1.0 INTRODUCTION

This document presents technical justifications for individual lines of evidence used to modify specific items in the 2010 Vance Air Force Base (AFB) Resource Conservation and Recovery Act (RCRA) Post Closure Permit (ODEQ, 2010), herein known as the Permit, through the use of a Class 2 Permit Modification, herein known as the (proposed) Permit Mod. This technical support document (TSD) will be submitted to the Oklahoma Department of Environmental Quality (ODEQ) by the Air Force (AF) as a companion document to the proposed Permit Mod. Note that concurrent with submittal of this TSD will be a revised Permit with redline and strikeout changes that indicate what has been modified. The proposed Permit Mod will also include a brief description of the “new” remedies for each site (remedies which have been implemented since the time of the last permit modification in 2010) and a revised sampling and analysis plan (SAP).

1.1 PURPOSE AND SCOPE

Vance AFB is an active U.S. Air Force Base located in Garfield County in northwestern Oklahoma, approximately five miles southwest of downtown Enid, Oklahoma (Figure 1-1). The Base occupies approximately 2,122 acres and is surrounded by privately owned agricultural properties. Construction of Vance AFB began in 1941, and the Base officially began basic flight training operations in November 1941. Vance AFB is primarily comprised of aircraft taxiways and runways, and currently is part of the Air Education Training Command. Flight training continues to be Vance AFB's chief mission (ITSI, 2010).

A RCRA Post-Closure Permit issued to Vance AFB in 1996 by the ODEQ was revised and renewed effective September 30, 2010. This current permit expires in September 2020. The permit covers operation of treatment systems and compliance sampling at the following five areas within the Base: Corrective Measures Implementation (CMI) area; Industrial Zone (IZ) area; Site DP005; Site FT002; and Site SS026. It also covers surface water and sediment sampling at Sites SS007, LF003, and DP005. The Groundwater SAP (Vance, 2006), appended to the 2010 Permit, requires the collection of six surface water samples and six sediment samples at Sites SS007, LF003, and DP005. The locations of these areas at Vance AFB are presented on Figure 1-2. The 70 compliance monitoring wells and six surface water/sediment sampling locations, included in the permit are presented in Table 1-1 and presented on Figure 1-3.

The technical basis for the modification of the Vance permit is data collected through June 2017.

The proposed Permit Mod addresses below items 1 through 6. These items are addressed in a stepwise process, where each subsequent section incorporates the proposed changes recommended in the previous section. The technical justification behind each of these items is presented in this technical support document.

1. Updates the remedies for each site and incorporates the remedies implemented since the permit was last modified.
2. Discontinuation of the fall compliance monitoring event.
3. Discontinuation of surface water and sediment sampling portion of the compliance monitoring program.
4. Removal of select monitoring wells from the compliance monitoring program.
5. Removal of select analytes from the compliance monitoring program.
6. Reassignment of select monitoring wells from originally designated sites to the sites whose contamination they actually monitor.

2.0 SITE DESCRIPTIONS AND NEW REMEDY IMPLEMENTATION

The following subsections characterize the Installation Restoration Program (IRP) sites associated with the five areas/sites (CMI Area, IZ Area, Site FT002, Site DP005, and Site SS026) at Vance AFB, as well as define the past and current remedies implemented at these sites, and the current compliance monitoring program. The new remedies described below have been implemented at each site and have been documented in regulatory submittals for each individual site including Remedial Design/Corrective Measures Implementation Reports (RD/CMIP), Construction Completion Reports (CCR) and Corrective Measures Completion Reports (CMCRs) where applicable.

Remedies at these sites were implemented in two phases as interim corrective measures (ICMs) and the corrective measures (CMs). In general, the ICMs primarily dealt with addressing source area contamination and the CM dealt with the down gradient portion of the plume. The ICM and CM portions of the remedy make up the final remedy, which is presented in the sections below.

Remedial actions operations (RA-O) activities are conducted at all sites with remedies, which includes periodic sampling to allow for an assessment of progress relative to the remedial goal at each site. Course corrections or additional remedial activities are conducted at the sites on an as needed basis. Course corrections generally involve reinforcement or adaptation of the site remedy using the approved remedial approach for the site to address changing plume morphology. An example of this would be the need for a second round of emulsified vegetable oil (EVO) injections at a site or the need for additional injection wells at a site.

The following appendices are attached to this technical support document:

- The analytes currently required to be monitored under the 2010 Permit are included in Appendix A.
- Groundwater potentiometric surface maps and contaminant plume maps from 2017 Annual Groundwater Compliance Monitoring Event are included in Appendix B.
- Five year data tables for analyte detections within past five years (2013-2017) are included in Appendix C. Note these tables only show analytes which have been detected or wells with detections within this 5 year period. As noted in Appendix A, as part of Corrective Measures (CM) program, a comprehensive analyte list is included for each site. However if an individual sample (or sample location) do not have any detects of compound within specified analyte list (for example, trichloroethene (TCE) within EPA (Environmental Protection Agency) SW-846 8260 list), then non-detected analytes will not appear on these tables. Complete analytical reports (which show data for all constituents – detected and not detected) are provided as an appendix in the annual monitoring reports.
- Previous five years of data (2009 to 2013) is included in Appendix D.
- Sediment and Surface Water Analytical Tables (2009-Present) are provided as Appendix E.

2.1 CMI Area

The CMI area includes IRP Sites ST012, WP023, SS024, and SS025. The aquifer in the CMI area has three transmissive zones associated with it, the shallow zone (10-30) feet below ground surface [bgs]), intermediate zone (35-50 feet bgs), and deep zone (55-75 feet bgs). These three zones of the aquifer underlying Vance AFB will be referred to herein as the shallow, intermediate, and deep zones.

The compliance well network associated with the CMI area includes 24 monitoring wells, with 16 wells screened in the shallow zone, five wells in the intermediate zone, and 3 wells in the deep zone. None of the sites in the CMI area have surface water or sediment sampling locations associated with it. Historical contaminants of concern (COCs) at the CMI area are tetrachloroethene (PCE), TCE, cis-1,2-dichloroethene (cis-1,2-DCE), vinyl chloride (VC), 1,2-dichloroethane (1,2-DCA), 1,1-dichloroethene (1,1-DCE), acetone, methyl ethyl ketone, and methylene chloride (Shaw, 2008). CMI area monitoring well locations are shown on Figure 2-1.

2.1.1 Site ST012 (Paint Stripping Equalization Tank)

Site ST012, also known as the Paint Stripping Equalization Tank, is located near Monitoring Well MW12-09 and extraction well EW12-01. The site was constructed as a concrete vault circa 1967 and operated until 1988. Water and sludge from paint stripping operations flowed into the tank and the liquid effluent was then discharged into the sanitary sewer system. This site is located near Sites WP023, SS024, and SS025 (ITSI, 2010). Historically, the COC at ST012 was methylene chloride. Presently, the primary contaminants at the site are PCE, TCE, cis-1,2-DCE and VC. Site ST012 is the only site within the CMI that has contamination in the intermediate and deep zones. ST012 and monitoring well locations are shown on Figure 2-2.

The remedy documented in the current permit at Site ST012 includes groundwater extraction from five extraction wells. Groundwater pumped from these wells was previously conveyed to the Central Groundwater Treatment Facility (CGTF) via below grade piping. The treated water was then discharged to the City of Enid Publicly-Owned Treatment Works (POTW). The ST012 groundwater extraction system was part of the CMI area groundwater extraction system, which consisted of a total of 13 shallow zone extraction wells (including the five ST012 extraction wells). Groundwater pumped from these wells was directed to the CGTF. The original CMI remedy was installed to collect and treat impacted groundwater and to provide hydraulic control to prevent further plume migration.

During 2014, the Site ST012 remedy was changed to include a more aggressive treatment using EVO injections in the shallow, intermediate, and deep zones. The change in the remedy has been documented through the following documents.

- Interim Corrective Measures Work Plan Site ST012, Vance AFB
- Interim Corrective Measure Construction Completion Report Site ST012, Vance AFB
- Remedial Design/Corrective Measures Implementation Report Site ST012, Vance AFB
- Construction Completion Report Site ST012, Vance AFB

The presence of EVO created conditions conducive to enhanced reductive dechlorination (ERD) in areas with elevated concentrations of chlorinated volatile organic compounds (CVOCs), e.g., “hot spots”. The injections were designed to reduce contaminant mass within the three zones and mass flux between the zones. The remedy also includes flow through biobarrier walls (lines of injection wells) to treat the downgradient portions of the plume. All five groundwater extraction wells (EW12-01 through EW12-05) were turned off during injections and have remained offline. Four of the extraction wells (EW12-01, EW12-02, EW12-04, and EW12-05)

were retrofitted to operate as soil vapor extraction (SVE) wells to address contaminant mass in shallow subsurface soils. The SVE system also mitigates/prevents soil vapors (methane), generated by the injections, from entering Building 192 through the subslab. The SVE system was turned off on July 27, 2015, as limited contaminant mass was being removed by the SVE system and the system was no longer needed to control methane vapors in the area.

Since the remedy was implemented at Site ST012, two additional rounds of EVO injections have been completed and four additional intermediate zone injection wells have been installed. These efforts were conducted to advance remedial progress at the site and address changing plume morphology.

Annual groundwater compliance monitoring at Site ST012 currently includes collection of samples from the monitoring wells listed in Table 2-1 below.

Table 2-1 Site ST012 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
12-9	Shallow	Annual
12-13	Deep	Annual
12-20	Deep	Annual
12-21	Deep	Annual
12-30	Intermediate	Annual
12-33	Shallow	Annual
12-34	Intermediate	Annual
12-35	Shallow	Annual
12-37	Shallow	Annual
12-38	Intermediate	Annual
12-43	Shallow	Annual
12-45	Shallow	Annual

These wells are monitored on an annual basis, with groundwater samples analyzed for volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs)

2.1.2 Site WP023 (Industrial Waste Pit)

Site WP023, also known as the Industrial Waste Pit, is located approximately 250 feet north of Site ST012. The initial COCs at WP023 were acetone, methylene chloride, toluene, and xylene. There currently is no contaminant present at Vance AFB that originated from the site waste pit. Multiple investigations (USACE, 1995 and USACE, 1998) conducted at the site have concluded that the TCE, cis-1,2-DCE and VC contamination originates from ST012. The site is hydrogeologically downgradient from ST012 and is hydraulically connected to the shallow and intermediate transmissive zones at ST012. Based on multiple investigations conducted at the site, there is no current soil or groundwater contamination present that originated from the WP023 release (USACE 1995). All investigations conducted at the site to date, have concluded that the TCE, cis-1,2-DCE and VC contamination present originates from upgradient ST012 (USACE 1994, USACE1995). The exception to this is the TCE contamination present at Monitoring Well MW23-14, which originates at the Contractor Owned and Maintained Base Supply (COMBS) Warehouse (designated as Site SS025). ST012, WP023 and monitoring well locations are shown on Figure 2-2.

This is further evidenced by the VC contamination that was detected in shallow zone Monitoring Well MW23-05. VC was not detected above maximum contaminant level (MCLs) in Monitoring Well MW23-05 during the investigations and was only detected once previously in 2006.

However, VC was detected in this well in 2016. The detection of VC in this well is the result of two factors. The first factor is the termination of groundwater extraction at Site ST012 in 2014, which had been containing the source area contamination at ST012. The groundwater extraction system in place at Sites ST012 and SS024 artificially skewed the direction of groundwater flow to the east. Upon termination of groundwater extraction, flows reverted to their natural northern direction, which is directly towards WP023. This is evident by a comparison of the potentiometric surface maps for the pre-extraction groundwater (September 1994), concurrent with groundwater extraction (April 2011) and post groundwater extraction (May 2015) conditions, which are shown on Figures 2-3, 2-4 and 2-5, respectively.

The second factor is the implementation of an ERD remedy at Site ST012 during 2013. ERD produces VC along the reductive dechlorination chain and significant concentrations of VC are being generated at ST012 as part of the ERD process. The VC being generated at ST012 is now migrating northward onto Site WP023, along the natural groundwater flow path. Monitoring Well MW23-05 is located near the former waste pit in the shallow zone. Low level VC concentrations in Monitoring Well MW23-05 are believed to be a transient condition, as VC is readily degraded both aerobically and anaerobically.

Monitoring Well MW23-14 is located downgradient of Building 192, which is believed to be the source of part of the Site SS025 plume. Monitoring Wells MW23-21 and MW23-22 are installed in the intermediate zone and monitor the downgradient edge of the intermediate TCE plume, originating at Site ST012.

Annual Groundwater Compliance Monitoring at the Site WP023 currently includes collection of samples from the monitoring wells listed in the table below.

Table 2-2 Site WP023 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
23-5	Shallow	Annual
23-14	Shallow	Annual
23-21	Intermediate	Annual
23-22	Intermediate	Annual

These wells are monitored on an annual basis, with groundwater samples analyzed for VOCs and SVOCs.

