# His family and background

Az apa: báró Eötvös József (1813–1871) író, költő és államférfi. A magyar kritikai realizmus első nagy alakja, aki rajongott a nemzeti és szabadelvű törekvésekért és harcolt az ország liberális átalakulásáért, a polgári reformokért. 1848-ban az első magyar kormány vallás- és közoktatásügyi minisztere. 1867-ben, a kiegyezés után ismét betölti ezt a tisztséget. Nevéhez fűződik az általános és kötelező népoktatásról, valamint a zsidók emancipációjáról szóló törvény.

Eötvös József fiához írt leveléből: "...én azzal vigasztalom magamat, hogy te majd folytatni fogod műveimet, és így a magyar kultúrának és tudományosságának megalapítása, ha nem is az én, legalább a kettőnk nevéhez lesz köve. Kollektív dicsőségünk."

\*\*\*

The father: Baron József Eötvös (1813–1871) author, poet and statesman. The first eminent figure of Hungarian critical realism, he had a passion for national and liberal aspirations and fought for bourgeois and liberal reforms. In 1848, in the first Hungarian government, became minister of religion and education; after the compromise between the

 8. Diszputa, Lilién báró ajándéka vejeinek, Eötvös Ádáméknak

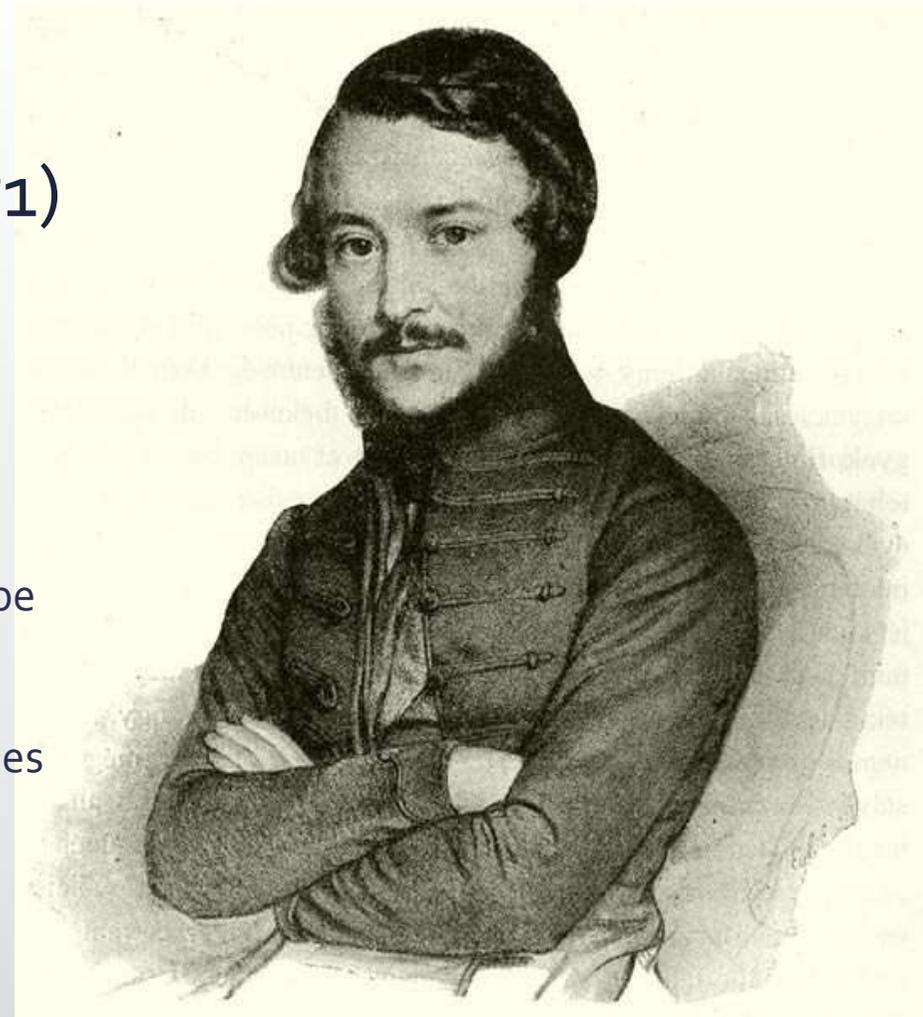

# Age of Eötvös

- 1848-1849: Revolution and independence war (against the Habsburg-dynasty)
- 1849-1867: from the revenge to the ‚Austro-Hungarian Compromise‘
- 1867-1918: Austro-Hungarian Monarchy
  - Emperor Franz-Joseph I. of Austria – King of Hungary
  - Partial independence of Hungarian State
  - Most of the 1848 (revolutionary) reform laws were restored
- The 1867 Compromise contract opened unknown dimensions of the economic growth
  - Agriculture, Industry, science, welfare

## báró Eötvös József – Baron Joseph von Eotvos (1813-1871)

- Father of Loránd Eötvös
- Writer, statesman
- Excellent education – spent many years in Western Europe
  - Germany, Switzerland, France, England
- Progressive political ideas – influential writings and articles

# báró Eötvös József – Baron Joseph von Eotvos (1813-1871)

- Main book:  
,Notary of the village'
- A novel about an  
imaginary Hungarian village  
it's people and their  
(political) problems

## 5. Loránd Eötvös und Agost Heller in Heidelberg

**Loránd Eötvös** (1848 – 1919) wünschte sich nach Abschluß eines Jurastudiums in Budapest, das er auf Wunsch seines Vaters absolvierte, ein naturwissenschaftliches Studium bei hervorragenden Professoren. Dafür kam in erster Linie Heidelberg in Frage. Hier lehrte neben Gustav Kirchhoff und Robert Bunsen auch Hermann Helmholtz. Kirchhoff und Bunsen hatten kurz zuvor mit ihren Arbeiten zur Spektralanalyse Aufsehen erregt.

In Heidelberg angelangt stürzte Eötvös sich mit Begeisterung in das ersehnte naturwissenschaftliche Studium. In einem Brief vom 24. Oktober 1867 an seine Schwester Ilona schreibt er, daß er frühmorgens um 8 Uhr sein Zimmer verläßt, erst abends um 6 zurückkehrt und dann noch die Vorlesungen ausarbeitet. Er hörte in der Woche 22 Stunden Vorlesungen, und zwar täglich „Experimentalchemie“ bei Bunsen von 9 bis 10 Uhr und von 11 bis 12 Uhr „Experimentalphysik“ bei Kirchhoff. Außerdem arbeitete er im Labor bei Bunsen, hörte einige Mathematikvorlesungen und bei Helmholtz „Allgemeine Resultate der Naturwissenschaften“.

Eötvös schrieb, das bereite ihm alles sehr viel Arbeit, aber noch mehr Freude. Am anstrengendsten war ihm das abendliche Ausarbeiten der Vorlesungen, auf das er aber sehr viel Mühe verwandte. Diesem Studieneifer verdanken wir unsere ausführlichen Kenntnisse der Kirchhoffschen Vorlesungen. Da Eötvös zunächst an ein Chemiestudium bei Bunsen dachte, hat er im Wintersemester 1867/68 die Vorlesung Bunsens viel detaillierter ausgearbeitet als Kirchhoffs Experimentalphysik. Aber die Persönlichkeit Kirchhoffs und dessen Vorlesung beeindruckten ihn so sehr, daß die Physik zu seinem Hauptinteressengebiet wurde. Mit Ausnahme des Sommersemesters 1868, das er auf Anraten Kirchhoffs bei Neumann in Königsberg verbrachte, blieb er in Heidelberg und schloß sein Studium im Sommer 1870 mit der Promotion ab.

**KIRCHHOFFS HEIDELBERGER  
VORLESUNGEN**

5. Loránd Eötvös und Agost Heller in Heidelberg
6. Die Vorlesungen über Experimentalphysik
7. Die Übungen im Physikalischen Praktikum
8. Die Vorlesungen über

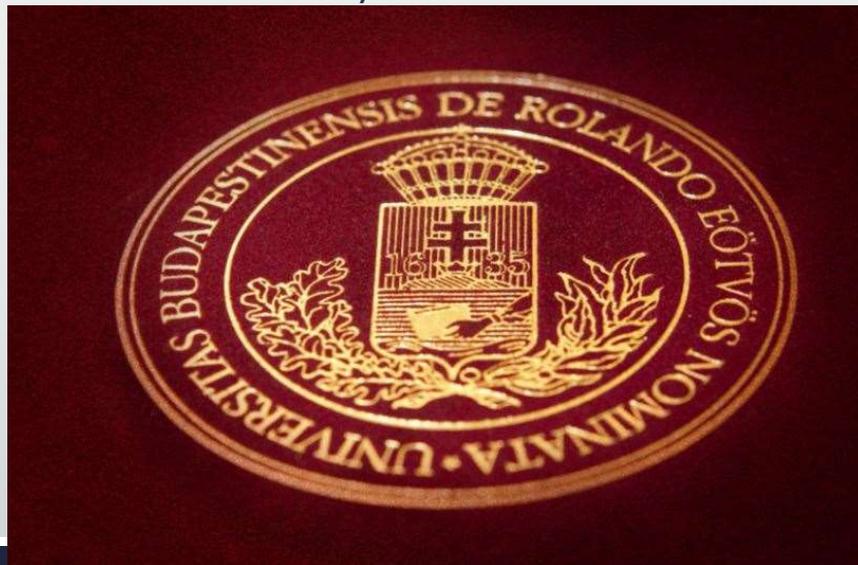

Frauenheim Aug 8, 87

# First years at the University

- 1871: His father passed away
- 1871: Theoretical Physics Lecturer at the Pest University  
(later: this University bears his name)
- 1872: Appointed professor of Theoretical Physics

