pollinator declines. For example, a link was found between the insecticide spray program of lowbush blueberries in eastern Canada, the reduced native pollinator populations of 70 wild insects needed to pollinate the blueberries, and lower blueberry yields. (Kevan and Plowright 1995; Kevan et al. 1997; Kevan 1975).

The majority of crops can be pollinated by generalist pollinators, such as the honey bee. However, some crops have specialist pollinators, such as the wasp pollinators associated with figs (Janzen 1979; Molbo et al. 2003). A decline in specialist pollinators would be detrimental to those specialist-dependent crops because no replacement pollinator exists. In addition, wild native pollinators have been shown to be more successful in pollinating crops than managed honey bees, making them not only a good backup to managed honey bees but also an important resource to cultivate.

The diversity and abundance of wild insect pollinators have declined in many agricultural landscapes (Garibaldi et al. 2013). Diverse wild-bee communities potentially provide enhanced stability, quality, and quantity of pollination services over space and time, compared with single, managed species such as the honey bee (Klein et al. 2003; Greenleaf and Kremen 2006; Hoehn et al. 2008; Winfree and Kremen 2009). Therefore, in the face of

<sup>1</sup> Ecosystem services are the benefits people obtain from ecosystems.

honey bee population declines, wild pollinators may become increasingly important to farmers. Maintaining pollinator habitats and pollinator diversity within agricultural landscapes, therefore, is important to provide food production, quality, and security.

## Potential Impacts of Pollinator Reductions on SSFP and Sensitive Natural Communities

Pollinators are essential to the survival of over 70 percent of the 250,000 flowering plants species on the planet today (Kearns et al. 1998). Honey bees are generalist pollinators that do not discriminate between flower types, visiting different species and families of flowering plants. Therefore, a wide range of native flowering plants benefit from honey bee pollination (Brosi and Briggs 2013; Memmott et al. 2004). Reductions in pollinator populations may have substantial “implications for ecosystem functioning in terms of reduced plant reproduction, even when potentially effective pollinators remained in the system... results suggest that ongoing pollinator declines may have more serious negative implications for plant communities than is currently assumed” (Brosi and Briggs 2013). It has been predicted that 20,000 flowering plant species will disappear in the next few decades. Although pollinator declines will not be the sole cause of these plant extinctions, and few plants are dependent exclusively on one pollinator species, large-scale losses of either flowering plants or pollinators are likely to result in cascading declines within both groups (Bronstein 1992:1–44). These conclusions could not only impact SSFP but also plant species that make up sensitive natural communities.

Some SSFP may have specialized pollinators, where successful pollination and reproduction is dependent on the existence of one specific pollinator or group of pollinators. Reduced reproduction of SSFPs is likely to result in fewer new individuals of that species. This correlative relationship is different for each SSFP, depending on its prime mode of reproduction, its life history, and the species' degree of seed limitation (Garren and Strauss 2009). It is beyond the scope of this evaluation to individually evaluate the likelihood of a pollinator-induced population decline for each SSFP in California.

Sensitive natural communities, sometimes referred to as special-status plant communities, are described in PEIR Section 6.3, Biological Resources. These communities generally are rare, unique, or support a high level of endemic or rare plant and/or animal species, or have limited distribution statewide or within a county or region. These communities often are vulnerable to the environmental effects of projects (CDFA 2009). Plants that make up natural communities may depend on a diverse group of native pollinators as a form of pollinator redundancy (Moisset and Buchmann 2011). These pollinators may be more susceptible to pesticides because they are much smaller than the honey bee, which was the surrogate species evaluated in the Ecological Risk Assessment (PEIR Appendix A) (Johansen et al. 1983).

Similar to SSFP, sensitive natural communities dominated by pollinator-dependent plant species are sensitive to reductions in pollinator numbers if they are pollinated by uncommon specialists or if they have no other options for reproduction. For example, Joshua trees (*Yucca brevifolia*), the namesake tree in the sensitive natural community Joshua tree woodlands, are only pollinated by two species of moths whose distributions do not overlap (Baker 1986; Pellmyr and Segraves 2003). California poppy fields, another

sensitive natural community, are dominated by California poppies (*Eschscholzia californica*), which are pollinated by a suite of generalists but are an obligate-outcrosser, which means the plant relies on the pollination services of insects for reproductive success without other modes of reproduction (i.e., self-pollination or wind-pollination) (Smith 2010).

## Potential Effects of the Proposed Program on Pollinators and Related Species

Proposed Program activities potentially could affect native and non-native pollinators through several mechanisms that are potential stressors on pollinators, as described above. These mechanisms include application of pesticides by soil application or foliar application, using both ground-based and aerial methods. The choices of chemical and application method are dependent on the pest and the circumstances at hand because specific protocols are in place for different application scenarios. Proposed Program activities would take place in agricultural areas, nurseries, and residential/urban areas as needed; recreational areas, protected lands, and public lands would generally be excluded. Both contact and systemic pesticides would be included in the Proposed Program; this would include four systemic pesticides: imidacloprid, thiamethoxam, acetamiprid, and dinotefuran (see PEIR Chapter 3, Proposed Program Activities, for more information regarding their use). Acetamiprid, imidacloprid, and thiamethoxam also are neonicotinoids. The toxicity of each of these chemicals on pollinators was evaluated in the Ecological Risk Assessment (PEIR Appendix A) and is summarized in PEIR Section 6.3, Biological Resources.

Soil application methods apply the chemical directly to the soil and not the plant. These methods potentially can affect soil-dwelling native bees; in addition, if the chemical applied to the soil is systemic, it can be absorbed into the tissue of the plant, reach pollen, and make contact with foraging pollinators.

Foliar application of chemicals can be applied using several methods, including a backpack sprayer and an airblast sprayer on a tractor). These methods can affect pollinators by depositing the chemical directly on the plant/flowers, as well as drift which can expand the area of contact beyond the target plants.

Aerial applications (which may be conducted in response to quarantines in non-residential areas) use aircraft (i.e., a helicopter or airplane), spreading pesticides through the atmosphere and over the area where a pest population exists. This technique provides a rapid, uniform application over a large area. During aerial applications, the applied pesticide directly contacts some non-target areas, including the ground surface, other vegetation, and waterbodies.

Magnitude and duration of the applications for the Proposed Program would be limited, compared to the widespread application of these pesticides throughout agricultural and residential areas of California. In addition, the CDFA would implement a number of avoidance and minimization measures as part of the Proposed Program, including:

- Specific pollinator protection measures (Attachment 1);
- Pesticide label restrictions to reduce potential for drift and protect pollinators;

- Additional MPs, described in Chapter 2, Proposed Program Description, of the Final PEIR; and
- Measures identified based on coordination with USFWS and CDFW.

Therefore, the contribution of the Proposed Program to pollinator declines and the stressors that potentially result in pollinator declines is likely to be small, relative to other mechanisms described above that are part of the baseline environment.

# Attachment 1. Beneficial Actions for Pollinators, California Department of Food & Agriculture (CDFA) Plant Health and Pest Prevention Services Division level, by Branch, and Pierce's Disease Control Program

## Background

CDFA currently is implementing or proposing to implement a number of actions to benefit pollinator species. To distinguish between actions that are reflected in baseline conditions, the actions are divided into two groups—those implemented by CDFA before issuance of the Notice of Preparation (June 2011), and those implemented since that time or to be implemented in the future.

### Actions before June 2011

The Department of Food and Agriculture (CDFA) conducts an Integrated Pest Management (IPM) analysis of alternative treatment methods for the control of the targeted pest in the project area including:

- Mechanical Control;
- Cultural Control;
- Biological Control; and
- Chemical Control.

After the analysis, CDFA selects the effective alternative or combination of alternatives which are scientifically found to be likely to achieve the desired outcome.

**CDFA (All programs)** conducts a site-specific evaluation of the project area to determine what beneficial actions may be needed to reduce or eliminate any unintentional impacts on non-target species, including bee hives and the environment. CDFA implements the following types of beneficial actions for the evaluated project site:

- Establish the minimum and maximum project area boundary based upon the target pest profile and scientific expert consultations. The project area is the area where activities take place including a smaller defined treatment area, any regulatory actions if applicable and survey activity for presence of pollinators.
- Consult the California Department of Fish and Wildlife Natural Diversity Data Base for threatened and endangered species including pollinators (when this information is available).
- As appropriate, request technical assistance from the United States Fish and Wildlife Service, the California Department of Fish and Wildlife, and/or the National Marine Fisheries Service.

- Establish a treatment plan based upon selected alternative(s) and scientific expert consultations with added focus on beneficial actions in regards to pollinator activity in treatment area.

**CDFA (All programs)** conducts the following beneficial avoidance actions including, but not limited to:

- Implement site specific buffers as necessary to protect pollinators from possible drift.
- Check properties for evidence of bee hives to ensure protection of pollinators.
- Choose appropriate sprayer and nozzles using site-specific parameters to avoid unintended impacts to pollinators.

### **CDFA (Pest Exclusion)**

- Maintains a Bee and Beehive Information webpage that includes European Honey Bee Pollination Information, Bumble Bee Pollination Information and Small Hive Beetle Management. Also included is information on Africanized Honey Bee.
- Staff provides information and additional referrals to callers re: bees.
- Border stations provide water in the form of available water faucet for hose hook-up by Apiary Shipment drivers at no charge to the drivers. When bees are shipped by truck in their respective bee hives, the interior of the hives will get very warm. At the point when the temperature in their hive becomes too dry and hot, the bees may be inclined to disperse to find a water source. Additionally the warm environment will cause stress and may be a detriment to bee health. The CDFA has worked with Apiary stakeholders and top bee scientists to improve conditions during critical inspections at the stations, as well as, worked to enhance the overall health and vitality of the colonies. Providing a water source to drivers to hose down their hives will ensure that bees can settle down comfortably in their hives & have the moisture needed for a healthy environment.
- With CDFA's border station operation data and coordination efforts, Project Apis m, (a non-profit organization dedicated to funding and directing research to enhance the health and vitality of honey bee colonies while improving crop production), created a video on Colony Management BMPs, in regard to preparing apiary shipments, what to expect at the California Agricultural Inspection Station and at the shipper's end destination. [http://projectapism.org/?page\\_id=225](http://projectapism.org/?page_id=225).
- Recent figures from Project Apis m reflect that the California Almond Industry requires over 1.6 million colonies of bees to pollinate their crop. Over 1.2 million bee colonies, or approximately 2,600 truckloads of bee hives, come from out of state and require inspection to make sure they are free of invasive pests that can cause damage to California's agriculture and natural environment. The Border Stations use digital imaging technology to send images to the California Plant Pest Diagnostic Laboratory Scientists to identify potential serious pests that may be discovered at the inspection station. The suspect pests intercepted and imaged are then sent to the Plant Pest Diagnostic Lab for final confirmation. The digital imaging and subsequent transmittal for identification at the lab is available 7 days a week at no extra charge to the bee keepers. The digital imaging will provide for faster

ID and less hold time for Apiary Shipments in order to get the trucks on their way and keep the bees from becoming stressed from heat, noise, or other stressors.

- An Ant Free Certification system created for certification of bee hives at origin. This certification allows beekeepers to prepare in advance for a more streamline inspection at the Border Station, and to be able to unload hives at their destination without waiting for county apiary inspectors.
- <http://www.cdfa.ca.gov/plant/PE/interiorexclusion/pdfs/BeeFlyer-HoneybeeShipmentsEnteringCA.pdf>.
- CDFA provides referrals to a location across the street from the Needles Border Station to provide Apiary shippers who do not pass inspection, the option of having their loads cleaned by 3 different vendors who will come out to the assigned location and perform the service. The vendors charge for this service. If the Apiary shipper does not want this service, they have the option to return out of state and locate another service. This referral service which is done informally, (the vendors have supplied their business information to CDFA for verification purposes) was a recommendation by the Apiary industry.

**CDFA (Pierce's Disease Control program)** contracts with the County Agricultural Commissioner's (CAC) office for local program activities. When needed, a licensed pest control operator hired by the CAC's office, and operating under the authority and direction of the PDCP and the CAC, performs urban & residential treatments . Pierce's Disease Control Program beneficial actions are included in the all CDFA Programs prior to June 2011.

### **Cdfa (Integrated Pest Control)**

- Actively survey area to be treated up to and including the day of treatment, specifically for new arrivals of pollinators. In rangeland treatment areas, beekeepers may set down hives on land that they believe is for public use. Private landowners may be unaware of this activity. Treatment schedules are altered if presence of new hives is discovered until hive owners are located and bees are moved out of the area.

### **Cdfa (Plant Pest Diagnostic Center)**

- Prior to June 2011, CDFA's Dr. Andrew Cline has been the main point of contact for insect interceptions on apiary loads at California border stations. Dr. Cline directs identification activities for pests of concern on apiary loads after hours (5pm-10pm M-F) and weekends (8am-10pm) to facilitate shipment of bees within the state. Dr. Cline's educational, research, and other scientific qualifications to serve as an apiary inspector are provided below.

#### **Dr. Andrew Cline:**

- Ph.D. Committee member; Edward Atkinson; University of Florida, Dissertation Title: Integration of Small Hive Beetle (*Aethina tumida* Murray, Coleoptera: Nitidulidae) into Western Honey Bee (*Apis mellifera* L., Hymenoptera: Apidae) Colonies. Graduated in spring 2011.

- Presenter in 2010: Pacific Coast Entomological Society; Sacramento, CA; Seminar Topic: Nitidulid Beetles as Pollinators of Different Plant Species from Around the World.
- Presenter in November 2010: Entomological Society of America, San Diego, CA; Poster Presentation; Topic: Small Hive Beetle Associations with Western Honeybees.
- Collaborator/Expert Identifier for work completed in 2008: two graduate student projects involving beetle pollinators—one project associated with New World palms in Colombia, and one project with cycads in South Africa.
- Collaborator for work completed in 2007: Investigations in the Biodiversity of Soil and Canopy Arthropods (IBISCA) working group in Panama and Vanuatu. Biodiversity initiative that looked at the differential diversity of insects in soil and canopy habitats in tropical regions throughout the world, including pollinators.

disjunctions as exemplified by pollen beetles of the *Meligethes planiusculus* species-group and related taxa (Coleoptera: Nitidulidae; Meligethinae). Biogeographia 29:45-65.

### **Dr. Martin Hauser**

- Scientific consultant and mentioned in the article “Pollinators in Peril” by D.L. Green in “South Carolina Wildlife” July/August 2008.

### **Actions Currently Taken**

#### **CDFA (Plant Health lead and all programs) –**

- Work collaboratively with the State Apiary Board to promote bee health.
- CDFA Secretary appointed a new Liaison to the Apiary Board in 2013 to facilitate a new exchange of ideas, better communication and recommendations from Apiary Industry regarding their concerns.
- In 2013, CDFA formed a California Pollinator Workgroup to exchange ideas, identify existing research areas, existing project areas, and identify potential criteria for critical research needs. The main goal was to discover gaps in research areas and suggest potential projects as a result of the dialog with bee experts, regulatory agencies, industry stakeholders and other conservation partners.

#### **CDFA – Pest Detection/Emergency Projects**

- Identify registered beekeepers in the treatment zone by contacting the Agricultural Commissioner for their list
- Once identified as located in the treatment area, notify registered beekeepers via a notification packet which includes:
  - Letter addressed to registrant serving as a “notification of pesticide application.”
  - Map(s) of treatment area.
  - Product labels and application rates, including any supplemental or section 18 registrations).
- Notify treatment personnel of any properties that are known to have bee hives so they can coordinate with bee keepers if alternative scheduling is required.
- Add Bee Rescheduling line in post treatment notice – your property was not treated today due to pollinator activity.
- Be on the lookout for bee hives to provide unregistered bee keepers that same information as registered bee keepers. Provide alternative treatment schedule to newly located bee keepers.
- Educate treatment personnel on how to handle bee encounters.

- Check host material before applying treatments for presence of pollinators.
- Identify actions to be taken in site specific situations.
- Cover non-target flowering plants and water sources (i.e. bird baths) during treatment to avoid drift or drip from adjacent or overhanging treated plants when necessary.
- Provide expert (entomologist) at public meetings or fact sheets to answer commonly asked pollinator questions.

### **Cdfa Pest Exclusion - Border Stations**

- Identify gaps and trends in border station hold times for bee shipments and work on process improvement to streamline inspections.
- Provide dedicated lines for watering stations for bee health management and colony control, located in border stations with high Apiary Shipment volume.
- Provide misting sprayers at designated border stations if possible. At some stations the water has a high mineral content and the sprayers become inoperable after only a week, so this service is not practical in all areas.
- Encourage Ant Free Certification to provide ease of inspection at Border Station and ability to unload at destination without waiting for County Apiary staff.
- Border Stations provide operation data to Apis m and Apiary Industry Point of Contact to allow for dialog and assessment of critical needs of the Apiary/Pollinator community.

### **Cdfa (Pierce's Disease Control Program)**

- Identify registered beekeepers in the treatment zone.
- Notify registered beekeepers with information about the upcoming treatments and offer alternative scheduling if needed to protect hives.
- Be on the lookout for additional bee keepers so the same information offered to registered bee keepers can be offered to new bee keepers.
- Educate treatment personnel on how to handle bee encounters.
- Provide for pollinator experts at public meetings.
- Follow the same protocols as CDFA Pest Detection and Emergency Project treatment crews.

### **Cdfa (Integrated Pest Control)**

- Apiary Brand – Information Packet for Resident Apiaries. Apiary Brand ensures that information regarding owner of hive will be retained by the County of origin. This information may be critical in case of any emergencies and appropriate regulatory staff must find out who owns the bee hive.

- Issues Apiary Brand for a \$25 one-time charge.

### Cdfa (Plant Pest Diagnostic Center)

- After June 2011, Dr. Andrew Cline has been the main point of contact for insect interceptions on apiary loads at California border stations. In addition to providing identification of possible invasive pests during the normal business hours of 8AM – 5PM, Dr. Cline directs identification activities for pests of concern on apiary loads **after hours** (5pm-10pm M-F) and **weekends** (8am-10pm). These additional on-call hours' result in better facilitation of bee shipments by providing inspections & identification 7 days per week for apiary shipments at select border stations that see a high volume of apiary shipments.
- **Dr. Stephen D. Gaimari**, Hosting a seminar for the Laboratory seminar series, Speaker, Leithen M'Gonigle (UC Berkeley/ Entomology), 17 April 2014, Title: "Reassembly of native pollinator communities in an agricultural landscape in California" to further educate pollinator community as well as other attendees on the latest research and current developments.
- **Dr. Martin Hauser** - First identification of Stingless bee (*Plebeia* sp.) and along with USDA determined no impacts to native pollinators. Research in cooperation with USDA and property owners.
- **Dr. Martin Hauser** - Since 2011 annually identifies the Syrphid pollinators (often around 2000 specimens per year) for the Kremen lab in Berkeley (<http://nature.berkeley.edu/kremenlab/index.html>).
- **Dr. Martin Hauser** -Publication: Dahlberg, L., **M. Hauser**, & D. Yanega. 2013. Japanese carpenter bee, *Xylocopa appendiculata* Smith 1852 (Hymenoptera: Apidae) potentially established in Santa Clara County, first record in North America. The Pan Pacific Entomologist 89(4):226-229.

### Proposed Activities/Actions to Benefit Pollinators

- Further promote benefits of the Apiary Brand and positive outcome of registration by expanding webpage information.
- Coordinate with University and Extension experts on more materials for Education and Outreach on Bee Biology and Management.
- Coordinate with Caltrans, land management, and conservation agencies to provide access for bees to native forage.
- Coordinate with other agencies and promote awareness of need for access to more forage for native pollinators.
- Provide dedicated water lines for watering bees at all border stations.
- Provide outreach and education about access to clean water for bees.

- Promote the protection of wild and native pollinators by education, outreach and coordination with native pollinator experts.
- Encourage permitting of native pollinators.
- Work collaboratively with State Apiary Board to make recommendations regarding funding of pollinator health research through sources of available funding including federal and state grant programs.
- Encourage Ant Free Certification to provide ease of inspection at Border Station and ability to unload at destination without waiting for County Apiary staff.
- Create an enhanced checklist for treatment crews that includes a pollinator awareness section.
- Enhance Pest Exclusion Webpage to include more information on pollinators to expand access to information and easy registration.
- Create a Plant Health Division Webpage and list serve.
- Partner with bee experts and sister agencies to develop more regionally located cleaning areas. CDFA currently only has the Needles staging area as an option for Apiary Shippers.
- State Fair Pollinator Garden – CDFA to provide funding for same.
- 21st Century IPM – Pollinator Section.

Crosswalk Between Surrogate Species and  
Californian Native Wildlife Species Federally or  
State-Listed as Threatened or Endangered

**Table L-1. Crosswalk Between Surrogate Species and Californian Native Wildlife Species Federally or State-Listed as Threatened or Endangered**

Common Name	Scientific Name	Federal Listing	State Listing	Surrogate species
<b>Gastropods</b>				
Black abalone	<i>Haliotis cracherodii</i>	FE	--	Black Abalone
White abalone	<i>Haliotis sorenseni</i>	FE	--	Black Abalone
Morro shoulderband (=banded dune) snail	<i>Helminthoglypta walkeri</i>	FE	--	Mimic Tryonia/ San Joaquin Tiger Beetle
Trinity bristle snail	<i>Monadenia setosa</i>	--	ST	Mimic Tryonia / San Joaquin Tiger Beetle
<b>Crustaceans</b>				
Conservancy fairy shrimp	<i>Branchinecta conservatio</i>	FE	--	Vernal Pool Fairy Shrimp
Longhorn fairy shrimp	<i>Branchinecta longiantenna</i>	FE	--	Vernal Pool Fairy Shrimp
Vernal pool fairy shrimp	<i>Branchinecta lynchi</i>	FT	--	Vernal Pool Fairy Shrimp
San Diego fairy shrimp	<i>Branchinecta sandiegensis</i>	FE	--	Vernal Pool Fairy Shrimp
Vernal pool tadpole shrimp	<i>Lepidurus packardi</i>	FE	--	Vernal Pool Fairy Shrimp
Shasta crayfish	<i>Pacifastacus fortis</i>	FE	SE	Shasta Crayfish
Riverside fairy shrimp	<i>Streptocephalus woottoni</i>	FE	--	Vernal Pool Fairy Shrimp California Freshwater
California freshwater shrimp	<i>Syncaris pacifica</i>	FE	SE	Shrimp
<b>Terrestrial Invertebrates</b>				
Pollinating Insects	--	--	--	Honeybee
Lange's metalmark butterfly	<i>Apodemia mormo langei</i>	FE	--	Honeybee
San Bruno elfin butterfly	<i>Callophrys mossii bayensis</i>	FE	--	Honeybee
Ohlone tiger beetle	<i>Cicindela ohlone</i>	FE	--	San Joaquin tiger beetle

**Table L-1. Crosswalk Between Surrogate Species and Californian Native Wildlife Species Federally or State-Listed as Threatened or Endangered**

Common Name	Scientific Name	Federal Listing	State Listing	Surrogate species
Valley elderberry longhorn beetle	<i>Desmocerus californicus dimorphus</i>	FT, pD	--	San Joaquin tiger beetle
Casey's June beetle	<i>Dinacoma caseyi</i>	FE	--	San Joaquin tiger beetle
Delta green ground beetle	<i>Elaphrus viridis</i>	FT	--	San Joaquin tiger beetle
El Segundo blue butterfly	<i>Euphilotes battoides allyni</i>	FE	--	Honeybee
Smith's blue butterfly	<i>Euphilotes enoptes smithi</i>	FE	--	Honeybee
Bay checkerspot butterfly	<i>Euphydryas editha bayensis</i>	FT	--	Honeybee
Quino checkerspot butterfly	<i>Euphydryas editha quino (=E. e. wrighti)</i>	FE	--	Honeybee
Kern primrose sphinx moth	<i>Euproserpinus euterpe</i>	FT	--	Honeybee
Palos Verdes blue butterfly	<i>Glaucopsyche lygdamus palosverdesensis</i>	FE	--	Honeybee
Mission blue butterfly	<i>Icaricia icarioides missionensis</i>	FE	--	Honeybee
Lotis blue butterfly	<i>Lycaeides argyrognomon lotis</i>	FE	--	Honeybee
Mount Hermon June beetle	<i>Polyphylla barbata</i>	FE	--	San Joaquin tiger beetle
Carson wandering skipper	<i>Pseudocopaeodes eunus obscurus</i>	FE	--	Honeybee
Laguna Mountains skipper	<i>Pyrgus ruralis lagunae</i>	FE	--	Honeybee
Delhi Sands flower-loving fly	<i>Rhaphiomidas terminatus abdominalis</i>	FE	--	Honeybee
Callippe silverspot butterfly	<i>Speyeria callippe callippe</i>	FE	--	Honeybee
Behren's silverspot butterfly	<i>Speyeria zerene behrensii</i>	FE	--	Honeybee
Oregon silverspot butterfly	<i>Speyeria zerene hippolyta</i>	FT	--	Honeybee
Myrtle's silverspot butterfly	<i>Speyeria zerene myrtleae</i>	FE	--	Honeybee

**Table L-1. Crosswalk Between Surrogate Species and Californian Native Wildlife Species Federally or State-Listed as Threatened or Endangered**

Common Name	Scientific Name	Federal Listing	State Listing	Surrogate species
Zayante band-winged grasshopper	<i>Trimerotropis infantilis</i>	FE	--	San Joaquin tiger beetle
<b>Birds</b>				
San Clemente sage sparrow	<i>Amphispiza belli clementae</i>	FT	--	tricolored blackbird/redwinged blackbird
golden eagle	<i>Aquila chrysaetos</i>	--	FP	White-tailed kite

## 1.0 INTRODUCTION

The Statewide Plant Pest Prevention and Management Program (Statewide Program) encompasses a range of prevention and management activities carried out or overseen by the California Department of Food and Agriculture (CDFA) against specific injurious agricultural and other pests, which include arthropods, mollusks, nematodes, fungi, bacteria, other microorganisms, viruses, and their vectors, throughout California. The Statewide Program consists of a variety of focused programs, targeted at the prevention and management of specific plant pests, and each program includes a suite of management approaches to control each target pest. The management approaches identified within each program are implemented as individual pest management activities, carried out by farmers, nursery managers, CDFA contractors, and CDFA field staff. The purpose of the Statewide Program is to protect California's agricultural, urban, and natural environments from damage caused by invasive plant pests. California is unique because it is free from many invasive species that cause substantial damage in the rest of the United States as well as in other countries.

The ongoing Statewide Program includes pest management activities occurring throughout California in a variety of contexts. Individual management activities that are conducted under the Statewide Program may occur anywhere that a pest is found, depending on management decision criteria, including the size and density of the pest population, the severity of threat to agriculture, natural lands, and/or urban populations, and a variety of other factors. The specific area and extent of management activities depend on the targeted pest, the type of program, and the management approaches available under the Statewide Program.

Every pest prevention and management activity under the Statewide Program is carried out by CDFA using an integrated pest management (IPM) approach. The IPM approach uses information about the life cycles of pests and their interaction with the environment, and takes advantage of all appropriate pest management options, including mechanical control, biological control, and the use of pesticides where indicated.

Three broad categories for pest management are used under the Statewide Program: physical, biological, and chemical management activities. This technical study focuses on noise associated with activities for each of these activity types. The following discussion summarizes the specific activities associated with each:

- **Physical Management Activities**—Physical management activities may include visual observation to identify and detect pests, the use of physical labor, devices, or machinery to remove and destroy pest or host material, and the restriction or prohibition of the movement of commodities that may harbor pests. These activities do not involve the use of chemical control agents. Physical management activities

that also employ chemical treatments are described under Chemical Management Activities below.

- **Biological Management Activities**—Biological management activities include release of biological control agents (or “natural enemies”) and sterile insect releases. Biological agents used to control pests may include parasites, predators, pathogens, and organisms with other control characteristics.
- **Chemical Management Activities**—Chemicals can be applied using various methods that can be generally categorized as trap and spot applications, soil applications, fumigation applications, and foliar spray applications.

This technical noise report predictively analyzes noise likely to be generated during implementation of the Proposed Program, discussed in the Final PEIR. The analysis focuses on noise generated from mechanical equipment that potentially could increase ambient noise levels for sensitive receptors.

## 2.0 NOISE FUNDAMENTALS

### 2.1 Fundamentals of Acoustics

Noise is generally defined as loud, unpleasant, unexpected, or undesired sound that typically is associated with human activity, and that interferes with or disrupts normal activities. Although exposure to high noise levels has been demonstrated to cause hearing loss, the principal human response to environmental noise exposure levels is annoyance. The responses of individuals to similar noise events are diverse and are influenced by many factors, including the type of noise, the perceived importance of the noise, its appropriateness to the setting, the time of day and the type of activity during which the noise occurs, and individual noise sensitivity.

Sound is a physical phenomenon consisting of minute vibrations that travel through a medium, such as air, and are sensed by the human ear. Sound is generally characterized by several variables, including frequency and amplitude. Frequency describes the sound's pitch (tone) and is measured in cycles per second (hertz [Hz]), while amplitude describes the sound's pressure (loudness). Because the range of sound pressures that occur in the environment is extremely large, it is convenient to express these pressures on a logarithmic scale that compresses the wide range of pressures into a more useful range of numbers. The standard unit of sound pressure measurement is the decibel (dB).

Outdoor sound levels decrease logarithmically as the distance from the emission source increases. The decrease occurs because of a combination of factors, including wave divergence, atmospheric absorption, and ground absorption attenuation. Sound radiating from a source in a homogeneous and undisturbed manner travels in spherical waves. As the sound waves travel away from the source, the sound energy is dispersed over a greater area, decreasing the sound pressure of the wave. Spherical spreading of the sound wave reduces the noise level at a rate of 6 dB per doubling of distance.

Atmospheric absorption also influences the sound levels received by an observer. The greater the distance traveled, the greater the influence of the atmosphere and the resultant fluctuations. Atmospheric absorption becomes important at distances greater than 1,000 feet. The degree of absorption varies depending on the frequency of the sound, as well as the humidity and temperature of the air. For example, atmospheric absorption is lowest (i.e., sound carries further) at high humidity and high temperatures, and lower frequency sounds are less readily absorbed (i.e., sound carries further) than those of higher frequencies. Hence, over long distances, lower frequency sound tends to become dominant as higher frequency sound is more rapidly attenuated. Turbulence, gradients of wind velocity, and other atmospheric phenomena also play a significant role in determining the degree of resulting sound attenuation between a noise-emitting source and a receiver position. Certain conditions, such as temperature inversions, can channel

or focus the sound waves, resulting in higher noise levels than would result from simple spherical spreading.