2.1.3 Site SS024 (Jet Engine Cleaning Shop)

Site SS024 is located at Building 187. Before 1992, hazardous material was transferred from inside the building via piping and an associated manhole outside the building. Prior to 1982, a manhole outside the southeast side of the building was used for the transfer of hazardous materials generated during jet engine cleaning processes (solvents and petroleum products) from inside the building to a truck awaiting pick up. Low concentrations of VOCs detected in soils and elevated concentrations of VOCs in groundwater indicate that spills could have occurred during these transfers and could be the source of the site's contamination. The manhole was closed in the late 1980s. SS024 and monitoring well locations are shown on Figure 2-6.

The remedy documented in the current permit at Site SS024 includes groundwater extraction from five extraction wells. Groundwater pumped from these wells was conveyed to the CGTF for treatment via below grade piping. The treated water is then discharged to the City of Enid POTW. The SS024 groundwater extraction system was part of the CMI area groundwater extraction system, which consisted of a total of 13 shallow zone extraction wells (including the

five SS024 extraction wells). Groundwater pumped from these wells was directed to the CGTF. The current CMI remedy was installed to collect and treat impacted groundwater and to provide hydraulic control to prevent further plume migration.

In 2014, the Site SS024 remedy was changed to incorporate an aggressive treatment via in-situ bioremediation. The site was treated using EVO injections into the subsurface to create conditions conducive to ERD in the source area. EVO injections into the shallow zone were conducted during the period August through October 2014. EVO was injected into a gridded series of injections located over the source area. These injection wells were installed, and injected into, as part of the ICM phase. EVO was also injected into a series of biowall injection wells that were installed in the downgradient portion of the plume during the CM phase. All five extraction wells (EW24-01 through EW24-05) were turned off during the injections and remain offline. Three of the extraction wells (EW24-01, EW24-02 and EW24-05) were retrofitted to operate as SVE wells to mitigate/prevent soil vapors (methane), generated by the injections, from entering Building 187 through the subslab. The change in the remedy has been documented through the following documents.

- Remedial Design/Corrective Measures Implementation Report Site SS024, Vance AFB
- Construction Completion Report Site SS024, Vance AFB

The SVE system was turned off on July 27, 2015 due to the lack of methane in the SVE influent.

Since the remedy was implemented at Site SS024, two additional rounds of EVO injections have been conducted and eight additional shallow zone injection wells have been installed. These efforts were conducted to advance remedial progress at the site and address changing plume morphology.

Annual Groundwater Compliance Monitoring at Site SS024 currently includes collection of samples from the monitoring well listed in Table 2-3 below.

Table 2-3 Site SS024 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
24-5	Shallow	Annual

The groundwater samples collected from this monitoring well are analyzed for VOCs and SVOCs.

2.1.4 Site SS025 COMBSWarehouse

Site SS025, also known as the COMBS Warehouse, is located near Site ST012 and adjacent to Hangar 170 (ITSI, 2010). The primary contaminant at the site is TCE. A drain or sump previously associated with Hangar 170 is the probable source of contamination at this site. The groundwater plume at the site, which was historically part of the TCE plume originating from Sites ST012 and SS024, is now segregated from those plumes and is considered its own source area. SS025 and monitoring well locations are shown on Figure 2-7.

The remedy documented in the current permit at Site SS025 includes three extraction wells. Groundwater pumped from these wells is conveyed to the CGTF for treatment via below grade piping. The treated water is then discharged to the City of Enid POTW. The SS025 groundwater extraction system was part of the CMI area groundwater extraction system, which consisted of a total of 13 shallow zone extraction wells (including the three SS025 extraction wells). Groundwater pumped from these wells was directed to the CGTF. The current CMI

remedy was installed to collect and treat impacted groundwater and to provide hydraulic control to prevent further plume migration.

In 2014, the SS025 remedy was changed to incorporate aggressive treatment via in-situ bioremediation. The site was treated using EVO injections to create subsurface conditions conducive to ERD in the source area. EVO injections into the shallow zone were conducted during the period of January and July 2014. The EVO was injected into a gridded series of injection wells located over the source area. These wells were installed, and injected into, as part of the ICM phase.

EVO was also injected into a series of biowall injection wells that were installed in the downgradient portion of the plume during the CM phase.

EVO was also injected into a series of biowall injection wells that were installed up gradient and downgradient of Monitoring Well MW12-45 during the CMI phase to address the areal extent of the TCE plume.

All three groundwater extraction wells (EW25-01, EW25-02 and EW25-03) were turned off during injections and remain offline. Six SVE wells were installed at the site. The SVE system mitigates/prevents soil vapors (methane) generated by the injections from entering Buildings 525 and 528 through the subslabs. The change in the remedy has been documented through the following documents.

- Remedial Design/Corrective Measures Implementation Report Site SS025, Vance AFB
- Construction Completion Report Site SS025, Vance AFB

The SVE system was taken offline on March 28, 2016, as a result of methane vapor concentrations in the system influent had decreased to levels where the system was no longer needed.

Since the remedy was implemented, two additional rounds of EVO injections have been conducted at Site SS025 to advance remedial progress and address changing plume morphology. During August 2017, a course correction was implemented that involved a series of BOS 100 injections at four areas of SS025 that had residual concentrations of TCE remaining above the MCL. These injections were conducted in an effort to shorten the remedial lifespan of SS025.

Annual groundwater compliance monitoring at the site includes collection of samples from the monitoring wells listed in the Table 2-4 below.

Table 2-4 Site SS025 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
25-1	Shallow	Annual
25-2	Shallow	Annual
25-4	Shallow	Annual
25-7	Shallow	Annual
25-8	Shallow	Annual
25-9	Shallow	Annual
25-15	Shallow	Annual

These wells are monitored on an annual basis, with groundwater samples analyzed for VOCs

and SVOCs.

2.2 Industrial Zone (IZ)

IRP Sites LF003, SS007 and ST008, are associated with the IZ and are shown on Figure 2-8. The historical COCs include arsenic, benzene, ethylbenzene, xylene, toluene, naphthalene, Oklahoma-gasoline range organics (OK-GRO), Oklahoma-diesel range organics (OK-DRO), 1,1-DCE, TCE, and VC. COCs vary from site to site. SS028 was validated as a new IRP site in 2016 when an upgradient intermediate well, MW8-18, was determined to not be associated with ST008. Site ST011 was a site previously closed under Oklahoma Corporation Rules but has been reopened because of petroleum products that have migrated to LF003. ST011 was previously moved to Table 2b in the 2010 Permit. Site ST011 will be moved to Table 2a in the Permit Modification. However, these sites are presented here as contamination originating at/from these sites directly impacts the other IZ sites. IZ area monitoring well locations are shown of Figure 2-8.

A description of each of the IRP sites is presented below.

2.2.1 Site LF003 (Tank Farm Landfill)

Site LF003, located in the northern portion of Vance AFB, was historically utilized as a landfill from 1941 to 1952. General refuse, containerized liquids, and tank sludge were disposed at the landfill using the trench-and-fill method. Free product (composed of leaded gasoline) has been detected during previous groundwater sampling efforts, including as recently as 2015. Free product was also detected during construction of the interceptor collection trench (ICT) associated with Site SS007 in 1994. LF003, ST011 and monitoring well locations included in the current groundwater compliance monitoring program are shown on Figure 2-9.

A free-product recovery (FPR) system was installed at Site LF003 in 2004. The FPR system consists of four recovery wells and a surface facility that housed recovery equipment and a free product tank. The FPR system was never fully operational due to the lack of recoverable free product. Currently, the FPR system remains inactive. A phytoremediation area consisting of 173 poplar trees was planted in 2004 to address contaminated groundwater at the site (ITSI, 2010). The phytoremediation system was removed in October 2017, as it was determined that the phytoremediation plot was no longer needed to address contamination at the site.

An investigation conducted in 2013 showed that there were no sources of contamination within the landfill and that the free product and petroleum contamination identified at the landfill originates upgradient at Site ST011. The AF reopened Site ST011 and a RCRA Facility Investigation is being conducted. There are no current plans to excavate the landfill waste material.

Annual groundwater compliance monitoring at the site includes collection of samples from the monitoring wells listed in the Table 2-5 below.

Table 2-5 Site LF003 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
03-6	Shallow	Annual
03-7	Deep	Annual
03-9	Shallow	Semiannual

These wells are monitored on either an annual or semiannual basis, with groundwater samples analyzed for VOCs and metals.

Additionally, two sediment samples and two surface water samples are collected annually from the outfall area located immediately east of the site. These samples are also analyzed for VOCs and RCRA metals.

2.2.2 Site SS007 (Hazardous Waste Accumulation Point)

Site SS007 is located along the former northern perimeter of the base, northeast of the flight line apron and west of the Tank Farm Landfill (LF003). It consists of three discrete areas: the Defense Reutilization and Marketing Office (DRMO); the old Base Civil Engineer (BCE) storage area; and the area north of Fox Drive, commonly known as North Site SS007 (ITSI, 2010). SS007 and monitoring well locations are shown on Figure 2-10.

From October 1980 to November 1992, the DRMO operated under RCRA Interim Status. Over this duration, drummed waste containing solvents, metal treatment sludge, waste oils, and contaminated fuels were handled at the site prior to transportation and disposal. Although no spills of drummed waste were reported over this period, and hazardous wastes are no longer being stored or handled at the site, undocumented spills from historical activities are believed to be the origin of soil and groundwater contamination at Site SS007.

Electrical transformers were stored at the BCE storage area, prior to installation. The storage dates are not documented. Solvent products of unknown type were also stored at this site prior to 1980. This area is now open space. Fuel and solvent related VOCs detected in soil and groundwater, together with polychlorinated biphenyls detected in soil, indicate that spills could have occurred during materials handling at Site SS007. However, a predesign investigation conducted in 2013 confirmed that no soil exceedances above unrestricted use criteria are currently present at SS007.

The only known historical use of North Site SS007 was agricultural purposes and record searches from prior studies did not uncover any industrial or disposal activities, prior to AF use of this site. Groundwater contamination at North Site SS007 is believed to have migrated from Site SS007, prior to installation of the ICT separating the two sites (as discussed below).

The remedy documented in the current permit is groundwater extraction using an ICT and six groundwater extraction wells, which were installed in 1997 to recover contaminants from the DRMO and BCE areas at Site SS007. A second ICT and five extraction wells were installed in 2002 in the northern portion of Site SS007. In 2004, one extraction well was replaced and an additional extraction well was installed. Groundwater recovered from two ICTs and 11 extraction wells was pumped to the CGTF, located just east of Site SS026, for treatment prior to discharge to the City of Enid POTW (ITSI, 2010).

In 2014, the SS007 remedy was changed to incorporate aggressive treatment via in-situ bioremediation. The site was treated using EVO injections to create subsurface conditions conducive to ERD in the source area(s). In the northern portion of the site, EVO injections into the shallow zone were conducted during January 2014. In the southern portion of the site, EVO injections into the shallow zone were conducted during January and February 2014.

The final remedy also included the installation of a groundwater extraction/recirculation system that incorporated the components of the existing Site SS007 groundwater extraction/treatment system, additional extraction wells, groundwater injection/recirculation wells, an onsite treatment equipment enclosure (trailer) and a treated water injection/recirculation system. As part of the final remedy, eight new groundwater extraction wells and 16 new recirculation wells were added

to treatment system. The water treatment process was changed from air stripping (at the CGTF) to granular activated carbon (GAC) located in the onsite treatment trailer. Treated groundwater is also amended with lactate and reinjected into recirculation wells located on the periphery of the contaminant plume. The change in the remedy has been documented through the following documents.

- Remedial Design/Corrective Measures Implementation Report Site SS007, Vance AFB
- Construction Completion Report Site SS007, Vance AFB

Several course corrections have been implemented at Site SS007 since the remedy was installed in 2014. The first was the conversion of three of the new groundwater extraction wells to recirculation wells. This was done to further segregate contamination within the plume. The second was that several additional rounds of EVO injections were conducted in the former source area to address contaminant rebound in this area.

As part of the permit required compliance monitoring program, 12 monitoring wells installed at the site are currently sampled annually and 11 monitoring wells are sampled semiannually.

Annual groundwater compliance monitoring at the site includes collection of samples from the monitoring wells listed in Table 2-6 below.

Table 2-6 Site SS007 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
7-4	Shallow	Annual
7-7	Deep	Annual
OB-2	Shallow	Semiannual
OB-3	Shallow	Semiannual
OB-4	Shallow	Semiannual
OB-5	Shallow	Annual
OB-6	Shallow	Annual
OB-9	Shallow	Semiannual
OB-13	Shallow	Annual
OB-16	Shallow	Annual
OB-18	Shallow	Semiannual
OB-19	Shallow	Annual
OB-21	Shallow	Semiannual
N7-38	Intermediate	Semiannual
N7-40	Shallow	Semiannual
N7-41	Shallow	Semiannual

N7-50	Intermediate	Annual
N7-51	Deep	Annual
N7-52	Intermediate	Semiannual
N7-53	Deep	Semiannual
N7-69	Shallow	Semiannual

Groundwater samples are analyzed for VOCs and RCRA metals.