# His career

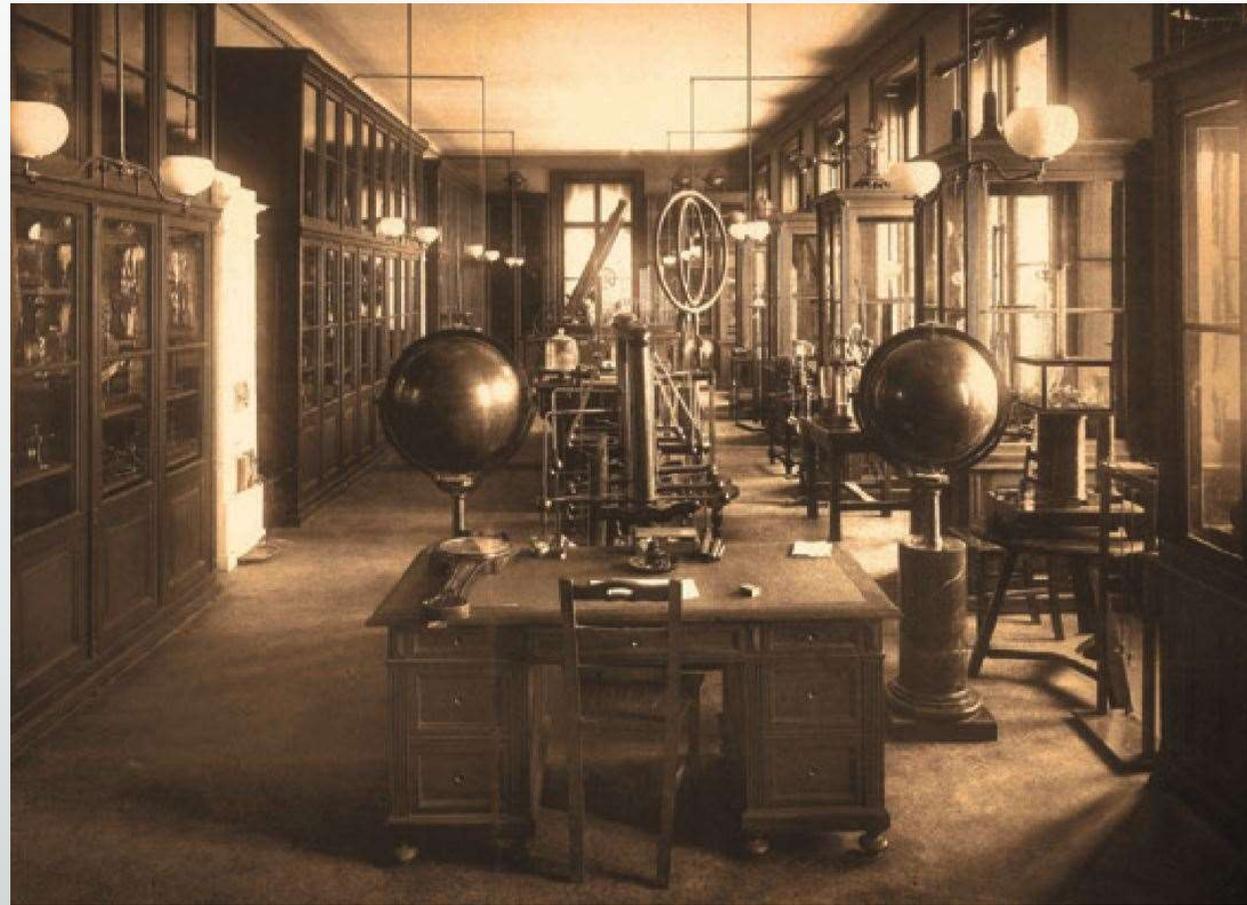

- 1873: Associate Member of the Hungarian Academy of Sciences (Age 25)

*"On Laws of Distant Effects as Implied by Oscillation Theory"*

# His career

- 1878: Director of the Institute of Physics
- 1881: International Electricity Congress (Paris)
- 1883: Elected member of the Academy (age 35)

## Scientific achievements

·DR·EÖTVÖS·LÓRÁND·BÁRÓ·

1891-92

# Honours

- The French government decorated him with the Cross of the Legion of Honour
- Saint Sava award – King of Serbia
- Franz Josef award – King of Hungary

# Honours

- Prussian Royal Academy of Sciences (Berlin) – honorary member
- Jagello University (Cracow) – honorary doctorates
- Norwegian Royal Frederick University (Christiania/Oslo) – honorary doctorates

- 1911, 1914, 1917:  
Nominated for **Nobel-prize**

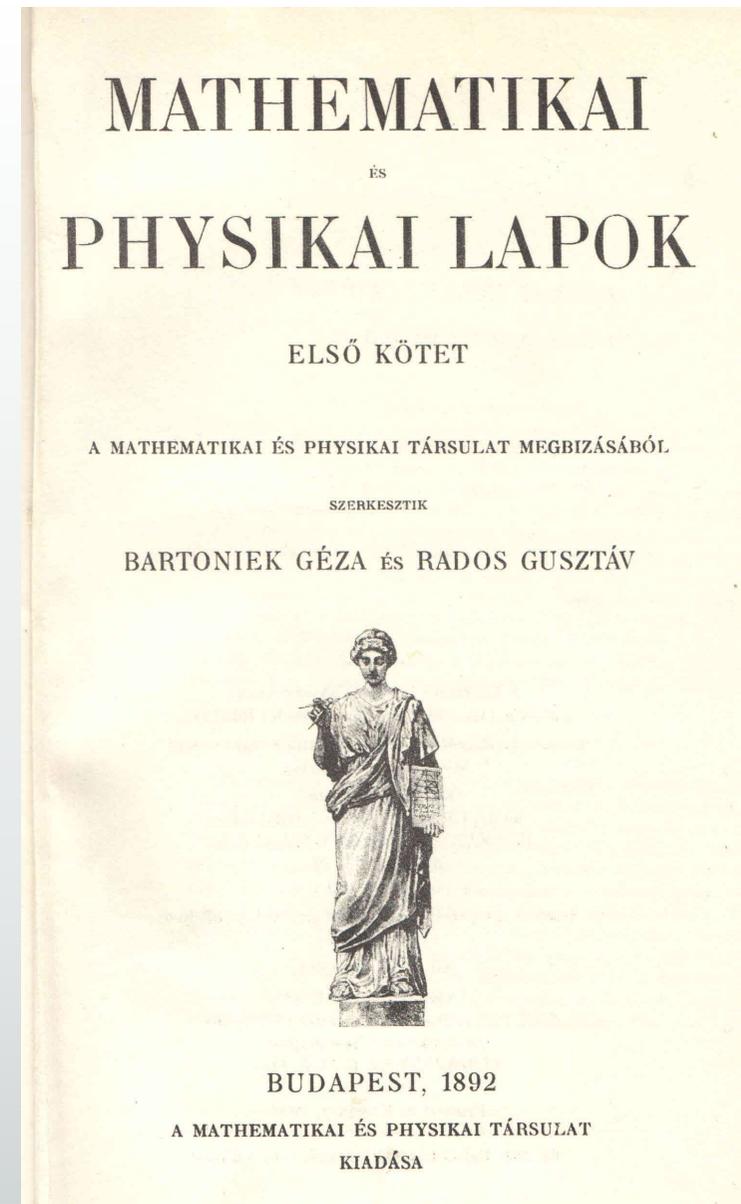

# His career

- 1889: President of the Academy (for 16 years)
  - Reforms: Open the Academy to the Public
  - Discussions, scientific presentations to the public

## His career

- 1891: Organized the Mathematical and Physical Society
  - Started the Mathematical and Physical Papers – 1892
- June 1894 – January 1895: Minister of religion and education
  - Law of freedom of religions
  - Founded the Joseph Eötvös College for poor teacher's

## His life

- 1896 Studies in the Field of Gravity and Magnetism (review)
- 1905: Resign of the Presidential position of the Hungarian Academy of Sciences to spend more time on research

# The Eötvös-College

- The new building of the Baron Eötvös József College (1911)

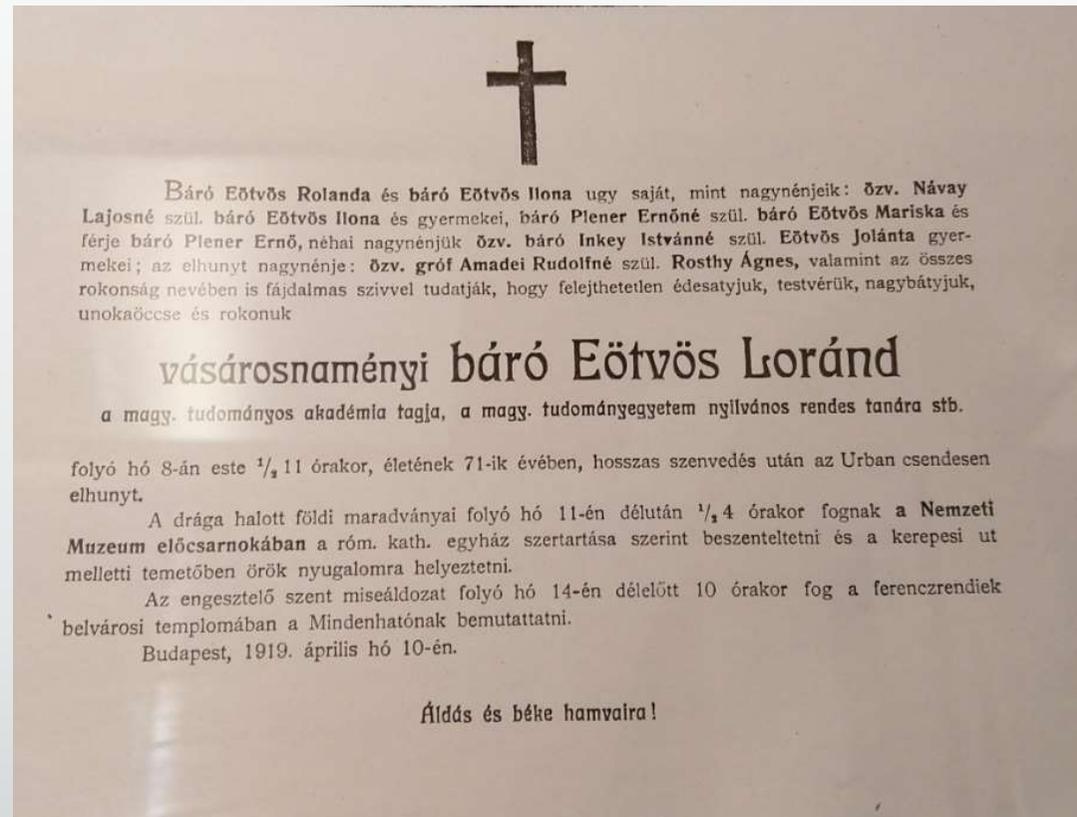

## 1919 – Final days

- 8 April 1919

„...a prince of classic physics has died”