Hz is a measure of how many times each second the crest of a sound pressure wave passes a fixed point. For example, when a drummer beats a drum, the skin of the drum vibrates a number of times per second. When the drum skin vibrates 100 times per second, it generates a sound pressure wave that is oscillating at 100 Hz, and this pressure oscillation is perceived by the ear/brain as a tonal pitch of 100 Hz. Sound frequencies between 20 and 20,000 Hz are within the range of sensitivity of the average healthy human ear.

Sound from a tuning fork contains a single frequency (a pure tone); however, most sounds that are heard in the environment do not consist of a single frequency, but rather a broad band of many frequencies differing in sound level. Because of the broad range of audible frequencies, methods have been developed to quantify these values into a single number. The most common method used to quantify environmental sounds consists of evaluating all frequencies of a sound according to a weighting system that emulates human hearing. Human hearing is less sensitive at both low frequencies and extremely high frequencies than it is at the mid-range frequencies (the ones normally associated with speech and music). This process of discriminating frequencies based on human sensitivity is termed “A-weighting,” and the resulting dB level is termed an “A-weighted” decibel (dBA). A-weighting is widely used in local noise ordinances and in state and federal guidelines. In practice, the level of a noise source is conveniently measured using a sound level meter that includes a filter corresponding to the dBA curve of weighting adjustments to the “raw” sound pressure level detected by the sound level meter microphone. Unless specifically noted, the use of A-weighting always is assumed with respect to environmental sound and community noise, even if the notation does not show the “A.” A-weighted sound pressure levels of typical sources of noise are shown in Table 2.1–1.

Because of the logarithmic nature of the dB unit, sound levels cannot be added or subtracted arithmetically and thus are somewhat cumbersome to express or explain to the layperson; however, common rules are useful in dealing with sound levels. First, if a sound’s intensity is doubled, the sound level increases by 3 dB, regardless of the initial sound level. For example:  $60 \text{ dB} + 60 \text{ dB} = 63 \text{ dB}$ , and  $80 \text{ dB} + 80 \text{ dB} = 83 \text{ dB}$ . Second, noise levels from point sources, such as an electrical substation, decrease by approximately 6 dB per doubling of distance due solely to geometric divergence.

**Table 2.1–1. Sound Pressure Levels of Typical Noise Sources and Noise Environments**

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
Jet Fly-over at 1,000 feet	110-100	Rock Band
Gas Lawn Mower at 3 feet	100-90	
Diesel Truck at 50 feet, at 50 miles per hour	90-80	Food Blender at 3 feet
Commercial Area, Gas Lawn Mower at 100 feet	70	Vacuum Cleaner at 10 feet
Heavy Traffic at 300 feet	60	Normal Speech at 3 feet
Quiet Urban Daytime	50-40	Large Business Office
Quiet Urban/Suburban Nighttime	40-30	Theater, Large Conference Room (Background)
Quiet Rural Nighttime	30-20	Library, Bedroom at Night
	20-10	Broadcast/Recording Studio
Lowest Threshold of Human Hearing	0	

Note:

dBA = A-weighted decibel

Source: Caltrans 2009

Although dBA may adequately indicate the level of environmental noise at any instant in time, community noise levels vary continuously. Most ambient environmental noise includes a mixture of noise from nearby and distant sources that creates an ebb and flow of sound, including some identifiable sources plus a relatively steady background noise in which no particular source is identifiable. A single descriptor called the equivalent sound level ( $L_{eq}$ ) is used to describe sound that is either constant or changing in level.  $L_{eq}$  is the energy-mean dBA during a measured time interval. It is the “equivalent” constant sound level that would have to be produced by a given constant source to equal the acoustic energy contained in the fluctuating sound level measured during the interval. The  $L_{eq}$  often is the “base” metric used to establish other measures of environmental noise, such as the Day-Night Average Sound Level ( $L_{dn}$ ) or the Community Noise Equivalent Level (CNEL) that are discussed in subsequent paragraphs.

In addition to  $L_{eq}$ , often it is desirable to know the acoustic range of the noise source being measured. This is accomplished through the maximum  $L_{eq}$  ( $L_{max}$ ) and minimum  $L_{eq}$  ( $L_{min}$ ). These values represent the root mean square (RMS) maximum and minimum noise levels measured during the monitoring interval. The  $L_{min}$  value obtained for a particular monitoring location often is called the “acoustic floor” for that location.

To describe the time-varying character of environmental noise, the statistical or percentile noise descriptors  $L_{10}$ ,  $L_{50}$ , and  $L_{90}$  may be used. These are the noise levels equaled or exceeded during 10 percent, 50 percent, and 90 percent of the measured time interval.

Sound levels associated with  $L_{10}$  typically describe transient or short-term events, such as the noise from distinct passing cars and trucks, measured from a position near a roadway. Sound levels are higher than this value only 10 percent of the measurement time.  $L_{50}$  represents the median sound level during the measurement interval. Levels will be above and below this value exactly one-half of the accumulated measurement time.  $L_{90}$  is the sound level exceeded 90 percent of the time, and often is used to describe background noise conditions or sources that are continuous or “steady-state” in character. As a result, 90 percent of the time measured levels are higher than this value; therefore,  $L_{90}$  represents the outdoor environment at its typically quietest periods, during which only the apparent continuous but indistinct din of background noise is being measured.

$L_{dn}$  is a cumulative noise metric, and represents the average sound level for a 24-hour day.  $L_{dn}$  is calculated from the  $L_{eq}$  by adding a 10-dB penalty to sounds that occur at night (from 10:00 p.m. to 7:00 a.m.).  $L_{dn}$  is the descriptor of choice that is used by nearly all federal, state, and local agencies throughout the United States to define acceptable land use compatibility with respect to noise.  $L_{dn}$  is the metric used by the Federal Transit Administration (FTA) for evaluating noise impacts at residential receivers.

In California, CNEL is sometimes used instead of  $L_{dn}$ . CNEL is very similar to  $L_{dn}$ , except that an additional 5-dB penalty is applied to sounds that occur during the evening hours (from 7:00 p.m. to 10:00 p.m.). Because of the time-of-day penalties associated with  $L_{dn}$  and CNEL descriptors,  $L_{dn}$  or CNEL dBA values for a continuously operating sound source during a 24-hour period will be numerically greater than the dBA value of the 24-hour  $L_{eq}$ . Thus, for a continuously operating noise source producing a constant noise level operating for periods of 24 hours or more, the  $L_{dn}$  value will be approximately 6 dB higher than the  $L_{eq}$  value.

Humans are better able to perceive changes in noise level than absolute noise levels. Potential responses of persons to changes in the noise environment are usually assessed by evaluating differences between the existing and total predicted future noise environments. The following relationships of perception and response to quantifiable noise changes are used as a basis for assessing potential effects of these changes in environmental noise level:

- Except in a carefully controlled laboratory condition, a change of 1 dBA is very difficult to perceive.
- In the outside environment, a change of 3 dBA is considered just perceptible.
- An increase of 5 dBA is considered readily perceptible, and would be likely to result in some level of community response.
- An increase of 10 dBA is perceived as a doubling in loudness, and would likely result in a widespread community response.

## 2.2 Fundamentals of Vibration

Groundborne vibration propagates from the source through the ground to adjacent buildings by surface waves. Vibration may be composed of a single pulse, a series of pulses, or a continuous oscillatory motion. The frequency of a vibrating object describes how rapidly it is oscillating, measured in Hz. Most environmental vibrations consist of a composite, or “spectrum” of many frequencies. The normal frequency range of most groundborne vibrations that can be felt generally starts from a low frequency of less than 1 Hz to a high of about 200 Hz. Vibration information for this analysis has been described in terms of the peak particle velocity (PPV), measured in inches per second, or vibration level measured with respect to RMS vibration velocity in decibels (VdB), with a reference quantity of 1 micro inch per second.

Vibration energy dissipates as it travels through the ground, causing the vibration amplitude to decrease with distance away from the source. High-frequency vibrations reduce much more rapidly than do low frequencies, so that in the far-field zone distant from a source, the low frequencies tend to dominate. Soil properties also affect the propagation of vibration. When groundborne vibration interacts with a building, usually a ground-to-foundation coupling loss occurs, but the vibration also can be amplified by the structural resonances of the walls and floors. Vibration in buildings typically is perceived as rattling of windows, shaking of loose items, or the motion of building surfaces. In some cases, the vibration of building surfaces also can be radiated as sound and heard as a low-frequency rumbling noise, known as groundborne noise.

Groundborne vibration generally is limited to areas within a few hundred feet of certain types of industrial operations and construction/demolition activities, such as pile driving. Road vehicles rarely create enough groundborne vibration amplitude to be perceptible to humans unless the receiver is in immediate proximity to the source or the road surface is poorly maintained and has potholes or bumps. Human sensitivity to vibration varies by frequency and by receiver. Generally, people are more sensitive to low-frequency vibration. Human annoyance also is related to the number and duration of events; the more events that occur or the greater the duration, the more annoying it becomes.

## 3.0 METHODOLOGY

### 3.1 Evaluation Criteria

This section discusses the U.S. Department of Housing and Urban Development (HUD) Noise Guidelines' (Title 24 CFR, Section 51, Subpart B) (HUD 1996) Daytime Criteria and the World Health Organization's (WHO) Nighttime Criteria that were used for this analysis.

#### 3.1.1 HUD Noise Guidelines (Daytime Criteria)

To provide a uniform system for analyzing noise impacts for Proposed Program activities throughout California, a criterion of 65 dBA  $L_{dn}$  for daytime management activity was used. Proposed Program implementation measures would be temporary activities by nature, with associated equipment and vehicles operating for short-term durations and at several locations. Thus, the predicted acoustical combination of these likely brief or intermittent activity-related noises occurring throughout the day, calculated as a day-night sound level that includes periods when no noise is expected, is compared with 65 dBA  $L_{dn}$  that HUD considers an acceptable standard for exterior noise.

In general, local and State standards are not available for determining vibration thresholds. Therefore, for potential groundborne vibration impacts, the FTA standard for human annoyance vibration level ( $L_v$ ) ranges from 75 to 83 vibration decibels (VdB) (depending on frequency of vibration event or duration) for "Category 3: Institutional Land Uses with Primarily Daytime Use" (FTA 2006). These annoyance thresholds are more stringent than the building damage risk vibration criteria, and therefore were used for this analysis, although building damage risk also was calculated for informational purposes. Although not a universally accepted notation, the acronym VdB is used herein for vibration decibels to reduce the potential for confusion with sound decibels.

#### 3.1.2 World Health Organization Nighttime Criteria

At night (between 10 p.m. and 6 a.m.), when Proposed Program activities may need to occur beyond or outside of typical daytime periods, this noise analysis uses an 8-hour  $L_{eq}$  of 45 dBA immediately outside an occupied bedroom window as the applicable noise threshold. Alternately, an  $L_{max}$  of 60 dBA must be satisfied during this 8-hour period. These criteria are based on a typically referenced World Health Organization (WHO) guidance limit with the intent of minimizing sleep disturbance for potentially noise-affected residential land uses and occupied dwellings (Berglund 1999). Because of it being an 8-hour metric, Table 3.1–1 shows that several ways exist to satisfy the 45 dBA  $L_{eq}$ , which would allow opportunity for a short-duration but higher than 44 dBA  $L_{eq}$ .

(from the perspective of the noise-sensitive receiver location) noise-producing activity to occur and still comply with this nighttime guideline.

**Table 3.1-1. Options for Duration that Proposed Program Noise  $L_{eq}$  May Exceed Nighttime World Health Organization-Based Threshold of 45 dBA**

Allowable Portion of 8-Hour Period above 45 dBA $L_{eq}$ (percent, cumulative minutes)	$L_{eq}$ Not to Exceed for Allowable Portion of 8-Hour Period, when above 45 dBA (dBA)
0.5 percent (2.4 minutes)	60
2 percent (9.6 minutes)	55
8 percent (38.4 minutes)	50
22 percent (105.6 minutes)	47

Notes:

dBA = A-weighted decibels;  $L_{eq}$  = Equivalent Sound Level, dBA

Source: WHO 2009

### 3.2 Analysis Methodology – Noise

The analysis of Proposed Program noise effects for anticipated daytime activities included the following steps:

1. From available CDFA information, the pieces of electro-mechanical equipment or vehicles associated with a specific type of activity were identified. This typically would include fuel-burning engines or anything powered with electric motors rated over 5 horsepower.
2. The following characteristics were determined or estimated for the equipment and vehicles under consideration:
  - a.  $L_{max}$  sound power or sound pressure level (in dBA) at some specified distance (e.g., 50 feet); and,
  - b. What the Federal Highway Administration Roadway Construction Noise Model User's Guide (DOT 2006) refers to as the "Acoustical Usage Factor", or the fraction of a given duration that the equipment or vehicle actually would be operating. This would include, for vehicles, when an engine would be idling—when it still would be generating noise. For aircraft, this usage factor refers to the actual time that it would be flying over a Proposed Program activity site and would be conducting its Proposed Program task (i.e., this would not include the gradual increase of noise because of the onset or the gradual decrease of noise because of the retreat of the aircraft).
  - c. The approximate duration, represented as a fraction of an hour ( $t$ ), that the equipment and vehicles associated with the activity under consideration would

be present at the implementation site or area. For example, if an activity would require only a half-hour to complete, then  $t = 0.5$ . If an activity would be expected to take more than an hour to complete,  $t = 1$ .

3. Calculating an hourly  $L_{eq}$  at a reference distance for each equipment piece or vehicle, applying the  $L_{max}$ , the acoustical usage factor (AUF) and activity duration value  $t$  per the following expression:  $L_{eq(h), ref} = L_{max} + 10 * LOG (AUF) + 10 * LOG (t)$ .
4. From the calculated  $L_{eq(h), ref}$  in Step 3, logarithmically adding the two loudest from the roster of equipment associated with the activity. The equipment with the loudest  $L_{max}$  may not, based on its AUF or the value for  $t$ , necessarily have the loudest anticipated  $L_{eq(h), ref}$ .
5. Using the following two expressions, iteratively calculating a minimum distance (“d”, in feet) at which the combined  $L_{eq(h), ref}$  from Step 4 would attenuate to an hourly  $L_{eq}$  noise level for the activity that, when applied for the number of hours  $N$  associated with the activity, would generate an  $L_{dn}$  that approaches but does not exceed the 65 dBA  $L_{dn}$  goal.
  - a.  $L_{eq(h), activity} = L_{eq(h), ref} - 20 * LOG (d/d_{ref}) - d/1000$ . In this expression, “ $d_{ref}$ ” is the reference distance that helps define  $L_{eq(h), ref}$  and often would be 50 feet. The first term accounts for geometric divergence, and the second approximates the effect of attenuation resulting from air absorption.
  - b.  $65 \text{ dBA} > L_{dn, activity} = 10 * LOG[N/24 * 10^{(L_{eq(h), activity}/10)} + (15 - N)/24 * 10^{(L_{eq(h), non-activity daytime}/10)} + 9/24 * 10^{(L_{eq(h), non-activity nighttime}/10)}]$ . This expression calculates an  $L_{dn}$  for the daytime management activity under consideration; therefore, the  $L_{eq(h), non-activity daytime}$  and  $L_{eq(h), non-activity nighttime}$  values would be zero because no management activity would occur during those hours.

This technique of considering only the two loudest noise-emitting sources from an activity, rather than computing an aggregate sound level from an exhaustive roster of equipment, is consistent with FTA construction noise general assessment guidance. This technique also has been adopted by the U.S. Bureau of Land Management (BLM) for management activity noise assessment (BLM 2005). Although the Proposed Program would not include activities specific to construction, this technique would be applicable for calculating predicted noise from the use of mechanical equipment and vehicles operating within a known and limited area or zone.

### 3.3 Analysis Methodology – Vibration

The analysis of Proposed Program vibration effects included the following:

1. The equipment that may be used under the Proposed Program with the greatest likelihood of being a substantial source of vibration emission, namely, a loaded truck. A loaded truck's peak particle velocity (inches per second) at 25 feet is 0.076 (FTA 2006).
2. Using this reference vibration level, the expected minimum distance between a receiver and the loaded truck for the set of potential human annoyance and building damage risk vibration criteria that would apply to a specific Proposed Program activity (and its location) under consideration. Separate expressions exist for calculating these distances, for human annoyance and building damage risk, respectively, as follows:
  - a. Human annoyance –  $Lv(d) = Lv(d_{ref}) - 30 * \text{LOG}(d/d_{ref})$
  - b. Building damage risk – peak particle velocity( $d$ ) =  
peak particle velocity( $d_{ref}$ ) \*  $(d_{ref}/d)^{1.5}$

In these expressions, “ $d$ ” is the distance between the receiver and a vibration source, “ $d_{ref}$ ” is the reference distance that applies for the indicated vibration magnitude.

## 4.0 ANALYSIS OF POTENTIAL NOISE TO BE GENERATED BY PROPOSED PROGRAM ACTIVITIES

### 4.1 Physical Management Activities

Physical management activities would include inspection, trapping, host removal of fruit or flowers, cleaning, and restricted movement. Table 4.1-1 includes activities that would require the use of mechanical equipment or vehicles that would generate the highest expected reference maximum noise levels. After accounting for activity duration, and the percentage of that duration when the listed equipment or vehicle is expected to be generating noise at a level no greater than the referenced maximum ( $L_{max}$ ) at 50 feet, Table 4.1-1 indicates that trapping would generate noise levels of 63.6 hourly  $L_{eq}$  dBA at 50 feet, and host removal activity would generate a combined level of approximately 62.7 dBA hourly  $L_{eq}$  at 50 feet. These noise levels were calculated per the methodology discussed in Section 3.2, Analysis Methodology – Noise.

**Table 4.1-1. Physical Management Noise-Generating Activities and Equipment/Vehicle List**

Management Activity	Equipment Type	Activity Duration per Site	Acoustical Usage Factor (percent)	Reference Level ( $L_{max}$ , dBA) at 50 feet	Combined Level (hourly $L_{eq}$ , dBA) of up to Two Noisiest Equipment, at 50 feet
Non-Chemical Trapping	Light Duty Truck	5 minutes	40	75	63.6
	ATV	5 minutes	40	75	
	Automobile	6 minutes	40	75	
Host Removal	Heavy Duty Truck	5 minutes	40	74	62.7
	Light Duty Truck	5 minutes	40	75	

Notes:

dBA = A-weighted decibel;  $L_{eq}$  = equivalent sound level;  $L_{max}$  = maximum equivalent sound level

Sources: CDFA 2013, FTA 2006

Table 4.1-2 shows the distance at which the Proposed Program would comply with HUD and WHO guidance for daytime and nighttime operation. Table 4.1-2 uses the predicted noise levels generated by a management activity (shown in Table 4.1-1) to determine at what minimum distance the Proposed Program would comply with the HUD and WHO significance criteria. Trapping and host removal would occur at distances of 9 feet and 8 feet or greater, respectively, during the daytime, and at 415 feet or 375 feet or greater, respectively, at night, and would comply with the established guidelines.

**Table 4.1-2. Minimum Activity-to-Receiver Distances for Physical Management Activity Operation (Compliant with Indicated Noise Criterion)**

Management Activity	Daytime, per HUD Guidance (65 dBA L <sub>dn</sub> )	Nighttime, per WHO Guidance (45 dBA)
Non-Chemical Trapping	9 feet	415 feet
Host Removal	8 feet	375 feet

Notes:

dBA = A-weighted decibels; FTA = Federal Transit Administration

Source: CDFA 2013, FTA 2006

With respect to groundborne vibration, if assuming a “loaded truck” resembles what is planned for host removal activities and trapping, Table 4.1-3 presents estimates of minimum distances that would comply with the human annoyance and building damage risk criteria. Using reference levels from the FTA for these types of equipment, the vibration levels generated by the physical management approaches were calculated using the FTA methodology.

**Table 4.1-3. Minimum Activity-to-Receiver Distances for Physical Management Activity Vibration Sources (Compliant with Indicated Noise Criteria)**

Equipment	Category 2 Human Annoyance (VdB)			Building Damage Risk Category (PPV)			
	Frequent Events (72 VdB)	Occasional Events (75 VdB)	Infrequent Events (80 VdB)	Cat. 1 (0.5 ips)	Cat. 2 (0.3 ips)	Cat. 3 (0.2 ips)	Cat. 4 (0.12 ips)
Loaded Truck	75 feet	60 feet	40 feet	8 feet	10 feet	13 feet	18 feet

Notes:

VdB = vibration velocity in decibels; ips = inches per second; PPV = peak particle velocity

Category 2 (Human Annoyance) refers to residences and buildings where people normally sleep.

Cat. 1 refers to building damage to reinforced-concrete, steel or timber (no plaster).

Cat. 2 refers to building damage to engineered concrete and masonry (no plaster).

Cat. 3 refers to building damage to non-engineered timber and masonry.

Cat. 4 refers to building damage to extreme susceptibility to vibration damage (e.g., historic structures).

Source: CDFA 2013, FTA 2006

## 4.2 Biological Management Activities

Biological management activities would occur in laboratories, growth chambers and outdoor areas. One biological management activity would include the use of airplanes for the sterile male release program. Table 4.2-1 shows activities that would require the use of mechanical equipment that would generate the highest noise levels. As shown in the table, the use of aircraft during biological management activities are expected to generate the highest noise levels.

**Table 4.2-1. Biological Management Noise-Generating Activities and Equipment List**

<b>Management Activity</b>	<b>Equipment Type</b>	<b>Activity Duration per Site</b>	<b>Usage Factor (percent)</b>	<b>Reference Level (<math>L_{max}</math>, dBA) at 50 feet</b>	<b>Level (hourly <math>L_{eq}</math>, dBA) at 50 feet (horizontal distance)</b>
Sterile Male Release	Beechcraft C90 Aircraft	20 minutes	100*	100	61.2 **
Biological Control Agent Release	Light Duty Truck	5 minutes	40	75	60.2

Notes:

dBA = A-weighted decibels;  $L_{eq}$  = equivalent sound level

\* This assumes time for release above area while aircraft is in flight.

\*\* This assumes the aircraft would maintain a minimum relative altitude of 2,000 feet.

Sources: CDFA 2013, FTA 2006, FAA 2013

Table 4.2-2 shows the minimum distances for the biological management activities necessary to achieve compliance during daytime and nighttime operation. Vibration activities were not analyzed because aircraft are not expected to operate close enough to sensitive receptors to generate vibration that could cause annoyance or damage.

**Table 4.2-2. Minimum Activity-to-Receiver Distances for Biological Management Activity Operation (Compliant with Indicated Noise Criterion)**

<b>Management Activity</b>	<b>Daytime, per FTA Guidance (65 dBA <math>L_{dn}</math>)</b>	<b>Nighttime, per WHO Guidance (45 dBA)</b>
Sterile Male Release *	0 feet	6,900 feet
Biological Control Agent Release	6 feet	280 feet

Notes:

dBA = A-weighted decibels

\* This assumes the aircraft would maintain a minimum relative altitude of 2,000 feet.

Source: CDFA, 2013, FTA 2006

### 4.3 Chemical Management Activities

Chemical management activities would include application of a chemical component, such as trap and spot applications, soil applications, fumigation applications, foliar spray applications, and disinfection. Table 4.3-1 shows activities that would require the use of mechanical equipment and the equipment that would generate the highest noise levels.

**Table 4.3-1. Chemical Management Noise-Generating Activities and Equipment/Vehicle List**

Management Activity	Equipment Type	Activity Duration per Site	Usage Factor (percent)	Reference Level ( $L_{max}$ , dBA) at 50 feet	Level or Combined Level of up to Two Noisiest Equipment (hourly $L_{eq}$ , dBA) at 50 feet (horizontal distance)
Chemical Trapping	Light Duty Truck	5 minutes	40	75	63.6
	ATV	5 minutes	40	75	
	Automobile	6 minutes	40	75	
MAT/Sprayed Bait	SPLAT Sprayer	1 minute	1	93.3	57.5
	Light Duty Truck	1 minute	40	75	
Fumigation	Sprayer/Injector	7 hours	40	71.3	67.3
Soil Injection	Pump/Injector	5 minutes	50	81	67.1
Tablet Soil Injection	Light Duty Truck	5 minutes	40	75	60.2
Airblast	Tractor	7 hours	40	84	80.4
	Airblast Sprayer	7 hours	40	74	
Aerial Spray	Aircraft (Beechcraft C90)	1 hour	100	100	79.5
Boom Spray	Tractor	7 hours	40	84	80.1
	Boom Spray	7 hours	40	69.5	
Chemigation	Water Pump	7 hours	50	81	77.9

Notes:

dBA = A-weighted decibel;  $L_{eq}$  = equivalent sound level;  $L_{max}$  = maximum equivalent sound level

\* This assumes time for release while the aircraft is in flight.

Sources: CDFA 2013, FTA 2006, Berger 2010, Smithco 2013, FAA 2013, Jacto 2013

Table 4.3-2 presents minimum distances for the chemical management activities that correspond with achieving compliance during daytime and nighttime periods of operation.

**Table 4.3-2. Minimum Activity-to-Receiver Distances for Chemical Management Activity Operation (Compliant with Indicated Noise Criterion)**

Management Activity	Daytime, per HUD Guidance (65 dBA $L_{dn}$ )	Nighttime, per WHO Guidance (45 dBA)
Survey/Trapping	9 feet	415 feet
MAT/Sprayed Bait	5 feet	220 feet
Fumigation	36 feet	625 feet
Soil Injection	14 feet	600 feet
Tablet Soil Injection	6 feet	280 feet

<b>Management Activity</b>	<b>Daytime, per HUD Guidance (65 dBA L<sub>dn</sub>)</b>	<b>Nighttime, per WHO Guidance (45 dBA)</b>
Airblast	160 feet	2,300 feet
Aerial Spray *	500 feet	9,500 feet
Boom Spray	155 feet	2,250 feet
Chemigation	120 feet	1,850 feet

Notes:

dBA = A-weighted decibel

\* This assumes the aircraft would maintain a minimum relative altitude of 200 feet.

Sources: CDFA 2013, FTA 2006, WHO 2009

#### **4.4 Cumulative Impacts**

Cumulative impacts, in the context of this report, represent consideration of Proposed Program activity noise combining with noise from other concurrent projects. Although a complete description and detailed assessment of noise from cumulative projects across the State of California is beyond the scope of this Noise Technical Report, the FTA-based guidelines discussed in Section 6.6, Noise of the Final PEIR offer criteria for assessing the relative effect of adding Proposed Program noise to an existing ambient sound level that presumably would include the acoustical contributions of other projects.

In summary, when the existing sound environment already is at an elevated level, the allowable increase is correspondingly narrow. Conversely, when the existing ambient sound level is quieter, the allowable increase (expressed as added dBA) widens considerably.

However, any such cumulative effects resulting from acoustical contribution of the Proposed Program would be temporary and would last in any given area only for as long as a specific activity was conducted.

Page left intentionally blank.

## 5.0 POTENTIAL MITIGATION MEASURES

This section discusses possible mitigation measures for potential impacts of the Proposed Program related to noise.

### 5.1 Noise

The following noise control or sound abatement options for the Proposed Program would comply with the applicable noise impact criteria.

- When possible, schedule the activity operation so that it occurs during the day, taking advantage of noise criteria that are higher (i.e., less stringent) than those that apply during nighttime hours.

Additionally, the following best management procedures are recommended:

- Before Proposed Program activities begin, conduct appropriate noticing to inform surrounding sensitive receptors to expect noise-generating activities during a given time period.
- In advance, check for the existence of applicable local (i.e., municipal or county) noise regulations that may influence how a given Proposed Program activity is to be conducted. CDFA or its approved contractors and other approved parties performing the activities should allow sufficient time to properly plan for and implement any necessary noise mitigation measures.

### 5.2 Vibration

The following vibration isolation options for the Proposed Program would comply with the applicable vibration impact criteria:

- When possible, schedule the activity operation so that it occurs during the day, and thus can take advantage of time frames where residential building occupants are less likely to be home (i.e., avoid nighttime work when vibration may be perceived and potentially interrupt sleeping residents).

Additionally, the following best management procedures are recommended:

- Before beginning Proposed Program activities, conduct appropriate noticing to inform surrounding sensitive receptors to expect vibration-generating activities during a given time period.

- In advance, check for the existence of applicable local (i.e., municipal or county) vibration regulations that may influence how a given Proposed Program activity is to be conducted. CDFA or its approved contractors and other approved parties performing the activities should allow sufficient time to properly plan for and implement any necessary vibration-related mitigation measures.

## Introduction

This Appendix identifies the federal, state, regional, and local plans, policies, laws, regulations, and ordinances that are relevant to each environmental resource topic discussed in Sections 6.1 through 6.7 of the Draft PEIR. It also presents the energy regulatory setting that corresponds to the energy discussion in Chapter 8, Other Statutory Considerations of the Draft PEIR.

All terms and acronyms used in this Appendix can be found in Section 9, Glossary and Acronyms of the Draft PEIR. All references are included in Section 11, References of the Draft PEIR, under the related subsections.

## O.1 Agricultural Resources and Economics Regulatory Setting

The federal, State, and local laws, ordinances, regulations, and standards related to agricultural resources and economics, and relevant to the Proposed Program are discussed next.

### O.1.1 Federal Laws, Ordinances, Regulations, and Standards

#### ***U.S. Environmental Protection Agency Pesticide Regulatory Program***

The U.S. Environmental Protection Agency (EPA), in conjunction with each state's Department of Pesticide Regulation, regulates agricultural pesticide use. Pesticides are registered or licensed for usage, and a tolerance level is set for the maximum residue limit for each pesticide. Tolerances are set after determining the toxicity of the pesticide and its breakdown products, how much pesticide remains in or on food by its market time, and the amount and frequency of pesticide application. In California, EPA and the California Department of Pesticide Regulation (CDPR) conduct testing and enforcement of these tolerance levels. Licensing and registration of pesticides primarily is intended to protect environmental assets, although tolerance levels for produce are designed to provide a safe food supply for public consumption. EPA sets the tolerance limits for pesticide residues on foods. USDA enforces tolerances established for meat, poultry, and some egg products, and the U.S. Food and Drug Administration enforces tolerances established for other foods, including agricultural commodities.