Additionally, two sediment samples and two surface water samples are collected annually from the creeks located in the northern portion of Site SS007. These samples also are analyzed for VOCs and RCRA metals.

2.2.3 Site ST008 (Underground Storage Tank (UST) No. 106 at Building 110)

Site ST008 consists of the former USTs at Building 110. ST008 is located near the northern boundary of Vance AFB, due south of Site SS007, west of Elam Drive, and east of the flightline (Figure 1-2). ST008 had five USTs that were removed during March 1989. The individual tanks were designated as UST No. 106, UST No. 108, UST No. 109, UST No. 112, and UST No. 113. UST No. 106 was the farthest west in the series of tanks. Only one UST, No. 106, was designated as a hazardous waste management unit. The other four tanks were petroleum product tanks only, while Tank No. 106 held a variety of solvents, contaminated fuels, and waste oils from 1970 through 1980. Each tank had a capacity of 12,000 gallons and was constructed of steel. ST008 and monitoring well locations are shown on Figure 2-11.

Residual wastes were removed and manifested for disposal; the wastes were identified as U.S. Environmental Protection Agency (EPA) Hazardous Waste Codes F001, F002, F003, F005, and D001 in 1989. However, impacted soil associated with UST No. 106 was left in-place and the area was subsequently covered with a concrete RCRA cap in 1991. Cap construction included a compacted aggregate base layer followed by a 10-inch thick layer of reinforced concrete. The cap area is approximately 100 feet by 80 feet with a 3 percent slope to a concrete curb system located along the cap/soil interface.

The soil beneath the RCRA cap was impacted above regulatory standards, but was left in place as contamination extended to and below the groundwater table. Shallow transmissive zone groundwater beneath the site is impacted above regulatory standards and was believed to be comingled with the Site SS007 contaminant groundwater plume

The remedy documented in the current permit requires sampling of specified monitoring wells at ST008 on an annual basis and inspection and maintenance of the RCRA cap in accordance with the ST008 Closure Plan, which was accepted by the Oklahoma State Department of Health, now known as the Oklahoma DEQ, on 18 August 1992.

As part of the predesign investigation (PDI)/confirmation sampling conducted at Site ST008 in 2013, several intermediate monitoring wells were installed in the vicinity of Monitoring Well MW8-18. Data from this investigation indicated that there was contamination upgradient of this well not related to the release at ST008. An additional investigation in the upgradient source area was conducted in February and March 2016 confirming that contamination was present in this upgradient area. Subsequently, the AF has opened a new site, designated as Site SS028 to address the contamination in this area upgradient of SS028. This site is included in the currently proposed Permit Mod.

In the summer of 2016, the Site ST008 remedy was changed to dual phase extraction (DPE) within the former tank pit area. DPE is a technology that uses a high-vacuum system to remove both contaminated groundwater and soil vapor from the subsurface. The DPE system depresses the water table and water flow is directed to the extraction well(s). DPE extracts contaminants from above and below the water table. The DPE system install at ST008 consisted of nine 1.5-inch DPE wells, a vacuum pump, and conveyance piping which carry water from ST008 to the CGTF where the extracted water is treated and discharged to the city of Enid POTW. Soil vapor is vented directly to the atmosphere. The remedy was implemented and put into operation in March 2017.

Annual Groundwater Compliance Monitoring at the site includes collection of samples from the monitoring wells listed in the Table 2-7 below.

Table 2-7 Site ST008 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
8-5	Shallow	Annual
8-9	Shallow	Annual
8-12	Shallow	Annual
8-16	Shallow	Annual
8-18	Intermediate	Annual

Collected groundwater samples are analyzed for VOCs and RCRA metals. The change in the remedy has been documented through the following documents.

- Remedial Design/Corrective Measures Implementation Report Site ST008, Vance AFB
- Construction Completion Report Site ST008, Vance AFB

2.2.4 Site SS028 (Solvent Spill Site)

Site SS028 is undergoing an RFI. Locations of current SS028 monitoring wells are shown on Figure 2-12.

2.2.5 Site ST011 (Aqua/Avgas Storage and Distribution System)

Site ST011 is undergoing an RFI. ST011, LF003 and monitoring well locations are shown on Figure 2-9.

2.3 Other IRP Sites

2.3.1 Site FT002 (Fire Training Area)

Site FT002 was used for fire training exercises between approximately 1953 and 2000, when the use of the site was discontinued after a new fire training facility was constructed to the west. Fire training exercises typically consisted of igniting flammable liquids such as fuel, oils, and/or solvents which had been dumped into a shallow depression in the ground surface. The Site was upgraded after 1970 with the construction of a berm and aircraft fuselage mock-up serviced by underground fuel supply lines. The pit was drained through lines leading to an underground oil/water separator. The Site was upgraded a second time in 1983 to include one pit with a full-scale aircraft fuselage mock-up, a second pit with a jet engine mock-up, and a fuel distribution head used to simulate automobile fires. Both of the pits were bermed and filled with gravel to help control drainage from firefighting activities. There were no containment or drainage controls around the fuel distribution head. Fuel for the pits was supplied through underground lines, and following training exercises, the pits were drained through underground lines into an oil/water separator and holding tank. FT002 (the fire training area) is located near the south-central boundary of the base and covers approximately 2 acres. FT002 and monitoring well locations are shown on Figure 2-13.

The Permit requires institutional controls and groundwater monitoring at FT002. The two monitoring wells associated with the site are Monitoring Wells MW02-04 and MW02-05.

In 2013, a PDI/confirmation sampling was conducted at Site FT002 focusing on soils to determine the nature and extent of residual soil contamination. The investigation concluded that there was a small area of soils between 12 and 16 feet below ground surface that exceeded ODEQ's standard for OK-GRO.

In 2014, a remedy was implemented to aggressively treat the remaining residual soil contamination that has COC concentrations above criteria using SVE. The SVE system consisting of four SVE wells was installed to treat soils in the vicinity of the former fire training pit. The system was placed online during August 2014 and taken offline in September 2014. The change in the remedy has been documented through the following documents.

- Remedial Design/Corrective Measures Implementation Report Site FT002, Vance AFB
- Construction Completion Report Site FT002, Vance AFB

There was also a small area on the site which had low level chlorinated volatile organic compounds that exceeded their relative standards. This area of impacted groundwater was treated using EVO injections to create subsurface conditions conducive to ERD in the area around Monitoring Well MW02-04. EVO injections into the shallow zone were conducted during May 2014.

Annual groundwater compliance monitoring at the site includes collection of samples from the monitoring wells listed in the Table 2-8 below.

Table 2-8 Site FT002 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
02-04	Shallow	Annual
02-05	Shallow	Annual

Groundwater samples are analyzed for VOCs, SVOCs, RCRA metals, pesticides, OK-GRO and OK-DRO.

Site FT002 is currently being investigated for perflourinated compounds (PFCs) by the AF.

2.3.2 Site DP005 (Tank Sludge Disposal Area)

Site DP005 is located between the Flight Line Drainage Creek and the southern boundary of the base, southwest of FT002. DP005 and monitoring well locations are shown on Figure 2-14.

A search of Vance AFB records indicates that Site DP005 resulted from a one-time disposal of approximately 1,000 gallons of fuel tank sludge in a shallow pit (or pits) on top of the south bank of FD Creek (ESE, 1984). Evidence from subsequent investigations at DP005 confirmed the findings that soil and groundwater in the area were contaminated with solvents and fuel related compounds, and that two or more disposal locations may have existed at the site.

In May 2003, Vance AFB implemented an Interim Removal Action (IRA) at Site DP005 to remediate shallow groundwater and protect surface water and sediment in FD Creek. During installation of the ICT, contaminated soil and miscellaneous metallic debris (crushed 55 gallon drums and 5-gallon buckets) were encountered in the shallow subsurface. This debris, along with the surrounding soil, was removed and placed in two roll-off containers. Waste characterization samples were collected from the two roll-off containers. The results indicated that the material was hazardous. The material was subsequently transported to an approved RCRA facility for stabilization and disposal.

Based on the observations made during construction activities in May 2003 and results of the 2004 geophysical surveys and test pit excavations, an IRA was performed to excavate contaminated soils and debris previously encountered during installation of the ICT. The impacted soils were then excavated and disposed of at an approved RCRA landfill. The

excavation was backfilled with clean fill. Removal of the source material was performed to enhance cleanup of groundwater contamination by minimizing the leaching of contaminants into groundwater, thereby reducing the operational time of the groundwater extraction and treatment system and the total costs of cleanup (Shaw, 2007).

The remedy documented in the current permit requires the operation of the groundwater extraction system coupled with long-term monitoring of groundwater and sediments at Site DP005.

In 2014, the Site DP005 remedy was modified to include a more aggressive treatment using injections of EVO to create subsurface conditions conducive to the ERD process. EVO injections into the shallow zone were conducted between the periods of January through April 2014. At the time of the injections, the groundwater extraction system (EW05-01 through EW05-03 and the ICT sump) was taken off line. EW05-02 and the ICT sump were subsequently placed back online. EW05-01 and EW05-03 will remain offline indefinitely, due to the presence of EVO. In addition, the existing groundwater extraction and treatment system was modified to include a new equipment enclosure (trailer) and a groundwater injection/recirculation system. Treated groundwater is amended with lactate and reinjected into four sets of reinjection wells, located within and upgradient of the plume, to aid in the distribution of a carbon source throughout the plume. An SVE system consisting of four SVE wells was also installed to treat soils adjacent to the groundwater interceptor trench. The system was installed and placed online during November 2014. The change in the remedy has been documented through the following documents.

- Interim Corrective Measures Work Plan Site DP005, Vance AFB
- Interim Corrective Measure Construction Completion Report Site DP005, Vance AFB
- Remedial Design/Corrective Measures Implementation Report Site DP005, Vance AFB
- Construction Completion Report Site DP005, Vance AFB

The skid mounted SVE unit was subsequently removed from DP005 during February 2015 due to limited mass removal rates.

Annual groundwater compliance monitoring at Site DP005 includes collection of samples from the monitoring wells listed in the Table 2-9 below.

Table 2-9 Site DP005 – 2010 RCRA Post Closure Permit Required Monitoring		
Well ID	Well Type	Monitoring Frequency
5-1	Shallow	Annual
5-3	Shallow	Annual
5-4	Shallow	Annual
5-6	Shallow	Annual
5-7	Shallow	Annual
5-8	Shallow	Annual
5-9	Deep	Annual
5-18	Intermediate	Annual
5-19	Shallow	Annual

Collected groundwater samples are analyzed for VOCs, SVOCs, RCRA Metals, OK-GRO and OK-DRO.

Additionally, two sediment samples and two surface water samples are collected annually at Site DP005. Sample location SW05-13/SD05-13 is located on the north eastern corner of DP005 and is representative of potential plume discharge to surface water and sediment at the site. Sample location SW05-14/SD05-14 is located approximately 3600 feet east. These samples also are analyzed for VOCs, SVOCs, RCRA Metals, OK-GRO and OK-DRO.

2.3.3 Site SS026 (Jet Fuel Storage Area)

Site SS026, the Jet Fuel Storage Area, is located in the northern portion of Vance AFB, near IZ Sites LF003, SS007, and ST008. Aboveground storage tanks (ASTs) containing jet fuel for Vance AFB operations are located approximately 100 feet west of a concrete-paved area used to store recreational vehicles. According to historical records, contamination at the site resulted from activities in the 1970s and early 1980s. Residual AST fluids, sludge, and/or rainwater, which may have contained JP-4 fuel contamination, were discharged periodically from the diked area surrounding the ASTs onto the ground in the area where the recreational vehicle facility was later constructed. A Remedial Investigation (RI)/Feasibility Study (FS) was performed at the site to support the IRP at Vance AFB. Following the RI/FS, an IRA, which included the removal of 43 tons of soil from the site, was performed in 2007. A remedial action immediately followed the IRA, which included the planting of a phytoremediation area consisting of 60 hybrid poplar trees for passive groundwater treatment and the placement of Oxygen Release Compound (ORC®) filter socks in five monitoring wells to facilitate the aerobic biodegradation process (ITSI, 2010). SS026 and monitoring well locations are shown on Figure 2-15.

The remedy documented in the current permit requires the continued operation and maintenance of the final remedy, which includes annual groundwater compliance sampling and maintenance of a phytoremediation system.

This remedy was changed in 2014 to aggressive treatment of residual areas of VOCs, SVOCs and OK-GRO contamination using biosparge technology to enhance biological activity and reduce contaminant mass in the aquifer. The phytoremediation plot was no longer required once the remedy was changed and it was removed in October 2017.