(Albert Einstein)

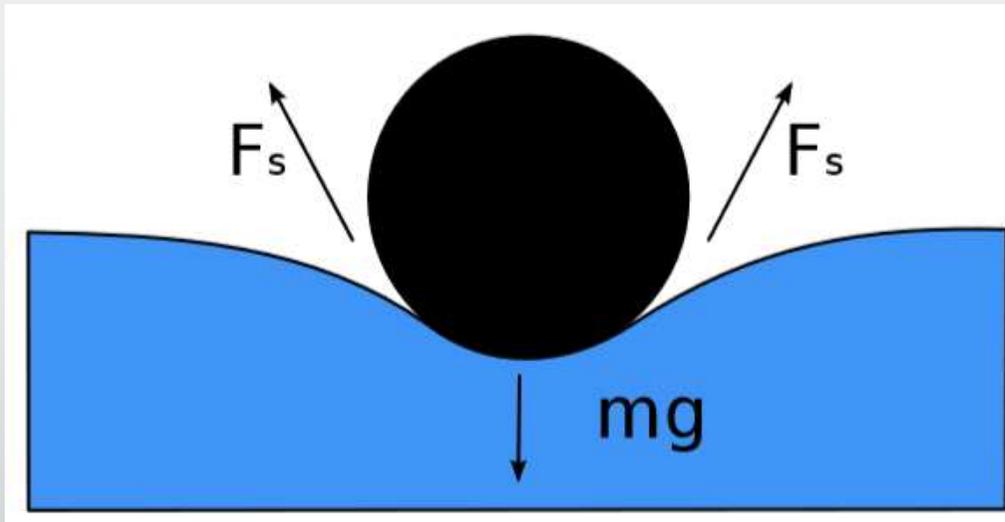

# Scientific achievements

# Eötvös in Physics

- 1875-1885: Studies in the field of capillarity:
- Reflexion method to determine the capillary constant

# Eötvös in Physics

- **The Eötvös-rule:** With increasing temperature, the surface tension of a liquid decreases until - at the critical temperature - it becomes zero.

Surface tension

The Eötvös-constant  $k = 2.1 \times 10^7 \text{ J}/(\text{K} \cdot \text{mol}^{2/3})$

$$\gamma v^{2/3} = k(T_k - T)$$

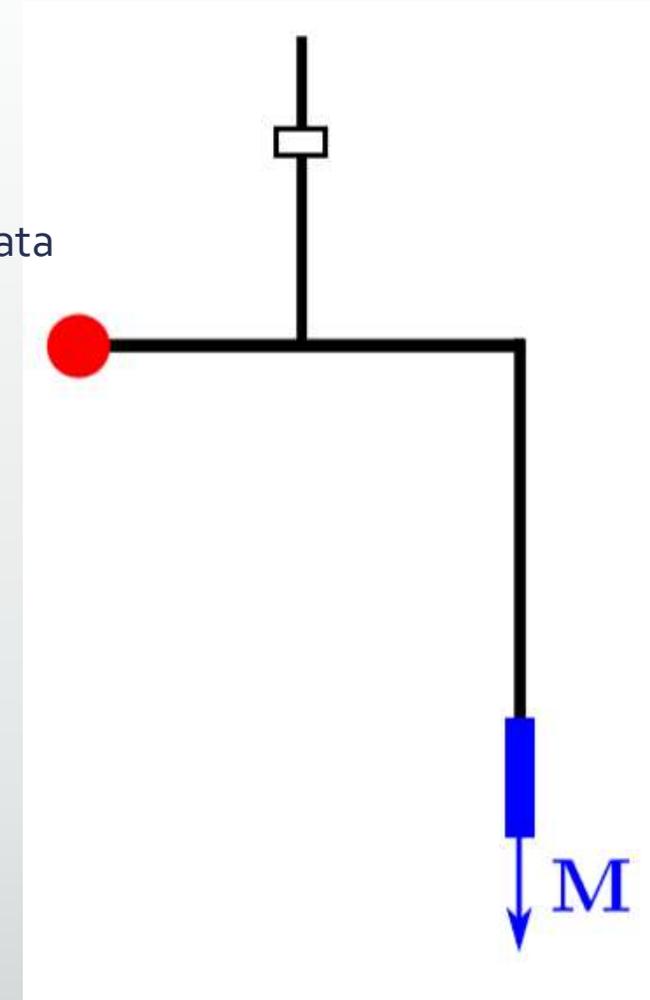

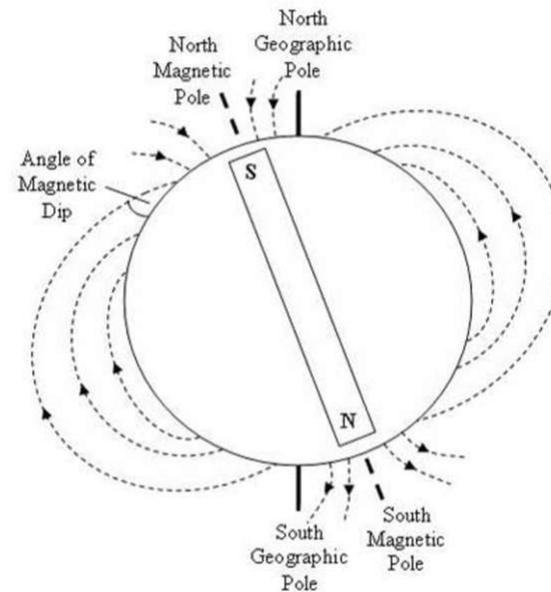

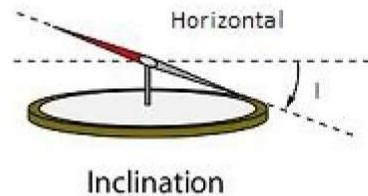

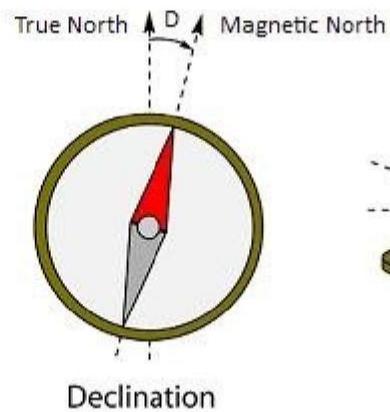

The molar volume  
of the liquids

Critical temperature

Temperature

# Eötvös in Physics

- **Magnetic translatometer by Eötvös**
- Very sensitive tool to determine the magnetic momentum of strata
- Similar to the Eötvös balance