#### ***Organic Foods Production Act of 1990 (Public Law 101-624)***

The Organic Foods Production Act of 1990, adopted under Title 21 of the 1990 Farm Bill and amended in 2005, required USDA to develop national standards for organically produced agricultural products to assure consumers that agricultural products marketed as "organic" met consistent, uniform standards. The Organic Foods Production Act authorized a National Organic Program to set national standards for the production, handling, and processing of organically grown agricultural products, based on recommendations of a 15-member National Organic Standards Board (NOSB). A farm or handling facility may be certified as organic by a private, foreign, or state entity that has been accredited by the USDA. These entities are called certifying agents (USDA AMS 2012a).

**National Organic Standards (Code of Federal Regulations [CFR] Title 7, Part 205)**

The National Organic Standards, which went into effect October 21, 2002, were developed by USDA to implement the Organic Foods Production Act based on recommendations of the National Organic Standards Board and other state, private, and foreign organic certification programs. The Agriculture Marketing Service of the USDA oversees the National Organic Program, the regulatory program for the National Organic Standards. The National Organic Standards include an extensive list of definitions, the National List of Allowed and Prohibited Substances (National List; 7 CFR Sections 205.600 et seq.; <http://www.ams.usda.gov/AMSV1.0/getfile?dDocName=STELPRDC5068682>), labeling, certification, accreditation, enforcement, and testing requirements.

The National List identifies substances that may and may not be used for organic crop and livestock production (USDA AMS 2013). In general, synthetic substances are prohibited unless specifically allowed, and non-synthetic substances are allowed unless specifically prohibited. For example, a synthetic pheromone that is chemically identical to a natural insect pheromone is an allowed substance, but the highly toxic natural substance arsenic is a prohibited substance. Some substances on the National List may be used only in specific situations (e.g., only for certain crops or up to a maximum amount). Notably, the use of genetically modified organisms is prohibited, including organisms produced by such methods as cell fusion, microencapsulation and macroencapsulation, and recombinant deoxyribonucleic acid (DNA) technology (including gene deletion, gene doubling, introducing a foreign gene, and changing the positions of genes when achieved by recombinant DNA technology).

The Organic Materials Review Institute (OMRI) is a national nonprofit organization that determines which agricultural input products available on the market are allowable for use in organic production and processing, and under what circumstances. OMRI approves the products that may be used in agricultural operations, as certified organic under the USDA National Organic Program. The OMRI Products List© is the most complete directory of allowable products for organic production or processing. The OMRI Products List includes over 2,800 products that are “OMRI Listed®” to U.S. National Organic Program standards (OMRI 2013).

The majority of pest control materials permitted in USDA organic agriculture are naturally derived from a plant (e.g., pyrethrum), microorganism (e.g., *Bacillus thuringiensis*), or other natural sources (e.g., sulfur) (USDA AMS 2012b). Organic standards prohibit the use of most synthetic substances for at least 3 years before the harvest of a certifiable USDA organic crop.

EPA establishes the maximum allowed levels of pesticides that may be present on foods. Although most EPA-registered pesticides are prohibited in USDA organic production, incidental contact from neighboring conventional farms, or shared handling facilities is allowed under USDA organic standards up to a certain tolerance level. As long as the operator has not directly applied prohibited pesticides and has documented efforts to minimize exposure to them, the USDA organic regulations allow residues of prohibited pesticides up to 5 percent of the EPA tolerance.

Section 205.202(c) requires producers to “have distinct, defined boundaries and buffer zones such as runoff diversions to prevent the unintended application of prohibited

materials." This means that growers must keep a specific distance from neighboring areas (or roadways) where prohibited materials are applied, or are likely to be applied, and the organic production areas seeking certification.

The following subsections discuss the USDA organic certification process, the decertification process, and how USDA organic certification is affected by CDFA or USDA emergency pest or disease management programs.

### Organic Certification

The USDA organic certification process is described in CFR Title 7, Part 205. Certifying agents are responsible for ensuring that USDA organic products meet all National Organic Standards (USDA AMS 2012a). To be certified as organic, a farm must submit an organic production plan to a certifying agent as part of the application for certification. Applicants must demonstrate that they will abide by land requirements, soil fertility, and crop nutrient management practice standards, seed and planting stock practice standards, crop rotation practice standards, crop pest, weed, and disease management practice standards, wild-crop harvesting practice standards, livestock standards, organic handling requirements, facility pest management practice standards, and commingling and contact with prohibited substance prevention practice standards. The certifying agent must conduct an on-site inspection to ensure that the facility conforms to the requirements and standards. Following submission of the proper documentation and site inspection, if the organic system plan and all procedures and activities of the lead agency's operation comply with the requirements, then the certifying agent grants certification. Annual inspections are conducted thereafter to determine whether the certification of the operation should continue.

### Organic Decertification

CFR Title 7, Part 205 also explains the process for decertification of an organic farm. When an inspection, review, or investigation of a certified operation by a certifying agent reveals noncompliance with the Organic Foods Production Act, the operation receives a written notification. The notification describes the noncompliance and sets a date by which the operation must refute or correct the noncompliance. If the operation demonstrates that the noncompliance has been resolved, the certifying agent sends the operation a written notification that the noncompliance has been resolved. If the rebuttal to the noncompliance notice is unsuccessful or the correction of the noncompliance is not completed within a specified time, the certifying agent sends a written notification of the proposed suspension or revocation of certification.

### Organic Pest Management Standards

The standards for organic farm pest management are described in CFR Title 7, Section 205.271 as follows:

- (a) The producer or handler of an organic facility must use management practices to prevent pests, including but not limited to: (1) Removal of pest habitat, food sources, and breeding areas; (2) Prevention of access to handling facilities; and (3) Management of environmental factors, such as temperature, light, humidity, atmosphere, and air circulation, to prevent pest reproduction.

- (b) Pests may be controlled through: (1) Mechanical or physical controls including but not limited to traps, light, or sound; or (2) Lures and repellents using nonsynthetic or synthetic substances consistent with the National List.
- (c) If the practices provided for in paragraphs (a) and (b) of this section are not effective to prevent or control pests, a nonsynthetic or synthetic substance consistent with the National List may be applied.
- (d) If the practices provided for in paragraphs (a), (b), and (c) of this section are not effective to prevent or control facility pests, a synthetic substance not on the National List may be applied: *Provided*, that, the handler and certifying agent agree on the substance, method of application, and measures to be taken to prevent contact of the organically produced products or ingredients with the substance used.
- (e) The handler of an organic handling operation who applies a nonsynthetic or synthetic substance to prevent or control pests must update the operation's organic handling plan to reflect the use of such substances and methods of application. The updated organic plan must include a list of all measures taken to prevent contact of the organically produced products or ingredients with the substance used.
- (f) Notwithstanding the practices provided for in paragraphs (a), (b), (c), and (d) of this section, a handler may otherwise use substances to prevent or control pests as required by Federal, State, or local laws and regulations: *Provided*, that measures be taken to prevent contact of the organically produced products or ingredients with the substance used.

#### Emergency Pest or Disease Treatment

The use of substances that are prohibited for use in USDA organic agriculture may be required in an organic growing operation because of CDFA's or USDA's statutorily mandated pest management objectives. If a certified USDA organic grower is required to use synthetic pesticide treatments to comply with a quarantine regulation or eradication order, the grower's certification status is not jeopardized. However, the crop treated with the prohibited substance may not be marketed as organic, and the pesticide residue standards continue to apply to all subsequent organic crops. CFR Title 7, Section 205.672 states:

When a prohibited substance is applied to a certified operation due to a Federal or State emergency pest or disease treatment program and the certified operation otherwise meets the requirements of this part, the certification status of the operation shall not be affected as a result of the application of the prohibited substance: *Provided*, that: Any harvested crop or plant part to be harvested that has contact with a prohibited substance applied as the result of a Federal or State emergency pest or disease treatment program cannot be sold, labeled, or represented as organically produced.

#### **O.1.2 State Agencies, Laws and Programs**

##### ***California Department of Pesticide Regulation***

CDPR is the State agency with primary responsibility for regulating pesticide use in California. CDPR oversees State pesticide laws, including pesticide labeling, and is vested by

the EPA to enforce federal pesticide laws in California. CDPR oversees the county agricultural commissioners' activities related to enforcement of pesticide and related environmental laws and regulations locally.

The mission of CDPR is to protect human health and the environment by regulating pesticide sales and use, and by fostering reduced-risk pest management. CDPR's strict oversight begins with pesticide product evaluation and registration, and continues through statewide licensing of commercial applicators, dealers, consultants, and other pesticide professionals. CDPR evaluates the health impacts of pesticides through illness surveillance and risk assessment; environmental monitoring of air, water, and soil; field enforcement (with the county agricultural commissioners) of laws regulating pesticide use; residue testing of fresh produce; and encouraging development and adoption of least-toxic pest management practices through incentives and grants (CDPR 2011).

### ***Farmland Mapping and Monitoring Program***

The California Department of Conservation established the FMMP in 1982, as a non-regulatory program to provide a consistent and impartial analysis of agricultural land use and land use changes throughout California. Creation of the FMMP was supported by the Legislature and a broad coalition of building, business, government, and conservation interests. The first Important Farmland Maps, produced in 1984, covered 30.3 million acres in 38 counties. This is an ongoing data set; the Department collects data every 2 years to assist in understanding changes in agricultural land in the state. Data now spans more than 24 years and has expanded to 49.1 million acres as modern soil surveys have been completed by USDA. FMMP now maps agricultural and urban land use for nearly 98 percent of the state's privately held land (CDOC 2013a).

The FMMP has developed categorical definitions of Important Farmland that incorporate the land's suitability for agricultural production rather than solely relying on the physical and chemical characteristics of the soil. It includes data on the location of agricultural land, land use changes from agriculture to urban development, and soil quality. Land that is identified as Important Farmland is mapped as one of the following four categories (CDOC 2004):

- **Prime Farmland:** Farmland with the best combination of physical and chemical features able to sustain long-term agricultural production. These lands have the soil quality, growing season, and moisture supply needed to produce sustained high yields. Prime Farmland must have been used for irrigated agricultural production at some time during the 4 years before the FMMP's mapping date.
- **Farmland of Statewide Importance:** Farmland similar to Prime Farmland, but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Farmland of Statewide Importance must have been used for irrigated agricultural production at some time during the 4 years before the FMMP's mapping date.
- **Unique Farmland:** Farmland of lesser quality soils used for the production of the state's leading agricultural crops. These lands usually are irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones. Unique

Farmland must have been cropped at some time during the 4 years before the FMMP's mapping date.

- **Farmland of Local Importance:** Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.

### ***California Land Conservation Act of 1965 (Williamson Act)***

The California Land Conservation Act of 1965, better known as the Williamson Act, is California's primary program to protect agricultural land. The Williamson Act discourages premature and unnecessary conversion of agricultural land to urban uses. The legislation benefits landowners by allowing them to enter into long-term contracts (10 or 20 years) with the State of California to keep agricultural land in production. In return, the State reduces property taxes based on a complex calculation tied to agricultural income. The State implements the Williamson Act when a city or county creates an agricultural preserve. The purpose of an agriculture preserve is the long-term conservation of agricultural and open space lands; the lands are restricted to agricultural, open space, or recreational uses in exchange for reduced property tax assessments. After a preserve is established, the landowner enters into a contract with a city or county. The landowner and any successors-in-interest are obligated to adhere to the contract's enforceable restrictions, unless the contract is rescinded or cancelled. In 1998, an option was added in the Williamson Act Program to create Farmland Security Zones (FSZs), which are areas within an agricultural preserve that offer private landowners a greater property tax reduction than the regular assessment within the Williamson Act. Land restricted by a FSZ contract is valued for property assessment purposes at 65 percent of its Williamson Act valuation (CDOC 2013b). The minimum initial term of FSZs is 20 years, and the contracts renew annually unless the nonrenewal process is initiated. Except under limited circumstances, land subject to an FSZ contract cannot be annexed into a city, or a special district that provides non-agricultural services, or acquired by a school district for use as a public school.

Williamson Act and FSZ contracts may be terminated by nonrenewal or by cancellation. If a 10- or 20-year contract is terminated through nonrenewal, a 9- or 19-year nonrenewal period must be initiated by either the landowner or the city or county, during which time the land is still under contract, and the property taxes rise by a statutory formula during the last 9 years of either form of contract. If a contract is terminated through cancellation, a city or county must make findings specific to each type of contract to justify cancellation. The State's policy is to avoid, whenever practicable, the location of any federal, State, or local public improvements and any improvements of public utilities, and the acquisition of land in agricultural preserves. However, under several provisions of the Williamson Act, land under contract may be removed from contract to convert land to a non-agricultural use. Land may be acquired from a willing seller or by public acquisition for a public improvement project. In 2008, Assembly Bill 2921 was enacted, providing for a mechanism to rescind Williamson Act agricultural contracts to enter into either an open space contract under the Williamson Act or an open space easement. Under the new provisions, the resulting agreement must be at least as restrictive as the contract it replaces, and the affected parcel must be large enough to provide open space benefits.

According to the Williamson Act 2010 Status Report, approximately 15 million acres were enrolled under the Williamson Act statewide as of January 1, 2009 (CDOC 2010). Of

California's 58 counties, all have adopted the Williamson Act program except Del Norte, San Francisco, Inyo, and Yuba counties. The Imperial County Board of Supervisors voted in 2010 to not renew all Williamson Act contracts. The FSZ program has been adopted by 25 counties, although not all of the counties have executed contracts; 21 counties reported a total of 863,530 acres of land under FSZ contract, which constituted approximately 6 percent of the statewide Williamson Act enrollment.

The Open Space Subvention Act of 1971 provided local governments an annual subvention of forgone property tax revenues from the State through 2009; these payments have been suspended since that time because of revenue shortfalls. Consequently, some counties have removed lands from Williamson Act contracts. In 2010, Senate Bill 863 restored funding to a statewide level of \$10 million for the 2010–2011 fiscal year. However, in 2011, Senate Bill 80 terminated this fund, although Assembly Bill 1265 reinstated the subvention to allow eligible counties to re-capture 10 percent of the property tax benefits provided to the owners of Williamson Act lands. (CDOC 2011)

### ***California Department of Food and Agriculture***

CDFA implements programs to support California agriculture and food production with improved quality assurance, animal safety programs, production, and on-farm safety management practices, and programs for processors of farm products. CDFA also conducts pest and disease prevention activities and programs to respond to emergencies that threaten California's food and agriculture, as described in detail in Chapter 2, Proposed Program Description, and Chapter 3, Proposed Program Activities. CDFA is responsible for inspection services regarding both the federal and state organic farming products.

### ***California Organic Products Act of 2003***

The California Organic Food Products Act of 2003 (Food and Agricultural Code, Sections 46000–46029; Health and Safety Code, Sections 110810–110959) implements all organic food or product regulations and amendments adopted pursuant to the federal Organic Foods Production Act and requires annual registration through county agricultural commissioners for anyone marketing products as organic before the first sale of the product. CDFA's Organic Program is responsible for the enforcement of both the Organic Foods Production Act and the California Organic Food Products Act. Enforcement activities include program administration, county biologist training, initiation of complaint investigation, registration of private certification organizations, and providing a source of information on California's organic industry. The California Department of Public Health enforces laws for processed products marketed as organic (CDFA 2013a).

#### **O.1.3 Local Laws, Plans, Policies, and Regulations**

##### ***General Plans***

General Plans are long-range comprehensive plans, developed for cities and counties to govern growth and development. Many county general plans include goals and policies to preserve agricultural land use through a variety of mechanisms, such as creation of urban growth boundaries, designation of agricultural overlay zones, requirement of buffers between agricultural and other uses, and mitigation fees for conversion of agricultural land associated with development. City general plans also may have some provisions for the

protection of agricultural land. An increasing number of general plans (e.g., Marin, Santa Cruz, and Sonoma counties) include provisions to promote organic agriculture.

### ***California Right-to-Farm Act***

The Right-to-Farm Act (Civil Code, Section 3482.5) of 1981 (amended in 1993 and 1999) protects agricultural operations from nuisance complaints and actions associated with adjacent residential uses. About 40 of California's 58 counties and 50 cities have adopted right-to-farm ordinances (Wacker et al. 2001). These laws do not interfere with other statutes, such as regulations affecting the application of pest control materials, fish and game laws, and air quality rules.

## **O.2 Air Quality Regulatory Setting**

The federal, State, regional, and local laws, ordinances, regulations, and standards related to air quality and relevant to the Proposed Program are discussed next.

### **O.2.1 Federal Laws, Ordinances, Regulations, and Standards**

Federal regulations and requirements applicable to the Proposed Program include the following:

- Clean Air Act (CAA)
- National Ambient Air Quality Standards (NAAQS)
- National Emission Standards for Hazardous Air Pollutants (NESHAP)
- EPA Aircraft Emissions Regulations
- Corporate Average Fuel Economy (CAFE) standards
- Nonroad Emissions Regulations
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)

#### ***Clean Air Act***

The federal Clean Air Act and the 1990 Clean Air Act Amendments (CAA) govern air quality in the United States and are administered by EPA. The CAA authorizes EPA to set limits on the concentrations in the air of certain air pollutants and the authority to limit emissions sources. EPA implements a variety of programs under the CAA that focus on reducing ambient air concentrations of pollutants that cause smog, haze, acid rain, serious health effects, and phasing out ozone depleting chemicals.

#### **National Ambient Air Quality Standards**

As required by the CAA, EPA has established NAAQS for six major air pollutants. These pollutants, known as criteria air pollutants, are: ozone ( $O_3$ ); particulate matter (PM), specifically PM<sub>10</sub> (PM with aerodynamic radius of 10 micrometers or less) and PM<sub>2.5</sub> (PM

with aerodynamic radius of 2.5 micrometers or less); carbon monoxide (CO); nitrogen dioxide ( $\text{NO}_2$ ); sulfur dioxide ( $\text{SO}_2$ ); and lead. California also has established ambient air quality standards, known as the California Ambient Air Quality Standards (CAAQS), which generally are more stringent than the corresponding federal standards, and incorporate additional standards for sulfates, hydrogen sulfide ( $\text{H}_2\text{S}$ ), vinyl chloride, and visibility-reducing particles. CAAQS are discussed in more detail under State Law, Ordinances, Regulations, and Standards in this section, under California Clean Air Act and California Ambient Air Quality Standards.

The federal standards for the criteria air pollutants as well as the California standards are shown in Table N-2-1. The primary standards have been established to protect public health. The secondary standards are intended to protect the nation's welfare and account for air pollutant impacts on soil, water, visibility, materials, vegetation, and other aspects of the general welfare.

Page left intentionally blank.

**Table O.2-1. State and Federal Ambient Air Quality Standards**

Pollutant	Averaging Time	California Standards <sup>1</sup>		Primary <sup>3,5</sup>	National Standards <sup>2</sup>		Method <sup>7</sup>
		Concentration <sup>3</sup>	Method <sup>4</sup>		Secondary <sup>3,6</sup>		
Ozone (O <sub>3</sub> )	1 Hour	0.09 ppm (180 µg/m <sup>3</sup> )	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry	
	8 Hour	0.070 ppm (137 µg/m <sup>3</sup> )		0.075 ppm (147 µg/m <sup>3</sup> )			
Respirable Particulate Matter (PM <sub>10</sub> )	24 Hour	50 µg/m <sup>3</sup>	Gravimetric or Beta Attenuation	150 µg/m <sup>3</sup>	Same as Primary Standard	Inertial Separation and Gravimetric Analysis	
	Annual Arithmetic Mean	20 µg/m <sup>3</sup>		—			
Fine Particulate Matter (PM <sub>2.5</sub> ) <sup>13</sup>	24 Hour	—	Gravimetric or Beta Attenuation	35 µg/m <sup>3</sup>	Same as Primary Standard	Inertial Separation and Gravimetric Analysis	
	Annual Arithmetic Mean	12 µg/m <sup>3</sup>		12 µg/m <sup>3</sup>	15 µg/m <sup>3</sup>		
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m <sup>3</sup> )	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m <sup>3</sup> )	—	Non-Dispersive Infrared Photometry (NDIR)	
	8 Hour	9.0 ppm (10 mg/m <sup>3</sup> )		9 ppm (10 mg/m <sup>3</sup> )	—		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m <sup>3</sup> )		—	—		
Nitrogen Dioxide (NO <sub>2</sub> ) <sup>8</sup>	1 Hour	0.18 ppm (339 µg/m <sup>3</sup> )	Gas Phase Chemiluminescence	100 ppb (188 µg/m <sup>3</sup> )	—	Gas Phase Chemiluminescence	
	Annual Arithmetic Mean	0.030 ppm (57 µg/m <sup>3</sup> )		0.053 ppm (100 µg/m <sup>3</sup> )	Same as Primary Standard		
Sulfur Dioxide (SO <sub>2</sub> )	1-hour	0.25 ppm (655 µg/m <sup>3</sup> )	Ultraviolet Fluorescence	75 ppb (196 µg/m <sup>3</sup> )	—	Ultraviolet Fluorescence; Spectrophotometry (Pararosaniline Method)	
	3-hour	—		—	0.5 ppm (1300 µg/m <sup>3</sup> )		
	24-hour	0.04 ppm (105 µg/m <sup>3</sup> )		0.14 ppm (for certain areas) <sup>9</sup>	—		
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas) <sup>9</sup>	—		

Pollutant	Averaging Time	California Standards <sup>1</sup>		Primary <sup>3,5</sup>	National Standards <sup>2</sup>		Method <sup>7</sup>
		Concentration <sup>3</sup>	Method <sup>4</sup>		Secondary <sup>3,6</sup>

	Calendar quarter	—		1.5 µg/m <sup>3</sup> (for certain areas) <sup>11</sup>	Same as Primary Standard	Same as Primary Standard	
	Rolling 3-month average	—		0.15 µg/m <sup>3</sup>	—	—	
Visibility Reducing Particles <sup>12</sup>	8-hour	See footnote 12	Beta Attenuation and Transmittance through Filter Tape	—	—	—	—
Sulfates	24-hour	25 µg/m <sup>3</sup>	Ion Chromatography	No National Standards			—
Hydrogen Sulfide	1-hour	0.03 ppm (42 µg/m <sup>3</sup> )	Ultraviolet Fluorescence	—	—	—	—
Vinyl Chloride <sup>10</sup>	24-hour	0.01 ppm (26 µg/m <sup>3</sup> )	Gas Chromatography	—	—	—	—

## Notes:

ppm = parts per million; ppb = parts per billion; µg/m<sup>3</sup> = micrograms per cubic meter

- 1 California standards for O<sub>3</sub>, CO (except 8-hour Lake Tahoe), SO<sub>2</sub> (1 and 24 hour), NO<sub>2</sub>, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200, Title 17 of the California Code of Regulations.
- 2 National standards (other than O<sub>3</sub>, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The O<sub>3</sub> standard is attained when the fourth highest 8-hour concentration measured at each site in 1 year, averaged over 3 years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m<sup>3</sup> is equal to or less than 1. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact EPA for further clarification and current national policies.
- 3 Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- 4 Any equivalent measurement method which can be shown to the satisfaction of CARB to give equivalent results at or near the level of the air quality standard may be used.
- 5 National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

- 6 National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- 7 Reference method as described by EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by EPA.
- 8 To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in ppb. California standards are in ppm. To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
- 9 On June 2, 2010, a new 1-hour SO<sub>2</sub> standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO<sub>2</sub> national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.  
Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
- 10 CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- 11 The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m<sup>3</sup> as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
- 12 In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.
- 13 On December 14, 2012, the national annual PM<sub>2.5</sub> primary standard was lowered from 15.0 µg/m<sup>3</sup> to 12.0 µg/m<sup>3</sup>. The existing national 24-hour PM<sub>2.5</sub> standards (primary and secondary) were retained at 35 µg/m<sup>3</sup>, as was the annual secondary standard of 15 µg/m<sup>3</sup>. The existing 24-hour PM<sub>10</sub> standards (primary and secondary) of 150 µg/m<sup>3</sup> also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

Source: CARB 2013

Page left intentionally blank.

Areas where air pollution levels persistently exceed one or more of the NAAQS may be designated “nonattainment” by EPA. As part of its enforcement responsibilities, EPA requires each state with nonattainment areas (NAAs) to prepare and submit a State Implementation Plan (SIP) that demonstrates the means by which it will attain the federal standards, and requires that a maintenance plan be prepared for each former NAA that subsequently has demonstrated attainment of the standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the time frame identified in the SIP.

#### National Emission Standards for Hazardous Air Pollutants

The National Emission Standards for Hazardous Pollutants are standards for major sources of hazardous air pollutants (HAPs). The standards are contained in two CFR parts, 40 CFR Part 61, promulgated before the 1990 CAAA, and 40 CFR Part 63, promulgated as part of the CAAA in 1990. Part 61 regulates only seven HAPs: asbestos, beryllium, mercury, vinyl chloride, benzene, arsenic, and radon/radionuclides. Part 63 was promulgated as a result of the 1990 CAAA, which established a list of 187 additional HAPs. The maximum achievable control technology standards of Part 63 regulate major sources of HAPs as well as specific source categories of HAPs. A major source is defined as having the potential to emit 10 tons per year of a single HAP or 25 tons per year of a combination of HAPs. The Statewide Program is not covered by any of the specific source categories of the NESHAP.

#### EPA Aircraft Emissions Regulations

The CAA authorizes EPA to regulate the emissions from aircraft. The Control of Air Pollution from Aircraft and Aircraft Engines: Emissions Standards and Test Procedures (codified in 40 CFR Part 87) were first issued in 1973. They have been updated several times since then with different standards for engine smoke, fuel venting, and emissions of hydrocarbons, nitrogen oxides (NO<sub>x</sub>), and CO. The most recent updates were adopted in 2012, adding two new tiers of more stringent emission standards for NOX. The regulations cover all types of engines; although turboprop engine standards are limited to controlling smoke, and even then, only if the engine's rated output is greater than 1,000 kilowatts. Because the turboprop engines on the aircraft to be used in the Proposed Program have a rated output less than 1,000 kilowatts, the regulations would not apply.

#### ***Corporate Average Fuel Economy Standards***

The CAFE standards were first enacted by Congress in 1975, requiring vehicle manufacturers to comply with the gas mileage or fuel economy standards. These standards are set and regulated by the National Highway Traffic Safety Administration (NHTSA), with testing and data support from EPA.

The issued rules include fuel economy standards for both light- and heavy-duty vehicles. On September 15, 2011, EPA and NHTSA issued a final rule on greenhouse gas (GHG) emissions standards and fuel efficiency standards for medium- and heavy-duty engines and vehicles model years 2014 to 2018 (76 FR 57106). On August 28, 2012, EPA and NHTSA issued a joint final rulemaking to establish 2017 through 2025 GHG emissions and CAFE standards for light-duty vehicles (77 FR 62624).

### ***Nonroad Emission Regulations***

EPA has adopted emissions standards for different types of nonroad engines, equipment, and vehicles. For nonroad diesel engines, EPA has adopted multiple tiers of emission standards.

EPA signed a final rule on May 11, 2004 introducing the Tier 4 emission standards, to be phased in between 2008 and 2015 (69 CFR 38957–39273, June 29, 2004). The Tier 4 standards require that emissions of PM and NOx be further reduced by about 90 percent. Such emission reductions can be achieved through the use of control technologies, including advanced exhaust gas after-treatment. To enable sulfur-sensitive control technologies in Tier 4 engines, such as catalytic particulate filters and NOx absorbers, EPA also mandated reductions in sulfur content in nonroad diesel fuels. In most cases, federal non-road regulations also apply in California, which has only limited authority to set emission standards for new nonroad engines. The CAA preempts California's authority to control emissions from new farm and construction equipment under 175 horsepower (CAA Section 209[e][1][A]) and requires California to receive authorization from EPA for controls over other off-road sources (CAA Section 209[e][2][A]).

### ***Federal Insecticide, Fungicide, and Rodenticide Act***

FIFRA was passed in 1947, with significant amendments made in 1972 under the Federal Environmental Pesticide Control Act, and in 1996 under the Food Quality Protection Act. FIFRA mandates for EPA to regulate the use and sale of pesticides, to protect human health and the environment. Pesticides must be registered by EPA and properly labeled so that they will not cause unreasonable harm to the environment when used in accordance with the labeling specifications. Because FIFRA does not preempt state, tribal, or local law, each of these governing sectors also may regulate pesticide use.

## **O.2.2 State Laws, Ordinances, Regulations, and Standards**

### ***California Clean Air Act and California Ambient Air Quality Standards***

The State of California initiated its own air quality standards, the CAAQS, in 1969 under the mandate of the Mulford-Carrell Act. The CAAQS are goals for air quality within the state. The CAAQS generally are more stringent than the NAAQS. In addition to the six criteria pollutants covered by the NAAQS, CAAQS exist for sulfates, H<sub>2</sub>S, vinyl chloride, and visibility-reducing particles. These standards are listed in Table N-2-1.

The California Clean Air Act (CCAA) was enacted in 1988. The CCAA provides a comprehensive framework for air quality planning. The CCAA requires NAAs to achieve and maintain the health-based CAAQS by the earliest practicable date. The CCAA is administered by the California Air Resources Board (CARB) at the State level and by local air districts at the regional level; the air districts are required to develop plans and control programs for attaining State standards.

The CCAA requires NAAs in the state to prepare attainment plans. The attainment plans are required to achieve a minimum 5 percent annual reduction in the emissions of nonattainment pollutants unless all feasible measures have been implemented. All air basins in California are either unclassified or in attainment of the NAAQS and CAAQS for CO

and SO<sub>2</sub>. Some air basins are classified as NAAs for the NAAQS and CAAQS for O<sub>3</sub>, PM10, and PM2.5, NO<sub>2</sub>, and lead. In addition, a few air basins have been classified as nonattainment for H<sub>2</sub>S under the CAAQS.