The biosparge system consists of six biosparge wells skid-mounted biosparge unit (compressor), which is located in the CGTF. The system operated for approximately two years at which time two additional biosparge wells were installed to accelerate remediation of the remaining area of the site that exhibited residual contamination above unrestricted use/unrestricted exposure (UU/UE) standards. The two new wells were connected to the biosparge system and placed into operation in April 2016 and concurrently; three biosparge wells were taken off line, as these wells were located in areas where contaminant concentrations in groundwater samples had decreased to levels below regulatory standards. The biosparge system operated as designed from the time of startup (June 2014) through September 2016, when the system was turned off based on analytical results of groundwater samples collected from the site, e.g., contaminant concentrations below regulatory standards. In June of 2017 contaminant concentrations in Monitoring Well MW24-4 rebound and the biosparge system was reactivated the system ran from September 2017 through January 2018 when samples collected from this monitoring well again fell below regulatory standards.

Annual groundwater compliance monitoring at the site includes collection of samples from the monitoring wells listed in the Table 2-10 below.

Table 2-10
Site SS026 – 2010 RCRA Post Closure Permit Required Monitoring

Well ID	Well Type	Monitoring Frequency
26-1	Shallow	Annual
26-2	Intermediate	Annual
26-3	Shallow	Annual
26-4	Shallow	Annual

Groundwater samples are analyzed for VOCs, SVOCs and OK-GRO.

3.0 PROPOSED CHANGES TO THE FALL COMPLIANCE MONITORING PROGRAM

The fall sampling event, as outlined in the 2010 Vance AFB RCRA Post Closure Permit, consists of the sampling of 13 groundwater monitoring wells associated with Sites LF003 and SS007 and listed below in Table 3-1.

Table 3-1 Fall Compliance Monitoring Program		
Well ID	Well Type	Monitoring Frequency
MW3-9	Shallow	Semiannual
OB-2	Shallow	Semiannual
OB-3	Shallow	Semiannual
OB-4	Shallow	Semiannual
OB-9	Shallow	Semiannual
OB-18	Shallow	Semiannual
OB-21	Shallow	Semiannual
N7-38	Intermediate	Semiannual
N7-40	Shallow	Semiannual
N7-41	Shallow	Semiannual
N7-52	Intermediate	Semiannual
N7-53	Deep	Semiannual
N7-69	Shallow	Semiannual

Monitoring wells MW3-9, MWOB-2, MWOB-3 are shallow monitoring wells that are used to monitor Site LF003.

Monitoring Wells MWOB-4, MWOB-9, MWOB-18, MWOB-21, and MWN7-40, MWN7-41 monitor the shallow zone at Site SS007, while Monitoring Wells MWN7-38, and MWN7-52 monitor the intermediate zone and MWN7-53 monitors the deep zone.

Groundwater

An analysis of the groundwater data of all of the monitoring wells in the fall compliance sampling program indicates that of the thirteen monitoring wells sampled four (MWOB-09, MWN7-41, MWN7-69 and MWN7-53) have never had a VOC exceedance in the past ten years. An additional four of these monitoring wells (MWN7-40, OB-03, OB-18 and OB-21) have not exceeded criteria for VOCs in the past three years. The remaining wells all exhibit stable to decreasing VOC trends with low VOC concentrations. The exception is Monitoring Well MW03-09, which is impacted by higher levels of petroleum hydrocarbons, but exhibits stable to decreasing trends. Groundwater monitoring results for the monitoring wells included in the fall compliance monitoring program for the past five years (2013 to 2017) are presented in Appendix C. The previous five years of monitoring data for these monitoring wells are included in Appendix D.

An analysis of historical data for the monitoring wells included in the semiannual sampling program shows that there is little variation in COC concentrations between spring and fall compliance monitoring events. This indicates that seasonal variation in contaminant concentrations is not a concern. Also, plume migration does not appear to be a concern as maximum contaminant concentrations within the North Site SS007 plume have decreased from 3,800 micrograms/liter ($\mu\text{g}/\text{L}$) in 1999 to less than 200 $\mu\text{g}/\text{L}$ currently. Additionally, in January 2015, new remedies consisting of source area injections and an expanded groundwater extraction and treated water injection/recirculation system were implemented at this site. This new remedy includes a robust groundwater extraction system that captures the plume through a

series of 16 groundwater extraction wells. The aerial extent of the TCE plume at this site has decreased approximately 90 percent since the new remedies were installed.

Summary

Based on the data presented above the fall groundwater compliance sampling plan is no longer warranted and the Permittee recommends deleting the requirement from the Permit.

4.0 ELIMINATION OF SEDIMENT AND SURFACE WATER SAMPLING AT SITES LF003, SS007 AND DP005 FROM THE COMPLIANCE MONITORING PROGRAM

Surface water and sediment samples are currently collected from three sites at Vance AFB on an annual basis, as part of the groundwater compliance monitoring program. These samples are collected at Sites LF003, SS007 and DP005 during the spring compliance monitoring event. Samples collected at Site DP005 are analyzed for VOCs, SVOCs, RCRA metals, OK-GRO and OK-DRO. Samples collected from Sites LF003 and SS007 are analyzed for VOCs and RCRA metals.

Samples were being collected on a semiannual basis until 2014, when a review of the Permit determined that there was no requirement to sample these locations on a semiannual basis. In addition, surface water and sediment samples collected at Sites LF003 and SS007 were analyzed for SVOCs until 2014, when it was discovered that this was not a required analytical suite at these sites.

Sampling locations for Sites LF003, SS007 and DP005 are shown on Figures 4-1 and 4-2, respectively. Analytical results dating back to 2009 are presented in Appendix E. The following sections summarize surface water and sediment sampling at each site and presents recommendations relative to the continuation of sampling at each site.

4.1 SITE LF003

Surface Water

Per the Permit, surface water is sampled from two Site LF003 locations (SW03-11 and SW03-12) on an annual basis. Collected samples are analyzed for VOCs and RCRA metals. An analysis of the data indicates that no compounds exceeded their relative standards in any of the samples collected. Based on this data, it is recommended that surface water sampling at LF003 be discontinued.

Sediment

Sediment is sampled from two Site LF003 locations (SD03-11 and SD03-12) on an annual basis. Collected samples are analyzed for VOCs and RCRA metals. An analysis of the data indicates that no compounds exceeded their relative standards in any of the samples collected. Based on this data, it is recommended that sediment sampling at LF003 be discontinued.

4.2 SITE SS007

Surface Water

Surface water is sampled from two Site SS007 locations (SW07-09 and SW07-10) on a semiannual basis, with the exception of 2012 where only annual samples were collected. Collected samples are analyzed for VOCs and RCRA metals. An analysis of the data indicates that no compounds exceeded their relative standards in any of the samples collected. Based on this data, it is recommended that surface water sampling at the SS007 site be discontinued.

Sediment

Sediment is sampled from two Site SS007 locations (SD07-11 and SD07-12) on an annual basis, with the exception of 2012, where only annual samples were collected. Collected samples are analyzed for VOCs and RCRA metals. An analysis of the data indicates that no

compounds exceeded their relative standards in any of the samples collected. Based on this data, it is recommended that surface water sampling at the SS007 site be discontinued.

4.3 SITE DP005

Surface Water

Surface water is sampled from two Site DP005 locations (SW05-13 and SW05-14) on an annual basis. Sample location SW05-13 is located on the northeastern corner of DP005. Sample location SW05-14 is located approximately 3,600 feet east of the site, where the drainage ditch that runs from DP005 (immediately south of Sites FT002, WP001 and LF004) approximately 3600 feet to a discharge point at the Base boundary discharges to a stream. Collected samples are analyzed for VOCs, SVOCs, metals, OK-GRO and OK DRO.

Since 2009 there has been only one exceedance in surface water samples collected from the SW05-13 location. In a sample collected during May 2013, chlorobenzene exceeded the 100 µg/L standard with a concentration of 112 micrograms per liter (µg/L).

At sample location SW05-14 two exceedances were noted since 2009. The first was a chlorobenzene exceedance where the sample collected during May 2013 had a concentration of 111 µg/L. The second was during May 2014 where the surface sample collected at location SW05-14 had a concentration of bis(2-ethylhexyl)phthalate of 106 µg/L.

Bis(2-ethylhexyl)phthalate is a plasticizer that can be introduced into the sample as a field or laboratory contaminant. This contaminant has been noted sporadically in other samples collected at the Base. Based on an analysis of this data, the lack of contamination in surface water samples, and that the Site DP005 contaminant plume is not discharging to surface water, it is recommended that surface water sampling be discontinued at DP005. Surface water data tables are included in Appendix E.

Sediment

Sediment is sampled from two Site DP005 locations (SD05-13 and SD05-14) on an annual basis. Sample location SD05-13 is located on the northeastern corner of DP005. Sample location SD05-14 is located approximately 3,600 feet east of the site, where the drainage ditch that runs from Site DP005 (immediately south of Sites FT002, WP001 and LF004) to a discharge point at the Base boundary discharges to a stream. Due to the long distance from DP005, and the fact that the ditch runs past several other IRP sites, collects storm water drainage from the runway, roadways and adjacent parking lots, e.g., analytical results from this location are more indicative of what is present at this Base boundary sampling location rather than what contamination originated at DP005.

Collected samples are analyzed for VOCs, SVOCs, metals, OK-GRO and OK DRO. Analytical results of sampling conducted at location SD05-13 indicate there have been no contaminants present in the samples that exceed standards since October 2009.

Sample location SD05-14 is located at the Base boundary. Samples collected from this location have consistently exceeded standards for the SVOCs benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene and OK-DRO. It is unlikely that Site DP005 is the source of the sediment contamination, as these contaminants were only detected above standards once (October 2009) at DP005 sample location SD05-13. Sediment samples should continue to be collected from this sample location, but should not be associated with DP005 but rather part of the Base's storm water permit as the ditch also collects surface runoff from runways, roadways parking lots, etc. Sediment data tables are included in Appendix E.

5.0 PROPOSED CHANGES TO THE COMPLIANCE MONITORING PROGRAM – GROUNDWATER

The Vance AFB compliance monitoring program was last modified during the 2010 RCRA Permit Renewal process. New remedies have been implemented resulting in changes to plume morphology that necessitate corresponding changes to the compliance monitoring program. Figure 5-1 shows the aerial extent of plumes for five areas/sites (CMI Area, IZ Area, Site FT002, Site DP005, and Site SS026) covered under this Permit in 2010 and Figure 5-2 shows the aerial extent of the plumes through March 2017. These two figures were previously presented in a meeting with ODEQ on 22 August 2017. In general, the plumes have decreased an average of 90 percent since the permit was last renewed, with the majority of the reduction occurring after implementation of the new remedies at the sites.

The section below provides the basis for the change to permit sections IV.B.1., IV.B.3. and IVC.3.

As a result of the shrinking aerial extent of the plumes, there are monitoring wells that no longer serve their original purpose, as they are too far away from the plumes. These wells have never been impacted, or have not been impacted above MCLs and Regional Screening Level (RSLs), for a period greater than three years. The three year period is outlined in Section IV Part C.3 and IV D.3 of the current Permit and is used as criteria for eliminating both monitoring wells and analytes from the groundwater compliance monitoring program.

A second impact resulting from the shrinking plumes is that there is now physical separation laterally and/or vertically between the plumes of adjacent sites that previously overlapped. As a result, it is necessary to realign monitoring wells in the Permit to the site that they monitor. This will simplify the overall monitoring program and allow individual sites to progress towards closure, as the monitoring wells used to monitor conditions within their plumes are assigned to them in the Permit.

A change recommended in this Permit Mod is to focus the compliance program and resources on defined contaminants of concern at each site. This will be done by modifying the SAP to include only COCs for each site, as well compounds which have exceeded MCLs/RSLs within the last three years. This will significantly reduce the complexity of the annual compliance monitoring program and corresponding annual report and allow for a better understanding of what is occurring at each site.

Random exceedances of contaminants will also be examined during this process to determine if the exceedance is actually the result of a release at the site or if the contaminant has been introduced or is a result of the sampling process. If these contaminants have only been detected once in the past five years, and not the current year's sampling event, the analyte will be considered random and will be proposed for elimination from the analyte list. Random exceedances predominantly occur for the metals lead, arsenic and selenium and for the SVOC bis(2-Ethylhexyl)Phthalate. None of these compounds, with exception of lead at Sites LF003 and DP005, are considered to be introduced by the release at these sites, as the metals arsenic and selenium are largely considered background metals, while bis(2-Ethylhexyl)Phthalate is a plasticizer and can be introduced during the sampling collection and handling process.

The following sections will address and provide rationales for the removal of individual monitoring wells from the compliance monitoring program, the realignment of monitoring wells and elimination of analytes from the sampling program. Five-year data tables for analyte detections within the past 5 years for all sites are included in Appendix C. Monitoring wells that had no detections of analytes listed in the Permit will not show up in the tables. The previous five years (2009 to 2013) of data is included in Appendix D.

5.1 DELETION OF MONITORING WELLS FROM THE COMPLIANCE MONITORING PROGRAM

For monitoring wells to be considered for removal from the basewide sampling program they must meet the three criteria outlined below.

1. At least three consecutive monitoring events with no analytes above their regulatory criteria (MCL/RSL). Monitoring events must be separated by one year period.
2. Monitoring wells in critical locations such as a well monitoring downgradient edge of plume will not be eliminated from program.
3. Monitoring wells that will be part of Long-term Monitoring (LTM) program, site closure process will not be eliminated from program.