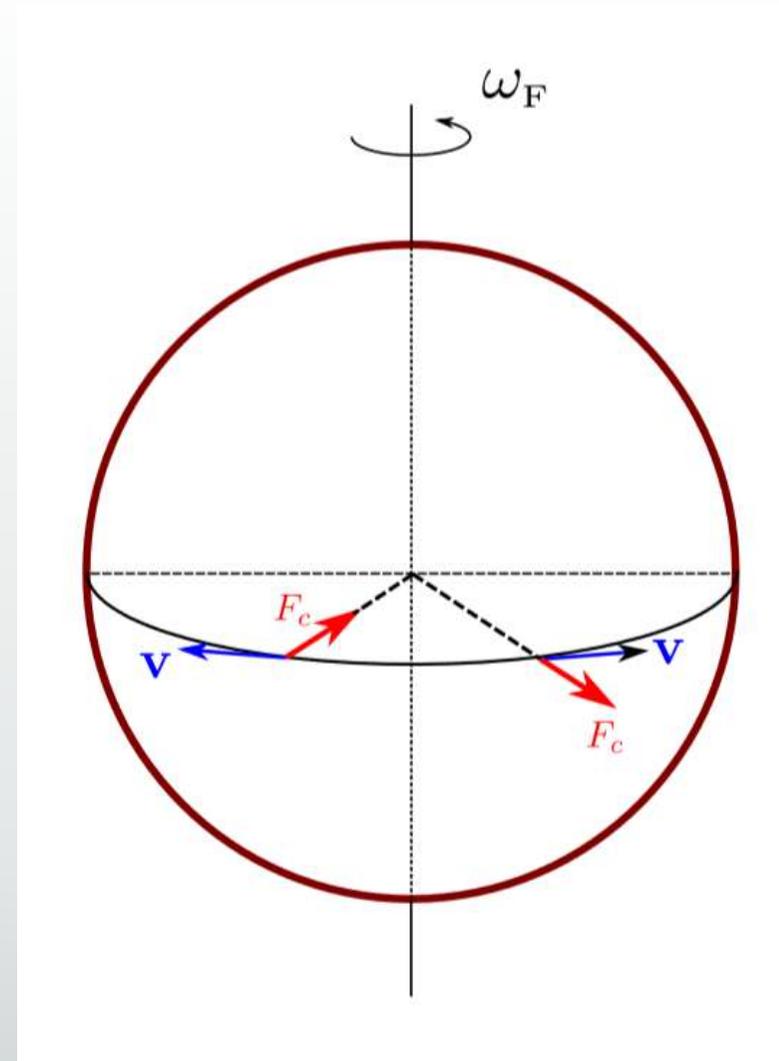

# Eötvös in Physics

- Precision tools to measure the magnetic Declination and the Inclination

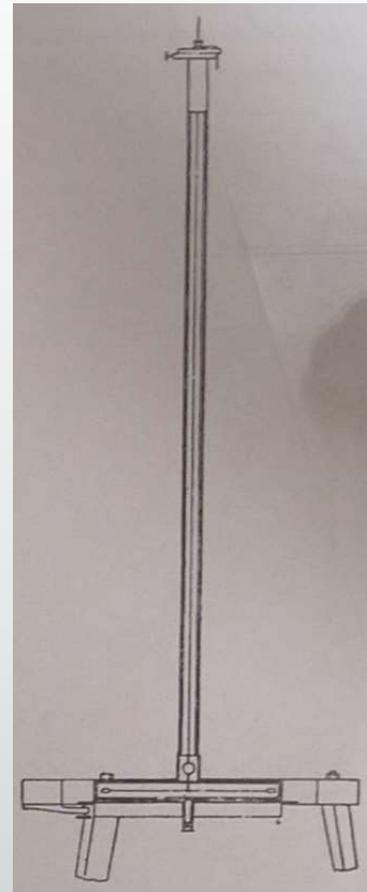

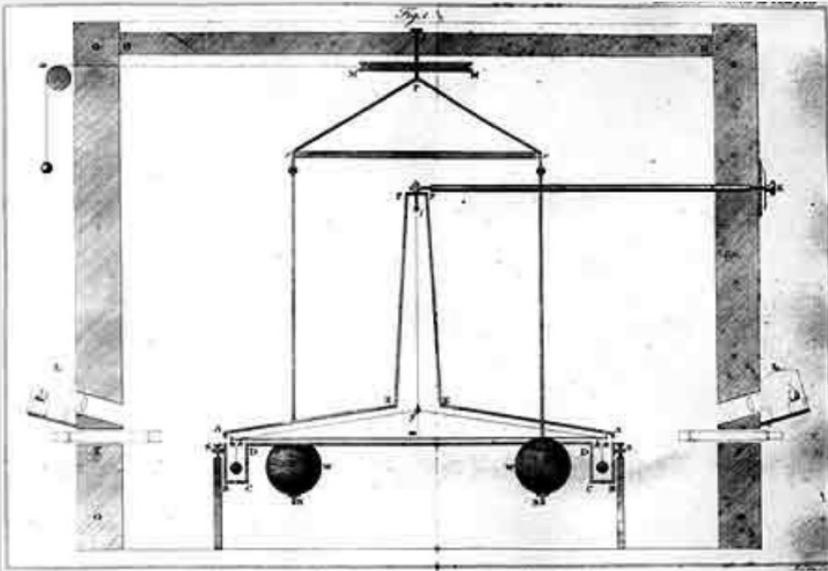

# Eötvös in Physics

- The Eötvös-effect:
- The vertical Coriolis-force lift up the things going to East
- In Budapest 100 kg man walks by 1 m/s to East
- He's weight is less by 1,5 g

# Curvature Variometer (1890)

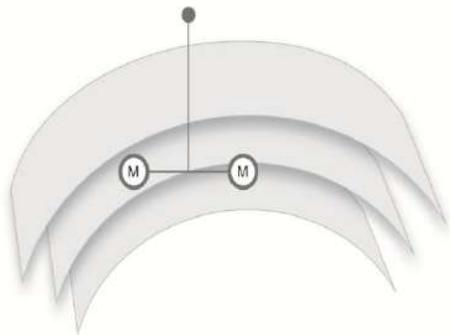

- Similar to a Coulomb-balance
- To measure the direction of the gravity field
- The masses were at the same level

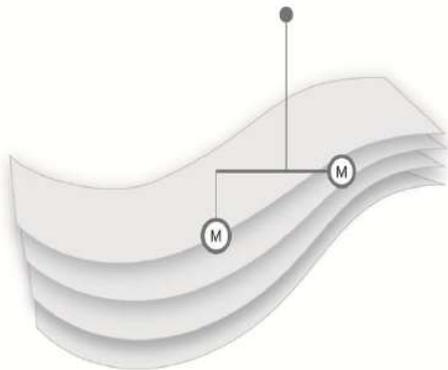

# Eötvös Torsion Balance – Horizontal Variometer (1891)

- One of the masses was at lower level than the other
- This makes the instrument sensitive to the horizontal gradient of the gravitational field

Coulomb torsion balance

Eötvös torsion balance

0,01–0,02 mm thick  
platina-, or wolfram-wire

aluminium arm

mirror

50-60 cm

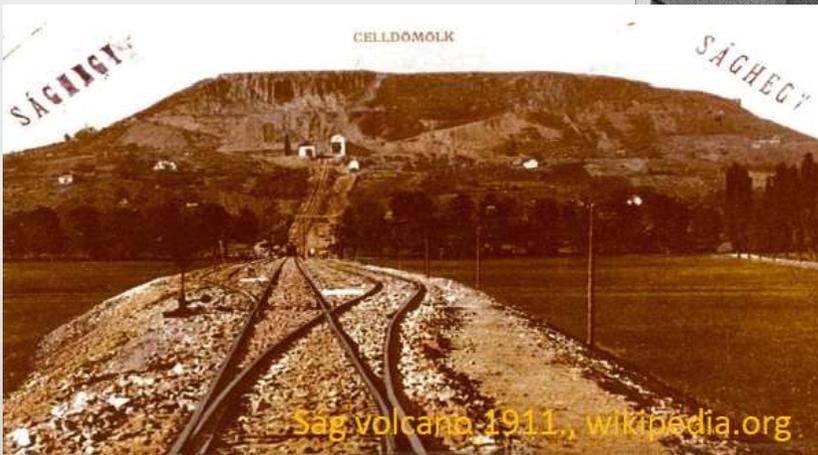

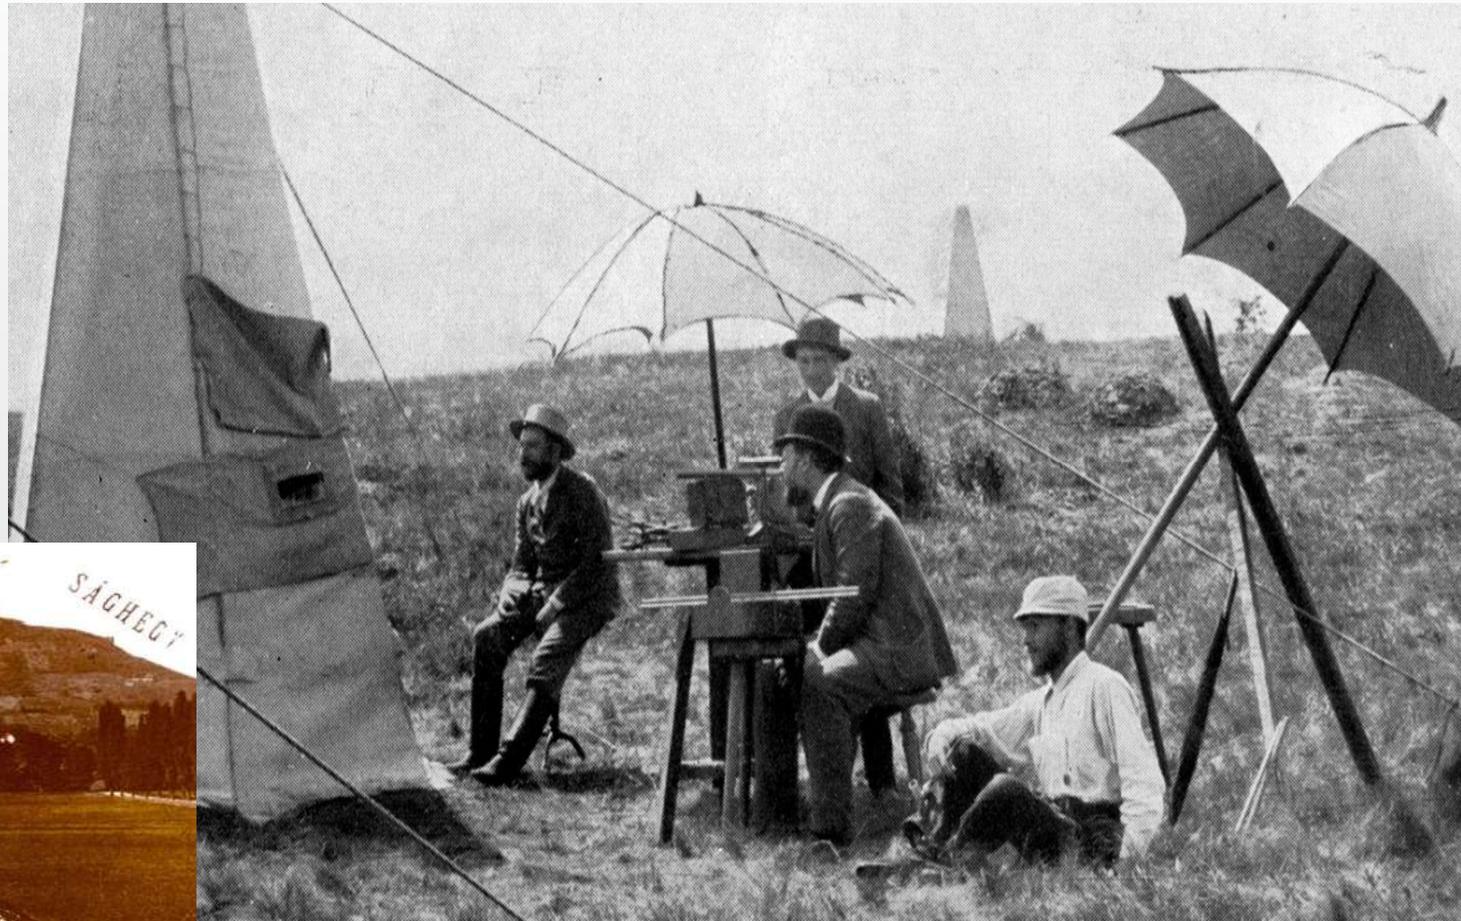

25-40 cm

platina masses  
( $m \approx 15-20$  g)