CARB is responsible for ensuring implementation of the CCAA, meeting State requirements for the federal CAA, and establishing the CAAQS. CARB oversees activities of local air districts and is responsible for incorporating air quality management plans for local air basins into a SIP for EPA approval. It also is responsible for setting emission standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. CARB also establishes passenger vehicle fuel specifications.

### ***Truck and Bus Regulation***

On December 12, 2008, CARB approved a new regulation to substantially reduce emissions of diesel PM, NOX, and other pollutants from existing on-road diesel vehicles operating in California. The regulation requires affected trucks and buses to meet performance standards and requirements between 2011 and 2023. Affected vehicles included on-road, heavy-duty, diesel-fueled vehicles with a gross vehicle weight rating great than 14,000 pounds. The regulation was updated in 2011, with revisions that provide more compliance flexibility and reflect the impact of the economic recession on vehicle activity and emissions. Therefore, heavy-duty trucks used in Proposed Program activities would have to comply with this regulation.

### ***Commercial Vehicle Idling Regulation***

On October 20, 2005, CARB approved the Airborne Toxic Control Measure (ACTM) to limit diesel-fuel commercial motor vehicle idling. This regulation was a follow-up to previous idling ATCMs, and it consists of new engine and in-use truck requirements, as well as idling emission performance standards. The regulation requires for 2008 and newer model year heavy-duty diesel engines to be equipped with a nonprogrammable engine shutdown system that automatically shuts down the engine after 5 minutes of idling or optionally meets a stringent NOX idling emission standard (i.e., 30 grams/hour). The regulation also is applicable to the operation of in-use trucks, requiring operators of both in-state and out-of-state registered, sleeper berth-equipped trucks to manually shut down their engine when idling more than 5 minutes at any location within California, beginning in 2008. Affected vehicles included diesel-fueled commercial vehicles with a gross vehicle weight rating greater than 10,000 pounds. Therefore, trucks used for vendor delivery of materials for Proposed Program activities would comply with the commercial vehicle idling regulatory requirements.

### ***Heavy-Duty On-Board Diagnostic System Regulations***

In 2004, CARB adopted a regulation requiring on-board diagnostic systems (OBD) on all 2007 and later model year heavy-duty engines and vehicles (i.e., vehicles with a gross vehicle weight rating greater than 14,000 pounds) in California. CARB subsequently adopted a comprehensive on-board diagnostic regulation for heavy-duty vehicles model years 2010 and beyond. The heavy-duty OBD regulation was updated in 2010 and 2013, with revisions to enforcement requirements, testing requirements, and implementation schedules. Therefore heavy-duty trucks used for Proposed Program activities would comply with the heavy-duty on-board diagnostic regulatory requirements.

## ***Heavy-Duty Vehicle Inspection Program***

This program requires for heavy-duty trucks and buses to be inspected for excessive smoke and tampering, and engine certification label compliance. Any heavy-duty vehicle (i.e., vehicles with a gross vehicle weight rating greater than 6,000 pounds) traveling in California, including vehicles registered in other states and foreign countries, may be tested. Tests are performed by CARB inspection teams at border crossings, California Highway Patrol weigh stations, fleet facilities, and randomly selected roadside locations. Owners of trucks and buses found in violation are subject to minimum penalties, starting at \$300 per violation. Heavy-duty trucks used for Proposed Program activities would be subject to the inspection program.

## ***California Standards for Diesel Fuel Regulations***

These regulations require for diesel fuel with sulfur content of 15 parts per million (ppm) or lower (by weight) to be used for all diesel-fueled vehicles that are operated in California. The standard also applies to non-vehicular diesel fuel, other than diesel fuel used solely in locomotives or marine vessels. The regulations also contain standards for the aromatic hydrocarbon content and lubricity of diesel fuels.

## ***In-Use Off-Road Diesel Vehicle Regulation***

In 2007, CARB adopted a regulation to reduce diesel PM and NOX emissions from in-use, off-road, heavy-duty diesel vehicles in California. The regulation imposes limits on vehicle idling and requires fleets to reduce emissions by retiring, replacing, repowering, or installing exhaust retrofits to older engines. In December 2010, major amendments were made to the regulation, including a delay of the first performance standards compliance date to no earlier than January 1, 2014 (CARB 2010). All fleets used in the Proposed Program owned by CDFA, individual contractors, or growers that are not otherwise exempt from the regulation must comply with these regulations.

## ***Assembly Bill 1803***

In 1983, the California Legislature enacted Assembly Bill 1803, establishing a two-step process of risk identification and risk management, to address the potential health effects from air toxic substances and protect public health. In the first step (identification), CARB and the Office of Environmental Health Hazard Assessment (OEHHA) determine whether a substance needs to be formally identified as a toxic air contaminant (TAC) in California. In the second step, CARB reviews the emission sources of an identified TAC to determine whether any regulatory action is necessary to reduce the risk. The analysis includes a review of controls already in place, the available technologies and associated costs for reducing emissions, and the associated risk. Public outreach is an essential element in the development of a control plan and any control measure, so that CARB's efforts are cost-effective and appropriately balance public health protection and economic growth. Using this process, CARB has adopted several ATCMs to reduce exposure to TACs. This includes several measures and controls to limit exposure of diesel PM by limiting vehicle idling and limiting the emission rate of engines through engine or exhaust control technologies. Other ATCMs are aimed at reducing exposure to several other sources of TACs, including benzene from retail service stations; hexavalent chromium from plating facilities and vehicle coatings; asbestos from construction, grading, quarrying, surface mining operations, and

surfacing applications; formaldehyde from composite wood products; various TACs associated with combustion sources; ethylene oxide from sterilizers and aerators; perchloroethylene from dry cleaning; and TACs from thermal spraying, cooling towers, non-ferrous metal mining, and automotive maintenance and repair.

### ***State Transport Refrigeration Unit Airborne Toxic Control Measure***

Transport Refrigeration Units (TRUs) are refrigeration systems, powered by diesel internal combustion engines, designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers, truck vans, shipping containers, and rail cars. Although TRU engines are relatively small, ranging from 9 to 36 horsepower, substantial numbers of these engines congregate at distribution centers, truck stops, and other facilities, resulting in the potential for health risks to those that live and work nearby. Because diesel PM has been identified as a TAC, CARB adopted an ATCM for TRUs and TRU generator sets on February 26, 2004. Compliance with this ATCM requires specific model year engines to meet Low Emission TRU or Ultra Low Emission TRU In-Use Standards by specific calendar years. TRUs are used in sterile insect release programs.

### ***State Portable Engine Airborne Toxic Control Measure***

The California Portable Engine ATCM is designed to reduce the PM emissions from portable diesel-fueled engines rated at 50 brake horsepower or larger. Because backpack sprayer engines are assumed to be electric or gas-powered and the vehicle-mounted pump engines are assumed to be smaller than 50 brake horsepower, they are exempt from the State Portable Engine ACTM. No other portable engines are expected to be used under the Proposed Program.

### ***Portable Equipment Registration Program***

The statewide Portable Equipment Registration Program (PERP) establishes a system to uniformly regulate portable engines and portable engine-driven equipment units. After being registered in this program, engines and equipment units may operate throughout the state without the need to obtain individual permits from air districts. Owners or operators of portable engines and certain types of equipment can voluntarily register their units under this program, to operate their equipment anywhere in the state. Operation of registered portable engines still may be subject to certain district requirements for reporting and notification. Engines with less than 50 brake horsepower are exempt from this program; therefore, some of the engines used for the Proposed Program would be exempt.

### ***California Toxic Air Contaminant Act***

Under the California Toxic Air Contaminant Act (pesticide regulations), CDPR is responsible for evaluating pesticide uses of chemicals as TACs. CDPR lists pesticides that have been previously identified under federal laws as HAPs and pesticides identified as TACs by CDPR through the TAC statute evaluation process. The list contains 38 HAPs, as well as 8 pesticides identified by CDPR through the TAC evaluation process. Some of these identified pesticides may be used in the Proposed Program.

## **California Department of Pesticide Regulation Air Program Activities**

As previously described, the federal CAA requires each state to submit a SIP for achieving and maintaining the NAAQS, including the standard for O3. NAAs are regions in California that do not meet either federal or state ambient air quality standards. CARB and CDPR have developed a plan to track and reduce pesticide sources of volatile organic compounds (VOCs) in NAAs as part of the California SIP, to meet the O3 standard. CDPR is responsible for agricultural and commercial structural pesticide products, and CARB is responsible for pesticides in consumer products. CDPR, in collaboration with CARB, implements several air program activities, as follows:

- **Air monitoring:** In February 2011, CDPR established a monitoring network to sample ambient air for 34 pesticides one day each week in Ripon (San Joaquin County), Salinas (Monterey County), and Shafter (Kern County). Since August 2010, CARB has been sampling ambient air for several fumigants in the Oxnard area (Ventura County) and Santa Maria (Santa Barbara County). CARB has been monitoring in the Pajaro area (Monterey County) since January 2012. Monitoring at all three sites continued through December 2013. Under an agreement with EPA, CDPR and CARB also conducted air monitoring for methyl bromide in several communities between 2011 and 2013. CDPR also requested for CARB to monitor a 2,4-Dichlorophenoxyacetic acid application and a chlorpyrifos application in 2013. Several of these monitored pesticides are included in the Proposed Program.
- **Evaluating health risk of pesticides in air:** CDPR conducts risk assessments on health effects and exposure to pesticides. CDPR is preparing risk assessments for the following pesticide(s), for which ambient air is the focus or a significant component of the evaluation: 1,3-dichloropropene, chlorothalonil, chlorpyrifos, diazinon, and methomyl.
- **Mitigating and controlling health risk of pesticides in air:** After completing a risk assessment, CDPR investigates the need for, and appropriate degree of, control for a pesticide. CDPR is preparing control measures for chloropicrin.
- **Tracking pesticide VOC emissions:** CDPR tracks emissions from agricultural and structural pesticide products of these O3 precursor compounds so that specified reduction goals are met. The most recent report from 2011 showed that all reduction goals for all five areas tracked were being met.
- **Reducing pesticide VOC emissions:** CDPR is required to reduce VOC emissions by specified amounts to help meet air quality standards. Between 2008 and 2011, CDPR implemented a series of regulations to reduce VOC emissions from fumigant pesticides. CDPR has given interim approval for fumigation methods that reduce VOC emissions using low permeability tarpaulins. CDPR finalized regulations to reduce VOC emissions from non-fumigant pesticides on May 23, 2013. These regulations went into effect on November 1, 2013, and require prohibitions on the use of “high-VOC” non-fumigant products on certain crops in the San Joaquin Valley O3 NAA during May 1 through October 31, if a VOC trigger level is exceeded. These prohibitions apply to high-VOC products containing abamectin, chlorpyrifos, gibberellins, or oxyfluorfen. Also, when purchasing or using certain products

containing these four active ingredients, the regulations require a written recommendation from a licensed pest control adviser and require pest control dealers to provide VOC information to the purchaser.

### **O.2.3 Regional Laws, Plans, Policies, and Regulations**

CARB has divided the state into fifteen air basins, which are managed by 35 air districts. These air basins may be under the jurisdiction of more than one district. Air districts have substantial authority regarding air quality control, in regulating stationary source emissions and developing local attainment plans.

A discussion of applicable district rules and regulations is provided below. Summaries for general regulatory areas are presented with examples from selected districts. The specific rules cited below represent a large sample of districts throughout the state, but because of their large number, not all applicable rules and regulations of all districts have been included. Further information on all district rules and regulations are available in CARB's District Rules database (CARB 2011).

#### ***Portable Equipment Regulations***

Many districts have adopted rules that require portable equipment to be registered with the district. Each air district may have different definitions of portable engines, based on the type of activity or duration of operation. These portable equipment rules generally contain registration protocols, source category standards (emission standards for pollutants such as NO<sub>x</sub>, CO, VOCs, and PM), testing requirements, and reporting and recordkeeping requirements. These rules include San Joaquin Valley Air Pollution Control District (SJVAPCD) Rule 2280, Yolo-Solano Air Quality Management District (YSAQMD) Rule 3.3, San Diego County Air Pollution Control District (APCD) Rule 12.1, and Northern Sierra Air Quality Management District (AQMD) Rule 523.

Other districts may require operators of portable equipment to obtain permits to operate. Under these rules, portable engines may be subject to emission standards, administrative requirements, and monitoring and reporting requirements. These rules include South Coast Air Quality Management District (SCAQMD) Rule 203, Bay Area Air Quality Management District (BAAQMD) Regulation 2-Rule 1, Sacramento Metropolitan Air Quality Management District (SMAQMD) Rule 201, Santa Barbara County APCD Rule 201, Ventura County APCD Rule 10, San Luis Obispo County APCD Rule 202, Mojave Desert AQMD Rule 203, Imperial County APCD Rule 201, Monterey Bay Unified APCD Rule 200, and Mendocino County AQMD Rule 1-200.

In addition, districts may adopt permitting and registration rules that specifically apply to equipment used in agricultural operations. These rules include YSAQMD Rule 11.3, SMAQMD Rule 215, Santa Barbara County APCD Rule 1201, Ventura County APCD Rule 250, San Luis Obispo County APCD Rule 250, Mojave Desert AQMD Rule 1160.1, and Monterey Bay Unified APCD Rule 220.

As stated previously, the statewide PERP allows portable units to be registered and operate anywhere within the state. Portable engines registered with PERP are exempt from district

registration and permitting requirements, although certain district requirements for reporting and notification of operation may still apply.

### ***Solvent Regulations***

Some districts have adopted rules to limit emissions of VOCs from the use of organic solvents and other organic materials. These rules may contain VOC emissions limits, control measures, reduction standards, and testing or monitoring requirements. In several districts, the application of pesticides, herbicides, and insecticides are exempt under these rules. These rules include SJVAPCD Rule 4661, SCAQMD Rule 442, YSAQMD Rule 2.13, SMAQMD Rule 441, Santa Barbara County APCD Rule 317, San Diego County APCD Rule 66.1, San Luis Obispo County AQMD Rule 407, Mojave Desert AQMD Rule 442, Imperial County APCD Rule 417, and Monterey Bay Unified APCD Rule 416.

Rules in some districts may not contain exemptions for these operations. For example, BAAQMD Regulation 8–Rule 2 regarding organic compound emissions from miscellaneous operations contains an emissions limit of 6.8 kilograms (15 pounds) per day for materials with a concentration of more than 300 ppm total carbon on a dry basis. BAAQMD does not exempt pesticides, herbicides, or insecticides from this rule.

### ***Visible Emission Regulations***

Rules regarding visible emissions may limit the duration, volume, or opacity of emissions from various sources. Exemptions for agricultural operations or insecticide spraying exist in certain district rules, including SJVAPCD Rule 4101, SCAQMD Rule 401, YSAQMD Rule 2.3, SMAQMD Rule 401, Santa Barbara County APCD Rule 302, San Diego County APCD Rule 50, San Luis Obispo County AQMD Rule 401, Monterey Bay Unified APCD Rule 400, and Mendocino County AQMD Rule 1-410. Other visible emission rules, such as BAAQMD Regulation 6, Mojave Desert AQMD Rule 401, and Northern Sierra AQMD Rule 202, may not provide these exemptions.

## **O.2.4 Local Laws, Plans, Policies, and Regulations**

### ***Local General Plans***

Many city and county general plans contain goals, policies, and strategies related to air quality and emissions. Applicable policies and strategies from these general plans include encouraging the use of alternative fuels, limiting idling time of vehicles and equipment, recommending appropriate practices for agriculture operations and construction, and encouraging the installation of emission control devices.

## **O.3 Biological Resources Regulatory Setting**

The federal, State, and local laws, ordinances, regulations, and standards related to biological resources and relevant to the Proposed Program are discussed next.

### O.3.1 Federal Laws, Regulations, and Standards

#### ***Endangered Species Act of 1973***

The Endangered Species Act (ESA) (16 U.S. Code [USC] Section 1531 et seq.; 50 CFR Parts 17 and 222) provides for conservation of species that are endangered or threatened throughout all or a significant portion of their range, as well as the protection of habitats on which they depend. The U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS) share responsibility for implementing the ESA. In general, USFWS manages land and freshwater species, whereas NMFS manages marine and anadromous species. The ESA and subsequent amendments provide guidance for projects that may affect the continued existence of federally listed species or adversely affect their designated critical habitat.

#### Section 9 (Prohibited Acts)

Section 9 of the ESA and its implementing regulations prohibit the “take” of any fish or wildlife species listed under the ESA as endangered or threatened, unless otherwise authorized by federal regulations. The term “take” means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. USFWS has interpreted the definition of harm to include habitat modification. Section 9 prohibits a number of specified activities with respect to endangered and threatened plants as well as adverse modifications to critical habitat.

#### Section 7 (Interagency Consultation and Biological Assessments)

Section 7 of the ESA (16 USC 1531 et seq.) outlines the procedures for federal interagency cooperation to conserve federally listed species and designated critical habitats. Section 7(a)(1) directs the Secretary of the Interior/Secretary of Commerce to review other programs administered by them and use such programs to further the purposes of the Act. It also directs all other federal agencies to use their authorities in furtherance of the purposes of the Act by carrying out programs for the conservation of species listed pursuant to the Act. Section 7(a)(2) states that each federal agency shall, in consultation with the Secretary, ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of designated critical habitat. In fulfilling these requirements, each agency must use the best scientific and commercial data available. This section of the Act defines the consultation process, which is further developed in regulations promulgated by 50 CFR Section 402.

#### Section 10 (Habitat Conservation Plans)

Section 10(a)(1)(B) of the ESA provides a process by which nonfederal entities may obtain an Incidental Take Permit from the USFWS or NMFS for otherwise lawful activities that incidentally may result in “take” of endangered or threatened species, subject to specific conditions. A habitat conservation plan (HCP) must accompany an application for an incidental take permit. The habitat conservation plan associated with the permit ensures that the effects of the authorized incidental take are adequately minimized and mitigated.

### ***Magnuson-Stevens Fishery Conservation and Management Act***

The amended Magnuson-Stevens Fishery Conservation and Management Act 1996, also known as the Sustainable Fisheries Act, provides for the conservation and management of all fish resources within the exclusive economic zone of the U.S. It requires that all federal agencies consult with NMFS on activities or proposed activities authorized, funded, or undertaken by that agency which may adversely affect Essential Fish Habitat of commercially managed marine and anadromous fish species.

### ***Migratory Bird Treaty Act***

The Migratory Bird Treaty Act (MBTA) (Title 16, USC Sections 703–712; 50 CFR Subchapter B) makes it unlawful to pursue, hunt, take, capture, kill, or possess any migratory birds, or part, nests, or eggs of such migratory birds, which are listed in wildlife protection treaties between the United States and Canada, Mexico, Japan, and Russia. The MBTA applies to almost all avian species that are native to California. The Act prohibits the take of such species, including the removal of nests, eggs, and feathers. It requires that all federal agencies consult with USFWS on activities or proposed activities authorized, funded, or undertaken by that agency which may adversely affect migratory birds.

The Migratory Bird Treaty Reform Act amends the MBTA so that nonnative birds or birds which have been introduced by humans to the United States or its territories are excluded from protection under the MBTA.

Protection of Migratory Bird Populations Executive Order 13186 directs each federal agency taking actions that have or may have adverse impact on migratory bird populations to work with USFWS to develop a memorandum of understanding, to promote the conservation of migratory bird populations.

### ***Bald and Golden Eagle Protection Act***

The Bald and Golden Eagle Protection Act (Title 16, USC Section 668; 50 CFR Part 22) prohibits take, which is defined to include molesting or disturbing bald eagles (*Haliaeetus leucocephalus*) and golden eagles (*Aquila chrysaetos*) and their occupied and unoccupied nests. The golden eagle, however, is accorded somewhat lighter protection under this Act than the bald eagle. The administering agency is the USFWS.

### ***Executive Orders***

#### **Executive Order 11990, Protection of Wetlands**

Executive Order 11990 provides for protection of wetlands from federal or federally approved projects when a practicable alternative is available. If wetland impacts cannot be avoided, all practicable measures to minimize harm must be included. The administering agency is the U.S. Army Corps of Engineers.

#### **Executive Order 13112, Invasive Species**

Executive Order 13112 requires federal agencies to work cooperatively to prevent the introduction of invasive species, to provide for their control, and to minimize the economic,

ecological, and human health impacts that invasive species cause, as outlined in the National Invasive Species Council's National Invasive Species Management Plan.

### **O.3.2 State Agencies, Laws, and Programs**

#### ***California Fish and Game Code***

##### **Sections 2050-2098 (California Endangered Species Act)**

The California Endangered Species Act (CESA) (California Fish and Game Code Sections 2050–2098) prohibits State agencies from approving a project that would jeopardize the continued existence of a species listed under the CESA as endangered or threatened, or would result in the destruction or adverse modification of habitat essential to the continued existence of those species, if reasonable and prudent alternatives are available that would avoid a jeopardy finding.

Section 2080 of the Fish and Game Code prohibits the take of any species that is state-listed as endangered or threatened, or designated as a candidate for such listing. "Take" is defined by Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill" an individual of a listed species. Under the CESA, the California Department of Fish and Wildlife (CDFW) may issue an incidental take permit authorizing the take of listed and candidate species that is incidental to an otherwise lawful activity, subject to specified conditions.

##### **Sections 3511, 4700, 5050, and 5515 (Fully Protected Species)**

CDFW has designated 37 fully protected species and prohibited the take or possession of these species at any time, and no licenses or permits may be issued for their take except for necessary scientific research or relocation of certain bird species for the protection of livestock.

##### **Sections 3503, 3503.5, and 3513 (Nesting Bird Protections)**

Section 3503 of the Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by code or any regulation made pursuant thereto. Section 3503.5 prohibits the take, possession, or needless destruction of any nests, eggs, or birds in the orders Falconiformes (New World vultures, hawks, eagles, ospreys, and falcons, among others) or Strigiformes (owls). Section 3513 prohibits the take or possession of any migratory nongame bird or part thereof, as designated in the MBTA. To avoid violation of the take provisions, project-related disturbance at active nesting territories generally are required to be reduced or eliminated during the nesting cycle.

##### **Section 1600 et seq. (Lake and Streambed Alteration)**

This section of the Fish and Game Code establishes the Lake and Streambed Alteration Program to provide for protection and conservation of fish and wildlife resources with respect to any project that may substantially divert or obstruct the natural flow of, or

substantially change or use any material from the bed, channel, or bank of any river, stream, or lake.

Pursuant to the program, CDFW must be notified before any activity that would: substantially divert or obstruct the natural flow of any river, stream, or lake; or would substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

CDFW typically interprets their jurisdiction under Section 1600 to include the bed and bank of lakes and stream, as well as the adjacent floodplain and riparian vegetation, if present.

#### Sections 1900-1913 (California Native Plant Protection Act)

California's Native Plant Protection Act requires all State agencies to use their authority to carry out programs to conserve endangered and rare native plants. Provisions of this Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least 10 days in advance of any change in land use. This allows CDFW to salvage listed plant species that otherwise would be destroyed.

#### ***Local/Regional Laws and Plans***

Within California, numerous regional, county and city-level ordinances and policies exist for the protection of biological resources. Examples include ordinances and local zoning that specify setbacks for wetlands, streams, and lakes, and regulate the removal of trees. Because of the broad geographic scope of the Proposed Program, local ordinances and land use designations are not considered specifically in this analysis.

## **O.4 Global Climate Change Regulatory Setting**

The federal, State, and local laws, ordinances, regulations, and standards related to global climate change and relevant to the Proposed Program are discussed next.

### **O.4.1 Federal Laws, Ordinances, Regulations, and Standards**

#### ***U.S. Supreme Court and Endangerment Ruling***

The U.S. Supreme Court ruled for the first time in 2007 that GHG emissions are air pollutants, covered under the Clean Air Act, in *Massachusetts v. The Environmental Protection Agency*. The Court found that EPA has a mandatory duty to enact rules regulating mobile GHG emissions pursuant to the federal Clean Air Act. The Court held that GHGs fit the definition of an air pollutant causing and contributing to air pollution, which reasonably may be anticipated to endanger public health or welfare. In 2009, the EPA Administrator determined that existing and projected concentrations of GHGs threaten public health and welfare of present-day and future generations, and that combined emissions from motor vehicles contribute to GHG pollution. EPA's endangerment finding covers emissions of six key GHGs: carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons (HFCs), perfluorocarbons, and sulfur hexafluoride. These GHGs are discussed further in Section 6.4.2, Environmental Setting of the Draft PEIR.

### ***Corporate Average Fuel Economy and Greenhouse Gas Emission Standards***

In 2009, NHTSA and EPA issued the first joint ruling to establish a national program to regulate model year 2012 through 2016 passenger cars and light trucks, to improve fuel economy and reduce greenhouse gas emissions. NHTSA previously had set Corporate Average Fuel Economy standards for vehicle fuel efficiency, but the joint rule was the first coordinated effort between federal programs for fuel economy and GHGs. Since then, NHTSA and EPA have issued new fuel efficiency and GHG emission standards. On August 9, 2011, standards were issued to reduce GHG emissions and improve fuel efficiency for heavy-duty trucks and buses. On October 15, 2012, EPA and NHTSA established a program to reduce GHG emissions and improve fuel economy standards for new cars and light trucks through 2025 (EPA 2012).

### ***Mandatory Reporting of Greenhouse Gases Rule***

In response to the 2008 Consolidated Appropriations Act, EPA issued the Mandatory Reporting of Greenhouse Gases Rule in 2009. The purpose of this rule is to collect accurate GHG data, to inform future policy decisions. The rule requires reporting of GHG data and other relevant information from large sources and suppliers in the United States. Large sources are considered to have facilities that emit more than 25,000 metric tons of carbon dioxide equivalent (CO<sub>2</sub>e) emissions per year. Facilities began reporting yearly emissions for 2010, and this data became available to the public in January 2012.

## **O.4.2 State Agencies, Laws, and Programs**

### ***California Department of Food and Agriculture GHG Reduction Actions***

The California Environmental Protection Agency (Cal/EPA) is required to prepare an annual report describing State agency actions to reduce GHG emissions. The 2013 State Agency Greenhouse Gas Reduction Report Card (Cal/EPA 2013) lists GHG reduction programs and actions being undertaken by CDFA. These include research and education programs to study GHG emissions from nitrogen fertilizers, implementation of dairy biodigester systems, and biofuel production from crops.

CDFA's California Agricultural Vision (Ag Vision) report addresses future sustainability challenges faced by the California agriculture system, and contains strategies and actions to adapt to climate change and reduce greenhouse gas emissions (CDFA 2010). Strategies include promoting renewable energy and substitutes for fossil-based inputs and identifying ways to reduce GHG emissions from diesel fuel, nitrogen fertilizer, pesticides and other agri-chemicals. CDFA has issued a progress report documenting ongoing progress in meeting the strategies and action items from the Ag Vision report (CDFA 2012).

### ***California Global Warming Solutions Act***

CARB is the lead agency for implementing Assembly Bill (AB) 32, the California Global Warming Solutions Act, adopted by the State Legislature in 2006. AB 32 set a statewide target to reduce GHG emissions to 1990 levels by 2020. AB 32 also required CARB to prepare a Scoping Plan with the main strategies to be used to achieve reductions in GHG emissions in California.

After receiving public input on their discussion draft of the Proposed Scoping Plan (released in June 2008), CARB issued its Climate Change Proposed Scoping Plan in October 2008, and adopted the plan in December 2008. This plan contains an outline of the proposed State strategies to achieve the 2020 GHG emission limits. Key elements of the Scoping Plan include the following recommendations:

1. Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
2. Achieving a statewide renewables energy mix of 33 percent;
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system;
4. Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets;
5. Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel standard;
6. Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the administrative costs of the State's long-term commitment to AB 32 implementation.

Under the Scoping Plan, approximately 85 percent of the state's emissions are subject to a cap-and-trade program, where covered sectors are placed under a declining emissions cap. Emissions reductions are to be achieved through regulatory requirements and the option to reduce emissions further or purchase allowances to cover compliance obligations. Emission reductions from this cap-and trade program are expected to account for a large portion of the reductions required by AB 32.

CARB is updating the Scoping Plan to reflect progress since 2005, additional reduction measures, and plans for reductions beyond 2020. CARB recently released the draft proposed first update (CARB 2014).

### ***Executive Order S-03-05 and B-16-2012***

In 2005, Executive Order S-03-05 was issued, calling for statewide GHG reductions to 2000 levels by 2010, to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050. The Executive Order also called for the creation of a "Climate Action Team," which was to report to the Governor every 2 years on progress toward meeting the targets and the effects of GHG emissions on the state. The latest of these reports, Climate Action Team Biennial Report, was published in December 2010 (Cal/EPA 2010). In March 2012, Executive Order B-16-2012 was issued, affirming the long-range climate goal for California to reduce greenhouse gases to 80 percent below 1990 levels by 2050.

### ***Low Carbon Fuel Standard***

Executive Order S-1-07, the Low Carbon Fuel Standard (LCFS), was issued in January 2007. The order called for a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020. The LCFS was approved by CARB in 2009, and it became effective in April 2010. The regulation established annual performance standards for fuel producers and importers, applicable to all fuels used for transportation in California (CARB 2011a).

### ***Assembly Bill 1493***

With the passage of AB 1493 in 2002, California launched an innovative and pro-active approach for dealing with GHG emissions and climate change at the State level. AB 1493 required CARB to develop and implement regulations to reduce automobile and light truck GHG emissions. These stricter emissions standards apply to automobiles and light trucks beginning with the 2009 model year. Although litigation was filed, challenging these regulations; EPA initially denied California's related request for a waiver, but a waiver subsequently was granted (CARB 2013b).

### ***Senate Bill 375***

Senate Bill 375, the Sustainable Communities and Climate Protection Act of 2008, enhanced California's ability to reach its AB 32 goals, by promoting good land use and transportation planning with the goal of more sustainable communities. Sustainable Communities requires CARB to develop regional GHG emission reduction targets for 2020 and 2035 for each region covered by one of the state's 18 metropolitan planning organizations (MPOs). Executive Order G-11-024 set these targets in 2011. The MPOs were tasked with developing Sustainable Communities Strategies (SCS), integrating land use and transportation planning and demonstrating an ability to attain the 2020 and 2035 reduction targets.