5.1.1 CMI Area

The CMI area includes IRP Sites ST012, WP023, SS024, and SS025 and is shown on Figures 5-1 and 5-2. The aquifer in the CMI area has three transmissive zones associated with it; the shallow zone (10-30 feet bgs), intermediate zone (35-50 feet bgs), and deep zone (55-75 feet bgs).

The compliance well network associated with the CMI area currently includes 24 monitoring wells, with 16 wells screened in the shallow zone, 5 wells in the intermediate zone, and 3 wells in the deep zone. No monitoring wells currently assigned to Sites WP023 and SS024 are being proposed for elimination from the compliance monitoring program. Five-year data tables for analyte detections within the past 5 years for all sites are included in Appendix C.

Site ST012

Two deep monitoring wells are being proposed for elimination from the Vance AFB groundwater compliance monitoring program. Site ST012 Monitoring Well MW12-20 is located side gradient of the source in the deep transmissive zone. This monitoring well has never had any exceedances and is not integral to monitoring the release to the ST012 deep zone. Therefore, it is recommended that it be deleted from the compliance monitoring program. In addition, Monitoring Well MW12-21 has historically not been impacted. It is recommended that it be deleted from the program as well. Site ST012 monitoring wells are shown on Figure 5-3.

Site SS024

No monitoring wells currently assigned to Site SS024 are being proposed for elimination from the compliance monitoring program. Site SS024 monitoring well are shown on Figure 5-4.

Site SS025

Three Site SS025 monitoring wells, (MW25-08, MW25-09 and MW25-15) are being proposed for elimination from the program, as they meet all of the above outlined criteria. The proposed wells have not exceeded MCLs/RSLs for a period exceeding three annual sampling events. In addition, these monitoring wells, as shown on Figure 2-7, are located at the northern extent of the CMI area closest to SS025. The proposed monitoring wells are not critically located with regards to monitoring current plume morphology within the CMI. Therefore, these wells provide no useful data with regards to monitoring the releases at any of the CMI area sites. None of

these wells will be used for LTM purposes. Site SS025 monitoring wells are shown on Figure 5-5.

Site WP023

No monitoring wells currently assigned to Site WP023 are being proposed for elimination from the compliance monitoring program.

5.1.2 IZ Area Including Site SS026

IRP Sites LF003, SS007, ST008, SS028, and ST011 are associated with the IZ area and are shown on Figure 2-8. The compliance well network in the IZ is comprised of 31 monitoring wells located within three IRP sites (LF003, SS007, and ST008). Twenty-two wells are screened in the shallow zone, five wells are screened in the intermediate zone, and four wells are screened in the deep zone. SS026 is located immediately east of LF003 and downgradient of ST011. SS028 is located immediately upgradient of ST008 and is being added to the Permit in this modification. Monitoring wells being proposed for elimination from the compliance monitoring program from the IZ Area are included in the following sections. The current compliance monitoring program at SS026 will not change. ST011 and SS028 are undergoing investigations and thus are not currently in the groundwater compliance monitoring program. Five-year data tables for analyte detections within the past 5 years for all sites are included in Appendix C.

Site LF003

The current compliance monitoring program at Site LF003 consists of the monitoring of two shallow zone and one deep zone monitoring wells. Locations of these monitoring wells are shown on Figure 2-9. Currently, two of the three monitoring wells (MW03-06 and MW03-07) meet the criteria for removal from the compliance monitoring program.

Monitoring Well MW03-06 is located upgradient of Site LF003 and has not had any VOC or metals exceedances (MCLs/RSLs) for over a period exceeding five years. This monitoring well does not provide any useful data relative to any potential release from LF003.

Monitoring Well MW03-07 is used to monitor the deep zone at Site LF003. Data collected from the inception of this well indicates that the deep zone within the aquifer was never impacted by waste in the LF003 landfill or from any other sites within the IZ and thus should be removed from the compliance monitoring program.

Site SS007

Site SS007 is located along the former northern perimeter of the base, northeast of the flight line apron and west of the Tank Farm Landfill (LF003). It consists of three discrete areas; the DRMO, the old BCE storage area, and the area north of Fox Drive (commonly known as North Site SS007) (ITSI, 2010).

There are currently 24 monitoring wells installed at Site SS007 that are used as sampling points for the groundwater compliance monitoring program. The monitoring wells address the three transmissive zones within the aquifer beneath the site. Sixteen wells are used to monitor the shallow zone; four wells are used to monitor the intermediate zone and four wells are used to monitor the deep zone. Monitoring well locations are shown on Figure 2-10.

Currently five of the 16 monitoring wells in the shallow zone (OB-03, OB-09, OB-18, MWN7-40 and MWN7-69) meet the criteria for removal from the compliance monitoring program and are being proposed for removal.

Monitoring Well OB-03 is located approximately 750 feet side gradient of the Site SS007 source area. This well has not exceeded MCLs/RSLs in excess of ten years and is highly unlikely to be impacted by contamination originating at the SS007 source area or from the Site LF003, ST011 or SS026 plumes. This is evidenced by the fact that contaminants would have already reached the well due to the age of the releases at the three sites and the relative proximity of these sites to Monitoring Well OB-03.

Monitoring Well OB-09 is another well located side gradient to the Site SS007 plume. This well has not exceeded MCLs/RSLs in excess of ten years and is highly unlikely to be impacted by contamination originating at the SS007 source area. This is evidenced by the fact that this area has largely been remediated and the distal end of the SS007 plume has significantly decreased in concentration and contracted to the west, since the new remedy was implemented in 2015. Given that groundwater flow paths in this area are well established and vary little, this well is no longer needed to monitor the lateral extent of the plume.

Monitoring Well OB-18 is located immediately adjacent to the northern ICT, on the western plume boundary. This well has not exceeded MCLs/RSLs for VOCs or metals since May of 2010, when TCE concentrations (5.10 µg/L) slightly exceeded the MCL of 5 µg/L. This well is located upgradient of the northern ICT and based on plume morphology is no longer needed to monitor the plume.

Monitoring Wells MWN7-40 and MWN7-69 are located downgradient of the toe of the Site SS007 plume at SS007. MWN7-40 has not exceeded MCLs/RSLs for VOCs or metals since April 2009 when TCE was detected at a concentration of 18.1 µg/L. MWN7-69 has not exceeded MCLs/RSLs for VOCs or metals since October 2009, with the exception of lead in June 2017, when TCE concentrations (16.5 µg/L) slightly exceeded the MCL of 5 µg/L. It appears the elevated reading result is likely due to turbidity in the sample, which had a turbidity of 53.1 NTUs. Lead is not present upgradient of this well and it is highly unlikely that the origin of lead in the sample is the SS007 release. Based on changing plume morphology, including the significant reduction in plume size and concentration since the original compliance network was instituted, these wells are no longer the best options to monitor the downgradient edge of the plume. Therefore, as these wells meet all of the criteria they should be removed from the program.

The deep zone at the Site SS007 has not been impacted by the release. There are three deep monitoring wells located at SS007 that monitor the deep zone. Monitoring Well MW07-07 is located near the source area of the SS007 plume. Selenium was not detected in soils in the source area nor in shallow zone groundwater at the site. Given this information, it appears that selenium observed at MW07-07 is naturally occurring and not an artifact of the release. Because there were never any impacts from the SS007 release observed in the deep aquifer, it is recommended that all three deep monitoring wells (MW07-07, MWN7-51 and MW7N-53) be removed from the groundwater compliance monitoring program.

Site ST008

Site ST008 consists of the former UST's at Building 110. ST008 is located near the northern boundary of Vance AFB, due south of Site SS007, west of Elam Drive, and east of the flightline (Figure 1-2). ST008 had five USTs that were removed during March 1989. The individual tanks were designated as UST No. 106, UST No. 108, UST No. 109, UST No. 112, and UST No. 113. UST No. 106 was the farthest west in the series of tanks. Only one UST, No. 106, was designated as a hazardous waste management unit. The current compliance monitoring program at ST008 consists of monitoring four shallow zone wells and one intermediate zone well at the site. Locations of these monitoring wells are shown on Figure 2-11. Currently two of

the four monitoring wells (MW08-12 and MW08-16) meet the criteria for removal from the compliance monitoring program and are being proposed for removal.

Monitoring Well MW08-16 is located approximately 500 feet west of the release from the No. 106 UST, which is the origin of the contamination at Site ST008. Due to the position of this well relative to the source of contamination originating at ST008 (sidegradient), contamination would never impact this well. Monitoring Well MW08-16 has not exceeded MCLs or relative RSLs for VOCs or metals since May of 2013, when TCE concentrations (5.62 µg/L) slightly exceeded the MCL of 5 µg/L. It is highly likely that the contamination observed in this well did not originate from the ST008 release.

Monitoring Well MW08-12 is located approximately 250 feet west/northwest of the release from the No. 106 UST, which is the origin of the contamination at Site ST008. This well is in a sidegradient location, with a slight down gradient component. This well has not exceeded MCLs/RSLs in excess of ten years. It is highly unlikely, given the changing plume morphology and the fact that the source of the ST008 contamination is currently being remediated, that this well will ever be impacted with contamination originating from the ST008 release.

Neither of the two monitoring wells proposed for elimination from the compliance monitoring program will be used as long-term monitoring wells for the purpose of obtaining unrestricted site closure.

Site SS026

No monitoring wells currently assigned to Site SS026 are being proposed for elimination from the compliance monitoring program

5.1.3 Site DP005

Site DP005 is located between the Flight Line Drainage Creek and the southern boundary of the base, southwest of Site FT002. A search of Vance AFB records indicates that DP005 resulted from a one-time disposal of approximately 1,000 gallons of fuel tank sludge in a shallow pit (or pits) on top of the south bank of FD Creek (ESE, 1984). Nine monitoring wells comprise the DP005 compliance well network, with seven of these wells screened in the shallow zone, one in the intermediate zone, and one in the deep zone. In addition, two surface water and sediment sampling locations are included at DP005. Groundwater, surface water, and sediment samples were analyzed for VOCs, SVOCs, metals, and total petroleum hydrocarbon (TPH).

Currently the only monitoring well that meets the criteria for elimination from the sampling program is deep zone Monitoring Well MW05-09. Contamination at DP005 does not extend to the deep zone as no contaminants, with the exception of lead (May 2015) and bis(2-Ethylhexyl)Phthalate (May 2013) have exceeded MCLs/RSLs. These contaminants are considered to be random, as they have only been detected above standards in over ten years of sampling. As a result, this well should be removed from the groundwater compliance monitoring program. Monitoring well locations are shown on Figure 2-14. Five year data tables for analyte detections within the past 5 years for all sites are included in Appendix C.

5.1.4 Site FT002

No monitoring wells currently assigned to Site FT002 are being proposed for elimination from the compliance monitoring program.

5.1.4 Summary

The following tables (Tables 5-1, 5-2a, 5-2b, 5-2c, and 5-3) summarize the wells remaining in the compliance monitoring program after the proposed deletions in the CMI area, IZ and DP005 sites. Monitoring wells proposed for elimination from the groundwater compliance monitoring program are identified in red text with a strikethrough.

5.2 PROPOSED REMOVAL OF ANALYTES

The goal of the groundwater compliance monitoring program, as outlined in the Permit, is to monitor groundwater contamination from known releases. All of the sites included in the Permit have undergone extensive investigative activities and subsequent groundwater compliance monitoring activities. Currently groundwater compliance monitoring activities conducted at the sites covered in the Permit includes an extensive list of analytes for each site. The majority of the analytes currently being monitored per the 2010 Permit SAP have never been detected. Table 5-4 presented below shows the number of analytes detected at each site relative to the number of analytes analyzed for at each site included in the groundwater compliance monitoring program.

Table 5-4 Total Number of Analytes vs. Detected Analytes		
Site	Total Number of Analytes	Total Number of Analytes Detected in the Past 3 years above MCLs/RSLs
CMI		
Site ST012	97	6
WP023	97	2
Site SS024	97	0
Site SS025	97	3
IZ		
LF003	45	5
SS007	45	8
ST008	45	4
Site SS026	105	2
Site DP005	124	15
FT002	135	4

Vance AFB proposes to modify the analyte list for each site to refocus the monitoring efforts and resources on monitoring remedial progress relative to achieving MCLs/RSLs for contaminants released at the site. Reducing the analyte list on the remaining wells in the compliance program (not including wells proposed for removal in Section 4-1) will also simplify the annual Groundwater Compliance Monitoring Report by solely focusing on the contaminants of concern at each site. Contaminants of concern for each site were outlined in the Remedial Design/Corrective Measures Implementation documents, which were submitted to and approved by ODEQ. The analyte lists will be modified on a well-by-well basis to account for special variability, as well as propose reassigning monitoring wells to the sites whose contamination they actually monitor.

The analyte lists will be modified using the following criteria.