# Eötvös Torsion Balance

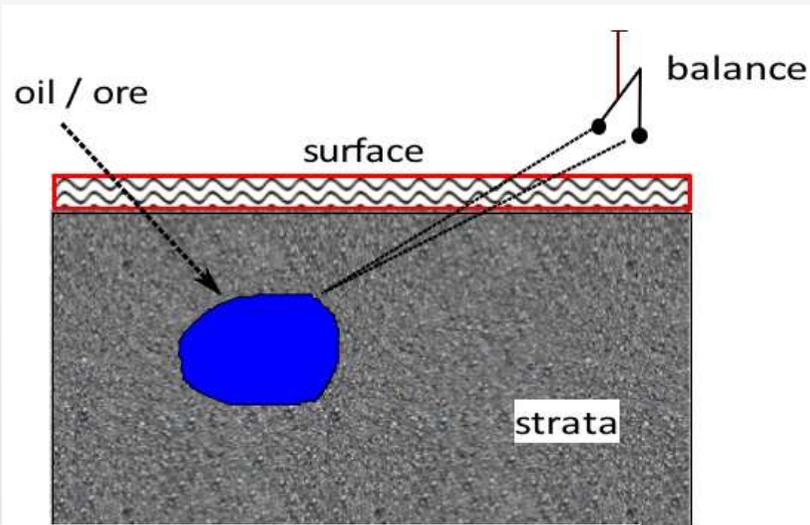

- 1891: First measurements – Ság-hill, Celldömök, Hungary
- Smaller volcanic hill
- Truncated cone shape
- Easy to calculate its mass

Ság volcano 1911., wikipedia.org

# Eötvös Torsion Balance

- The Eötvös Torsion Balance is the perfect and very precise tool to measure the local variances of the gravitational field

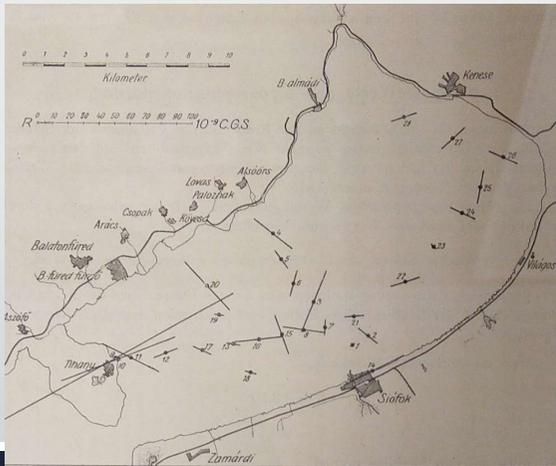

- The unit of this was named as ,Eötvös'

$$1 \text{ E} = 10^{-7} \frac{\text{Gal}}{\text{m}} = 0,1 \frac{\text{mGal}}{\text{km}} = 10^{-9} \frac{1}{\text{s}^2}$$

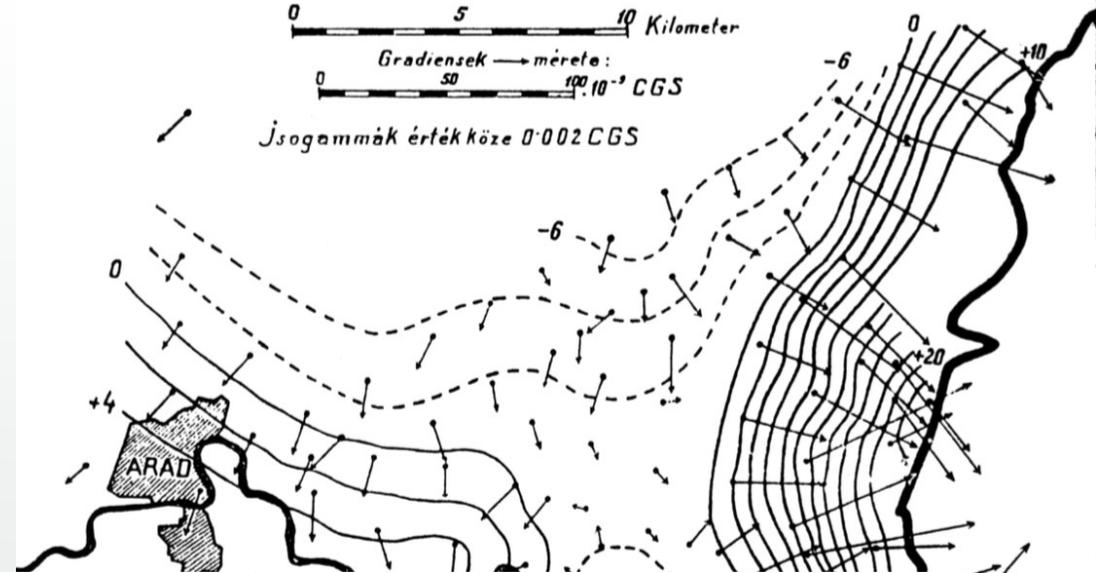

- 1901: Measurements on the frozen lake Balaton
- a 70km long lake in Hungary – ideal to measure on its surface
- (Almost) perfect geoid shape
- Discovered an underground tectonic line

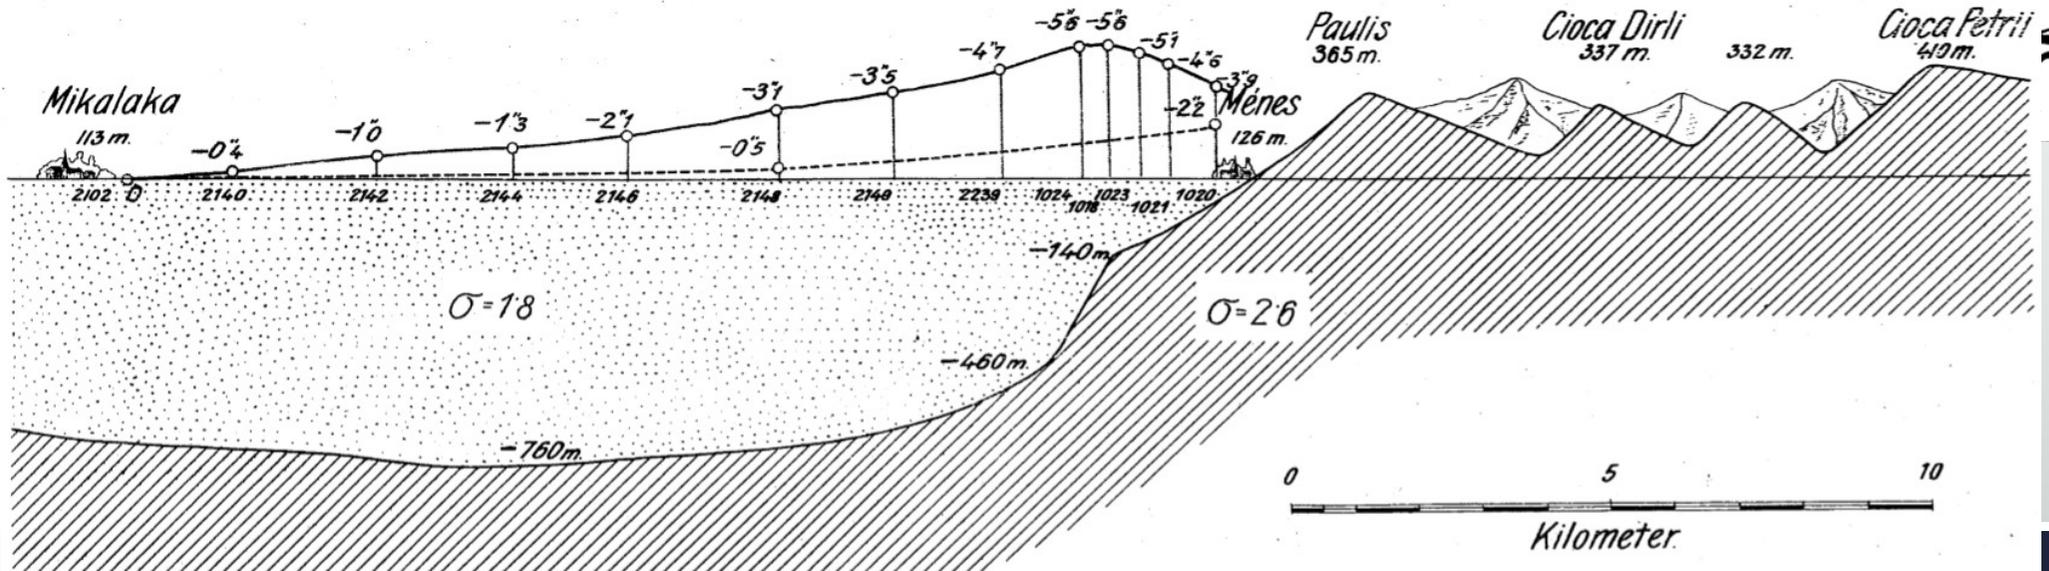

# Measurements – Arad, 1906

- The first geophysical map
- The mountains continued under the Hungarian Great Plain

