

## **Appendix 2: IDENTIFYING SPECIES OF CONSERVATION CONCERN IN THE SAGEBRUSH ECOSYSTEM**

Rich (1999) compiled an initial list of species potentially at risk of local or regional extirpation within the geographic boundaries of the sagebrush ecosystem, based on a variety of information sources. Key sources included species designated as having special status (e.g., sensitive species) by State Offices of the Bureau of Land Management and Regional Offices of the USDA Forest Service. Other sources for terrestrial vertebrates included Saab and Rich (1997), Neel (1999), Idaho Partners in Flight (2000), Wisdom et al. (2000), Altman and Holmes (2000), the Western Bat Working Group Regional Priority Matrix (Western Bat Working Group 1998), and GAP Analysis (e.g., Washington Department of Fish and Wildlife 1999). Information sources for plants included comprehensive assessments of sensitive plants (e.g., Croft et al. 1997). Aquatic species highly dependent on watersheds within sagebrush ecosystems also were included on the original list (Rich 1999).

We condensed this initial list for several reasons. First, we dropped fish species because we sought to establish a list of terrestrial species explicitly associated with sagebrush habitats. Second, some of the species inhabit areas within the sagebrush ecosystem, but are not explicitly associated with sagebrush habitats (e.g., wetland- and riparian-associated species imbedded in a larger matrix of sagebrush). And third, some species were not at risk within the boundaries of the sagebrush ecosystem (see sagebrush ecoregions, Fig. 1.1, Chapter 1), based on further examination of their status in relation to their geographic occurrence. Consequently, species remaining on our list, following the exclusion of fish, were screened based on 2 criteria: (1) degree of association with sagebrush habitats; and (2) degree of population risk for the species within the sagebrush ecosystem.

To apply the first of these 2 criteria, habitat associations were assigned to species from the NatureServe database when such information was available ([Table A2.1](#)). Otherwise, habitat associations were determined by consulting recent literature and status reports for individual species (e.g., CalFlora 2000). Based on these information sources, species not specifically associated with sagebrush habitats were dropped.

To apply the second of these 2 criteria, we used estimates of the degrees of extirpation risk at global, national, and state levels as described in the NatureServe Explorer database, referred to as conservation status ranks (i.e., G1/S1-critically imperiled, G2/S2-imperiled, G3/S3-vulnerable, G4/S4-apparently secure, and G5/S5-secure) ([Table A2.2](#)). The science staffs of NatureServe and its member programs used a rigorous method consistent across states to assign these ranks of extirpation risk (Master 1991, Stein 2002). Evaluation criteria considered by NatureServe in assigning a rank to each species included the following risk factors: number of populations; the area over which the species occurs; population trend (i.e., whether numbers are increasing, stable, or declining); and known threats to the species.

We considered a species to meet our second criteria if the species was ranked S4 or worse by NatureServe in any of the 11 western states that encompass the sagebrush ecosystem in the United States (i.e., Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico,

Oregon, Utah, Washington, and Wyoming). That is, species were retained if ranked S1, S2, S3, or S4 by NatureServe within any of these 11 western states where sagebrush occurs.

Application of the above criteria resulted in a reduction of species from 735 ([Table A2.3](#)) to 630 when combined with the decision to exclude fish. An additional 268 species were dropped because they either were not specifically associated with sagebrush habitats (98% of the 267) or not at risk within the range of sagebrush (2%), or in 1 case, because the subspecies was no longer recognized as a valid taxon ([Table A2.4](#)). The remaining 367 species are specifically associated with the sagebrush ecosystem and considered to be of conservation concern ([Tables A2.5, A2.6, A2.7](#)), which we define as species with rare or declining habitats or populations.

The majority of the 367 species of conservation concern are plants (68.2% of all species, [Table A2.5](#)). Although plants and invertebrates have the highest potential vulnerability based on the ranking process, we have the least knowledge about needs of these taxa (e.g., see Bonnet et al. [2002], and Clark and May [2002]).