1. Any COCs detected above their relative MCL/RSL, during the past three years, would be included in each sites/monitoring wells analyte list.
2. Any non-COC detected above its MCL/RSL, during past three years, would be added to the site/monitoring well analyte list.
3. Sites where ERD has been implemented, which include Sites ST012, SS024, SS025, SS007, DP005 and FT002, analyte list would also include TCE, cis-1,2-DCE and VC at all wells regardless of whether there have been detections above MCLs within last three years.

The following sections present a site by site breakdown of the proposed analyte list at each location based on the implementation of the above criteria. A complete list of current analytes is included in the SAP that is appended to the 2010 RCRA Post Closure Permit. This SAP has been modified to include the changes proposed in this technical support document. Five-year data tables for analyte detections at all sites within the past 5 years are included in Appendix C to support recommendations made in the following sections.

5.2.1 CMI Area Monitoring Well Analytes

The remedy for all sites within the CMI area includes ERD, as a result, all of the monitoring wells remaining in the groundwater compliance program in this area will include TCE, cis-1,2-DCE and VC regardless of whether they exceed MCLs or not.

Proposed Site ST012 Monitoring Well Analytes

PCE and naphthalene are present in the deep zone at the source area and thus will be retained as parameters for Monitoring Well MW12-13. PCE will also be retained for Monitoring Well MW12-09, which is screened in the shallow zone and also located in the source area.

Bis(2-Ethylhexyl)Phthalate was detected at Monitoring Well MW12-35 in the last two compliance monitoring events. This contaminant is not related to the release at Sites ST012 or SS024, but is most likely being introduced during the sampling process. Bis(2-Ethylhexyl)Phthalate is a plasticizer that is a component of polyethylene tubing and polyvinylchloride (PVC). It is believed that the EVO present in this monitoring well is causing this compound to leach from the sampling apparatus and contaminate the sample. This analyte will be retained for this monitoring well until it can be verified that the contaminant is being introduced during the sampling process.

The permit also requires Monitoring Well MW12-33 be sampled for 1,4-Dioxane and thus this parameter will be retained for this well.

Table 5-5 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site ST012.

Table 5-5 Site ST012 Proposed Compliance Monitoring		
Well ID	VOCs	SVOCs
12-9	PCE, TCE, Cis- 1,2 DCE and VC	None
12-13	PCE, TCE, Cis-1,2 DCE and VC	Naphthalene
12-30	TCE, Cis-1,2 DCE,VC and 1,1 DCE	None
12-33	1,1-DCE,TCE, Cis-1,2 DCE and VC	1,4-Dioxane
12-34	TCE, Cis-1,2 DCE and VC	None
12-35	1,1-DCE,TCE, Cis-1,2 DCE and VC	1,4-Dioxane, bis(2-Ethylhexyl)Phthalate
12-37	1,1-DCE,TCE, Cis-1,2 DCE and VC	1,4-Dioxane
12-38	TCE, Cis-1,2 DCE and VC	None
12-43	TCE, Cis-1,2 DCE, VC, and trans 1,2-DCE	None
12-45	TCE, Cis-1,2 DCE,VC, trans 1,2-DCE	None

Proposed Site WP023 Monitoring Well Analytes

The monitoring wells with the Site WP023 designation in the permit are all in locations that have ERD as the main remedy and thus have TCE, cis-1,2-DCE and VC as analytes. Bis(2-Ethylhexyl)Phthalate was detected once in the past three years at Monitoring Well MW23-14. This analyte will be retained for this monitoring well until it can be verified that the contaminant is being introduced during the sampling process.

Table 5-6 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site WP023.

Table 5-6 Site WP023 Proposed Compliance Monitoring		
Well ID	VOCs	SVOCs
23-5	TCE, Cis-1,2 DCE and VC	None
23-14	TCE, Cis-1,2 DCE and VC	bis(2-Ethylhexyl)Phthalate
23-21	TCE, Cis-1,2 DCE and VC	None
23-22	TCE, Cis-1,2 DCE and VC	None

Proposed Site SS024 Monitoring Well Analytes

Monitoring Well MW24-05 has not had any detections of contaminants above their MCL/RSLs in a period exceeding 10 years, but was retained in the compliance monitoring program as it is located downgradient monitoring well for Site SS025. This monitoring well will be monitored for the analytes TCE, cis-1,2-DCE and VC.

Table 5-7 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site SS024.

Table 5-7 Site SS024 Proposed Compliance Monitoring		
Well ID	VOCS	SVOCs
24-5	TCE, Cis-1,2 DCE and VC	None

Proposed Site SS025 Monitoring Well Analytes

The proposed analytes for wells designated as Site SS025 monitoring wells in the current permit consist of TCE, cis-1,2-DCE and VC at Monitoring Wells MW25-1, MW25-2 and MW25-4. The analyte carbon tetrachloride was added to MW25-4, as it was detected once in the past three years at concentrations exceeding the MCL of 5 µg/L. The only analyte being proposed for Monitoring Well MW25-7 is the SVOC 1,4-Dioxane, as the permit mandates that this well be sampled for this analyte.

Table 5-8 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site SS025.

Table 5-8 Site SS025 Proposed Compliance Monitoring		
Well ID	VOCs	SVOCS
25-1	TCE, Cis-1,2 DCE, VC	None
25-2	TCE, Cis-1,2 DCE, VC	None
25-4	TCE, Cis-1,2 DCE, VC and Carbon tetrachloride	None
25-7	None	1,4-Dioxane

5.2.2 IZ Area Monitoring Well Analytes

Remedies for sites within the IZ area have varying COCs with Site LF003 being primarily a petroleum release site, Site SS007 being a chlorinated VOC site and Site ST008 being a mixed waste site. SS007 and ST008 will include TCE, cis-1,2-DCE, and VC regardless of whether they exceed MCLs or not as reductive dechlorination appears to be actively occurring at ST008 and ERD is part of the remedy at SS007. LF003 will primarily consist of petroleum based compounds.

Proposed Site LF003 Monitoring Well Analytes

The contamination at Site LF003 originates at Site ST011 and is petroleum in nature. Both benzene and ethylbenzene exceed MCLs at this site, along with lead and arsenic. The lead contamination is likely the result of the release at ST011. The arsenic contamination is most likely naturally occurring or the result of pesticide use in this area. Concentrations of both lead and arsenic contamination are likely elevated due to the reducing conditions present in the aquifer caused by the petroleum release. Lead and arsenic will be retained as analytes in addition to benzene and ethylbenzene.

Table 5-9 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site LF003.

Table 5-9 Site LF003 Proposed Compliance Monitoring		
Well ID	VOCs	Metals
3-9	Benzene, Ethylbenzene	Arsenic and Lead

Proposed Site SS007 Monitoring Well Analytes

Monitoring wells indicated as OB, MW7 and MW7N are designated as Site SS007 wells in the current Permit. Monitoring Wells MW7-15 and OB-2 are used to monitor the petroleum release from Site ST011. Monitoring Well MW7-15 monitors benzene, ethylbenzene, toluene, m&p-xylene, o-xylene as proposed analytes, along with lead and arsenic as all of these compounds exceed their MCL/RSL. Monitoring Well OB-2 is located downgradient of the ST011 plume and historically has low level benzene contamination it, with one sample exceeding the 5 µg/L MCL by 0.45 µg/L within the past three years. No other compounds exceeded MCLs or RSLs in this well.

The remaining wells designated as Site SS007 wells within the current Permit are impacted primarily by TCE. SS007 has an ERD component to its remedy and thus TCE, cis-1,2-DCE, and VC will be included as analytes for all wells, with the exception of Monitoring Wells MW7-15 and OB-02. In addition 1,1 DCE and arsenic will be added to the analyte list for Monitoring Well MW7-4, as these analytes were detected above MCLs once in the past three. Arsenic was detected slightly above the MCL of 10 µg/L and is likely caused by the reducing conditions generated by EVO injections in the vicinity of this monitoring well.

Arsenic was also retained as an analyte for Monitoring Well OB-21, which had detections of arsenic slightly above standards for the past three years. It is highly unlikely that these compounds are related to the release at Site SS007 and are more likely the result of the previous agricultural use of the property and ongoing grounds maintenance activities as this area is considered a Bird Aircraft Strike Hazard (BASH) area at Vance AFB.

Table 5-10 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site SS007.

Table 5-10 Site SS007 Proposed Compliance Monitoring		
Well ID	VOCs	Metals
7-4	TCE, Cis-1,2 DCE, VC	Arsenic and Lead
7-15	Benzene, Ethylbenzene, Toluene, m&p-Xylene, o-Xylene	Arsenic and Lead
OB-2	Benzene	None
OB-4	TCE, Cis-1,2 DCE, VC	None
OB-5	TCE, Cis-1,2 DCE, VC	None
OB-6	TCE, Cis-1,2 DCE, VC	None
OB-13	TCE, Cis-1,2 DCE, VC	None
OB-16	TCE, Cis-1,2 DCE, VC	None
OB-19	TCE, Cis-1,2 DCE, VC	None
OB-21	TCE, Cis-1,2 DCE, VC	Arsenic
N7-41	TCE, Cis-1,2 DCE, VC	None
N7-48	TCE, Cis-1,2 DCE, VC	None
N7-50	TCE, Cis-1,2 DCE, VC	None
N7-52	TCE, Cis-1,2 DCE, VC	None

Proposed Site ST008 Monitoring Well Analytes

The release at Site ST008 was from a mixed waste tank, which contained both solvents and petroleum products. Based on the Remedial Design/Corrective Measures Implementation Plan it was agreed that benzene, TCE, VC, and naphthalene be monitored at the site. The analyte cis-1,2-DCE has been added to the list, as TCE in the presence of a carbon source reduces (by reductive dechlorinated) to this daughter product. PCE was added as an analyte to intermediate zone Monitoring Well MW8-18, as PCE has regularly been detected above standards in samples collected from this well. Monitoring Well MW8-18 will be realigned to Site SS028 in this proposed Permit Mod.

Table 5-11 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site ST008.

Well ID	VOCs	Metals
8-5	Benzene, TCE, Cis-1,2 DCE, VC, Naphthalene	Arsenic
8-9	Benzene, TCE, Cis-1,2 DCE, VC, 1,1,2-TCA, 1,1,2,2-PCA, Naphthalene	None
8-18	PCE, Benzene, TCE, Cis-1,2 DCE, VC, Naphthalene	None

5.2.3 Proposed Site SS026 Monitoring Well Analytes

No VOC contamination has been detected above MCLs/RSLs within the past five years with the only remaining contamination at Site SS026 being TPH (OK-GRO) and naphthalene contamination detected in Monitoring Well MW26-04. Based on this data, naphthalene and OK-GRO will be carried forward as analytes to monitor the remaining contamination at SS026.

Table 5-12 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site SS026.

Table 5-12 Site SS026 Proposed Compliance Monitoring		
Well ID	SVOCs	TPH
26-1	Naphthalene	OK-GRO
26-2	Naphthalene	OK-GRO
26-3	Naphthalene	OK-GRO
26-4	Naphthalene	OK-GRO

5.2.4 Proposed Site DP005 Monitoring Well Analytes

Table 5-13 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site DP005.

Table 5-13 Site DP005 Proposed Compliance Monitoring				
Well ID	VOCs	SVOCs	Metals	TPH
5-1	Benzene, TCE, Cis-1,2-DCE, VC	Bis(2-Ethylhexyl) Phthalate	None	OK-GRO
5-3	TCE, Cis-1,2 DCE, VC, 1,1,1-TCA	None	None	None
5-4	Benzene, TCE, Cis-1,2 DCE, VC, 1,1,1 TCE, 1,1,2- TCA, 1,1- DCA, 1,1- DCE, Chloroform, Methylene Chloride, Toluene, Trans 1,2 DCE, PCE	Naphthalene	Arsenic	OK-DRO and OK-GRO
5-6	TCE, Cis-1,2 DCE, VC	None	Arsenic	OK-DRO
5-7	TCE, Cis-1,2 DCE, VC	None	Arsenic	OK-DRO
5-8	TCE, Cis-1,2 DCE, VC	None	None	OK-GRO
5-18	TCE, Cis-1,2 DCE, VC	None	None	None
5-19	Benzene, TCE, Cis-1,2 DCE, VC	bis(2-Ethylhexyl) Phthalate, Naphthalene	None	OK-DRO and OK-GRO

5.2.5 Proposed Site FT002 Monitoring Well Analytes

Contamination is only present in one of the two monitoring wells (MW02-4) at Site FT002. The main COC in this well is TCE and its daughter products cis-1,2-DCE and VC. Selenium and OK-DRO are also present. The selenium appears to be naturally occurring and its concentration hovers around the MCL of 50 µg/L, while the DRO contamination appears to be an artifact of the EVO injections conducted in the vicinity of this well. Both selenium and OK-DRO will be retained as analytes.

Table 5-14 lists the wells and analytes proposed for annual groundwater compliance monitoring at Site FT002.