### ***CEQA Guidance and GHG Significance Thresholds***

Several State-authorized air districts have drafted or adopted guidance on the analysis of GHGs for CEQA. These guidance documents contain recommendations of methods for quantifying GHGs and determining the significance of GHG emission impacts. Typically, these significance thresholds are based on a bright-line level of GHG emissions, best performance standards, a reduction target from baseline GHG emission levels, or consistency with a Climate Action Plan (CAP). A discussion of thresholds applicable to this analysis is included in the Methodology section of Section 6.5.3, Impact Analysis.

## **O.4.3 Local Laws, Plans, Policies, and Regulations**

### ***Sustainable Community Strategies***

As mentioned previously, MPOs throughout the state were tasked with developing an SCS to integrate land use and transportation planning in their respective planning regions. An SCS may contain provisions for projects to be relieved of certain environmental review requirements if the project is consistent with the SCS, although these streamlining processes mainly are applicable to development involving residential and mixed-use projects.

### ***Local General Plans and Climate Action Plans***

Many city and county general plans contain goals, policies, and strategies related to air quality and GHG emissions. In addition, a number of cities and counties have adopted or drafted CAPs or GHG emission reduction plans that include measures for GHG emission reductions and guidelines for evaluating project consistency with the CAP. Depending on the specific CAP, demonstration of project compliance and consistency with the CAP may involve evaluation of GHG emissions with a bright-line threshold, implementation of mandatory or voluntary GHG reduction measures, or a comparison of project emission reductions and CAP emission reduction goals.

For example, the Tulare County CAP requires that projects achieve a 6 percent reduction in GHG emissions to be consistent with the CAP (Tulare County 2010). The City of Sacramento CAP lists primary actions for GHG emissions reductions that must be incorporated into new development projects and existing development for CAP compliance (City of Sacramento 2012). The San Diego County CAP contains an efficiency threshold (emissions per service population), a bright line threshold, and a performance threshold for development projects, as well as a stationary source threshold (San Diego County 2012).

Applicable policies and strategies from these general plans and CAPs include encouraging the use of low carbon fuels and alternative energy, limiting idling time of vehicles and equipment, recommending best management practices for agriculture operations and construction, and supporting heavy-duty fleet conversions.

## **O.5 Hazards and Hazardous Materials Regulatory Setting**

The federal, State, and local laws, ordinances, regulations, and standards related to hazards and hazardous materials and relevant to the Proposed Program are discussed next.

### **O.5.1 Federal Laws, Ordinances, Regulations, and Standards**

#### ***Comprehensive Environmental Response, Compensation, and Liability Act***

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, also called the Superfund Act) (42 USC Section 9601 et seq.) was established to protect the public and the environment from the effects of past hazardous waste disposal activities and new hazardous material spills. CERCLA created a tax on the chemical and petroleum industries to generate funds to clean up abandoned or uncontrolled hazardous waste sites in which no responsible party could be identified (EPA 2011a). CERCLA also granted authority to EPA to respond directly to hazardous waste spills. The Superfund Amendments and Reauthorization Act of 1986 (SARA) (Public Law 99-499) amended some provisions of CERCLA (EPA 2011b). For example, SARA increased the focus on human health problems posed by hazardous waste releases, stressed the importance of permanent remedies and innovative treatment technologies in cleaning up hazardous waste sites, and encouraged greater citizen participation in making decisions on how sites should be cleaned up (EPA 2011b). CERCLA also requires those responsible for a spill or accidental release of hazardous materials to report the release to EPA. With respect to pesticides and the Proposed Program, normal applications of registered pesticides that are consistent with the pesticides' purpose are not subject to CERCLA reporting requirements. However, CERCLA

does require the reporting of accidents, spills, improper application, and improper disposal of pesticides, and it authorizes EPA to take action to address such releases. It also would ensure that CDFA, or pesticide applicators using pesticides pursuant to the Proposed Program, would be held liable for improper releases of pesticides and any resulting environmental contamination.

### ***Resource Conservation and Recovery Act***

The Resource Conservation and Recovery Act (RCRA) (42 USC Section 6901 et seq.) was enacted in 1976, to address the increasing problems the nation faced from the growing volume of municipal and industrial solid waste (EPA 2013a). RCRA sets national goals for protecting human health and the environment from the potential hazards of waste disposal, conserving energy and natural resources, reducing the amount of waste generated, and ensuring that wastes are managed in an environmentally-sound manner. To achieve these goals, RCRA established three interrelated programs: the solid waste program, the hazardous waste program, and the underground storage tank program. Of the most relevance to the Proposed Program, the hazardous waste program established a system for controlling hazardous wastes from the time they are generated to the time they are disposed ("cradle-to-grave") (EPA 2013a). Under RCRA and the hazardous waste program, owners and operators of hazardous waste treatment, storage, and disposal facilities have to follow a set of standards (e.g., regarding facility design and operation, contingency planning and emergency preparedness, and recordkeeping) to minimize risk and impacts on human health and the environment, codified in Title 40 of the Code of Federal Regulations (CFR), Part 264. These standards would apply to pesticide manufacturers, transporters, and applicators conducting activities under the Proposed Program.

### ***Federal Insecticide, Fungicide, and Rodenticide Act***

The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) (7 USC Section 136 et seq.) was enacted in 1947, but has since been amended by the Federal Environmental Pesticide Control Act of 1972 and the Food Quality Protection Act of 1996. In its current form, FIFRA mandates EPA to regulate the use and sale of pesticides to protect human health and the environment (EPA 2012a). EPA achieves this mandate by registering and labeling pesticides. Under FIFRA, all new pesticides (with minor exceptions) must be registered by the Administrator of EPA; a process in which appropriate crops and sites for the pesticide are identified and prescribed based on research data (EPA 2012a). So that registrations are up to date, all registrations must be reviewed every 15 years, and all pesticides registered before 1984 must be reregistered (EPA 2013c). Labeling requirements control when and under what conditions pesticides can be applied, mixed, stored, loaded, or used, and when a field can be reentered after application and crops can be harvested (EPA 2012a). For an emergency condition, however, Section 18 of FIFRA authorizes EPA to allow temporary unregistered use of a pesticide to avert risks to the environment, economy, and public health (EPA 2013b).

In relation to the Proposed Program, the regulations that govern Section 18, located in CFR, Title 40, Part 166, authorize EPA to issue pesticide emergency exemptions to state and federal agencies to control the introduction of invasive pests or avert significant economic losses, such as those associated with agricultural crops. To exercise such exemptions, state and federal agencies are required to submit to EPA, among other information, a detailed explanation of why pesticides currently registered for the proposed use are not available or

would not be effective, and why alternative methods of control either would not be effective or are not feasible. They also must submit a discussion of the potential risks to human health, endangered species, beneficial organisms, and the environment associated with use of the proposed pesticide. With respect to the Proposed Program, FIFRA requires that pesticides used to control invasive pests in non-emergency conditions be registered by EPA and their proposed uses be supported by research data. These pesticides must be labeled with application and storage instructions.

### ***Toxic Release Inventory-Emergency Planning and Community Right-to-Know Act***

Section 313 of the Emergency Planning and Community Right-to-Know Act (EPCRA) established the Toxic Release Inventory (TRI) (EPA 2013d). TRI is a database containing information on disposal and other releases of toxic chemicals from industrial facilities that is accessible to the public. As stipulated in 40 CFR Part 372, owners or operators of facilities that release toxic chemicals above a certain threshold (25,000 pounds or more per year) are required to submit information about: (1) on-site releases and other disposals of toxic chemicals; (2) on-site recycling, treatment, and energy recovery associated with TRI chemicals; (3) off-site transfers of toxic chemicals from TRI facilities to other locations; and (4) pollution prevention activities at facilities.

Many of the pesticide manufacturing facilities producing, recycling, or disposing pesticides that may be used under the Proposed Program would be subject to TRI reporting requirements. The owners or operators of these facilities would have to report information about their releases of toxic chemicals to EPA. This information would be available to the public in the TRI database.

### ***Occupational Safety and Health Act and Occupational Safety and Health Administration Regulations***

The Occupational Safety and Health Act of 1970 created the Occupational Safety and Health Administration (OSHA) to assure safe and healthful working conditions for working men and women by setting and enforcing standards and by providing training, outreach, education, and assistance (U.S. Department of Labor 2013a). To fulfill this purpose, OSHA develops and enforces mandatory job safety and health standards (U.S. Department of Labor 2013b). These standards, codified in Title 29, Part 1910 of the CFR, range in scope from walking and working surfaces, to exit routes and emergency planning, to hazardous materials and personal protective equipment. They include exposure limits for a wide range of specific hazardous materials, including pesticides, as well as requirements that employers provide personal protective equipment (i.e., protective equipment for eyes, face, or extremities; protective clothing; respiratory devices) to their employees wherever it is necessary (i.e., when required by the pesticide label instructions) (CFR Title 29, Section 1910.132). The OSHA standards also require that chemical manufacturers and importers obtain and develop safety data sheets, known as Material Safety Data Sheets (MSDSs) (CFR, Title 29, Section 1910.1200; U.S. Department of Labor 2013c). Employers must have an MSDS in the workplace for each chemical they use (CFR, Title 29, Section 1910.1200). With respect to the Proposed Program, OSHA regulations would require that pesticide applicators not be exposed to levels of pesticides greater than the limits set by OSHA and that employers of persons potentially exposed to pesticides as a result of treatments performed pursuant to the Proposed Program provide employees with personal protective

equipment and information (e.g., active ingredients, health hazards, signs and symptoms of exposure).

### ***Federal Aviation Administration Regulations, 14 CFR Part 137***

Aerial applications of pesticides are regulated by state and federal laws. The Federal Aviation Administration (FAA) regulations, Title 14 of the CFR contains several general aviation regulations that pertain to all pilots and aircraft operation, and specifically to agricultural aircraft operations. The parts of Title 14 of the CFR that are most relevant to aerial applicators are as follows:

- Part 61, Certification, Pilots and Flight Instructors
- Part 91, General Operating and Flight Rules
- Part 133, Rotorcraft External-Load Operations
- Part 137, Agricultural Aircraft Operations

The first three (14 CFR 61, 14 CFR 91, and 14 CFR 133) pertain to all pilots; the fourth (14 CFR 137) is specific to aerial pesticide applicators. Part 137 prescribes rules governing agricultural aircraft operations in the U.S. and the requirements for commercial and private Agricultural Aircraft Operator Certificates for those operations. This regulation consists of four subsections: general provisions, operator certification rule, operating rule, and records and reports.

#### **General Provisions**

Agricultural aircraft operation involves any operation of an aircraft for the purpose of:

- Dispensing an economic poison (i.e. pesticide)
- Dispensing other substances intended for plant nourishment, soil treatment, propagation of plants, or pest control
- Engaging in dispensing activities directly affecting agriculture, horticulture, or forest preservation

Using an aircraft to dispense live insects for pest control is not an “agricultural aircraft operation” under this federal regulation, but it is considered a pest control activity in California and a State-issued Pest Control Aircraft Pilot Certificate is required.

An “economic poison” is any substance or mixture of substances used to prevent, destroy, repel, or mitigate pests such as insects and mites, rodents, weeds, nematodes, fungi, and other microorganisms. It also is any substance or mixture of substances intended for plant growth regulation, plant defoliation, or plant desiccation. Under this definition, pesticides are economic poisons.

### Operator Certification Rule

Pilots conducting agricultural aircraft operations must possess a valid agricultural aircraft operator certificate, issued under the provisions of the 14 CFR 137 regulations. An exception to this rule is any federal, state, or local government conducting agricultural aircraft operation using public aircraft.

Two types of federal agricultural aircraft operator certificates are available, one for private operator pilots and one for commercial operator pilots. The applicant for a private certificate must:

- Hold a current U.S. private, commercial, or airline transport pilot certificate and be properly rated for the aircraft to be used;
- Have at least one certified and airworthy aircraft, equipped for agricultural operations; and
- Show, or have the person who is designated as the chief supervisor of agricultural aircraft operations for him/her show, that he/she has satisfactory knowledge and skill regarding agricultural aircraft operations.

The applicant for a commercial certificate must have available the services of at least one person who holds a current U.S. commercial or airline transport pilot certificate and is properly rated for the aircraft to be used. The applicant must be that person. In addition, the applicant must:

- Have at least one certified and airworthy aircraft equipped for agricultural operations; and
- Show, or have the person who is designated as the chief supervisor of agricultural aircraft operations for him/her show, that he/she has satisfactory knowledge and skill regarding agricultural aircraft operations.

Whether an individual is working towards a private or commercial certificate, that individual must show knowledge about the following:

- Steps to be taken before starting operations, including surveying the area to be worked;
- Performance capabilities and operating limitations of the aircraft to be used;
- Safe flight and application procedures;
- Safe handling of economic poisons and the proper disposal of used containers for those pesticides;
- The general effects of pesticides on plants, animals, and people, with emphasis on those normally used in the areas of intended operations;
- The precautions to be observed in using pesticides; and

- Primary symptoms of poisoning of people from pesticides, the appropriate emergency measures to be taken, and how to contact poison control centers.

The applicant also must pass a skills test in the certified and airworthy aircraft that has been equipped for agricultural operations. The applicant must perform a variety of maneuvers at that aircraft's maximum certified takeoff weight, or the maximum weight established for a special purpose load, whichever is greater.

#### Operating Rule

No one may operate an aircraft for agricultural operations unless the aircraft is certified, airworthy, and equipped for agricultural operations. A person conducting an agricultural aircraft operation under the authority of a private agricultural aircraft operator certificate may not operate the aircraft for compensation or hire, over a congested area, or over any property unless he or she is the owner or lessee of the property or has ownership or other property interest in the crop located on that property.

According to 14 CFR 137, it is illegal to dispense pesticides or other materials from an aircraft in a manner that creates a hazard to people or property. Pesticides that are dispensed from an aircraft must be used:

- Only for the use for which they are stated on the registered pesticide label;
- According to any safety instructions or use limitations on their labels; and
- In accordance with any federal or state laws.

The only exception to the above requirements is if the pesticide is being dispensed for experimental purposes under the supervision of a federal or state agency, authorized by law to conduct research in the field of economic poisons, or under a permit issued by EPA.

FAA inspectors administer the knowledge and skills test to agricultural aircraft operators applying for this certificate. The certificate holder then examines any pilots working for him/her under this certificate so that they meet the standards of Part 137.

Except for flights to and from a dispensing area, agricultural aircraft operations cannot occur within Class D airspace, or within an associated, active, surface-based Class E airspace, unless authorization is received for that operation from the control tower. Class D airspace is generally cylindrical in form and normally extends from the surface to 2,500 feet (760 meters) above the ground; Class D airspace is typically limited to a 4-mile radius of an airport. Class E airspace extends from 1,200 feet (370 meters) above ground level up to but not including 18,000 feet (5,500 meters) mean sea level, the lower limit of Class A airspace. Agricultural aircraft operations also cannot occur in weather conditions below visual flight rule minimums within a surface-based Class E airspace unless authorization is received from the appropriate air traffic control facility.

According to 14 CFR 137, the pilot in command of an aircraft may deviate from an airport traffic pattern only when authorized by the control tower concerned. At an airport without a functioning control tower, the pilot in command may deviate from the traffic pattern if:

- Prior coordination is made with the airport management concerned;
- Deviations are limited to the agricultural aircraft operation;
- Except in an emergency, landing and takeoffs are not made on ramps, taxiways, or other areas of the airport not intended for such use; and
- The aircraft at all times remains clear of, and gives way to, aircraft conforming to the traffic pattern for the airport.
  - The regulations strictly limit operations over a congested area. According to 14 CFR 137.51:
- An aircraft may be operated over a congested area at altitudes required for the proper accomplishment of the agricultural aircraft operation if the operation is conducted:
  - With the maximum safety to persons and property on the surface, consistent with the operation; and
  - In accordance with the requirements of paragraph (b) of this section.
- No person may operate an aircraft over a congested area except in accordance with the requirements of this the following:
  - Prior written approval must be obtained from the appropriate official or governing body of the political subdivision over which the operations are conducted.
  - Notice of the intended operation must be given to the public by some effective means, such as daily newspapers, radio, television, or door-to-door notice.
  - A plan for each complete operation must be submitted to, and approved by appropriate personnel of the FAA Flight Standards District Office having jurisdiction over the area where the operation is to be conducted. The plan must include consideration of obstructions to flight; the emergency landing capabilities of the aircraft to be used; and any necessary coordination with air traffic control.
- Single engine aircraft must be operated as follows:
  - Except for helicopters, no person may take off a loaded aircraft, or make a turnaround over a congested area.
  - No person may operate an aircraft over a congested area below the altitudes prescribed except during the actual dispensing operation, including the approaches and departures necessary for that operation.
  - No person may operate an aircraft over a congested area during the actual dispensing operation, including the approaches and departures for that operation, unless it is operated in a pattern and at such an altitude that the

aircraft can land, in an emergency, without endangering persons or property on the surface.

- Multiengine aircraft must be operated as follows:
  - No person may take off a multiengine airplane over a congested area except under conditions that will allow the airplane to be brought to a safe stop within the effective length of the runway from any point on takeoff up to the time of attaining, with all engines operating at normal takeoff power, 105 percent of the minimum control speed with the critical engine inoperative in the takeoff configuration or 115 percent of the power-off stall speed in the takeoff configuration, whichever is greater, as shown by the accelerate stop distance data. In applying this requirement, takeoff data is based upon still-air conditions, and no correction is made for any uphill gradient of 1 percent or less when the percentage is measured as the difference between elevation at the end points of the runway divided by the total length. For uphill gradients greater than 1 percent, the effective takeoff length of the runway is reduced 20 percent for each 1-percent grade.
  - No person may operate a multiengine airplane at a weight greater than the weight that, with the critical engine inoperative, would permit a rate of climb of at least 50 feet per minute at an altitude of at least 1,000 feet above the elevation of the highest ground or obstruction within the area to be worked or at an altitude of 5,000 feet, whichever is higher. For the purposes of this subdivision, it is assumed that the propeller of the inoperative engine is in the minimum drag position; that the wing flaps and landing gear are in the most favorable positions; and that the remaining engine or engines are operating at the maximum continuous power available.
  - No person may operate any multiengine aircraft over a congested area below the altitudes prescribed except during the actual dispensing operation, including the approaches, departures, and turnarounds necessary for that operation.

#### Reporting and Record Keeping

- Holders of agriculture aircraft operator certificates must maintain a listing of the following and have them available for at least 12 months for inspection.
- The name and location of all services provided;
- The date of services provided;
- Name and quantity of chemicals used ; and
- Name and certification for each pilot involved in operations.

#### **Pending: Bilingual Pesticide Labeling Effort**

EPA is considering a petition from the Migrant Clinicians Network, Farmworker Justice, and other farm work interest groups to require that pesticide manufacturers make their product

labels available in both English and Spanish (EPA 2012b). Currently, EPA does not require that pesticide labels be printed in Spanish as well as English (although it does require certain parts of some pesticide product labels to include words or phrases in Spanish, pursuant to the Worker Protection Standard) (EPA 2012b). The California Environmental Protection Agency (Cal/EPA) and the California Department of Pesticide Regulation (CDPR) follow EPA's lead and do not require bilingual pesticide labeling in California. After receiving responses to the petition, EPA is leaning towards only requiring the health and safety-related portions of pesticide labels (e.g., acute toxicity information, protective equipment) to be printed in Spanish (Gayoso, pers. comm., 2013). EPA is considering establishing a pilot program in certain states, to test out Spanish labeling requirements, and California has expressed interest in participating. To ease the burden of developing new pesticide label formats to accommodate Spanish translations, EPA also is considering developing label templates for states to use in their regulatory programs. At this point, it is unclear whether EPA will ultimately require bilingual pesticide labeling (Gayoso, pers. comm., 2013).

## **O.5.2 State Laws, Ordinances, Regulations, and Standards**

### ***California Health and Safety Code: Hazardous Waste and Hazardous Materials***

Several sections of the California Health and Safety Code deal with hazardous waste and hazardous materials. Division 20, Chapter 6.5 addresses hazardous waste control and contains regulations on hazardous waste management plans, hazardous waste reduction, recycling and treatment, and hazardous waste transportation and hauling. For example, under Chapter 6.5, Article 6, persons generating hazardous wastes that are to be transported for off-site handling, treatment, storage, or disposal must complete a Hazardous Waste Manifest before transportation, indicating to which facility the waste is to be shipped for treatment, disposal, or other purposes. Chapter 6.91 promulgates regulations requiring the California Department of Toxic Substances Control (DTSC), in conjunction with the California Department of Public Health and California Office of Environmental Health Hazard Assessment (OEHHA), to conduct epidemiological studies to identify and monitor health effects related to hazardous materials exposure.

Under Chapter 6.95, areas and businesses that have a threshold amount of hazardous materials on site (500 pounds for businesses) must have plans in place for emergency response to an accidental materials release. Area plans must provide the following:

- Procedures and protocols for emergency rescue personnel, including the safety and health of those personnel;
- Pre-emergency planning;
- Notification and coordination of on-site activities with State, local, and federal agencies, responsible parties, and special districts;
- Training of appropriate employees;
- On-site public safety and information;

- Required supplies and equipment;
- Access to emergency response contractors and hazardous waste disposal sites;
- Incident critique and follow up; and
- Requirements for notification.

Business plans must include at least the following:

- A listing of the chemical name and common names of every hazardous substance or chemical product handled by the business;
- The category of waste, including the general chemical and mineral composition of the waste, of every hazardous waste handled by the business;
- The maximum amount of each hazardous material or mixture containing a hazardous material;
- Sufficient information on how and where the hazardous materials are handled by the business to allow fire, safety, health, and other appropriate personnel to prepare adequate emergency responses to potential releases of the hazardous materials;
- Emergency response plans and procedures in the event of a reportable release or threatened release of a hazardous material; and
- Training for all new employees and annual training, including refresher courses, for all employees in safety procedures in the event of a release or threatened release of a hazardous materials.

Under Chapter 6.95, stationary sources of hazardous materials are required (if they are deemed an accident risk) to prepare RMPs, detailing strategies to reduce the risk of accidental hazardous material release, and submit them to the California Emergency Management Agency. Under Article 2 of this chapter, toxic chemical manufacturing facilities (that produce, process, or use toxic chemicals over specific threshold quantities) also are required to disclose their releases of toxic chemicals to the environment through submission of Toxic Chemical Release Forms to DTSC, pursuant to the California Toxic Release Inventory Program Act of 2007. With respect to the Proposed Program, hazardous waste and hazardous materials elements of the California Health and Safety Code would require manufacturers and suppliers of pesticides that may be used under the Proposed Program to develop RMPs to reduce the chance of accidental release of pesticides, document and disclose any releases of pesticides, and complete a Hazardous Waste Manifest before shipping any hazardous wastes that they generate.

### ***California Accidental Release Prevention Program***

First implemented in 1997, the California Accidental Release Prevention (CalARP) program was designed to prevent accidental releases of hazardous substances (e.g., pesticides), minimize damage if releases occur, and satisfy community right-to-know laws (Cal OES 2014). Similar to the federal CAA chemical accident prevention provisions, the CalARP

program and implementing regulations (19 CCR, Division 2, Chapter 4.5) require businesses that handle more than a certain threshold quantity of regulated substances to develop an RMP. The components and submission requirements for the RMP required under CalARP are the same as those for the RMP required under the CAA. However, substantially more substances are listed in the State's program regulations.

In most cases, the Certified Uniform Program Agency (CUPA) is the Administering Agency (AA), or the agency responsible for implementing the CalARP program. When no CUPA exists, the implementing agency is an agency designated by the Secretary for Environmental Protection or Office of Emergency Services. The AA determines the level of detail in the RMPs, review the RMPs, conduct facility site inspections, and provide public access to most of the information provided by facilities.

The only chemical listed in the CalARP program regulations that may be used under the Proposed Program is methyl bromide. Under CalARP program regulations, facilities that produce or handle methyl bromide for use under the Proposed Program would have to develop an RMP and, in doing so, would have to analyze the worst-case release scenario for their covered process(es) and any potential impacts on nearby populations and environmental receptors, as well as ensure that response actions have been coordinated with local emergency planning and response agencies, among other requirements.

#### Hazardous Waste Generator and On-site Waste Treatment Surveillance and Enforcement Programs

The Hazardous Waste Generator Program is administered by CUPAs under the Unified Program, with oversight and assistance from DTSC. Under the program, CUPAs conduct inspections at hazardous waste generator facilities. Inspectors check such requirements as having an EPA identification number, having contingency plan information posted near a phone, having containers in good condition and properly labeled, and having authorized waste transport vehicles (DTSC 2010). If generators refuse or fail to comply with regulations or permit requirements, CUPAs may assess penalties (DTSC 2002a).

CUPAs also administer on-site, tiered permitting programs. Based on the type of waste they treat and the treatment processes they employ, businesses are required to obtain a permit for the appropriate tier (DTSC 2002b). Permits may require businesses to clean equipment or alter processes to improve safety (DTSC 1999).

Under these programs, pesticide manufacturing facilities or other businesses that handle pesticides that may be used under the Proposed Program would be subject to inspections and would have to obtain permits. They would be required to meet hazardous waste generator and permit requirements, which are designed to prevent accidental releases.

#### **Pesticide Contamination Prevention Act**

The Pesticide Contamination Prevention Act (Sections 13145–13152 of the Food and Agricultural Code) requires CDPR to: obtain environmental fate and chemistry data for agricultural pesticides before they can be registered for use in California; identify agricultural pesticides with the potential to pollute groundwater; sample wells for presence of agricultural pesticides in groundwater; obtain, report, and analyze the results of well sampling for pesticides for public agencies; formally review a detected pesticide to

determine whether its use can be allowed; and adopt use modifications to protect groundwater from pollution if the formal review indicates that continued use can be allowed. More specifically, the act requires CDPR to develop numerical values for water solubility, soil adsorption coefficient, hydrolysis, aerobic and anaerobic soil metabolism, and field dissipation for pesticides to protect groundwater, based in part on data submitted by pesticide registrants. The act also states that CDPR shall establish a list of pesticides that have the potential to pollute groundwater, called the Groundwater Protection List. Any person who uses a pesticide that is listed on the Groundwater Protection List is required to file a report with the county agricultural commissioner (CAC) and pesticide dealers are required to make quarterly reports to CDPR of all sales of pesticides on the list to persons not otherwise required to file a report. CDPR will not register or renew the registration of a pesticide that is intended to be applied to the ground by ground-based application equipment if a groundwater protection data gap exists for that pesticide. In addition, the act requires CDPR to conduct soil and groundwater monitoring in areas of the state where pesticides are used primarily, to determine the mobility and persistence of the pesticides.

### ***California Food and Agricultural Code***

Section 11456 of the California Food and Agricultural Code (CFAC) gives authority to CDPR in the areas of regulation adoption, inspection authority, licensing, and intergovernmental personnel agreements. Joint authority for pesticide use enforcement activities is performed by CACs under CDPR's direction and supervision. Under the CFAC, CDPR has the authority and responsibility to register pesticides for use and sale within California. Pesticides registered by CDPR must, at a minimum, be registered for use by EPA. In addition, CDPR performs risk assessments of pesticides before they can be sold or used in California, and it periodically re-evaluates already registered pesticides.

### ***California Code of Regulations: Pesticides and Pest Control Operations***

Title 3, Division 6 of the California Code of Regulations (CCR) addresses Pesticides and Pest Control Operations. This portion of the CCR contains detailed implementing regulations for CDPR's pesticide regulatory program. CDPR evaluates proposed pesticide products and only registers those pesticides that it determines can be used safely. In addition, CDPR's oversight includes:

- Licensing of pesticide professionals;
- Site-specific permits before restricted-use pesticides may be used in agriculture;
- Strict rules to protect workers and consumers;
- Mandatory reporting of pesticide use by agriculture and by pest control businesses;
- Environmental monitoring of water and air; and
- Testing fresh produce for pesticide residues; and
- Cultural commissioners.

As described in further detail below, CDPR's regulations include a description of the pesticide registration process and information requirements, pesticide applicator safety standards, field worker safety standards and training, and greenhouse ventilation requirements, among other requirements. In addition, the regulations include a list of pesticides considered to be toxic air contaminants (TACs), prohibitions on use of certain pesticides to prevent environmental contamination in aquatic and marine environments, and surface water protection provisions. The regulations outline the appropriate enforcement actions for CACs to take in response to violations of the regulatory program, as well as the inspection authority and procedures for CACs in inspecting pesticide operations and investigating pesticide operation employee illness. It contains pesticide possession and use limitations and requirements for specific pesticides, as well as license requirements for pesticide applicators and dealers, and standards for worker safety. As discussed below, under the regulations in CCR, Title 3, Division 6, employers of pesticide workers are required to provide protective clothing, eyewear, gloves, respirators, and any other required protection, and also ensure that protective wear is worn according to product labels during application. The regulations also require that employers: provide field workers with adequate training in pesticide application and safety; communicate pesticide-related hazards to field workers; ensure emergency medical services is available to field workers; and ensure adherence to restricted entry intervals between pesticide treatments (CCR, Title 3, Section 6764). Furthermore, the Pesticides and Pest Control Operations regulations contain standards and requirements related to environmental protection, including use reporting requirements for pesticides with the potential to contaminate groundwater found on the Groundwater Protection List.

One of the first parts of the pesticide and pest control operation regulations involves the registration of pesticides. Information that factors into CDPR's pesticide registration decisions includes the following:

- Health effects data (acute and chronic)
  - Acute oral and dermal LD<sub>50</sub>
  - LC<sub>50</sub> for respirable aerosols and gases
  - Studies on oncogenicity, teratogenicity, and mutagenicity
- Residue data
- Exposure studies for specific receptors
- Pesticide drift
- Field reentry
- Toxicity to aquatic biota and wildlife
- Phytotoxicity
- Environmental effects

- Adjuvants, inert ingredients, and contaminants
- Methodology for managing poison and injuries
- Available feasible alternatives
  - Application and Use Permits are required to use the pesticides subject to this regulation. These applications and permits must adhere to the following:
- Permits are required for possession of any restricted material.
- Permits are required for use within ground water protection areas for chemicals listed in section 6800a except if used in pest eradication programs approved by CDFA.
- Permits require adoption of any reasonable mitigation measures or alternatives which would decrease any significant adverse environmental effect.
- Permits may be canceled and no new permits issued if residues, symptoms or health hazards appear at the discretion of CDPR director or commissioners.
  - Pesticide labeling has specific regulations that apply which include the following:
- All words, statements, graphic presentations, or designs required to appear on the label or labeling must be clearly legible and easy to read by a person with normal vision.
- Warning or caution statements must appear on the label in a place sufficiently prominent to warn the user, and must state clearly and in nontechnical language the particular hazard involved in the use of the pesticide, e.g., ingestion, skin absorption, inhalation, flammability or explosion, and the precautions to be taken to avoid accident, injury, or damage.
  - Pest control operations must adhere to strict regulations which include the following conditions:
- Equipment must be in good repair and safe to operate.
- Methods and equipment that ensure proper application must be used.
- Applications may only be performed under climatic conditions suitable to ensure proper application of pesticides.
- Reasonable precautions must be taken to avoid contamination
- A copy of registered labeling must be available at site of use.
- All equipment shall be thoroughly cleaned.