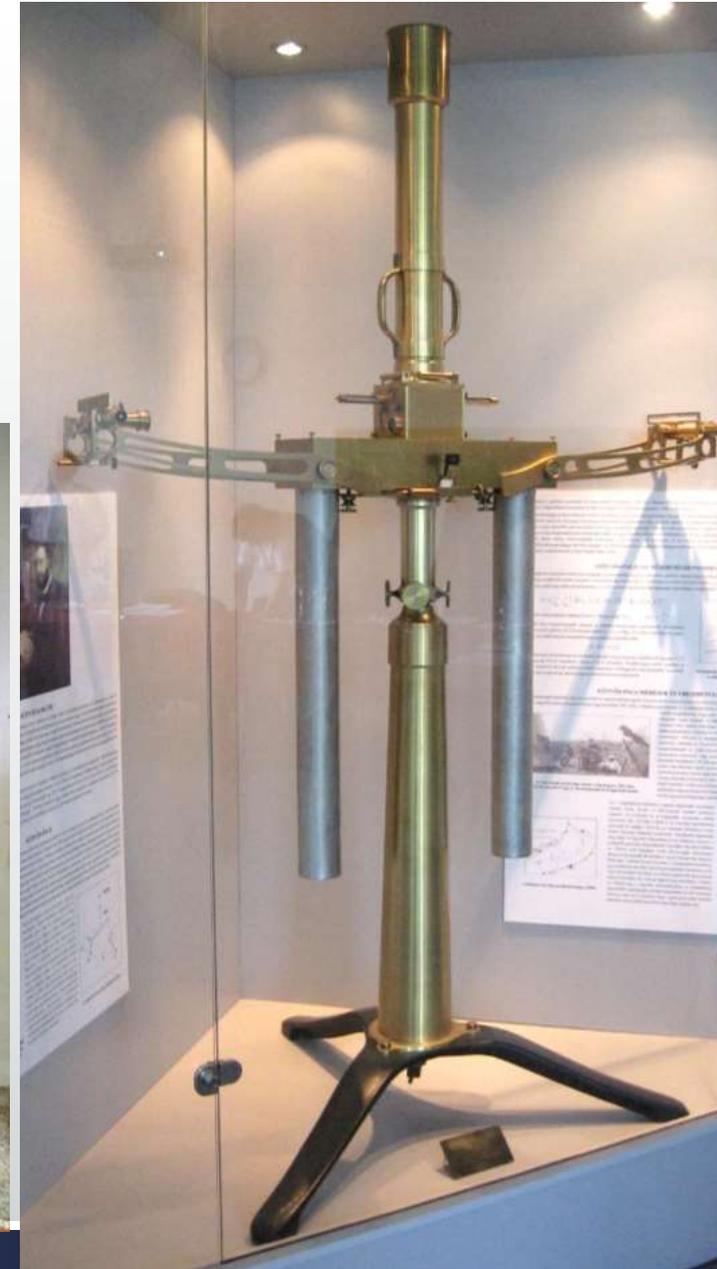

Lotabweichungen nach Osten längs des Breitenkreises von Ménes ( $\varphi = 46^\circ 8'$ ).

# Double Balance, 1902

- Two balances, rotated by  $180^\circ$
- The time of 1 measurement reduced from 100 mins to 60 mins.
- Double Small balance, 1908

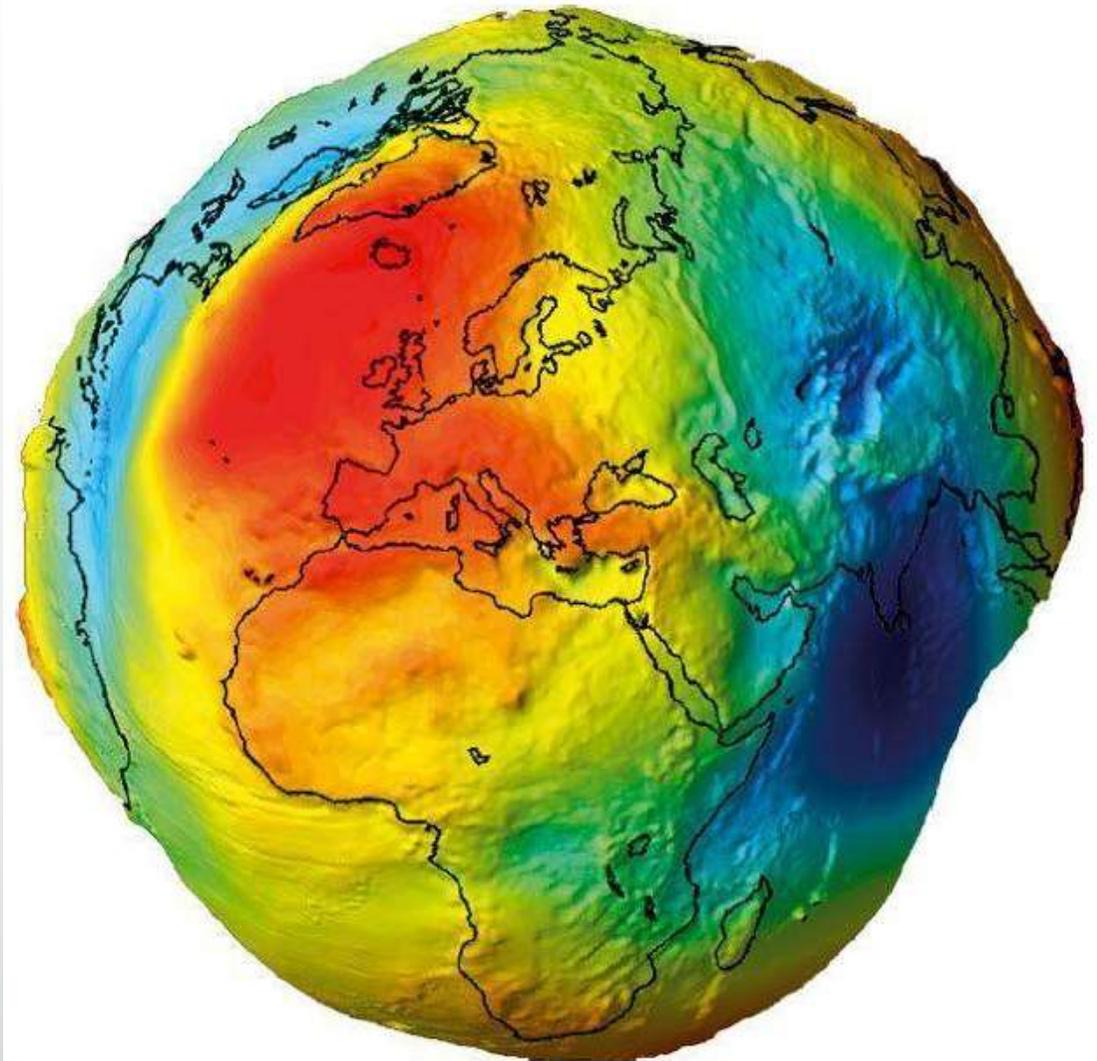

- The equipment somewhere in the Hungarian Great-plane

# Shape of Geoid

- His method was fundamental until the 1950's
- The Eötvös Balance is an effective tool for detection of underground geological formations, deposits, reservoirs or simply of buried objects
- Its perfect knowledge is inevitable in the determination of the irregular equipotential surface of the planet which is called geoid. Precise geodetic height positioning is based on the geoid modelling, and the accuracy of the GNSS positioning strongly depends on the reference frame.

# Gravimeter, 1901

- To measure the gravity of the Earth, he created a gravimeter
- He was far ahead in technology, but he wasn't satisfied with the field results of the experiments
- He didn't published his achievements
- It was the essential tool for oil-searchers until the 1940's
- „It was good enough for the industry, but not good enough for the science“

# The geophysicist

- 1906: IUGG XV.  
Conference in Budapest
- He presented his Balance
- 1907: The 1st Geophysical Institute of the World was founded in Budapest, lead by Eötvös

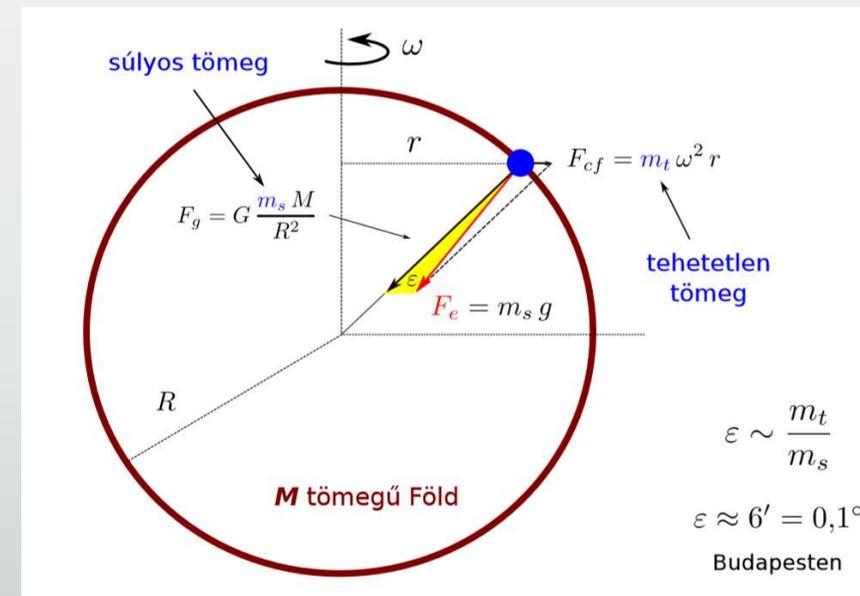

# Benecke award - 1909

- Proportionality of the inertial and the gravitational masses?
- University of Göttingen 1906 – connected to the Newton-rule
- Newton's precision (1686):  $10^{-2}$
- Bessel's precision (1832):  $10^{-5}$
- Eötvös's precision, 1889:  $10^{-8}$       1909:  $10^{-9}$
- Roll, Krotkov and Dicke (1964):  $10^{-11}$
- It was fundamental for Einstein's theory of the general relativity