Table 5-14 Site FT002 Proposed Compliance Monitoring					
Well ID	VOCS	SVOCs	TPH	Metals	Pesticides
2-4	TCE, Cis-1,2 DCE, VC Benzene	None	OK-DRO	Selenium	None
2-5	TCE, Cis-1,2 DCE, VC Benzene	None	None	None	None

5.3 CONCEPTUAL SITE MODEL (CSM) BASED REALIGNMENT OF MONITORING WELLS IN THE RCRA PERMIT

Changing plume morphology has allowed a shift from a groundwater management unit concept to a site based management concept of the groundwater plumes at Vance AFB. Plumes have significantly decreased in size since 2010 when the Permit was last revised and specifically since the new remedies were implemented. There is now physical separation either laterally or vertically, between the plumes that originate at each site. This is specifically applicable to the CMI and IZ areas that had previously been managed as groundwater management units even though they were called out specifically as individual sites in the Permit.

The change to a site based concept of groundwater management necessitates a realignment of monitoring wells within the Permit. Monitoring wells that are included in the Permit were installed during the RFIs conducted at the various Sites. In general, the majority of the monitoring wells installed during the RFIs were abandoned. The proposed revisions to the monitoring well networks and sites are based on the conceptual site models

The monitoring wells in the groundwater compliance program of the current Permit were assigned to the Sites based on the original designation assigned during the RFIs conducted at the base. The installed monitoring wells were frequently located beyond the investigated site's final delineated boundaries, and as a result many of these wells do not monitor the release from the site to which they are assigned in the permit. Due to the sequencing of the RFI's, many of these monitoring wells actually monitor releases from other nearby sites that had not undergone RFI's at the time.

As these sites progress toward closure, it is necessary to realign the monitoring wells to the sites whose contamination they monitor in order to facilitate the closure process. Monitoring well designations will not change but the monitoring wells will be reassigned to the site that is being monitored.

The following sections outline the rationale behind the changes. Figure 5-1 and Figure 5-2 show the plume morphology in 2010 and 2017, respectively, to illustrate how the plume has changed in size and shape over this time period. Groundwater potentiometric surface water maps are included in Appendix B. The proposed monitoring well reassessments were presented in draft format to ODEQ in an August 22, 2017 meeting.

5.3.1 CMI AREA MONITORING WELL REALIGNMENT

Site ST012

Site ST012, also known as the Paint Stripping Equalization Tank, is located near Monitoring Well MW12-09 and Extraction Well EW12-01. Contamination at this site primarily consists of the chlorinated VOCs; PCE, TCE, cis-1,2-DCE, and VC. Contamination occurs in all three transmissive zones (shallow, intermediate and deep) within the aquifer. As a result, ST012 is the source of all contamination in the intermediate and deep zones in the CMI area, as no other

release has penetrated into the intermediate or deep zones. The current groundwater compliance program consists of 12 groundwater monitoring wells installed in the various transmissive zones at the sites. Many of these monitoring wells, specifically in the shallow zone, monitor contamination at Sites SS024 and SS025. In addition, many monitoring wells installed as part of the RFIs at Site WP023 and SS025 within the shallow and intermediate zones monitor contamination originating from Site ST012.

Monitoring Wells MW25-1, MW25-2 and MW25-4 are located along the flightline, north of Site ST012. Contamination in these wells is most likely the result of localized impacts along the flightline from historic operations. ODEQ concurred with the assessment, but indicated that ST012 was a more appropriate site to assign the wells, as opposed to Site SS025, as the monitoring is somewhat downgradient of this site even though it is a significant distance. Table 5-15 below presents the rationale for the realignment.

Table 5-15
Site ST012 Rationale for Monitoring Well Reassignment

Well ID	Well Type	Rationale for Reassignment
12-9	Shallow	
12-13	Deep	
12-30	Intermediate	
12-33	Shallow	This well monitored the downgradient edge of the Site SS024 plume. This well is located 400 feet downgradient of the Site ST012 shallow plume. The Site ST012 and SS024 shallow plumes are not comingled. This well is proposed to be assigned to Site SS024.
12-34	Intermediate	
12-35	Shallow	This well monitors the source area near the Site SS024 release. The well is proposed to be reassigned to Site SS024.
12-37	Shallow	This well monitored the side gradient edge of the Site SS024 plume. This well is located 600 feet downgradient of the Site ST012 shallow plume. The ST012 and SS024 shallow plumes are not comingled. This well is proposed to be assigned to Site SS024
12-38	Intermediate	
12-43	Shallow	This well monitors the upgradient edge of the Site SS025 "hotspot" and is located over 100 feet away from Site ST012. This well is proposed to be assigned to Site SS025.
12-45	Shallow	This well monitors the upgradient edge of the Site SS025 "hotspot" and is located over 100 feet away from Site ST012. This well is proposed to be assigned to Site SS025.
23-05	Shallow	The well is immediately downgradient of the source at Site ST012 and is proposed to be reassigned to ST012. The 1995 RFI concluded that the contamination was coming from Site ST012 which is located approximately 100 feet directly upgradient. Recent (2016) contaminant concentration increases in this well are attributable to EVO injections conducted upgradient of the monitoring well that have moved TCE impacted water around in the subsurface.
23-21	Intermediate	Recommend reassigning this well to monitor the side/downgradient edge of the Site ST012 intermediate plume. The well is upgradient of Site WP023 and no intermediate zone contamination was found at Site WP023. The 1995 RFI concluded that the contamination was coming from Site ST012 which is located approximately 100 feet directly upgradient. Recent (2016 and 2017) contaminant concentration increases in this well are attributable to EVO injections conducted upgradient of the monitoring well that have moved TCE impacted water around in the subsurface.
23-22	Intermediate	Recommend reassigning this well to monitor the side/downgradient edge of the Site ST012 intermediate plume. The well is upgradient of Site WP023 and no intermediate zone contamination was found at Site WP023. The 1995 RFI concluded that the contamination was coming from Site ST012 which is located approximately 100 feet directly upgradient. Recent (2016 and 2017) contaminant concentration increases in this well are attributable to EVO injections conducted upgradient of the monitoring well that have moved TCE impacted water around in the subsurface.

25-1	Shallow	Well reassigned to Site ST012 per direction of ODEQ on August 2016 conference call. Contamination in this well most likely the result of localized releases along the flightline.
25-2	Shallow	Well reassigned to Site ST012 per direction of ODEQ on August 2016 conference call. Contamination in this well most likely the result of localized releases along the flightline.
25-4	Shallow	Well reassigned to Site ST012 per direction of ODEQ. Contamination in this well most likely the result of localized releases along the flightline.

Figure 5-3 shows monitoring wells that are proposed to be assigned to Site ST012.

Site WP023

Site WP023, also known as the Industrial Waste Pit, is located approximately 250 feet north of Site ST012. The initial COCs at WP023 were acetone, methylene chloride, toluene, and xylene. There currently has been no contaminant present at Vance AFB that originated from the WP023 waste pit in excess of 10 years. WP023 is hydrogeologically downgradient from ST012 and the shallow and intermediate zones of the two sites are hydraulic connected. As concluded in multiple investigations conducted at WP023, the source of chlorinated VOC contamination detected there originates at ST012. The exception to this is the TCE contamination at Monitoring Well MW23-14, which originates at the COMBS Warehouse (Site SS025). As a result of the new site based approach, WP023 should be considered for closure and the monitoring wells reassigned. Table 5-16 below presents the rationale for the reassignment.

Table 5-16 Site WP023 Rationale for Monitoring Well Reassignment		
Well Type	Well Type	Rationale for Reassignment
23-5	Shallow	Propose reassigning to Site ST012 as the well is immediately downgradient of the source at Site ST012.
23-14	Shallow	Propose reassigning to Site SS025 as the well is immediately downgradient of the source at Site SS025. Well is approximately 900 feet away from Site WP023.
23-21	Intermediate	Recommend reassigning this well to monitor the side/downgradient edge of the Site ST012 intermediate plume. The well is upgradient of Site WP023 and no intermediate zone contamination was found at Site WP023. The 1995RFI concluded that the contamination was coming from Site ST012 which is located approximately 100 feet directly upgradient. Recent (2016 and 2017)contaminant concentration increases in this well are attributable to EVO injection conducted upgradient of the monitoring well that have moved TCE impacted water around in the subsurface.
23-22	Intermediate	Recommend reassigning this well to monitor the side/downgradient edge of the Site ST012 intermediate plume. The well is upgradient of Site WP023 and no intermediate zone contamination was found at Site WP023. The 1995 RFI concluded that the contamination was coming from Site ST012 which is located approximately 100 feet directly upgradient.

Site SS024

Site SS024 is located at Building 187. Before 1992, hazardous material was transferred from inside the building via piping and an associated manhole outside Building 187. Prior to 1982,

a manhole outside the southeast side of Building 187 was used for the transfer of hazardous materials generated during jet engine cleaning processes (solvents and petroleum products) from inside the building to a truck awaiting pick up.

Currently no wells are listed in the Permit that have a Site SS024 designation to monitor the release from the site. Contaminants released from this site only impact the shallow zone within the aquifer and are currently monitored by Site ST012 Monitoring Wells MW12-33, MW12-35 and MW12-37. Monitoring Well MW24-5 is located downgradient of Site SS025 and monitors the downgradient edge of the plume associated with SS025. The proposed well reassessments for Site SS024 are shown below in Table 5-17.

Table 5-17 Site SS024 Rationale for Monitoring Well Reassignment		
Well Type	Well Type	Rationale for Reassignment
24-5	Shallow	Well is located downgradient of Site SS025 "hotspot" and over 2,000 feet downgradient of Site SS024. Propose reassigning this well to Site SS025.
12-33	Shallow	This well monitors the downgradient edge of the Site SS024 plume. There is physical separation from the Site ST012 Shallow plume. Propose reassigning this well to Site SS024.
12-35	Shallow	This well monitors the source area near the Site SS024 release. Propose reassigning this well to Site SS024.
12-37	Shallow	This well monitors the side gradient edge of the Site SS024 plume. There is physical separation from the Site ST012 Shallow plume. Propose reassigning this well to Site SS024.

The monitoring wells proposed to be assigned to Site SS024 are shown on Figure 5-4.

Site SS025

Site SS025, also known as the Contractor Operated and Maintained Base Supply Warehouse, is located downgradient of Site ST012 and adjacent to Hangar 170 (ITSI, 2010). The primary COC at the site is TCE. A drain or sump previously associated with Hangar 170 is the probable source of contamination at this site, although some of the contamination may have originated from Sites ST012 and SS024. The ST012 and SS024 contaminant plumes are currently spatially segregated from the remaining plumes at SS025.

The only monitoring well designated as a Site SS025 well in the Permit that actually monitors SS025 contamination is Monitoring Well MW25-7, which is monitored for 1,4-Dioxane per Permit requirements. It is proposed that Monitoring Wells MW12-43, MW12-45, MW23-14 and MW24-5 be reassigned to SS025 in the Permit because the monitoring wells monitor the plumes currently at this site. As previously mentioned, Monitoring Wells MW25-1, MW25-2 and MW25-4 are being proposed to be reassigned to Site ST012. The proposed well reassessments for SS025 are shown below in Table 5-18.

Table 5-18 Site SS025 Rationale for Monitoring Well Reassignment		
Well Type	Well Type	Rationale for Reassignment
25-1	Shallow	Well reassigned to Site ST012 per direction of ODEQ. Contamination in this well most likely the result of localized releases along the flightline.
25-2	Shallow	Well reassigned to Site ST012 per direction of ODEQ. Contamination in this well most likely the result of localized releases along the flightline.
25-4	Shallow	Well reassigned to Site ST012 per direction of ODEQ. Contamination in this well most likely the result of localized releases along the flightline.
12-43	Shallow	This well monitors the upgradient edge of the Site SS025 “hotspot” and is located over 100 feet away from Site ST012. Propose reassigning this well to Site SS025.
23-14	Shallow	Propose reassigning to Site SS025 as the well is immediately downgradient of a suspected source at Site SS025. Well is approximately 900 feet away from Site WP023.
12-45	Shallow	This well monitors the upgradient edge of the Site SS025 “hotspot” and is located over 100 feet away from Site ST012. Propose reassigning this well to Site SS025.
24-5	Shallow	Well is located downgradient of Site SS025 “hotspot” and over 2,000 feet downgradient of Site SS024. Propose reassigning this well to Site SS025.
25-7	Shallow	

The monitoring wells that are proposed to be assigned to Site SS025 are shown on Figure 5-5.

Industrial Zone Area

Site LF003

Site SS007 has two monitoring wells that monitor a petroleum-related release that is associated with Sites LF003 and ST011. It is proposed that these two monitoring wells be reassigned to LF003 in the Permit. The proposed well reassessments for LF003 are shown below in Table 5-19.

Table 5-19 Site LF003 Rationale for Monitoring Well Reassignment		
Well ID	Well Type	Rationale for Reassignment
3-9	Shallow	
OB-2	Shallow	Monitors petroleum contamination originating at site ST011 migrating under LF003. Not associated with Site SS007.
7-15	Shallow	Monitors petroleum contamination originating at site ST011 migrating under LF003. Not associated with Site SS007.