- The applicator must evaluate the surrounding area and determine likelihood of harm or damage. No application can continue if there is reasonable possibility of contamination or harm during the application process.
- Adjacent property owners must be informed and consent obtained before discharging any pesticides onto adjacent property or having protection zones on adjacent property.
- All directions of approach for pesticide storage areas must contain signage.
  - Pesticide worker safety portions of the regulation specify numerous conditions that are aimed at protecting workers who use or are around pesticides. This includes the following:
- Employers shall inform employees in a language they understand the pesticide being used, pesticide safety hazards, personal protective equipment to use, procedures to follow, and safety regulations that are applicable to work they perform,
- Employers must supervise employees and assure that safe work practices are complied with
- Employers must prohibit entry to work areas if directed to do so to protect human health.
- Employers must provide medical supervision if a suspected exposure occurs. Emergency medical care for employees must be planned for in advance. If pesticide exposure is suspected the employer shall ensure that the employee is taken to a physician immediately.
- Employers must provide a written copy of Hazard Communication Information for Employees Handling Pesticides in Agricultural Settings or Hazard Communication Information for Employees Handling Pesticides in Noncrop Settings. The material must be read upon request in a language understood by employee. These are available in English and Spanish.
- Employers shall maintain a central location for pesticide use records, Pesticide Safety Information Series leaflets, and MSDSs.
- A written training program is required.
- Workers may not work alone during mixing, loading, or applying unless contact is made to a responsible adult at intervals not exceeding 2 hours.
- Employers must assure sufficient water, soap, and towels for routine washing, eye flushing, and whole body washing are available to employees.
- Employer must provide coveralls for employees handling pesticide with signal word "DANGER" or "WARNING". Coveralls must be washed at end of each work day and may not be taken home by employees unless stored in sealable container outside of the living quarters.

- Employers must provide all required personal protective equipment and ensure proper use by employees.
- Field workers must be provided written copy of Hazard Communication Information for Employees Working in Fields and upon request it must be read in language understandable to employee.
- Employers may not allow a person other than applicator to enter or remain in a treated area during application.

These pesticides and pest control operation regulations would require that pesticide handlers and workers conducting activities under the Proposed Program would be trained in safe pesticide application, notified of the health hazards of pesticide exposure, and provided with protective clothing and equipment. In addition to the details described above, the regulations also ensure that aerial applicators are fully qualified and operate in a safe manner and possess a valid Pest Control Aircraft Pilot Certification issued by CDPR. They would also require that pesticide application standards are developed to protect groundwater, wildlife, and the environment are followed.

As mentioned above, workers must receive training and use personal protective equipment. The pesticides and pest control operation regulations give specific details of what must be covered in worker training for both pesticide handlers and field workers as well as specifics on personal protective equipment usage which is detailed below.

#### Pesticide Handler Training

According to CDPR's pesticide regulations, a pesticide handler is any employee who:

- mixes, loads, transfers, applies (including chemigation), or flags during aerial applications (flaggers are used on the ground to assist the pilot in identifying the area for application)
- maintains, services, repairs, cleans, or handles equipment that may contain residues or that has been used in pesticide mixing or application activities
- works with opened pesticide containers, including emptied but not rinsed containers
- adjusts, repairs, or removes treatment site coverings, such as tarpaulins covering fumigated soil or agricultural commodities
- incorporates pesticides into the soil through mechanical means, or chemigation through an irrigation system
- enters a treated area during any application, or before the inhalation exposure level listed on pesticide product labeling has been reached, or before greenhouse ventilation criteria have been met
- performs the duties of a crop advisor, including field checking or scouting, making observations of the well-being of the plants, or taking samples during an application or any restricted entry interval listed on pesticide product labeling

- CDPR regulations require all employers to have written training programs for pesticide handlers working in their operations. Certified private and commercial applicators and licensed Pest Control Advisers are exempt from this training. The training program addresses each of the following topics as they apply to the pesticides that employees handle:
  - understanding the format and meaning of information, such as precautionary statements about human health hazards, contained in the labeling of the pesticide products being handled
  - understanding the hazards of the pesticides being handled, including acute and chronic effects, delayed effects, and sensitization, as identified in pesticide product labeling, MSDSs, or Pesticide Safety Information Series leaflets
  - knowing the routes by which pesticides can enter the body
  - recognizing the signs and symptoms of overexposure
  - knowing specific emergency first aid for overexposure to the pesticides being handled
  - knowing how to obtain emergency medical care
  - knowing routine and emergency decontamination procedures, including spill cleanup and the need to thoroughly shower with soap and warm water after the exposure period
  - understanding the need for, limitations, appropriate use, and cleaning of any required PPE
  - knowing the prevention, recognition, and first aid for heat-related illness
  - understanding safety requirements and procedures, including engineering controls (such as closed mixing systems and enclosed cabs) for handling, transporting, storing, and disposing of the pesticides being handled
  - recognizing environmental concerns such as drift, runoff, and wildlife hazards
  - heeding warnings about taking pesticides or pesticide containers home
  - knowing the requirements relating to pesticide safety, MSDSs, and Pesticide Safety Information Series leaflets
  - understanding the purposes and requirements for medical supervision if organophosphate or carbamate pesticides with the signal word “DANGER” or “WARNING” on the labeling are mixed, loaded, or applied
  - knowing the location of the written *Hazard Communication Information for Employees Handling Pesticides* (Pesticide Safety Information Series leaflet A-8), other Pesticide Safety Information Series leaflets, and MSDSs

- knowing the employee's rights, including the right
  - to personally receive information about pesticides to which he or she may be exposed
  - for his or her physician or employee representative to receive information about pesticides to which he or she may be exposed
  - to be protected against retaliatory action due to the exercise of any of his or her rights
- The following topics are also covered, if appropriate, during training. These are general pesticide handling procedures that apply to any pesticide product being handled:
  - understanding the importance of wearing clean work clothing daily
  - knowing how to handle, open, and lift containers
  - knowing how to properly pour pesticides out of containers
  - knowing how to operate mixing and application equipment
  - knowing procedures for triple rinsing containers
  - knowing how to dispose of empty containers
  - knowing how to confine spray to the target area
  - knowing how to avoid contamination of people, animals, waterways, and sensitive areas
  - knowing how and where to store containers that hold pesticides or are empty
  - understanding procedures to follow when containers cannot be locked up
  - understanding the importance of washing hands thoroughly before eating, smoking, drinking, or using the restroom

Employers shall assure that their agricultural field workers are also provided pesticide safety training before they enter treated areas within 30 days of completion of the application or expiration of a restricted entry interval. Field worker training also shall be performed by qualified trainers. This training shall be provided to any workers who enter pesticide-treated areas for the 30 days following expiration of a restricted entry interval. Training shall be provided to workers when an area has been treated with any type of pesticide, such as herbicides, fungicides, and insecticides. The current employer does not have to provide training if the worker or employer can verify such training has been provided within the past five years.

#### Field Worker Training

The following topics are covered in field worker training:

- where and how workers may come in contact with pesticides or pesticide residues during work, including hazards from chemigation and drift
- the routes by which pesticides can enter the body (skin, mouth, inhalation, and eyes)
- symptoms of acute pesticide poisoning or injury, and long-term and delayed health effects from pesticide exposure, including sensitization
- first aid for pesticide injury and poisoning, and emergency decontamination
- how workers can protect themselves from exposure, e.g., clothing; avoiding skin, eye, and mouth contact; personal hygiene
- obtaining medical help
- after-work storage, laundering, and decontamination of contaminated work clothes
- warnings about taking home pesticides or pesticide containers
- an explanation of the work place safety (WPS) entry restrictions, application limitations, posting, oral warnings, access to pesticide use information, and protection from employer retaliation

### Personal Protective Equipment

California regulation requirements for PPE may be more restrictive than pesticide label requirements, and the California requirements must be understood and followed when they are more restrictive. The Pesticides and Pest Control Operations Regulations state that the employer shall provide the required PPE, and shall assure that it is worn. At the minimum, employers shall provide appropriate eyewear and chemical resistant gloves to pesticide handlers and assure that employees use them properly. In addition, employers shall follow certain requirements when the label requires using chemical resistant footwear, head covering, apron, or body covering.

**Eyewear.** California regulations require employers to assure that their employee handlers wear protective eyewear

- when required by the pesticide product labeling
- during all mixing or loading activities
- while adjusting, cleaning, or repairing the mixing, loading, or application equipment that contains pesticide material in hoppers, tanks, or lines
- when making applications by hand or using hand held equipment, except when:
  - applying vertebrate pest control baits that are placed without being propelled from application equipment

- applying solid fumigants (including aluminum phosphide, magnesium phosphide, and smoke cartridges) to vertebrate burrows
- baiting insect monitoring traps
- applying noninsecticidal lures
- while making ground application using vehicle-mounted or towed equipment, except when:
  - injecting or incorporating pesticides into soil
  - spray nozzles are located below the employee and the nozzles are directed downward
  - working in an enclosed cab
- while flagging for aerial operations to identify the location, except when the flagger is in an enclosed cab
  - Whenever protective eyewear is required, one of the following types shall be worn:
- safety glasses that provide front, and supplemental brow and temple protection (common eyeglasses, including sunglasses, do not meet this requirement)
- goggles
- face shield
- full face mask used in conjunction with respiratory protection
- visor (for aircraft operation only)
  - **Gloves.** California regulations require employers to assure that their employee handlers wear chemical resistant gloves:
- when required by the pesticide product labeling (unless the pesticide product labeling specifies that gloves shall not be worn)
- when employees are engaged in:
  - mixing or loading (pilots are not required to wear gloves while flying the aircraft during an application)
  - adjusting, cleaning or repairing contaminated mixing, loading, or application equipment
  - application by hand or using hand-held equipment, except when applying vertebrate pest control baits using long handled implements that avoid actual hand contact with the bait or potentially contaminated areas of the equipment

If the type of glove is not specified on product labeling for the pesticide being handled, gloves made of rubber, neoprene, or other chemical resistant material that provides equivalent or better protection shall be used. Pesticide handlers shall not wear gloves or glove linings of leather, cotton, or other absorbent materials unless expressly permitted by pesticide product labeling. If chemical resistant gloves with sufficient durability and suppleness are not available, leather gloves may be worn over chemical resistant glove liners. Once leather gloves have been used for this purpose, they shall not be worn in any other situation.

**Footwear.** The employer shall assure that their employee handlers wear chemical resistant footwear when required by the pesticide product label. Chemical resistant footwear includes the following types of footwear:

- chemical resistant shoes
- chemical resistant boots
- chemical resistant coverings worn over boots or shoes

For aircraft operation, chemical resistant footwear need not be worn.

**Headwear.** The employer shall assure that their employee handlers wear chemical resistant headgear when required by the pesticide product labeling. Either a chemical resistant hood or a chemical resistant hat with a wide brim will satisfy this requirement. For aircraft operation, a helmet may be substituted for chemical resistant headgear.

**Chemical Resistant Apron.** Employers shall assure that their employee handlers wear a chemical resistant apron when required by the pesticide product labeling. It shall be a garment that covers the front of the body from mid-chest to the knees.

**Bodywear.** Employers shall assure that their employee handlers wear chemical resistant body wear when required by pesticide product labeling or regulations. Chemical resistant body wear includes waterproof or impervious pants and coat, or a rain suit that covers the torso, head, arms, and legs.

Except for those conditions listed below, when the pesticide label requires chemical resistant bodywear, employees cannot handle the material if the outdoor temperature exceeds 80°F during daylight hours or 85°F during nighttime hours. If outdoor temperatures exceed those maximums listed above, employees can only perform handling activities if employees are

- using cooled chemical resistant suits (mixers, loaders, other handlers, and applicators)
- working in an enclosed cab or cockpit (applicators)
- using a closed mixing system (mixers and loaders)
- handling pesticides packaged in water-soluble packets and the packets are not opened (mixers and loaders)

### **Pesticide Illness Surveillance Program**

California law requires physicians to report any known or suspected illness caused by a pesticide exposure. The Pesticide Illness Surveillance Program (PISP) is tasked with collecting and evaluating these reports before they are assigned to county agricultural commissioners to investigate the exposure circumstances. Scientists then review the collected information and enter it in a database. This data not only reflects the effectiveness of the California's pesticide regulatory program but also identifies areas for improvement. The Pesticide Illness Surveillance Program helps CDPR reevaluate pesticide registrations and modify use practices to enhance protection for people and the environment. The PISP applies a broad definition to the term pesticide-related. If health effects appear to derive from exposure to any component of a pesticide product, including inert ingredients, impurities, and breakdown products, the surveillance program attributes those health effects to that pesticide product. Similarly, reporting includes but is not limited to toxic effects similar to those seen in pests. For example, a product designed to disrupt insect nerve function may, at excessive levels, cause neurologic symptoms in humans. The surveillance program records such cases, and also records cases in which contact with a pesticide causes local irritant effects such as rashes or inflammation of the eyes. Pesticides may act as irritants or allergens, through their odor, or by resulting in fires or explosions. These effects are all recognized as potential causes of illness or injury, along with the toxic impact of pesticide active ingredients.

### **Safe Drinking Water and Toxic Enforcement Act (Proposition 65)**

The Safe Drinking Water and Toxic Enforcement Act, or Proposition 65, requires the Governor to maintain and publish a list of chemicals known to the State of California to cause cancer, birth defects, or other reproductive harm. Once a chemical has been listed, businesses are responsible for providing a warning before knowingly or intentionally exposing their employees or the public to an amount of the chemical that poses a significant risk (CDPR 2013b). OEHHA is the lead agency responsible for implementing Proposition 65, with input from CDPR and other agencies so that the best scientific information is used in listing chemicals. In its current state, the Proposition 65 list contains a wide variety of chemicals, including a number of pesticides (OEHHA 2013a). Five pesticide active ingredients, one adjuvant, and four inert ingredients that may be used under the Proposed Program are required to have Proposition 65 warning labels. These are: carbaryl, tau-fluvalinate, methyl bromide, DDVP, methyl eugenol, hydrated aluminum magnesium silicate, cumene, ethyl benzene, methyl chloride, and naphthalene.

### **California Occupational Safety and Health Administration Regulations**

Title 8 of the California Occupational Safety and Health Administration (Cal/OSHA) regulations contains some requirements for agricultural operations related to pesticide application. For example, the regulations require that all tanks over 100 gallons in capacity, used for pesticides, have an attached notice that provides precautionary instructions and controls placed in such a way as to minimize exposure to employees from ruptured or breaking lines (8 CCR, Section 3453). Also, according to the Cal/OSHA regulations, all hoppers on crop dusting aircraft must have dust-tight covers and lids secured so that they would not open in the event of a flip-over (8 CCR, Section 3452). Machines, aircraft, applicators, or other equipment used for pesticide application also must be decontaminated before they are overhauled or placed in storage (8 CCR, Section 3451). In addition, the

Cal/OSHA regulations contains various provisions that require safe operation of equipment, safety instructions provided in a language that employees understand, access to first-aid, and specific regulations regarding fumigations. With respect to the Proposed Program, these regulations would require for businesses implementing Proposed Program activities to provide pesticide workers with precautionary instructions for storage tank operation and minimize their risk of exposure from storage tank malfunction. The regulations also would require that those responsible for aircraft and machinery to be used in implementing Proposed Program activities take basic safety precautions.

### ***California Government Code Sections 51175-51181, Fire Prevention***

Sections 51175 to 51181 of the California Government Code outline the responsibilities of the California Department of Forestry and Fire Prevention (CAL FIRE) and local agencies with respect to fire prevention. CAL FIRE is legally responsible for providing fire protection on all State Responsibility Area (SRA) lands (CAL FIRE 2012). SRA lands are defined based on land ownership, population density, and land use (e.g., SRAs would not include densely populated areas, agricultural lands, or lands administered by the federal government) (CAL FIRE 2012).

### ***Hazardous Materials Management Plans and Hazardous Materials Inventory***

#### ***Statements—California Fire Code***

Title 29, Part 9 of the CCR (also referred to as the California Fire Code) requires businesses that handle over a threshold quantity of hazardous materials to prepare a Hazardous Materials Management Plan (HMMP) and a Hazardous Materials Inventory Statement (HMIS). The HMMP and HMIS are very similar to the Hazardous Materials Release Response Plan and Inventory, or Business and Area Plans, required under Chapter 6.95 of the California Health and Safety Code. Like Business and Area Plans, the HMMP/HMIS requirement is an element of the Unified Program. However, the CAL FIRE Office of the State Fire Marshall is responsible for implementing the HMMP and HMIS (CAL FIRE 2013).

The HMMP must include a facility site plan designating information such as the location of emergency equipment, hazardous material storage tanks, and emergency exits. The HMIS must include information on the hazardous materials at the site, such as product name, chemical components, amount in storage, and hazard classification. As part of an application for a permit from the fire code official, owners or operators of facilities that handle hazardous materials also must submit an emergency response plan and an emergency response training plan.

Pesticide manufacturers supplying pesticides that may be used under the Proposed Program would have to provide the information above under the California Fire Code.

### ***California Emergency Services Act (California Code, Chapter 7)***

The California Emergency Services Act established the California Emergency Management Agency (Cal EMA) and created requirements for emergency response training and planning. Under the act, the State is required to develop a state toxic disaster contingency plan that can facilitate an effective, multi-agency response to a situation where toxic substances are dispersed in the environment so as to cause, or potentially cause, injury or death to a

significant number of persons or significant harm to the natural environment (7 California Code, Section 8574.18). The California Emergency Services Act also requires Cal EMA to develop and manage the California Hazardous Substances Incident Response Training and Education Program, to provide classes in hazardous substance response (7 California Code 8574.20).

With respect to the Proposed Program, the California Emergency Services Act would require that a contingency plan be in place to protect people and the environment for the possibility of a substantial pesticide spill or other incident associated with implementation of activities under the Proposed Program. The act also would require for emergency responders to any substantial pesticide spill be trained or have access to training in hazardous substances incident response.

### ***Environmental Justice Legislation***

Enacted in 2003, Assembly Bill 1360 required OEHHA to develop and maintain a system of environmental indicators, to evaluate the effectiveness of the agency's programs in improving environmental quality and protecting public health throughout the state, including environmental quality and public health in low-income communities and communities of color (Steinberg 2003). This law would require CDPR (and other agencies responsible for regulating pesticide use) to evaluate Proposed Program activities based on their effectiveness in improving environmental quality and protecting public health in low-income and minority communities.

Senate Bill 89, enacted in 2000, required Cal/EPA to convene a working group, to analyze data and studies on environmental justice, recommend criteria for addressing gaps in programs or policies impeding the achievement of environmental justice, and recommend procedures for implementing environmental justice strategies (Escutia 2000). The Bill also ordered Cal/EPA to "conduct its programs, policies, and activities that substantially affect human health and the environment in a manner that ensures the fair treatment of all races, cultures, and income levels, including minority populations and low-income populations of the state (Escutia 2000:2)." Because CDPR and DTSC are part of Cal/EPA, Senate Bill 89 would require for regulatory programs administered by CDPR and DTSC for pesticide use, storage, transport, and disposal under the Proposed Program to be consistent with environmental justice objectives.

Senate Bill 32, enacted in 2001, authorizes local governments to investigate and remediate properties contaminated with hazardous waste (Escutia 2001). Specifically, Senate Bill 32 authorizes local governments to require property owners to provide information regarding whether hazardous materials release may occur on their properties (Escutia 2001). If the information provided to a local government indicates that the property is affected by a hazardous materials release or is a site for a potential hazardous materials release, then the local government may require the property owner to conduct a Phase I Environmental Assessment for remediation (Escutia 2001). Because Senate Bill 32 addresses ongoing as well as past hazardous waste contamination, it would authorize local governments to order site investigations and remedial actions if they had reason to believe that properties used pursuant to the Proposed Program potentially threatened contamination of the surrounding community.

***Healthy School Act of 2000 (California Education Code, Sections 17608–17613)***

The Healthy School Act of 2000 restricts the use of certain pesticides at school sites and requires noticing for application of approved pesticides at schools. Under Section 17610 of the California Education Code, the use of a pesticide on a school site is prohibited if that pesticide is granted a conditional registration, an interim registration, or an experimental use permit by CDPR, or if the pesticide is subject to an experimental registration issued by EPA, and (a) the pesticide contains a new active ingredient, or (b) the pesticide is for new use. The use of a pesticide on a school site is prohibited if CDPR cancels or suspends registration, or requires phase out of use, of that pesticide. Property owners who own properties where child daycare facilities are located must provide notice to the child daycare facility if they intend to personally apply any pesticide: (a) inside the rented premises on which the child daycare facility is located; (b) on a designated child daycare facility playground designated by the owner; (c) on an area designated for use by the child daycare facility; or (d) on an area within 10 feet of the perimeter of any child daycare facility.

Under Section 17611 of the California Education Code, each school site must keep records of all pesticide use at the school site for a period of 4 years, and make such information available to the public. Under Section 17612, the school designee annually has to provide to all staff and parents or guardians of pupils written notification of the name of all pesticide products (as well as product active ingredients) that are expected to be applied at the school site in the upcoming year. The school designee must post each area of the school site where pesticides are to be applied with a warning sign, displaying the pesticide product's name, manufacturer's name, EPA's product registration number, intended date and areas of application, and the reason for the pesticide applications. Sections 17611 and 17612 do not apply to pesticides deployed in the form of a self-contained bait or trap devices.

Under the Proposed Program, it is possible that pesticides would be applied at school sites or child daycare facilities. If an infestation of a potentially economically damaging pest was detected on vegetation in a school playground, for example, then that infestation may be eradicated using chemical methods. As required under the California Education Code, if such a situation occurs, only EPA-registered pesticide products would be used; school facilities would be notified in advance of the application; records of pesticide applications would be kept and made available to the public, and warning signs would be displayed at pesticide application areas. None of the pesticide products that may be used in the Proposed Program meet the criteria specified in Section 17610, and thus they would be permitted for use at school sites.

***Assembly Bill 304, Toxic Air Contaminant Control***

On October 5, 2013, amendments to Sections 14022, 14023, and 14024 of the CFAC relating to pesticides were enacted. These amendments added additional requirements for public reporting and specific timing of actions required when any pesticide is determined to be a TAC that poses a present or potential hazard to human health resulting from airborne emission from its use. For each pesticide that had had a risk assessment, which identified the pesticide as a TAC based on its listing as a federally identified hazardous air pollutant, would require the Plant Health Division Director (Director), in consultation with OEHHA, CARB, and the air districts in the affected counties, to determine the need for and appropriate degree of control measures, as specified. These amendments place specific time

limits on responses, requires responses in writing, and preparation of reports in detailing why additional control measures were not adopted, and all of these details including comments received must be available to the public.

### ***Statewide Pesticide Use and Label Restrictions***

To use a pesticide product in California, the pesticide first must be registered by EPA and CDPR. When a pesticide is evaluated for registration, EPA and CDPR consider the chemical characteristics of the active ingredient(s) and potential exposure during pesticide application. Potential effects are considered to human health, water quality and aquatic environments, and non-target ecological organisms. Potential incompatibilities with other chemicals also are considered. From this evaluation, these agencies add restrictions to the pesticide product label to prohibit the use of the pesticide from occurring in a manner that has the potential to produce adverse effects. Label restrictions can specify where a pesticide can or cannot be applied, the maximum rate of application, the time period during which additional applications of the pesticide may or may not be made, or incompatible chemicals that must be avoided.

EPA examines the ingredients of a pesticide, the site or crop on which it is to be used, the amount, frequency and timing of its use, and storage and disposal practices. EPA evaluates the pesticide so that it will not have unreasonable adverse effects on humans, the environment and non-target species. Pesticides must be registered or exempted by EPA's Office of Pesticide Programs before they may be sold or distributed in the U.S. (EPA 2013c).

CDPR considers the toxic properties of a chemical and estimates the amount of the chemical that potentially may cause an adverse effect. This includes acute (one-time), subchronic (1 to 3 months), and chronic (long-term and lifetime) evaluations. Compared to EPA's review, CDPR's review of a pesticide focuses on California-specific potential impacts and may require additional studies, such as data on worker exposure, foliar residue, indoor exposure potential, hazards to bees, dust hazards, and efficacy (CDPR 2011).

California requires reporting of all commercial pesticide use, including amounts applied and types of crops or places (e.g., structures, roadsides) treated. In 2011, in an effort to more efficiently and accurately capture pesticide use data, a new county-based reporting system known as CalAgPermits was created, to streamline reporting procedures for pesticide users and upgrade data management capabilities of county departments of agriculture.

CDPR annually collects and processes more than 2.5 million records of pesticide applications. A single application creates more than one record if multiple pesticide products are applied at the same time. The reporting requirements include pesticide applications in production agriculture, parks, golf courses, cemeteries, rangeland, pastures, and along roadside and railroad rights-of-way. In addition, all post-harvest pesticide treatments of agricultural commodities must be reported, along with all pesticide treatments in poultry and fish production as well as some livestock applications. All uses by licensed applicators and outdoor applications of pesticides with the potential to pollute ground water must be reported. The primary exceptions to the reporting requirements are home-and-garden use pesticide products and most industrial and institutional pesticide product uses (CDPR 2011).

### O.5.3 Local Laws, Plans, Policies, and Regulations

#### ***Pesticide Regulatory Program: County Agricultural Commissioners***

Although CDPR is responsible for managing California's statewide pesticide regulatory program, the local administration of pesticide use enforcement is delegated to CACs. With assistance from CDPR, CACs plan and develop county programs and regulate pesticide use so that applicators comply with label directions and pesticide laws and regulations (CDPR 2011). CACs oversee pesticide use reporting, promote best management practices, monitor field applications, and may assist in cleanup of accidental pesticide spills. CACs inspect operations and records of growers, nonagricultural applicators (including industrial and institutional), pest control dealers, agricultural pest control advisers, farm labor contractors, and government agencies for compliance with worker protection standards and other pesticide safety requirements. CACs, assisted by CDPR, investigate incidents where pesticides harm agricultural workers, people nearby, and the environment, including contamination or environmental damage such as fish or wildlife kills, and water quality contamination. When an enforcement action is needed, CACs have the option to revoke or suspend the right of a pest control or other company to do business in the county or to issue civil or criminal penalties (CDPR 2011). With respect to the Proposed Program, local CACs are responsible for implementing and enforcing many aspects of pesticide regulation discussed in the section State Agencies, Laws, and Programs.

#### ***Unified Program—Certified Unified Program Agencies***

The Unified Program consolidates and coordinates a number of regulatory programs in California related to hazardous wastes and materials (Cal/EPA 2012). Codified in the 27 CCR Division 1, and Chapter 6.11 of the California Health and Safety Code, the Unified Program consolidates the Hazardous Materials Release Response Plans and Inventories, CalARP Program, Underground Storage Tank Program, Aboveground Petroleum Storage Act, Hazardous Waste Generator and Onsite Hazardous Waste Treatment (tiered permitting) programs, and California Uniform Fire Code: Hazardous Material Management Plans and Hazardous Material Inventory Statements. The Unified Program also transfers responsibility for implementation of these hazardous waste and materials regulatory programs to local agencies, such as cities and counties (Cal/EPA 2012). After local agencies are certified by Cal/EPA as CUPAs, they must establish a program that consolidates, coordinates, and makes consistent the administrative requirements, permits, inspection activities, enforcement activities, and hazardous waste and hazardous materials fees associated with programs under the Unified Program. With oversight from Cal/EPA, CUPAs conduct inspections for all program activities according to the standards contained in the relevant statute or regulation (Cal/EPA 2012). With respect to the Proposed Program, local CUPAs are responsible for implementing and enforcing many of the state hazardous waste and materials requirements, as discussed in Section 6.6.2.2, State Agencies, Laws, and Programs. If a pesticide spill or other incident occurred under the Proposed Program, a CUPA or other local government agency likely would be the first to respond.

## ***California Government Code Sections 51175–51181, Fire Prevention—Local Government Responsibilities***

Local agencies are responsible for providing fire protection on Local Responsibility Area (LRA) lands. Like State Responsibility Areas, LRAs are defined based on land ownership, population density, and land use (CAL FIRE 2012).

## **O.6 Noise Regulatory Setting**

The federal, State, and local laws, ordinances, regulations, and standards related to noise and relevant to the Proposed Program are discussed next. Local noise guidelines are often based on the broader guidelines of State and federal agencies, and many are implemented as enforceable noise ordinances. A detailed discussion of local ordinances was not included in this analysis because the Proposed Program activities may occur in various locations throughout California. Although not specifically noise-related, some of the following regulations and standards were influential in development of the noise assessment techniques used in this document.

### **O.6.1 Federal Laws, Ordinances, Regulations, and Standards**

No federal laws, ordinances, regulations, or standards related to noise are directly relevant to the Proposed Program. However, the following guidelines at the federal level direct consideration of a broad range of noise issues:

- National Environmental Policy Act (Title 42, U.S. Code (USC) Section 4321, et seq.) (PL-91-190) (Title 40, Code of Federal Regulations [CFR] Section 1506.5)
- Noise Control Act of 1972 (Title 42, USC Section 4910)
- U.S. Department of Housing and Urban Development Noise Guidelines (Title 24, CFR Section 51, Subpart B) (HUD 1996)

Furthermore, the U.S. Environmental Protection Agency (EPA) has published a guideline document that specifically addresses issues of community noise, the EPA Levels Document Report 556/9-74-004 (EPA 1974). This report, commonly referred to as the “levels document,” contains goals for noise levels affecting residential land use of a day-night average sound level ( $L_{dn}$ ) less than 55 A-weighted decibels (dBA) for exterior levels and an  $L_{dn}$  less than 45 dBA for interior levels. The U.S. Department of Housing and Urban Development Noise Guidelines (HUD 1996), in Chapter 2, Section 51.101(a)(8) also recommends that exterior areas of frequent human use follow the EPA guideline of 55  $L_{dn}$ . However, the same section of these guidelines indicates that a noise level of up to 65 dBA  $L_{dn}$  can be considered acceptable.