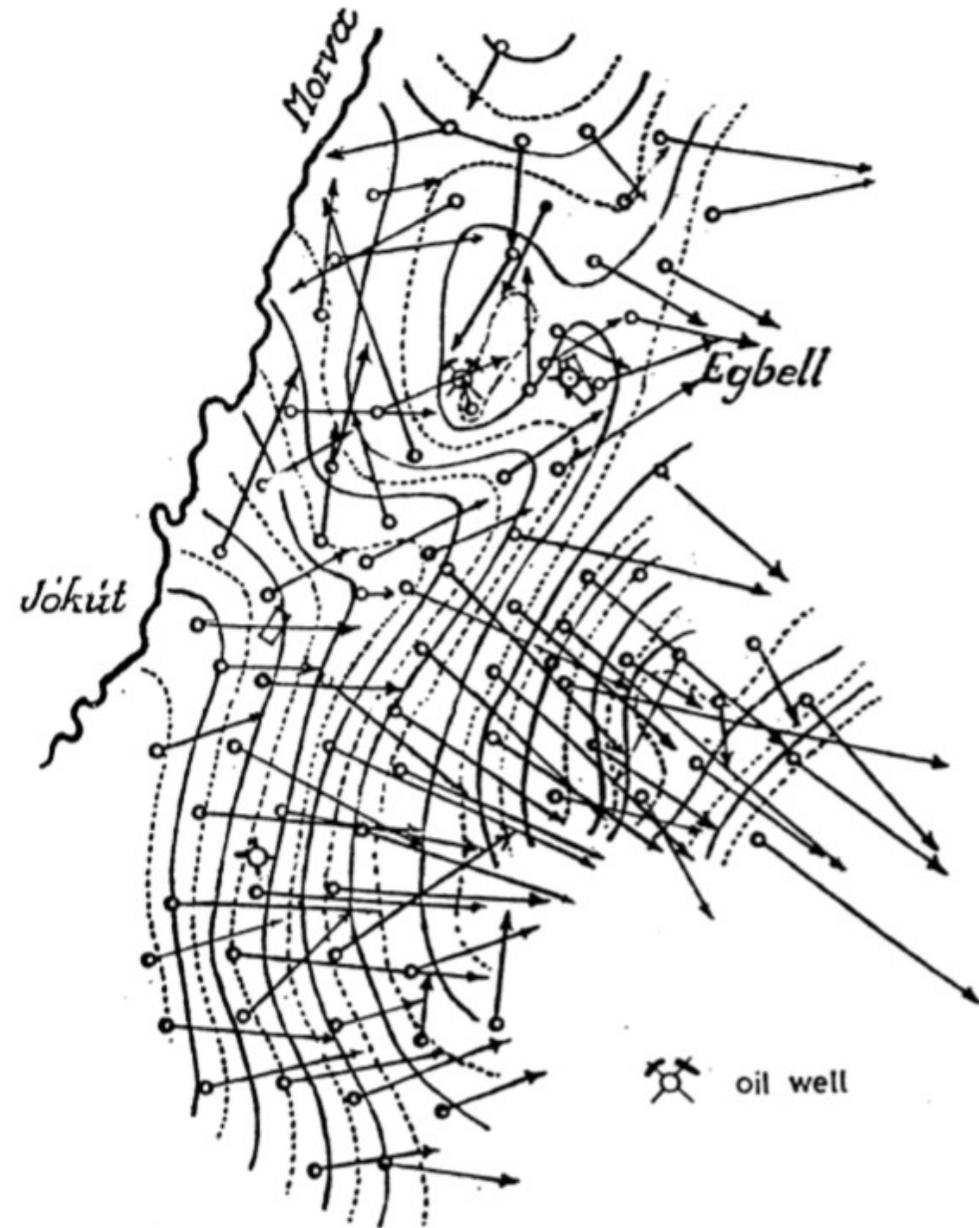

$$F = m_t a$$

$$F = G \frac{m_s M}{r^2}$$

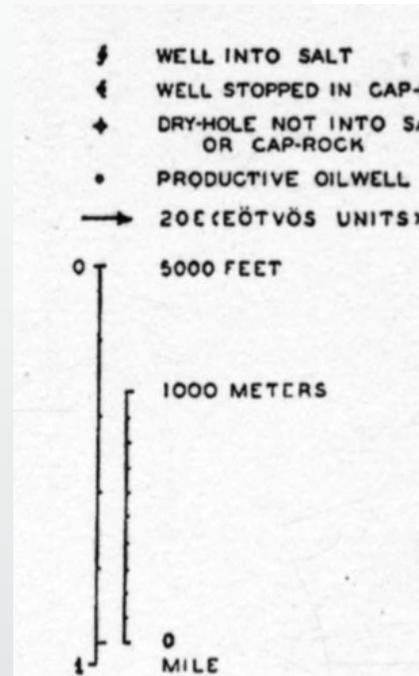

# Scientific achievements

- 1913: The 1st deep-drills in Transylvania by Eötvös' measurements
- 1915 Rotating balance – to demonstrate the Eötvös effect
- 1916 The Egbell-survey – the birth of petroleum-geophysics

# Triumph of the Eötvös Balance

- The Balance was not patented, he didn't invent it for the money and fame
- First tests in Germany (1917), in Egypt (1921), in Texas (1924)
- „By the 1920s the Eötvös Institute had become a virtual Mecca of the oil industry”.
- At the beginning of the 1930's more than 125 torsion balances were in use in the USA

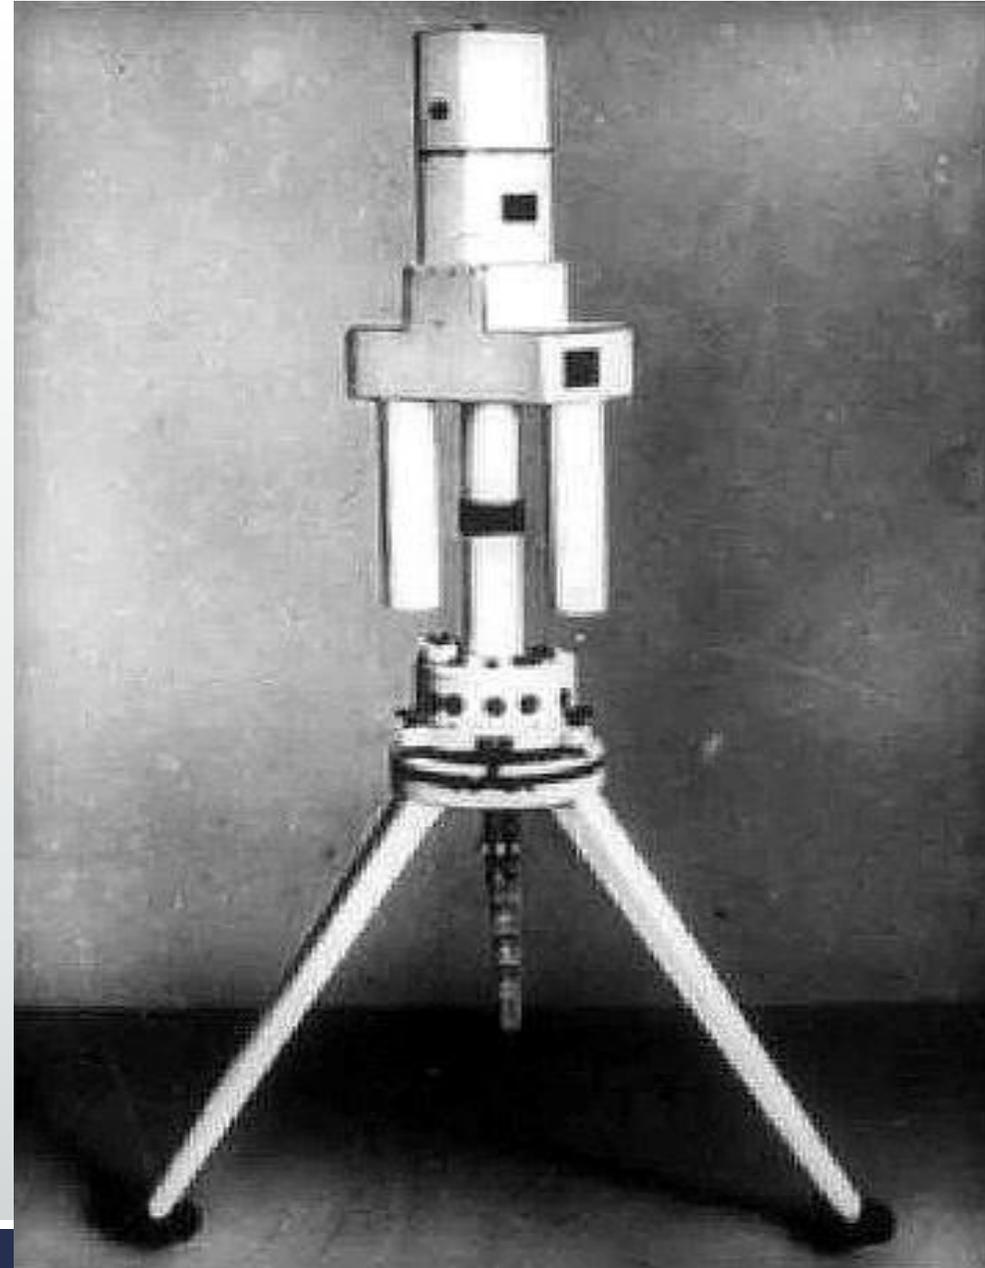

- India (1926)
- 1926-1938:  
300+ Torsion Balances  
to all over the World
- 159 Oil fields  
discovered