The monitoring wells that are proposed to be assigned to Site LF003 are shown on Figure 5-6.

Site SS007

Site SS007 has two monitoring wells that monitor a petroleum related release that is associated with Sites LF003 and ST011. It is proposed that these two monitoring wells be reassigned to LF003 in the Permit. The proposed well reassessments for SS007 are shown below in Table 5-20.

Table 5-20 Site SS007 Rationale for Monitoring Well Reassignment		
Well ID	Well Type	Rationale for Reassignment
7-4	Shallow	
OB-2	Shallow	Monitors petroleum contamination originating at site ST011 migrating under LF003. Not associated with Site SS007.
OB-4	Shallow	
OB-5	Shallow	
OB-6	Shallow	
OB-13	Shallow	
OB-16	Shallow	
OB-19	Shallow	
OB-21	Shallow	
7-15	Shallow	Monitors petroleum contamination originating at site ST011 migrating under LF003. Not associated with Site SS007.
N7-38	Intermediate	
N7-41	Shallow	
N7-48	Intermediate	
N7-50	Intermediate	
N7-52	Intermediate	

The monitoring wells that are proposed to be assigned to Site SS007 are shown on Figure 5-7.

Site ST008

Site ST008 consists of a mixed waste release in the shallow zone in the vicinity of former waste Tank No. 106. The proposed well reassessments for ST008 are shown below in Table 5-21.

Table 5-21 Site ST008 Rationale for Monitoring Well Reassignment		
Well ID	Well Type	Rationale for Reassignment
8-5	Shallow	
8-9	Shallow	

The monitoring wells that are proposed to be assigned to Site SS008 are shown on Figure 5-8.

Monitoring well MW8-18 is located upgradient of Site ST008 and monitors the intermediate zone in what is now Site SS028. This well does not monitor any of the contamination associated with Site ST008 and therefore will no longer be assigned to ST008. However this well will continue to be monitored as part of the Vance Compliance Monitoring Program and will be assigned to a site upon completion of the SS028 RFI.

6.0 REVISED GROUNDWATER COMPLIANCE MONITORING PROGRAM

The revised groundwater compliance program including all of the recommendations in this technical support document is summarized on a site by site basis below. The changes to the groundwater compliance monitoring program include:

- Elimination of fall compliance monitoring sampling event.
- Elimination of groundwater monitoring wells from compliance monitoring program no longer needed to monitor current extent of groundwater contamination at sites.
- Elimination of analytes that are not COCs or have not been detected in monitoring wells within past three years.
- CSM-based realignment/reassignment of monitoring wells to sites which they monitor.

WP023

There are no monitoring wells assigned to Site WP023, as all COCs at the site have not been detected in excess of ten years. Contamination currently present at this site originates at Site ST012.

Monitoring Well MW8-18

Monitoring Well MW8-18 is located upgradient of Site ST008 and monitors the intermediate zone in what is now Site SS028. This well does not monitor any of the contamination associated with Site ST008 and therefore will no longer be assigned to ST008. However this well will continue to be monitored as part of the Vance Compliance Monitoring Program and will be assigned to a site upon completion of the SS028 RFI. This well will be sampled annually for benzene, PCE, TCE, Cis-1,2 DCE, VC and naphthalene.

Tables 5-23 through 5-31 list the revised groundwater monitoring for each site.

**Table 6-1
Site ST012 Revised Groundwater Monitoring**

Well ID	Well Type	Frequency	Analytes
12-9	Shallow	Annual	PCE, TCE, Cis-1,2 DCE and VC

26-4	Shallow	Annual	Naphthalene and OK-GRO

7.0 FUTURE MODIFICATIONS TO THE COMPLIANCE MONITORING PROGRAM

To simplify the process of modifying the groundwater compliance monitoring with regards to the addition or removal of monitoring wells, or analytes from the program, a series of criteria will be set up that must be met for either monitoring wells or analytes being removed from the program. These are the same criteria used in sections 4.1 and 4.2 to modify the monitoring well network and list of analytes in this Permit Mod. This monitoring program modification procedure will be added to the current proposed Permit Mod.

Monitoring Wells

For monitoring wells to be considered for removal from basewide sampling program they must meet three criteria outlined below.

1. At least three monitoring events with no analytes above their regulatory criteria (MCL/RSL). Monitoring events must be separated by one year period.
2. Monitoring wells in critical locations such as well monitoring downgradient edge of plume will not be eliminated from program.
3. Monitoring wells that will be part of LTM program, as part of the site closure process, will not be eliminated from program.

Analytes

The analyte lists will be modified using the following criteria.

1. Any COCs detected above their relative MCL/RSL, during past three years, would be included in each sites/monitoring wells analyte list.
2. Any non COC detected above its MCL/RSL, during past three years, would be included in each sites/monitoring wells analyte list.
3. Sites where reductive dechlorination has been implemented, which include Sites ST012, SS024, SS025, SS007, DP005 and FT002, analyte list would include TCE, cis-1,2-DCE and VC at all wells regardless of whether there have been detections above MCLs within last three years.

If a monitoring well or analyte meets the outlined criteria, a recommendation will be made in the Annual Groundwater Monitoring Report to drop or add a monitoring well or analyte. The recommendation will include data and rationale supporting the recommendation. Upon concurrence, by ODEQ, that the recommendation is acceptable, a letter will be sent to ODEQ that includes the updated groundwater compliance monitoring well list for the next year's groundwater compliance sampling. A section has been added to the SAP to incorporate the groundwater compliance monitoring program modification process into the permit.

Notes:

¹ USEPA Maximum Contaminant Level (MCL; April 2012). "*" indicates an MCL is unavailable and the USEPA Regional Screening Level (RSL; June 2017) is used.

RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^{-5} .

² Wells MW12-33 and MW12-35 were not sampled in June 2016 due to the presence of Emulsified Vegetable Oil (EVO) in the well. These wells were sampled in September 2016.

Bold value with shaded cell indicates exceedance of listed regulatory criteria.

For non-detected results, the MDL is shown.

F = The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ).

J = The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

UJ = Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = Not sampled

Notes:

¹ USEPA Maximum Contaminant Level (MCL; April 2012). "*" indicates an MCL is unavailable and the USEPA Regional Screening Level (RSL; June 2017) is used.

RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^{-5} .

Bold value with shaded cell indicates exceedance of listed regulatory criteria.

For non-detected results, the MDL is shown.

F = The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ).

J = The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

UJ = Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = Not sampled

Notes:													

¹ USEPA Maximum Contaminant Level (MCL; April 2012). "*" indicates an MCL is unavailable and the USEPA Regional Screening Level (RSL; June 2017) is used.

RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^{-3} .

² Wells MW12-33 and MW12-35 were not sampled in June 2016 due to the presence of Emulsified Vegetable Oil (EVO) in the well. These wells were sampled in September 2016.

MW12-33 was sampled in September 2016, but 1,4-Dioxane and Pentachloroethane were not analyzed.

Bold value with shaded cell indicates exceedance of listed regulatory criteria.

For non-detected results, the MDL is shown.

B = Result is judged to be an artifact because of contamination in associated blanks.

F = The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ).

J = The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

R = The result is rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria.

U = Not detected. The associated number indicates the analyte limit of detecting (LOD).

UJ = Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = Not sampled

Notes:

¹ USEPA Maximum Contaminant Level (MCL; April 2012). "*" indicates an MCL is unavailable and the USEPA Regional Screening Level (RSL; June 2017) is used.

RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^{-6} .

Bold value with shaded cell indicates exceedance of listed regulatory criteria

For non-detected results, the MDL is shown

B = Result is judged to be an artifact because of contamination in associated blanks.

F = The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ)

J = The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy

M = Detected result above the LOQ; a matrix effect was present

UJ = Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies

NS = Not sampled

Notes:

¹ USEPA Maximum Contaminant Level (MCL; April 2012). "*" indicates an MCL is unavailable and the USEPA Regional Screening Level (RSL; June 2017) is used.

RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^{-5} .

² Wells MW-05-06, MW-05-07, and MW-05-19 were not sampled in June 2016 due to the presence of Emulsified Vegetable Oil (EVO) in the well. These wells were sampled in September 2016.

Bold value with shaded cell indicates exceedance of listed regulatory criteria.

For non-detected results, the MDL is shown.

B = Result is judged to be an artifact because of contamination in associated blanks.

F = The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ).

J = The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

R = The result is rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria.

UJ = Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = Not sampled

Notes:

¹ USEPA Maximum Contaminant Level (MCL; April 2012). "*" indicates an MCL is unavailable and the USEPA Regional Screening Level (RSL; June 2017) is used.

RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^5 .

Bold value with shaded cell indicates exceedance of listed regulatory criteria.

For non-detected results, the MDL is shown.

F = The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ).

J = The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

UJ = Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = Not sampled

Notes:

* Well resampled on November 2012

** = May 2013 value is for total xylenes

¹2013 EPA Regional Screening Level for tap water

F – The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ) (equivalent to J for 2009-2012)..

J – The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

U – Not detected. The associated number indicates the analyte limit of detection (LOQ).

UJ – Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = not sampled

NA = not analyzed

MCL = Maximum Contaminant Level

HGL/AECOM did not validate or review results prior to May 2013. Data prior to May 2013 was taken from previous compliance monitoring reports generated by others.

¹2013 EPA Regional Screening Level for tap water

²6.1 µg/L Concentration specified in the RCRA Permit (EPA Screening Level for tap water).

¹2013 EPA Regional Screening Level for tap water

J – The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

R – The result is rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria.

U – Not detected. The associated number indicates the analyte limit of detection (LOQ).

NS = not sampled

NA = not analyzed

NL = not listed

NE = no exceedance

MCL = Maximum Contaminant Level

HGL/AECOM did not validate or review results prior to May 2013. Data prior to May 2013 was taken from previous compliance monitoring reports generated by others.

Notes:

¹2013 EPA Regional Screening Level for tap water

** = May 2013 value is for total xylenes

F – The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ) (equivalent to J for 2009-2012).

J – The analyte was detected above the LOQ at the reported concentration; the quantitation is an estimate due to an associated QC discrepancy.

M – Detected result above the LOQ; a matrix effect was present.

U – Not detected. The associated number indicates the analyte limit of detection (LOD).

UJ – Not detected. The associated number indicates the analyte LOD, which may be inaccurate due to associated QC discrepancies.

NS = not sampled

NA = not analyzed

NL = not listed

MCL = Maximum Contaminant Level

HGL/AECOM did not validate or review results prior to May 2013. Data prior to May 2013 was taken from previous compliance monitoring reports generated by others.

Notes:

* Well resampled on November 2012.

¹2013 EPA Regional Screening Level for tap water

F – The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ) (equivalent to J for 2009-2012).

R – The result is rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria.

U – Not detected. The associated number indicates the analyte limit of detection (LOD).

NS = not sampled

NA = not analyzed

MCL = Maximum Contaminant Level

HGL/AECOM did not validate or review results prior to May 2013. Data prior to May 2013 was taken from previous compliance monitoring reports generated by others.

Notes:

* Well resampled on November 2012.

*** Elevated laboratory Method Detection Limit (MDL) > screening criteria.

¹2012 EPA Regional Screening Level for tap water

IW = an insufficient volume of groundwater was present in the well for sample collection and analysis (May 2013 sampling event).

F – The analyte was detected at the reported concentration; the quantitation is an estimated value below the limit of quantification (LOQ) (equivalent to J for 2009-2012).

U – Not detected. The associated number indicates the analyte limit of detection (LOD).

NS = not sampled

NA = not analyzed

MCL = Maximum Contaminant Level

HGL/AECOM did not validate or review results prior to May 2013. Data prior to May 2013 was taken from previous compliance monitoring reports generated by others.

**Sediment Analytical Data Summary – 2009 to Present
Vance Air Force Base**

Notes:

Blank results indicate sample not collected and/or parameter not analyzed.

RSL-Res = USEPA Regional Screening Level for Residential Soil (TR=1E-5, HQ=1, November 2015).

The RSL-Res value for m-xylene was used.

* USEPA Residential Regional Screening Level (RSL; June 2017). RSLs are the lower of the noncarcinogen screening level based on an HQ of 1 and the carcinogenic screening level based on a risk level of 1×10^{-5} .

J = Parameter detected between the limit of detection and the limit of quantitation.

Q = One or more quality control criterial failed.

Bold = Compound detected at or above the limit of detection.

Shading = RSL-Res Exceedance.

**Surface Water Analytical Data Summary – 2009 to Present
Vance Air Force Base**

Notes:

Blank results indicate sample not collected and/or parameter not analyzed.

OK WQS = Appendix G. Numerical Criteria to Protect Beneficial Uses, Table 2, and Appendix I. Criteria for Groundwater Protection, Oklahoma Water Quality Standards, Oklahoma Water Resources Board, Sept. 11, 2017.

J = Parameter detected between the limit of detection and the limit of quantitation.

Q = One or more quality control criteria failed.

Bold = Compound detected at or above the limit of detection.

Shading = MCL or RSL-Tapwater Exceedance.

* = SW03-11 DUP sample results used.