Occupational exposure to noise is regulated by Title 29 of the CFR, Section 1910.95, Occupational Noise Exposure, which in summary describes requirements of an employer for implementation of feasible administrative or engineering controls, personal protective equipment, and/or a hearing conservation program to protect employees against the effects of noise exposure when it exceeds an average of 90 dBA for an 8-hour period.

## **Federal Aviation Administration**

The major parts of Title 14 of the CFR: Aeronautics and Space, Chapter I: Federal Aviation Administration (FAA), Department of Transportation, Subchapter C (U.S. National Archives and Records Administration 2008–2009) were reviewed for applicability to the proposed use of aircraft; specifically of interest to this noise study are the reference noise levels from fixed-wing and rotary-wing delivery platforms under consideration and the minimum relative altitudes that they may fly when used for designated Proposed Program activities.

Pertinent sections of 14 CFR are cited and discussed next.

### Part 36: Noise Standards: Aircraft Type and Airworthiness Certification

Noise data from aircraft power plants, propellers, and combinations of each by aircraft type are well documented because each aircraft type must be certified by the FAA under Part 36 before use by general and commercial aviation.

The primary aircraft proposed for use under the Proposed Program is a Beechcraft A90. This aircraft make, model, engines, and propellers, as a system, was certified by the FAA in the 1960s. Noise levels were recorded for three configurations: takeoff, normal cruise, and landing, at locations specified in the regulation. Other aircraft under consideration for use in the Proposed Program include a Fletcher FU-24A and Robinson R-44.

### Part 91: Flight Operations

Elements of Part 91 are provided here as a reference. Altitude limitations governing agricultural operations are stated in Part 137, Agricultural Operations.

Fixed-wing aircraft not operating under an Instrument Flight Rules, emergencies, during takeoff or landing, or Part 137 are required to maintain the altitudes listed in Section 91.119—Minimum Safe Altitudes: General (a)–(d). Section 91.119 (a), (b), and (c) are provided below. Except when necessary for takeoff or landing, no person may operate an aircraft below the following altitudes:

(a) Anywhere. An altitude allowing, if a power unit fails, an emergency landing without undue hazard to persons or property on the surface.

(b) Over congested areas. Over any congested area of a city, town, or settlement, or over any open air assembly of persons, an altitude of 1,000 feet above the highest obstacle within a horizontal radius of 2,000 feet of the aircraft.

(c) Over other than congested areas. An altitude of 500 feet above the surface, except over open water or sparsely populated areas. In those cases, the aircraft may not be operated closer than 500 feet to any person, vessel, vehicle, or structure.

### Section 137.49 – Operations over Other than Congested Areas

Notwithstanding Part 91 of this chapter, during an actual dispensing operation, including approaches, departures, and turnarounds reasonably necessary for the operation, an aircraft may be operated (other than over congested areas) below 500 feet above the

surface and closer than 500 feet to persons, vessels, vehicles, and structures, if the operations are conducted without creating a hazard to persons or property on the surface.

### **Federal Transit Administration Guidelines**

#### Noise

The Federal Transit Administration (FTA) has published guidance for assessment of noise and vibration impacts for transit projects, including construction activity (FTA 2006). Although the Proposed Program is not transit-related, the FTA guidelines provide a widely accepted method for analyzing noise and vibration impacts specifically related to mechanical equipment that may be used for Statewide Program activities. The FTA has developed three “sensitive” land use categories to evaluate the compatibility of predicted noise levels, as described below and also provided in Table N-6-1.

- Category 1 includes land where quiet is an essential element, such as outdoor amphitheaters.
- Category 2 includes residences where people sleep.
- Category 3 includes institutional buildings where quiet is important, such as schools, libraries, and churches.

Categories 1 and 3 use the hourly equivalent sound level ( $L_{eq}$ ), whereas Category 2 uses  $L_{dn}$ . Such criteria recognize the heightened community annoyance caused by late-night or early-morning operations, and respond to the varying sensitivities of communities to projects under different ambient noise conditions. The noise criteria are to be applied outside of building locations for residential land use and at the property line for parks and other significant outdoor use.

The applicable noise criteria in this context, as shown in Table N-6-2, are both relative to and vary with the existing ambient sound environment that a receiving category is experiencing.

As the existing level of ambient noise increases, the allowable level of transit noise decreases, but the total community noise exposure is allowed to increase at a reduced rate. This accounts for the unexpected result when noise exposure that is less than the existing noise exposure can still cause an impact. This is clearer from the examples given in Table N-6-2, which indicate the level of noise allowed for different existing levels of exposure.

**Table 0.6-1. Land Use Categories and Metrics for Transit Noise Impact Criteria**

Land Use Category	Noise Metric <sup>1</sup> (dBA)	Land Use Category
1	Outdoor $L_{eq}(h)$ <sup>2</sup>	Tracts of land where quiet is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet, and such land uses as outdoor amphitheaters and concert pavilions, as well as National Historic Landmarks with significant outdoor use.
2	Outdoor $L_{dn}$	Residences and buildings where people normally sleep. This category includes homes and hospitals, where nighttime sensitivity to noise is

Land Use Category	Noise Metric <sup>1</sup> (dBA)	Land Use Category
3	Outdoor $L_{eq}(h)^2$	assumed to be the utmost importance.

**Notes:**

Onset-rate adjusted sound levels ( $L_{eq}$ ,  $L_{dn}$ ) are to be used where applicable.

$L_{eq}$  for the noisiest hour of transit-related activity during hours of noise sensitivity.

dBA = A-weighted decibels;  $L_{dn}$  = day-night sound level, dBA;  $L_{eq}(h)$  = equivalent sound level for a 1-hour period, dBA

Source: FTA 2006

**Table O.6-2. Noise Impact Criteria Effect on Cumulative Noise Exposure**

Existing Noise Exposure	$L_{dn}$ or $L_{eq}$ in dBA (rounded to nearest whole decibel)	Allowable Noise Exposure	Allowable Combined Total Noise Exposure	Allowable Noise Exposure Increase
45	51	52	7	
50	53	55	5	
55	55	58	3	
60	57	62	2	
65	60	66	1	
70	64	71	1	
75	65	75	0	

**Notes:**

dBA = A-weighted decibels;  $L_{dn}$  = Day-Night Sound Level, dBA;  $L_{eq}$  = Equivalent Sound Level, dBA

Source: FTA 2006

## Vibration

Summarized in Table N-6-3, FTA guidance indicates groundborne vibration impact levels associated with three categories of receiver sensitivity (that resemble those previously described for noise) as they pertain to human annoyance.

**Table O.6-3. Groundborne Vibration Impact Criteria - Human Annoyance**

Land Use Category	Velocity in Decibels (VdB) (re: 1 micro-inch/second)		
	Frequent Events <sup>1</sup>	Occasional Events <sup>2</sup>	Infrequent Events <sup>3</sup>
<i>Category 1: Buildings where Vibration Interferes with Interior Operations</i>	65 <sup>4</sup>	65 <sup>4</sup>	65 <sup>4</sup>
<i>Category 2: Residences and Buildings where People Normally Sleep</i>	72	75	80
<i>Category 3: Institutional Land Uses with Primarily Daytime Usage</i>	75	78	83

Notes:

1. "Frequent Events" is defined as more than 70 vibration events of the same source per day.
2. "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
3. "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day.
4. This criterion limit is based on levels that are acceptable for most moderately sensitive equipment, such as optical microscopes. Vibration-sensitive manufacturing or research would require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the heating, ventilating, and air conditioning systems and stiffened floors.

Source: FTA 2006

In Table N-6-4, FTA guidance indicates groundborne vibration impact levels associated with four building categories as they pertain to risk of building damage.

**Table O.6-4. Groundborne Vibration Impact Criteria - Building Damage Risk**

Building Category	Peak Particle Velocity (inches per second)	VdB (re: micro-inches/ second)
<i>Category 1: Reinforced-Concrete, Steel or Timber (no plaster)</i>	0.5	102
<i>Category 2: Engineered Concrete and Masonry (no plaster)</i>	0.3	98
<i>Category 3: Non-Engineered Timber and Masonry</i>	0.2	94
<i>Category 4: Extreme Susceptibility to Vibration Damage (e.g., historic structures)</i>	0.12	90

Source: FTA 2006

## O.6.2 State Codes and Agencies

### ***California Building Code, Title 24***

Title 24, Part 2, Section 1207 of the California Building Code establishes a uniform minimum noise insulation performance standard to protect persons within hotels, motels, dormitories, apartment houses and dwellings other than detached single-family dwellings from the effects of excessive noise, including hearing loss or impairment and interference with speech and sleep. Title 24 states that interior noise levels attributable to exterior

sources are not to exceed 45 decibels in any habitable room (California Building Code 2010). The noise metric must be either the  $L_{dn}$  or the community noise equivalent level, consistent with the noise element of the local general plan.

### ***California Department of Transportation, Division of Aeronautics***

The Division of Aeronautics administers noise regulation and land use planning laws that foster compatible land use around airports and encourages environmental mitigation measures to lessen noise caused by aviation. The Aeronautics Act (Public Utilities Code Section 21001 et seq.) is the foundation for the California Department of Transportation's aviation policies.

#### **O.6.3 Local Laws, Plans, Policies, and Regulations**

Table N-6-5 summarizes existing noise requirements and guidelines found in noise ordinances and general plans (i.e., noise elements) from all California counties with respect to anticipated Proposed Program noise-producing activities located on unincorporated county land. Proposed Program activities also may occur within municipalities, such as an eradication project conducted in a residential area<sup>1</sup>, in which case a local enforceable noise ordinance and/or general plan noise element may apply, and if so, could be identified (e.g., by online search). The results of such a search, like the one conducted to produce Table N-6-5, most likely would yield one of the following with respect to agricultural or other activities that would reasonably describe Proposed Program activities:

- **None found**—Noise regulation, policy, or guidelines may exist, but they do not pertain to the anticipated Proposed Program activities, or the language defers to county requirements and guidance.
- **Exempt**—Agricultural and/or pest control processes, which some Proposed Program activities may relate to or be categorized under, are specifically exempted.
- **Quantitative** (absolute, relative or both)—Either noise thresholds apply to Proposed Program noise or the combined ambient of pre-Proposed Program ambient and the added Proposed Program noise; or, allowable increases over existing ambient noise that result from the added Proposed Program noise; or, such as the example of Ventura County, shown in Table N-6-5, for both types of limits may apply.
- **Qualitative**—No quantitative levels exist, but noise is characterized as a potential nuisance that needs to be addressed on a case by case basis, or is subject to review and judgment by a city administrator.

The search also may yield terms for a noise permit, waiver, or variance application, which could be important if the activity itself (regardless of noise level) may be prohibited (or allowed) during certain time periods or under certain circumstances.

---

<sup>1</sup> Aerial spraying would not occur in residential areas without conducting additional tiered CEQA analysis and associated public review.

**Table 0.6-5. Summarized Requirements of California's County Noise Ordinances**

<b>County(ies)</b>	<b>Applicable Noise Criteria (exterior unless otherwise noted)</b>
Alameda, Alpine, Butte, Calaveras, Fresno, Glenn, Imperial, Kings, Lake, Merced, Napa, Orange, Placer, Plumas, Riverside, San Benito, San Luis Obispo, San Mateo, Santa Cruz, Stanislaus	None – Agricultural and/or pest control activities are exempt.
Sacramento, San Diego, San Bernardino	Agricultural and/or pest control activities are exempt during daytime.
Contra Costa, Del Norte, Humboldt, Inyo, Kern, Lassen, Marin, Mariposa, Modoc, Sonoma, Sutter, Tehama, Trinity	None found
El Dorado	Daytime and Nighttime: 60 dBA Leq, 70 dBA Lmax
Amador	Allowable increase above existing ambient: if Ldn = 55 dBA, +3 dBA Ldn; if Ldn = 60 dBA, +2 dBA Ldn; and, if Ldn = 65 dBA, +1 dBA Ldn Higher Leq values permitted for cumulative time periods < 1 hour duration
Colusa	55 dBA
Los Angeles	Within 500 feet of a residential zone, between 7 a.m. and 10 p.m., 75 dBA at 50 feet for powered equipment
Madera	Daytime: 70 dBA; Nighttime: 65 dBA
Mendocino	Nighttime: 50 dBA not exceed for more than one-half hour
Monterey	No equipment to exceed 85 dBA at 50 feet, unless 2,500 feet from any occupied dwelling unit
San Francisco	No equipment to exceed 80 dBA at 100 feet
San Joaquin, Santa Barbara, Siskiyou, Solano	"Right to farm" and/or "not a nuisance" (no quantitative criteria)
Santa Clara	Daytime: 55 dBA; Nighttime: 50 dBA
Shasta	Daytime: 55 dBA hourly; Nighttime: 50 dBA hourly
Tuolumne	65 dBA Ldn or community noise equivalent level at exterior use
Ventura	Daytime (6 a.m. to 7 p.m.): 55 dBA hourly or ambient + 3dBA, whichever is greater; Evening (7 p.m. to 10 p.m.): 50 dBA hourly or ambient + 3dBA, whichever is greater; and, Nighttime (10 p.m. to 6 a.m.): 45 dBA hourly or ambient + 3dBA, whichever is greater
Yolo	Daytime (6 a.m. to 6 p.m.): 80 dBA L <sub>eq</sub> at site boundary, or 60 dBA L <sub>eq</sub> at any off-site residences or noise-sensitive land uses; Nighttime (6 p.m. to 6 a.m.): 65 dBA L <sub>eq</sub> at site boundary
Yuba	Single-family residential: 60 (day), 55 (night); Multi-family residential: 65 (day), 60 (night)

**Notes:**

dBA = A-weighted decibels; Ldn = Day-Night Sound Level, dBA; Leq = Equivalent Sound Level, dBA

## O.7 Water Quality Regulatory Setting

The federal, State, and local laws, ordinances, regulations, and standards related to water quality and relevant to the Proposed Program are discussed next.

### O.7.1 Federal Laws, Regulations, and Standards

#### ***Clean Water Act and Associated Programs***

The Federal Water Pollution Control Act, also known as the Clean Water Act (CWA), is the primary federal law that protects the quality of the nation's surface waters, including lakes, rivers, and coastal wetlands (EPA 1977). The objective of the CWA "is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." The U.S. Environmental Protection Agency (EPA) defines water quality as "the biological, chemical and physical conditions of a waterbody...[and] a measure of the waterbody's ability to support beneficial uses," and has established specific water quality criteria for various pollutants, as well as an anti-degradation policy (EPA 2011a).

EPA is responsible for implementing the CWA, although sections of the act are implemented by other federal agencies under EPA's oversight, such as Section 404 dealing with discharge of dredged and fill material into water. EPA also has the option to delegate implementation of certain sections to a state. In California, the State Water Resources Control Board (SWRCB) and its nine Regional Water Quality Control Boards (RWQCBs) administer various sections of the CWA.

The key sections pertaining to water quality regulation for the Proposed Program are Sections 402 and 303.

#### **Section 402**

Section 402 of the CWA establishes the National Pollutant Discharge Elimination System (NPDES). Under Section 402, a permit is required for point source discharges of pollutants into navigable waters of the United States (other than dredge or fill material). In California, the NPDES Permit program is administered by the SWRCB. Permits contain specific water quality-based limits and establish pollutant monitoring and reporting requirements. Discharge limits in NPDES Permits may be based on water quality criteria designed to protect designated uses of surface waters, such as recreation or supporting aquatic life. The various NPDES Permits that may apply to the Proposed Program are discussed below.

#### **NPDES PERMIT FOR BIOLOGICAL AND RESIDUAL PESTICIDE DISCHARGES**

The SWRCB has adopted an NPDES Permit (Water Quality Order No. 2011-0004-DWQ, General Permit No. CAG990007) for biological and residual pesticide discharges to waters of the United States from spray applications (SWRCB 2011). CDFA is listed as the discharger

with full coverage, and the U.S. Department of Agriculture (USDA) is covered for specified biological controls only. The permit addresses point source discharges of the following biological and residual pesticides: acetamiprid, aminopyralid, *Bacillus thuringiensis* subsp. *kurstaki* (Btk), carbaryl, chlorsulfuron, clopyralid, cyfluthrin, dinotefuran, glyphosate, imazapyr, imidacloprid, malathion, naled, nuclear polyhedrosis virus (NPV), pheromones, pyrethrins, Spinosad A and D, triclopyr butoxyethyl ester (BEE) and triclopyr triethylamine salt (TEA). This does not include all of the active ingredients that may be used under the Proposed Program. Most notably it does not contain any organophosphate pesticides, such as dichlorvos (DDVP). Activities covered by the permit include control of invasive insect and weed species.

To obtain authorization under the permit, dischargers must submit a signed Notice of Intent (NOI), pay an application fee, and submit a Pesticide Application Plan (PAP). The PAP must be posted for a 30-day comment period on the SWRCB website, and a Notice of Applicability, which specifies the pesticide products that may be used, must be issued for the permit coverage to be effective. In addition, applicators of a pesticide designated as a restricted material must be licensed by the California Department of Pesticide Regulation (CDPR) or must work under the supervision of a licensed professional. (SWRCB 2011)

This permit is applicable for activities carried out by CDFA or its contractors, but it is not valid for pesticides used by individual growers in response to a CDFA quarantine. The main activities carried out by CDFA or its contractors not covered by this permit are related to exotic fruit flies, using pesticides that contain DDVP, an organophosphate.

Furthermore, this permit is only applicable when discharges occur to a surface water. CDFA prefers to avoid any discharge to waterbodies through implementation of best management practices (BMPs) specified in the permit, and uses this permit when it is not feasible to avoid discharge to surface water despite the implementation of BMPs. All pesticides applied by CDFA under the NPDES Permit for Biological and Residual Pesticide Discharges are done in accordance with the permit requirements, including implementing the BMPs specified in the permit, provided in Appendix C of this Draft PEIR.

#### NPDES PERMIT FOR INDUSTRIAL DISCHARGES

The SWRCB also has adopted a permit (Water Quality Order 97-03-DWQ) for regulation of stormwater discharges associated with industrial activity (General Industrial Permit). Water Quality Order 97-03-DWQ has expired but remains in effect until a new General Industrial Permit is adopted. This permit applies to manufacturing facilities, mining/oil/gas facilities, hazardous waste treatment, storage, and disposal facilities, landfills, land application sites, and open dumps that receive industrial waste, recycling facilities, steam electric-generating facilities, transportation facilities that conduct any type of vehicle maintenance, sewage treatment plants, and “light industry” facilities where industrial materials, equipment, or activities are exposed to stormwater.

Similar to other NPDES general permits, a discharger must submit a signed NOI, accompanied by details on how the proposed discharge will meet effluent limitations, will not impair receiving waterbodies, how stormwater may be captured and treated (as applicable), and the discharger must prepare and implement a Stormwater Pollution Prevention Program (SWPPP) and implement a Mitigation Monitoring Program. The

General Industrial Permit may be applicable to certain facilities where Proposed Program activities take place, such as landfills where host material may be buried or otherwise properly disposed.

### NPDES PERMITS FOR MUNICIPAL DISCHARGES

The Municipal Storm Water Permitting Program regulates stormwater discharges from municipal separate storm sewer systems (MS4s). Stormwater is runoff from rain or snow melt that runs off surfaces such as rooftops, paved streets, highways, or parking lots, and can carry with it pollutants such as oil, pesticides, herbicides, sediment, trash, bacteria, and metals. This runoff ultimately may reach surface waterbodies.

The municipal or urban areas addressed by this program commonly include large areas of impervious surface. These large impervious surfaces can contribute to increased pollutant loads, with results such as turbid water, nutrient enrichment, bacterial contamination, increased temperature, and accumulation of trash. In addition, these impervious areas can contribute to an increase in runoff timing, volume, and velocity, and streams may be affected by streambed scouring, sedimentation, and loss of aquatic and riparian habitat.

MS4 permits were issued in two phases. Under Phase I, which started in 1990, the RWQCBs adopted NPDES Permits for medium (serving between 100,000 and 250,000 people) and large (serving 250,000 people) municipalities. Most of these permits have been issued to groups of co-permittees, encompassing entire metropolitan areas. The Phase I MS4 permits require the discharger to develop and implement a Storm Water Management Plan/Program with the goal of reducing the discharge of pollutants to the maximum extent practicable (MEP). MEP is the performance standard specified in Section 402(p) of the CWA. The management programs specify management measures used to address various program areas. These program areas include: public education and outreach; illicit discharge detection and elimination; construction and post-construction; and good housekeeping for municipal operations. In general, medium and large municipalities also are required to conduct monitoring.

Under Phase II, the SWRCB issued a General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2003-0005-DWQ) in 2003, to provide permit coverage for smaller municipalities (population less than 100,000), including non-traditional Small MS4s, which are facilities such as military bases, public campuses, and prison and hospital complexes. The most recent Phase II Small MS4 General Permit was adopted in 2013. The Phase II Small MS4 General Permit addresses Phase II permittees statewide.

Proposed Program activities may occur in locations with permit coverage under the MS4 program, and as such, Proposed Program activities may be subject to the requirements of such permits.

### Section 303

Section 303 of the CWA (as well as the State-level Porter-Cologne Water Quality Control Act [Porter-Cologne Act], discussed further below) requires that California adopt water quality standards. In addition, under CWA Section 303(d), states are required to identify "impaired waterbodies" (those not meeting established water quality standards), identify the

pollutants causing the impairment, establish priority rankings for waters on the list, and develop a schedule for development of control plans to improve water quality. EPA then approves the state's recommended list of impaired waters, or adds to and/or removes waterbodies from the list. Each RWQCB must update the Section 303(d) list every 2 years. Waterbodies on the list have no further assimilative capacity for the identified pollutant, and the Section 303(d) list identifies priorities for development of pollution control plans for each listed waterbody and pollutant.

The pollution control plans triggered by the CWA Section 303(d) list are called Total Maximum Daily Loads (TMDLs). The TMDL is a "pollution budget," designed to restore the health of a polluted waterbody and provide protection for beneficial uses. The TMDL also contains the target reductions needed to meet water quality standards and allocates those reductions among the pollutant sources in the watershed (i.e., point sources, nonpoint sources, and natural sources) (40 Code of Federal Regulations [CFR] 130.2). A TMDL is unique to a specific waterbody and its surrounding pollutant sources, and is not applicable to be used for other waterbodies.

The current effective EPA-approved 303(d) list for waterbodies in California is the 2008–2010 list, approved on November 12, 2010 (see Table 6.7-1 in the Draft PEIR for the number of waterbodies listed as impaired by region and pollutant type). For the Proposed Program, activities that may result in discharge of a contaminant to waterbodies listed as impaired for that contaminant would be of particular concern, because of the lack of the waterbody's assimilative capacity for that contaminant.

### ***National Toxics Rule and California Toxics Rule***

EPA issued the National Toxics Rule (NTR) in 1992. The goal of the NTR is to establish numeric criteria for specific priority toxic pollutants, to ensure that all states comply with the requirements in Section 303 of the CWA. A total of 126 priority toxic pollutants currently are specified in the NTR.

In 2000, EPA promulgated the California Toxics Rule (CTR), containing additional numeric water quality criteria for priority toxic pollutants for waters in the state. For California, the criteria in the CTR supplements the criteria in the NTR (i.e., the CTR does not change or supersede any criteria previously promulgated for California in the NTR, but it does include them in the table of criteria, for convenience). (EPA 2009)

The Proposed Program contains only a few of the chemicals listed on the NTR and CTR. The only active ingredient is methyl bromide, and inert ingredients include naphthalene and ethylbenzene. Inert chemicals are chemicals contained in the pesticide that are not part of the active ingredient and are present in a formulation for reasons other than pesticidal activity, such as solvents.

### ***Federal Anti-Degradation Policy***

The federal anti-degradation policy includes minimum criteria to protect existing beneficial uses, ensure the level of water quality is offset to maintain existing uses, and prevent degradation of quality water. This policy stipulates that states adopt at a minimum the following provisions and allows states to adopt even more stringent rules (40 CFR 131.12):

- (1) Existing instream water uses and the level of water quality necessary to protect the existing uses shall be maintained and protected.
- (2) Where the quality of waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the state finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the state's continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located.
- (3) Where high quality waters constitute an outstanding National resource, such as waters of National and state parks, wildlife refuges, and waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected.

The Proposed Program would be required to follow this policy.

### ***Safe Drinking Water Act***

The Safe Drinking Water Act (SDWA) is intended to protect drinking water and its sources: rivers, lakes, reservoirs, springs, and groundwater wells that serve more than 25 individuals. The goal of the SDWA is to ensure that drinking water is safe for human consumption and will not have adverse health effects on the typical person who drinks water. Under the SDWA, EPA has set drinking water standards for 90 chemical, microbiological, radiological, and physical contaminants (EPA 2011b). Of the contaminants regulated by the SDWA, glyphosate, xylenes, and ethylbenzene are included in the Proposed Program.

## **O.7.2 State Agencies, Laws, and Programs**

### ***Porter-Cologne Water Quality Control Act***

In January 1970, The Porter-Cologne Act ratified the federal CWA on the State level, establishing the SWRCB and dividing California into nine regions, each overseen by a RWQCB. The Act established regulatory authority over "waters of the state," defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code Section 13050). More specifically, the SWRCB and its nine RWQCBs have jurisdiction over any surface or groundwater to which a beneficial use may be assigned. The Act also assigned responsibility for implementing CWA Sections 303, 401, and 402 to the SWRCB and RWQCBs.

The Porter-Cologne Act requires the RWQCBs to adopt water quality control plans (Basin Plans) for the protection of surface water and groundwater quality. The Act also authorizes the RWQCBs to issue waste discharge requirements (WDRs), including NPDES Permits. Any activity, discharge, or proposed activity or discharge from a property or business that could affect California's surface, coastal, or groundwater will (in most cases) be subject to a WDR. The California Water Code authorizes the SWRCB and the RWQCBs to conditionally waive WDRs if this is in the public interest. Discharges made under the Proposed Program may be subject to WDR requirements. (California Code of Regulations, Title 22, Division 4, Chapter 15)

Title 22, Division 4, Chapter 15, of the California Code of Regulations establishes parameters for safe drinking water throughout the state. Table N-7-1 lists the chemicals which may be used under the Proposed Program, for which maximum contaminant levels have been established.

**Table 0.7-1. Applicable Maximum Contaminant Levels for Chemicals in Drinking Water**

Chemical Name	Maximum Contaminant Level (milligram per liter)
Glyphosate	0.7
Xylenes	1.750

Source: Title 22 CCR Section 64444

### ***Policy for Implementation of Toxics Standards for Inland Surface Waters***

#### ***Enclosed Bays and Estuaries of California***

In 1994, the SWRCB and EPA agreed to a coordinated approach for addressing priority toxic pollutants in inland surface waters, enclosed bays, and estuaries of California. In March 2000, the SWRCB adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, commonly referred to as the State Implementation Policy. The State Implementation Policy implements NTR and CTR criteria, and applicable Basin Plan objectives, for toxic pollutants. When the RWQCBs issue any permit allowing the discharge of any toxic pollutant(s) pursuant to the CWA or the Porter-Cologne Act, the permit's promulgation and implementation must be consistent with the State Implementation Policy's substantive or procedural requirements. Any deviation from the State Implementation Policy requires the concurrence of EPA if the RWQCBs are issuing any permit pursuant to the CWA. Consistency with the State Implementation Policy occurs when water permits are issued for Proposed Program activities.

#### ***California Anti-Degradation Policy***

The SWRCB enacted the Statement of Policy with Respect to Maintaining High Quality of Waters in California, which is also referred to as the California Anti-Degradation Policy. This policy incorporated the federal anti-degradation policy and is used to ensure that high quality water is maintained and limits the discharge of pollutants into high quality water in the state (Resolution Number 68-16, SWRCB 1968), as follows:

- (1) Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies.
- (2) Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control of the discharge necessary to assure that (a) a pollution or nuisance will not occur and

(b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

The Proposed Program would be required to follow this policy. The Proposed Program does not expect or anticipate any violation of this policy.

### ***California Pesticide Management Plan***

The California Pesticide Management Plan is a joint effort between CDPR, county agricultural commissioners, the SWRCB, and the RWQCBs to protect water quality from pesticide pollution. To reduce the possibility of pesticides entering groundwater or surface water, a four-stage approach was designed by CDPR and the SWRCB. Stage 1 involves educational outreach to the community to prevent pesticide contamination in water supplies. Stage 2 occurs after pesticides are detected in a water supply, and an appropriate response is selected that is safe and site-specific. If Stage 2 is not effective, then Stage 3 tactics are employed, which include implementing restricted material use permit requirements, regulations, and other regulatory authority by CDPR and the county agricultural commissioners. In addition, the SWRCB and RWQCBs employ Stage 4 and a variety of water quality control planning programs and other regulatory measures to protect water quality as necessary. (CDPR 1997) The Proposed Program would be subject to Stage 3 and 4 tactics that may restrict the use of pesticides used in the management activities.

### **Surface Water Protection Program**

Implementation of the California Pesticide Management Plan for surface water protection is done by CDPR through its Surface Water Protection Program (SWPP), under a Management Agency Agreement with the SWRCB. The SWPP is designed to characterize pesticide residues, identify contamination sources, determine flow of pesticides to surface water, and prepare site-specific mitigation measures. The SWPP addresses both agricultural and nonagricultural sources of pesticide residues in surface waters. It has preventive and response components that reduce the presence of pesticides in surface waters. The preventive component includes local outreach to promote management practices that reduce pesticide runoff. Prevention also relies on CDPR's registration process, in which potential adverse effects to surface water quality, and particularly those in high-risk situations are evaluated. The response component includes mitigation options to meet water quality goals, recognizing the value of self-regulating efforts to reduce pesticides in surface water as well as regulatory authorities of CDPR, the SWRCB, and the RWQCBs. (CDPR 1997, 2010). The Proposed Program management activities would be affected during re-registration of pesticides by CDPR and would require implementation of any new mitigation options for meeting water quality goals.