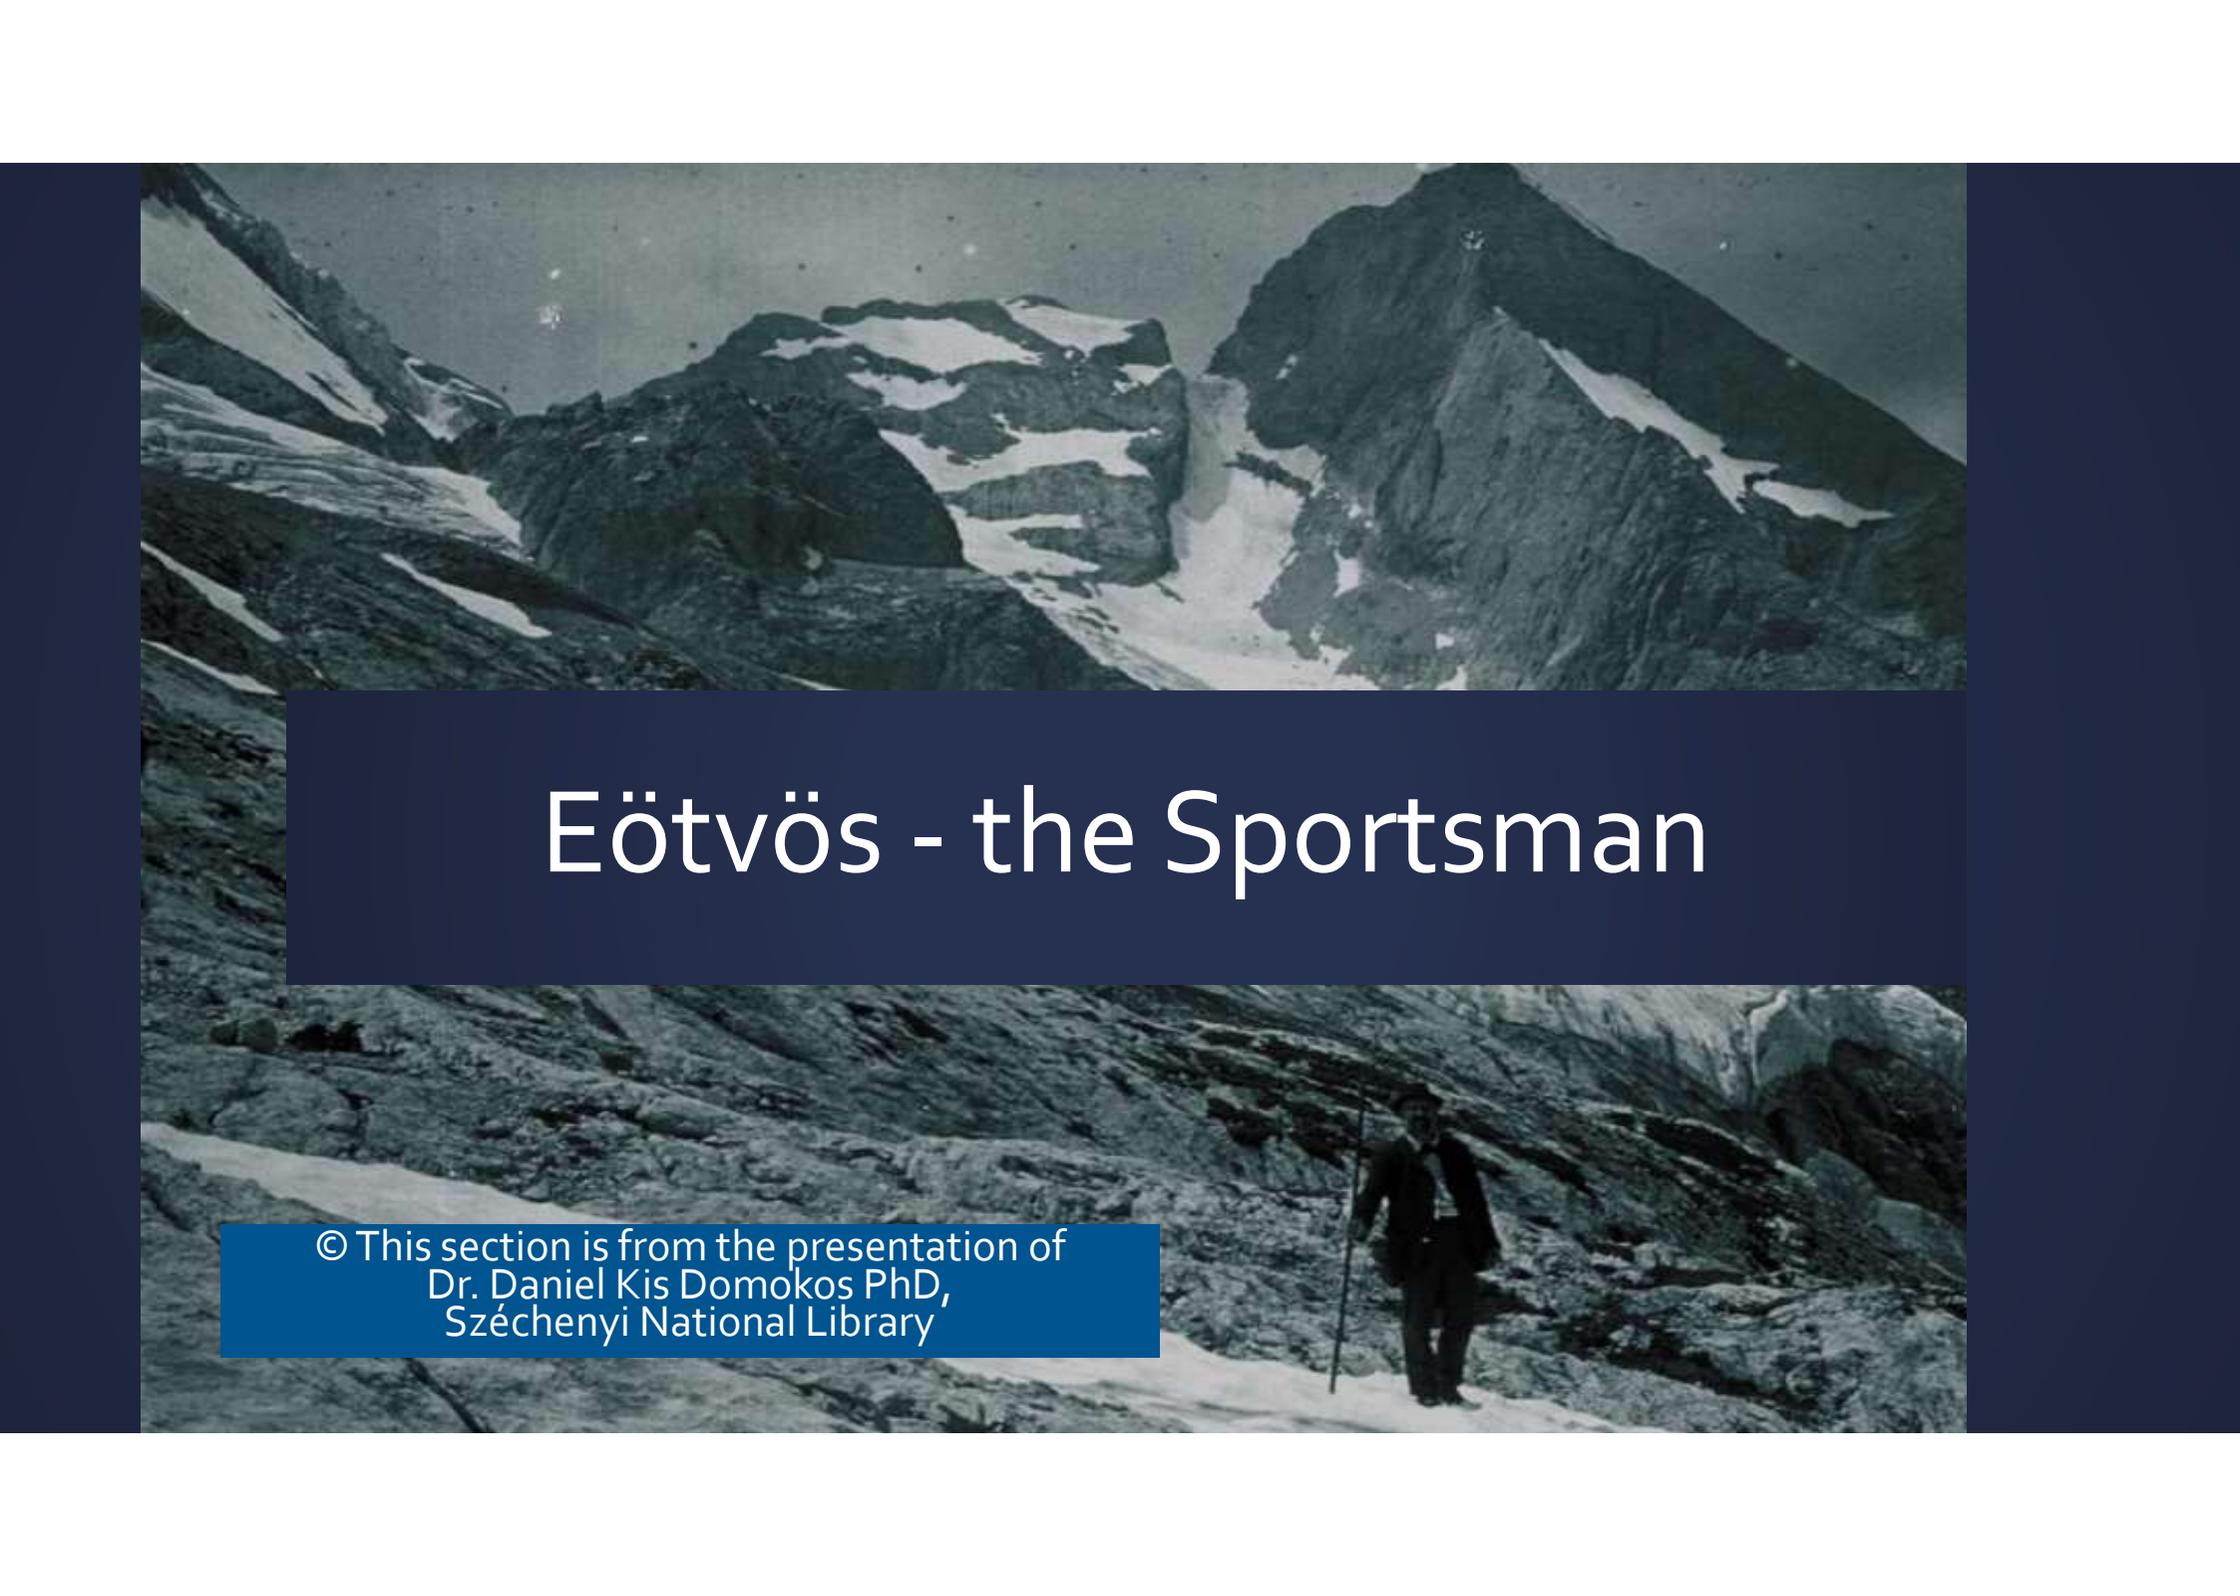

## The 2nd Golden Era

- After the WW2, Eastern countries had no rights to buy modern gravimeters.
- The ELGI (Eötvös Loránd Geophysical Institute) developed a modernised, easier instrument and sold more than a 100 of that around the World.
- E54 Balance: Gran prix Brussel Expo, 1958
- 1958-59: Hungarian-Chinese test in China
- 1969: the Last Eötvös Balance
- 60.000+ stations (measurements) in Hungary so far