Global/State rank code	Rank	Definition
GX/SX	Presumed extinct	Believed to be extinct throughout its range. Not located despite intensive searches and virtually no likelihood that it will be rediscovered.
GH/SH	Possibly extinct	Known only from historical occurrences. Still some hope of rediscovery.
G1/S1	Critically imperiled	Critically imperiled because of extreme rarity or because of some factor(s) making it especially vulnerable to extinction. Typically 5 or fewer occurrences or very few remaining individuals (<1,000).
G2/S2	Imperiled	Imperiled globally because of extreme rarity or because of some factor(s) making it especially vulnerable to extinction. Typically 6 to 20 occurrences or few remaining individuals (1,000 to 3,000).
G3/S3	Vulnerable	Vulnerable either because very rare and local throughout its range, found only in a restricted range (even if abundant at some locations), or because of other factors making it vulnerable to extinction. Typically >80 occurrences or between 3,000 and 10,000 individuals.
G4/S4	Apparently secure	Uncommon but not rare, and usually widespread. Possibly cause for long-term concern. Typically more than 100 occurrences globally or more than 10,000 individuals.
G5/S5	Secure	Common, typically widespread and abundant.
G#G#/S#S#	Range rank	A numeric range rank (e.g., G2G3) is used to indicate uncertainty about the exact status of a taxon.
GU/SU	Unrankable	Currently unrankable due to lack of available information about status or trends.
GNR/SNR	Unranked	Global (or State) rank not yet assessed.
?	Inexact rank	Denotes inexact numeric rank.

Table A2.2. Degrees of extirpation risk assigned to species by NatureServe (2005), and subsequently used as part of our process of identifying species of conservation concern in the sagebrush ecosystem.

Global/State rank code	Rank	Definition
Q	Questionable taxonomy	Taxonomic status is questionable; numeric rank may change with taxonomy.
Z	Moving	Occurs in the area of interest, but as a diffuse, usually moving population; difficult or impossible to map static occurrences.
T	Infraspecific taxon (trinomial)	The status of infraspecific taxa (subspecies or varieties) is indicated by a "T-rank" following the species' global rank. Rules for assigning T ranks follow the same principles outlined above. For example, the global rank of a critically imperiled subspecies of an otherwise widespread and common species would be G5T1.
B	Breeding	The associated rank refers to breeding occurrences of mobile animals.
N	Non-breeding	The associated rank refers to non-breeding occurrences of mobile animals.

<sup>a</sup>Habitat associations are: 1 - herbaceous vegetation; 2 - shrubland; 3 - sparse vegetation; 4 - non-vascular plants; 5 - forest; 6 - woodland; 7 - dwarf-shrub; 8 - cave; and 9 - aquatic/wetlands.

<sup>b</sup>1 - species is not specifically associated with sagebrush habitats; 2 - species is not at risk within the range of sagebrush; 3 – no longer recognized as a valid subspecies.

<sup>c</sup>“r” was added for riparian habitat designations.

<sup>d</sup> NatureServe does not provide common names for this species.

Key to rank designations:

G = Global rank indicator, based on worldwide distribution at the species level

T = Global trinomial rank indicator, based on worldwide distribution at the infraspecific level

S = State/province rank indicator, based on distribution within the state/province at the lowest taxonomic level

1 = Critically imperiled, at very high risk of extinction or extirpation due to extreme rarity, very steep declines, or other factors

2 = Imperiled due to rarity from very restricted range, very few populations, steep declines, or other factors

3 = Vulnerable due to restricted range, relatively few populations, recent and widespread declines, or other factors

4 = Apparently secure, uncommon but not rare, some cause for long-term concern due to declines or other factors

5 = Secure, common, widespread, and abundant

\_#\_# = Range of uncertainty in a numeric rank (for example, G2G4 or S1S2)

SH = Possibly extirpated

SNR = Conservation status not assessed at the state/province level

SNA = Conservation status not applicable due to direct or indirect human intervention on the species' presence within the state

SU = Unrankable; present and possibly in peril, but not enough data yet to estimate rank

SX = Presumed extirpated

? = Inexact or uncertain numeric rank

B = Applies to breeding populations in the state/province

N = Applies to non-breeding populations in the state/province

Q = Questionable taxonomy