### ***Pesticide Contamination Prevention Act***

The Pesticide Contamination Prevention Act (PCPA), approved in 1985, was developed to prevent further pesticide contamination of groundwater from legal agricultural pesticide applications. Pesticide pollution is defined for PCPA as "the introduction into the groundwaters of the state of an active ingredient, other specified product, or degradation product of an active ingredient of an economic poison above a level, with an adequate margin of safety that does not cause adverse health effects." CDPR has compiled a list of pesticide active ingredients on the

Groundwater Protection List that have the potential to pollute groundwater. These various pesticides are reviewed and their use is modified when found in groundwater (CDPR 1997). The following active ingredients that may be used under the Proposed Program are listed on the Groundwater Protection List (CDPR 2013): acephate, carbaryl, diazinon, dinotefuran, imidacloprid, malathion, and thiamethoxam.

### Groundwater Protection Program

Implementation of PCPA is done through CDPR's Groundwater Protection Program, which is coordinated with the SWRCB under the California Pesticide Management Plan. The Groundwater Protection Program evaluates and samples pesticides to determine whether they may contaminate groundwater, identifies areas sensitive to pesticide contamination, and develops mitigation measures to prevent the movement of pesticides. CDPR may adopt regulations to carry out these mitigation measures. CDPR conducts four groundwater monitoring programs. The first is to monitor whether pesticides on the Groundwater Protection List with the potential to pollute have been found in groundwater. The second type is four-section monitoring, which monitors wells in the vicinity of a contaminated well. The third monitoring type is sensitive area monitoring that identifies areas sensitive to pesticide pollution. The fourth type is investigative monitoring, used to identify and understand the factors that affect pesticide movement into groundwater. (CDPR 1997)

### **O.7.3 Local/Regional Laws and Plans**

The Porter-Cologne Act created nine RWQCBs in California. The RWQCB boundaries are based on watersheds, and water quality requirements are based on differences in climate, topography, geology, and hydrology for each watershed. Each RWQCB sets standards, issues permits, determines compliance with requirements, and takes enforcement actions to make water quality decisions for its region.

#### ***Basin Plans***

Each RWQCB must adopt a Basin Plan, intended to protect water quality in each of the state's nine regions. A Basin Plan is unique to each region and must identify beneficial uses, establish water quality objectives for the reasonable protection of the beneficial uses, and establish a program of implementation for achieving the water quality objectives. The California Anti-Degradation Policy is incorporated into each of the basin plans (SWRCB 2011). Table N-7-2 shows water quality standards from the various Basin Plans that are applicable to the Proposed Program.

Page left intentionally blank.

**Table O.7-2. Applicable RWQCB Basin Plan Water Quality Standards**

Water Quality Standard	Regional Water Quality Control Board, by Number								
	1	2	3	4	5	6	7	8	9
Waters not discolored	X	X	X	X	X	X	X	X	X <sup>5</sup>
No impaired tastes/odors	X	X	X	X	X	X	X	X	X <sup>6</sup>
No oils/greases/visible film on surface	X	X	X	X	X	X	X	X	X
No acute/chronic toxicity of substances in waters	X	X	X	X	X	X		X	
No detectable levels of chlorinated hydrocarbons where concentrations are currently undetectable			X			X <sup>1</sup>			
Pesticide shall not exceed lowest levels technically, economically feasible					X				
No discharge of pesticide wastes from cleaning/manufacturing/ processing operations								X <sup>4</sup>	
No bioaccumulation of toxins in humans/aquatic life/sediment	X	X	X	X	X	X	X		X
Chlorpyrifos					0.025 µg/L; one hour average for acute circumstances and 0.015 µg/L; four day average for chronic circumstances <sup>2</sup>				
Diazinon					0.016 µg/L; one hour average for acute circumstances and 0.010 µg/L; four day average for chronic circumstances concentrations <sup>2</sup>				

Water Quality Standard	Regional Water Quality Control Board, by Number								
	1	2	3	4	5	6	7	8	9
Glyphosate (less than 0.7 mg/L)	X	X	X	X	X	X			X
Naphthalene (less than 0.25 µg/L)							X <sup>3</sup>		
Phenol (less than 1.0 µg/L)			X						X
Xylenes (less than 1.750 mg/L)	X	X	X	X	X		X <sup>3</sup>		X

## Notes:

1. In waters designated as "COLD" (waters that support cold water ecosystems), the Tulare Basin Plan specifically mentions that total identifiable chlorinated hydrocarbon pesticides shall not be present at detectable concentrations.
2. These maximum allowable concentrations are not to be exceeded more than once in a 3-year period.
3. The direct or indirect discharge of chlorpyrifos or diazinon in to the Sacramento and Feather Rivers is prohibited if, in the previous measurement year (e.g. July 2012–June 2013), any exceedance of the chlorpyrifos or diazinon water quality objectives or loading capacities occurred (unless the discharge is subject to a waiver of waste discharge requirements implementing the chlorpyrifos or diazinon water quality objectives and load allocations for the chemicals in the Sacramento and Feather Rivers, or is governed by individual or general waste discharge requirements. Also, these prohibitions apply only to dischargers causing or contributing to the exceedance of the water quality objective or loading capacity).
4. The direct or indirect discharge of chlorpyrifos or diazinon into the San Joaquin River is prohibited during the dormant season (December 1 through March 1) if any exceedance of the chlorpyrifos or diazinon water quality objectives or loading capacities occurred during the previous dormant season. Also, direct or indirect discharge of chlorpyrifos or diazinon into the San Joaquin River is prohibited during the irrigation season (March 2 through November 30) if any exceedance of the chlorpyrifos or diazinon water quality objectives or loading capacities occurred during the previous irrigation season. (These prohibitions apply only to dischargers who discharge the pollutant causing or contributing to the exceedance of the water quality objective or loading capacity; and dischargers located in sub-areas which do not meet their allocations. The prohibitions do not apply if the discharge of chlorpyrifos or diazinon is subject to a waiver of waste discharge requirements implementing the chlorpyrifos or diazinon water quality objectives and load allocations for chlorpyrifos or diazinon in the San Joaquin River, or is governed by individual or general waste discharge requirements.)
5. The direct or indirect discharge of chlorpyrifos or diazinon into the Delta Waterways is prohibited during the dormant season (December 1 through March 1) if any exceedance of the chlorpyrifos or diazinon water quality objectives or loading capacities occurred during the previous dormant season. Also, direct or indirect discharge of chlorpyrifos or diazinon into the Delta Waterways is prohibited during the irrigation season (March 2 through November 30) if any exceedance of the chlorpyrifos or diazinon water quality objectives or loading capacities occurred during the previous irrigation season. (These prohibitions do not apply in the following situations if the discharge of chlorpyrifos or diazinon is subject to a waiver of waste discharge requirements implementing the chlorpyrifos or diazinon water quality objectives and load allocations for chlorpyrifos or diazinon in the Delta Waterways, or is governed by individual or general waste discharge requirements, nor do they apply to direct or indirect discharges to the Sacramento or San Joaquin Rivers upstream from the legal boundary of the Delta, which is defined in Section 12220 of the California Water Code. Furthermore, these prohibitions only apply to dischargers causing or contributing to

Water Quality Standard	Regional Water Quality Control Board, by Number								
	1	2	3	4	5	6	7	8	9
the exceedance of the water quality objective or loading capacity.)									
6.	In the Mojave Hydrologic Unit, the concentration of xylene outside of project boundaries shall not exceed the detection levels for the compounds at any time, and the concentration of naphthalene outside of project boundaries shall not exceed 25 µg/L at any time.								
7.	The Water Quality Control Plan for the Colorado River Basin also provides information for specific areas within the Regional boundary. In the case of the New River, waters of the River shall be free of pesticides in concentrations which could cause harmful effects to human life, fish, and wildlife. Herbicide spraying in irrigation canals must be conducted in coordination with the county agricultural commissioner, California Department of Fish and Wildlife, and the California Department of Health Care Services/California Department of Public Health. In canals used for domestic supply, no herbicides shall be applied in concentrations which are toxic or otherwise harmful to humans; also no herbicides shall be applied in concentrations that are toxic or otherwise harmful to aquatic life, except that herbicides may be used in cases where the herbicide only affects the targeted species, is a legally registered product, and is used in accordance with label requirements and in accordance with all applicable laws and regulations.								
8.	The RWQCB has established a threshold of 20 Color Units for inland surface waters, which shall not be exceeded more than 10 percent of the time during any 1-year period.								
9.	Inland surface waters shall not contain any odors for listed waterbodies in the Plan (Table 3-2 in the San Diego Basin Water Quality Control Plan); for all others, the secondary drinking water standard for odor is three odor units.

### ***Irrigated Lands Regulatory Program (Ag Waivers)***

To prevent agricultural discharges from impairing the waters that receive these discharges, the Irrigated Lands Regulatory Program (ILRP) regulates discharges from irrigated agricultural lands. This program also is referred to as Ag Waivers. This is done by issuing WDRs or conditional waivers of WDRs (Orders) to growers. Discharges from agricultural lands include irrigation return flow, flows from tile drains, and stormwater runoff. These discharges can affect water quality by transporting pesticides and other pollutants. To control and assess the effects of discharges from irrigated agricultural lands, the Los Angeles, Central Coast, Central Valley, and San Diego RWQCBs have adopted comprehensive conditional waivers. The Colorado River Basin and North Coast RWQCBs have adopted Conditional Prohibitions as a TMDL implementation plan incorporated into their respective Basin Plans. The Santa Ana RWQCB is in the initial phase of developing an irrigated lands regulatory program. The San Francisco Bay and Lahontan RWQCBs have no immediate plans to adopt waivers for agricultural discharges, but may do so eventually to implement TMDLs.

Because of the differences in how the RWQCBs address dealing with discharges from irrigated lands, the Ag Waiver process differs, depending on which RWQCB has jurisdiction over the land. (SWRCB 2014) Each RWQCB must evaluate its program every five years. The Ag Waivers typically requires growers to obtain education on water quality issues, participate in monitoring plans, and implement BMPs that are applicable to their region and farm size.

The Irrigated Lands Regulatory Program is applicable to agricultural operations that may conduct activities under the Proposed Program. Individual growers subject to quarantines will be required to comply with regulations of irrigated agricultural lands when conducting any pesticide applications in response to quarantines.

## **O.8 Energy Regulatory Setting**

Federal and State agencies regulate energy consumption through various policies and programs. Federal agencies such as the U.S. Department of Energy, U.S. Department of Transportation (DOT), and the U.S. Environmental Protection Agency (EPA) affect energy consumption in the United States by setting fuel economy standards and energy efficiency requirements for consumer appliances.

### **O.8.1 Federal Regulations**

#### ***Energy Policy and Conservation Act***

The Energy Policy and Conservation Act of 1975 required that all vehicles sold in the U.S. meet certain fuel economy goals. The act gave the National Highway Traffic and Safety Administration (NHTSA, part of DOT) authority to establish additional vehicle standards and revise existing standards. NHTSA set the fuel economy standard for new passenger cars at 27.5 miles per gallon (mpg) in 1990, and 20.7 mpg for new light trucks in 1996. Heavy-duty vehicles (i.e., vehicles and trucks over 8,500 pounds gross vehicle weight) currently are not subject to fuel economy standards. The Corporate Average Fuel Economy (CAFE) program, administered by EPA, was created to determine vehicle manufacturers'

compliance with the fuel economy standards. EPA calculates a value for each manufacturer based on city and highway fuel economy test results and vehicle sales. Based on the information generated under the CAFE program, DOT is authorized to assess penalties for noncompliance.

### ***Renewable Fuel Standard Program***

The national Renewable Fuel Standard (RFS) program was developed to increase the volume of renewable fuel that is blended into transportation fuels. As required by the Energy Policy Act of 2005, EPA finalized RFS program regulations, effective September 1, 2007. The Energy Independence and Security Act of 2007 increased and expanded this standard. By 2022, 36 billion gallons of renewable fuel must be used per year. A certain percentage of the renewable fuel blended into transportation fuels must be cellulosic biofuel, biomass-based diesel, and advanced biofuel. Cellulosic biofuel is defined as any renewable fuel derived from cellulose, hemicellulose, or lignin that achieves a 60 percent greenhouse gas (GHG) emissions reduction. Biomass-based diesel is defined as a renewable transportation fuel, transportation fuel additive, heating oil, or jet fuel that meets the definition of either biodiesel or non-ester renewable diesel, and achieves a 50 percent GHG emissions reduction. If intended for use in a motor vehicle, it also must be registered with EPA as a motor vehicle fuel or fuel additive. Renewable fuel that is co-processed with petroleum is not considered biomass-based diesel. Advanced biofuel is defined as any renewable fuel, other than ethanol derived from corn that achieves a 50 percent GHG emissions reduction.

Each year, EPA determines the Renewable Volume Obligation (RVO) for parties required to participate in the RFS program. This standard is calculated as a percentage, by dividing the amount of renewable fuel (gallons) required by the RFS to be blended into gasoline for a given year by the amount of gasoline/transportation fuel expected to be used during that year. Any party that produces gasoline for use in the United States, including refiners, importers, and blenders (other than oxygenate blenders), is considered an obligated party under the RFS program. Parties that do not produce, import, or market fuels within the 48 contiguous states are exempt from the renewable fuel tracking program.

To facilitate and track compliance with the RFS, a producer or importer of renewable fuel must generate Renewable Identification Numbers (RINs) to represent renewable fuels, produced or imported by the entity on or after September 1, 2007, assigned by gallon or batch. Assigned RINs are transferred when ownership of a batch of fuel occurs, but not when fuel only changes custody. A trading program is in place to allow obligated parties to comply with the annual RVO requirements through the purchase of RINs. Obligated parties must register with EPA to participate in the trading program. For each calendar year, an obligated party must demonstrate that it has sufficient RINs to cover its RVO. RINs may be used only for compliance purposes in the calendar year that they are generated or the following year. Obligated parties must report their ownership of RINs to EPA's Office of Transportation and Air Quality on a quarterly and annual basis.

### ***Corporate Average Fuel Economy***

CAFE standards are federal regulations that are set to reduce energy consumed by on-road motor vehicles. On May 19, 2009, President Obama presented a new national fuel economy program that adopts uniform federal standards to regulate both fuel economy and GHG

emissions. Recently issued rules include fuel economy standards for both light- and heavy-duty vehicles. On September 15, 2011, EPA and NHTSA issued a final rule of Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles model years 2014 to 2018 (76 Federal Register [FR]. 57106), intended to achieve between a 10 and 20 percent increase in fuel economy, depending on vehicle class. On August 28, 2012, EPA and the NHTSA issued a joint Final rulemaking to establish 2017 through 2025 GHG emissions and CAFE standards for light-duty vehicles (77 FR 62624), with a fuel economy equivalent to 54.5 mpg.

### O.8.2 State Regulations

#### ***California Environmental Quality Act***

Appendix F of the CEQA Guidelines describes the energy conservation information and analyses that should be included in an EIR. Energy conservation is defined in terms of decreased reliance on natural gas and oil, decreased per capita energy consumption, and increased reliance on renewable energy sources. An EIR should include a discussion of potentially significant energy impacts of the proposed project, with emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

#### ***Integrated Energy Policy Report***

The California Energy Commission (CEC) identifies emerging trends in energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy in the Integrated Energy Policy Report. The 2013 report discusses the need for increased energy efficiency, improved demand response efforts for electricity supply reliability, electricity supply including use of bioenergy and nuclear power, strategic transmission investment planning, use of natural gas, transportation energy trends, and climate change (CEC 2013).

#### ***Pavley Rule [Assembly Bill 1493]***

In California, the Pavley Rule regulations for automobile efficiency are expected to reduce GHG emissions from California passenger vehicles by about 22 percent in 2012 model year vehicles and about 30 percent in 2016 model year vehicles, while improving fuel efficiency and reducing motorists' costs.

#### ***Low Carbon Fuel Standard***

California's Low Carbon Fuel Standard (LCFS) program requires a reduction in the carbon intensity of transportation fuels that are sold, supplied, or offered for sale in the state by a minimum of 10 percent by 2020. The California Air Resources Board (CARB) regulations require transportation fuel producers and importers to meet specified average carbon intensity requirements for fuel. In the regulations, carbon intensity reductions are based on reformulated gasoline mixed with 10 percent corn-derived ethanol and low-sulfur diesel fuel. Liquefied petroleum gas (propane) is exempt from LCFS requirements, as are non-biomass-based alternative fuels that are supplied in California for use in transportation at an aggregated volume of less than 3.6 million gasoline gallon equivalents per year. Other exemptions apply for transportation fuel used in specific applications. The LCFS program allows producers and importers to generate, acquire, transfer, bank, borrow, and trade

credits. Fuel producers and importers that are regulated under the LCFS must meet quarterly and annual reporting requirements. (Title 17 California Code of Regulations, Section 95480–95490; Executive Order S-01-07, 2007; and California Health and Safety Code, 38500–38599).

### ***Vehicle Acquisition and Petroleum Reduction Requirements***

The California Department of General Services (DGS) is responsible for maintaining specifications and standards for passenger cars and light-duty trucks that are purchased or leased for State office, agency, and department use. These specifications include minimum vehicle emissions standards and encourage the purchase or lease of fuel-efficient and alternative fuel vehicles (AFVs). On an annual basis, DGS must compile information including the number of AFVs and hybrid electric vehicles acquired, the locations of the alternative fuel pumps available for those vehicles, and the total amount of alternative fuels used.

Vehicles the State owns or leases that are capable of operating on alternative fuel must operate on that fuel unless the alternative fuel is not available. In addition, the California State and Consumer Services Agency, in consultation with DGS and other appropriate State agencies, must develop, implement, and submit to the California Legislature and governor a plan to increase the state fleet's use of alternative fuels, synthetic lubricants, and fuel-efficient vehicles. This must be done by reducing or displacing the fleet's consumption of petroleum products by 20 percent by January 1, 2020, as compared to the 2003 consumption level. DGS also must do the following (Executive Order S-14-2009 and Public Resources Code, 25722.5–25722.9):

- Take steps to transfer vehicles between agencies and departments so that the most fuel-efficient vehicles are used and the least fuel-efficient vehicles are eliminated from the State's motor vehicle fleet;
- Submit annual progress reports to the California Department of Finance, related legislative committees, and the general public via the DGS website;
- Encourage other agencies to operate AFVs on the alternative fuel for which they are designed, to the extent feasible;
- Encourage the development of commercial fueling infrastructure at or near State vehicle fueling or parking sites; and
- Work with other agencies to incentivize and promote State employee use of AFVs through preferential or reduced-cost parking, access to electric vehicle charging, or other means, to the extent feasible.

### ***Zero Emission Vehicle Promotion Plan***

All state agencies must support and facilitate the rapid commercialization of zero emission vehicles (ZEVs) in California. In particular, CARB, the CEC, the Public Utilities Commission, and other relevant State agencies must work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership, to establish benchmarks for achieving targets for ZEV commercialization. These targets include:

- By 2015, all major metropolitan areas in California will be able to accommodate ZEVs and have infrastructure plans and streamlined permitting in place;
- By 2020, the State will have established adequate infrastructure to support one million ZEVs;
- By 2025, 1.5 million ZEVs will be on the road in California, and clean, efficient vehicles will displace 1.5 billion gallons of petroleum fuels annually; and
- By 2050, GHG emissions from the transportation sector will be 80 percent less than 1990 levels.

The ZEV promotion plan also directs the State fleet to increase the number of ZEVs in the fleet through gradual vehicle replacement. By 2015, ZEVs should make up at least 10 percent of fleet light-duty vehicle (LDV) purchases, and by 2020, at least 25 percent of fleet LDV purchases should be ZEVs. Vehicles with special performance requirements necessary for public safety and welfare are exempt from this requirement. (Executive Order B-16, 2012)

### ***Tire Inflation Requirement***

CARB enforces regulations to reduce GHG emissions from vehicles operating inefficiently with under inflated tires. These regulations apply to vehicles with a gross vehicle weight rating of 10,000 pounds or less. Automotive service providers performing or offering to perform automotive maintenance or repair services in the state must do the following (Title 17, California Code of Regulations, Section 95550):

- Check and inflate vehicle tires to the manufacturer-recommended tire pressure rating, with air or nitrogen as appropriate, using a tire pressure gauge with a total permissible error of no more than plus/minus 2 pounds per square inch, when performing maintenance or repair;
- Indicate on the vehicle service invoice that a tire inflation service was completed and specify the resulting pressure measurements;
- Have access to a tire inflation reference, published within the last 3 years; and
- Keep a copy of the service invoice for at least 3 years and make the invoice available to ARB or an authorized representative on request.

### ***Fleet Emissions Reduction Requirements – South Coast***

The South Coast Air Quality Management District (SCAQMD) requires government fleets and private contractors that are under contract with public entities to purchase non-diesel, lower emission, and alternative fuel vehicles. The rule applies to transit bus, school bus, refuse hauler, and other vehicle fleets of at least 15 vehicles that operate in Los Angeles, San Bernardino, Riverside, and Orange counties. (SCAQMD Rules, 1186.1 and 1191-1196)

# Appendix P

---

## Mitigation Reporting Program

## Introduction

The Proposed Program would involve implementation of a number of mitigation measures to reduce potentially significant environmental effects identified in the environmental analysis (see Volume 1, Chapter 6). These mitigation measures are listed in Tables C-2 through C-4 in Appendix C, CEQA Tiering Strategy, as they apply to physical, biological, and chemical management activities under the Proposed Program. The mitigation measures are also summarized in Attachment 2 to Appendix C.

As many of the activities proposed under the Proposed Program would be carried out by entities besides CDFA, CDFA would not monitor implementation of mitigation measures itself. Rather, CDFA would establish a mitigation reporting program and rely on reporting from those entities implementing mitigation measures on the ground (including CDFA, as applicable). Section 15097 (a) of the State CEQA Guidelines states: "A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity which accepts the delegation; however, until mitigation measures have been completed the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program." Section 15097 (c) states: "The public agency may choose whether its program will monitor mitigation, report on mitigation, or both."

This appendix describes the mitigation reporting program for the Proposed Program. Two key components of the overall mitigation reporting program would be the application of the CEQA Tiering Strategy and the development and execution of compliance agreements, contracts, permits and other agreements.

## CEQA Tiering Strategy

As described in Appendix C, the CEQA Tiering Strategy is a tool designed to assist CDFA staff in determining (1) the extent to which a specific activity has been evaluated in the PEIR; (2) the management practices (MPs), mitigation measures, and other requirements from the PEIR to apply to each activity; and (3) the level and focus of any additional CEQA analysis (and related documentation) that may be necessary before beginning the activity. The Tiering Strategy includes a series of questions and steps to enable CDFA staff to determine if proposed activities have been evaluated in the PEIR, and, if so, what the applicable PEIR requirements are for those activities (see Tables C-2 through C-4 in Appendix C).

With respect to mitigation reporting, CDFA would use the CEQA Tiering Strategy and the Tiering Strategy Checklist (see Attachment 1) to identify MPs and mitigation measures for inclusion in compliance agreements, permits, contracts, grants, or other similar means. MPs and mitigation measures identified through the tiering strategy would be written into such agreements and would thus be binding conditions. Compliance agreements, contracts and other contractual agreements are discussed in more detail below. The Tiering Strategy Checklist also includes a section where CDFA staff can verify that mitigation measures have been complied with, documenting CDFA's completion of its obligation to ensure that implementation of the mitigation measures has occurred in accordance with the program.

## Contractual Agreements

As described in Volume 1, Chapter 2, Proposed Program Description, CDFA may enter into agreements with growers or other public or private entities to carry out Proposed Program activities. These agreements may include compliance agreements with regulated entities within quarantine areas (e.g., to treat commodities to standards described in quarantine regulations before moving them outside the quarantine area); contracts with city and county government, non-profit organizations, or other entities (e.g., to conduct detection, eradication or other management activities), or permits (e.g., to move certain materials outside of quarantine areas). In addition to listing the applicable PEIR requirements (i.e., MPs and mitigation measures) for the subject activities, contractual agreements would clearly describe the contractee's responsibilities for implementing and reporting those requirements.

Any grower, city or county government, or other entity that entered into such an agreement with CDFA would have to sign the document to indicate that they intend to implement all PEIR requirements included in the agreement. Upon completion of the activities authorized under the agreement, the same party would have to sign an additional document indicating that they have implemented all PEIR requirements included in the agreement. Submission of the signed documents to CDFA would constitute mitigation reporting for the purposes of CEQA, allowing CDFA to sign off on the Tiering Strategy Checklist.

## Mitigation Reporting Program

The mitigation reporting program for the Proposed Program would encompass the processes described above for identifying applicable PEIR requirements through use of the CEQA Tiering Strategy, inclusion of applicable requirements into contractual agreements, and obtaining signed copies of agreements indicating requirements were adhered to/implemented. This program would be in compliance with Section 21081.6 of the CEQA Statute and Section 15097 of the CEQA Guidelines.

## Attachment 1 – CEQA Tiering Checklist

Start Date:	
Project Leader:	
Description of Activity:	
Activity Surroundings (Residential, agriculture, mixed use, other regulated entities):	

### Part A

	<b>Response</b>	<b>Justification/Rationale</b>
Is the proposed activity under CDFA's discretion?		
Is the activity described in the PEIR?		(If the Response is "Partially" or "No" skip to Part C)

### Part B

		<b>Check Applicable Requirements</b>
<b>General Requirements</b>		
Conduct activity as described in Chapters 2 and 3 of PEIR		
Include applicable PEIR requirements in Compliance Agreements with regulated entities, based on the activities the regulated entities may conduct in response to quarantine		
<b>Activity Site Specific Review</b>		
<b>Database</b>	<b>Date Reviewed</b>	<b>Mitigation If Any</b>
California Natural Diversity Database		
303(d) List of Impaired Waters		
EnviroStor Hazardous Site		
<b>Management Practices</b>		
<b>MP-SPRAY-1:</b> Conduct a Site Assessment		
<b>MP-SPRAY-2:</b> Properly clean and calibrate all equipment to apply chemicals uniformly and in the correct quantities		
<b>MP-SPRAY-3:</b> Follow pesticide application laws and regulations, and label directions		
<b>MP-SPRAY-4:</b> Apply chemicals only under favorable weather conditions		
<b>MP-SPRAY-5:</b> Follow integrated pest management and drift reduction techniques		
<b>MP-SPRAY-6:</b> Clean equipment and dispose of rinse water per label directions		

	Check Applicable Requirements
<b>Management Practices</b>	
<b>MP-SPRAY-7:</b> Follow appropriate product storage procedures	
<b>MP-AERIAL-1:</b> Use appropriate aerial spray treatment procedures	
<b>MP-GROUND-1:</b> Follow appropriate ground-rig foliar treatment procedures	
<b>MP-GROUND-2:</b> Follow appropriate low-pressure backpack treatment procedures	
<b>MP-GROUND-3:</b> Train personnel in proper use of pesticides	
<b>MP-GROUND-4:</b> Enforce runoff and drift prevention	
<b>MP-HAZ-1:</b> Implement a Spill Contingency Plan	
<b>MP-HAZ-2:</b> Use safety and cleanup materials checklist	
<b>MP-HAZ-3:</b> Implement decontamination	
<b>MP-HAZ-4:</b> Follow appropriate disposal procedures	
<b>Mitigation Measures</b>	
<b>Mitigation Measure BIO-CHEM-2:</b> CDFA will obtain technical assistance from USFWS, CDFW and NMFS to identify site-specific buffers and other measures to protect habitats utilized by special-status species	
<b>Mitigation Measure HAZ-GEN-4a:</b> Determine Potential for Hazardous Materials Exposure	
<b>Mitigation Measure HAZ-GEN-4b:</b> Conduct a Hazardous Materials Records Search before Beginning Proposed Program Activities at a Given Site	
<b>Mitigation Measure HAZ-GEN-4c:</b> Stop work and implement hazardous materials investigations/remediation for contamination health risks	
<b>Mitigation Measure HAZ-CHEM-1a:</b> Conduct Public Information Sessions Regarding Pesticide Safety Practices	
<b>Mitigation Measure HAZ-CHEM-1b:</b> Conduct Training Sessions and Prepare Educational Materials Regarding Safe Handling and Application of Pesticides	
<b>Mitigation Measure HAZ-CHEM-3:</b> Require Compliance with the Proposed Program's Authorized Chemical Application Scenarios	
<b>Mitigation Measure NOISE-PHYS-1:</b> Conduct Activities during the Daytime	
<b>Mitigation Measure WQ-CHEM-2:</b> Track Emerging Water Quality Standards and Implement Additional Mitigation as Appropriate	
<b>Mitigation Measure WQ-CHEM-5:</b> Require Implementation of Proposed Program MPs as Part of Compliance Agreements	
<b>Mitigation Measure WQ-CUM-1:</b> Identify whether Proposed Program Pesticide Applications May Occur in Proximity to Impaired Waterbodies, and Implement Appropriate MPs	

**Part C**

	Y/N	Justification/Rationale
Step 1		(If yes go to Step 2, if no move to the next question)
Is the Activity substantially similar to that considered in the PEIR?		(If yes go to Step 2, if no move to the next question)
If a management practice that was not included in the PEIR is being considered, would it be equivalent or more effective to the management practice originally considered in the PEIR?		(If yes go to Step 2, if no move to the next question)
If a mitigation measure that was not included in the PEIR is being considered, would it be equivalent		(If yes go to Step 2, if no move to the next question)

or more effective to the mitigation measure originally considered in the PEIR?		
Would the activity result in potentially significant impacts which were not considered in the PEIR, not considered to be significant in the PEIR, or would be substantially more significant than disclosed in the PEIR?		(If yes go to Step 3, if no go to Step 2)
Step 2		Attach supporting documentation for determination, and CEQA Addendum, as applicable
Step 3		Attach tiered CEQA document, and identify additional requirements from that document

<b>Confirmation of Implementation (following completion of activity)</b>
